"Besides, I hope the devil does not owe me such a shame. Mad Tom tells us that the Prince of Darkness is a gentleman, and this mysterious personage will, I hope, partake as much of his honorable feelings as of his invisibility, and resuming his incognito, permit me to enjoy, in his stead, an honor which I value more than I do that which has been bestowed on me by the credit of having written any of his novels.

"I regret deeply I cannot soon avail myself of any new privileges; but courts, which I am under the necessity of attending, officially sit down in a few days, and, *hei mihi!* do not arise for vacation until July. But I hope to be in town next spring; and certainly I have one strong additional reason for a London journey, furnished by the pleasure of meeting the Roxburghe Club. Make my most respectful compliments to the members at their next merry meeting; and express, in the warmest manner, my sense of obligation.

"I am always, my dear sir, very much your obedient servant,

WALTER SCOTT.

Abbotsford, May 1, 1823."

[From Traits of Indian Life.]

DWELLING OF A EUROPEAN LADY.—"The mansion, with its porticoes and pillard verandas, stood in the midst of glittering lawns, the verdure of which was relief to the eye from the painful glare of the burning sunlight; the evergreen shrubberies formed a shady border to the emerald-colored carpet, and a sheltered choir for the mango-bird, the meina, and the coel. From the Portico Eva entered a circular hall, floored with polished marble and portioned off by rows of pillars, through which the eye wandered amongst a lengthened chain of halls, all similarly paved with marble, and apparently only separated from the hall itself by clusters of columns. But to Eva, just landing after the confinement of the beautiful, the delicious and sombre light which penetrated through the closed venetians, gave to the gray marble floors the cool semblance of a still surface of water, sheltered in the shady nook of some deep valley. In the secret of admitting the exact portion of external light, lies half of that beauty which our oriental residences possess. The suite of well-furnished drawing-rooms on the first floor was not less splendid, though in a different character. November, the cool season, having commenced, the whole suite of rooms had been carpeted with one rich piece of Brussels' handsomest manufacture. Ottomans and couches of light blue satin, heavy chandeliers and girandoles, musical instruments, and elegant fancy tables, filled the spacious apartments, with a profusion which perhaps the better taste of London would pronounce too redundant; yet amidst all the richness of furniture with which the fashion of later years has adorned the houses of Calcutta, few things strike the stranger's eye so forcibly as the picturesque forms and customs of the numerous native servants; and above all, the silent and graceful manner in which they seem to glide through the apartments."

TO STEAMBOAT COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, post paid, 81 R J M M & F

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon dale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, January 29, 1833.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORNBURN, 247 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* Mr. Thornburn is also Agent for the following publications, to wit:

New York Farmer and American Gardener's Magazine. Mechanics' Magazine and Register of Inventions & Improvements.

American Railroad Journal and Advocate of Internal Improvements; and the

New-York American, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & O. W. BLUNT, 154 Water street, corner of Maiden-lane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG, Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend, JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY B. CAMPBELL, Eng. Philad., German and Norrist. Railroad

ml 1y

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads No. 264 Elizabeth street, near Bleecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete. J. ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. No. 1 Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTLE, at the sign of the Quadrant, No. 58 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartle.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable.

They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER, Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit levels, and surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing and Heartle.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

E. H. LATROBE, Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any person desirous of perusing the same.

AN INTERESTING AND USEFUL MAP.

A friend of ours has now in a state of forwardness, a Map upon which will be delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It will be completed in a few weeks, and may be had either in sheets, or put up in morocco for pocket maps, in any quantity, by applying to the subscriber.

D. K. MINOR, 35 Wall street.

New-York, August 14, 1833.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty sd nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for shive. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 16, 1833.

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level or hilly roads. They will save ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1825, by his patents filed in the Patent Office. Apply, post paid.

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of ANTIGNIS, or Incombustible Varnish, at one dollar per lb.

Apply to C. S. RAFINESQUE, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 49 North 8th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanics' Magazine; Messrs. Rushton & Aspinwall, Druggists Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means.

RAILWAY IRON.

	Ninety-five tons of 1 inch by 1 inch,	Flat Bars in length of 14 to 16 feet counter sunk holes, end cut at an angle of 45 degrees with applying plates; nails to suit.
200	do. 1 1/2 do. do.	
40	do. 1 1/2 do. do.	
800	do. 3 do. do.	
800	do. 3 1/2 do. do.	
	soon expected.	

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 4 1/2, and 5 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON, 9 South Front street, Philadelphia. Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroads and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 24, 1833. For further information on this subject see No. 46, page 772 of this Journal.

[From the Evening Post.]

We have looked over the Fifteenth Annual Report, made to the Legislature of this State by the Directors of the Institution in this city for the Instruction of the Deaf and Dumb. From this document we learn that the whole number of pupils in the institution at present is 134, having increased from 87 since the last report. During the present year 11 have been dismissed and 58 admitted. The greater part of the pupils, as we learn from the report of the Superintendent of Common Schools, contained in the appendix, are educated at the expense of the State. Ninety-seven, the whole number which the law authorizes, are provided for in this manner. Of the remainder, 11 are supported by the supervisors of the city of New-York, 5 by the Legislature of New-Jersey, 3 by the New-York Female Association; 15 are pay pupils, and 3 are educated at the cost of the Institution. The cessation of lotteries in the State has cut off one of the sources of income enjoyed by this institution, amounting to several thousand dollars. This diminution of its means will, it is said, prove a serious check to its usefulness; an application is therefore to be made to the Legislature for a grant to make up the deficiency. Very considerable improvements have recently been introduced into the methods of instruction. Two additional professors have been added to the five by whom the task of education has been hitherto performed. A class is about to be formed for the purpose of receiving lessons in articulation, after the method by which the deaf and dumb have been taught to speak in some of the European institutions. Among the improvements which have been introduced into the course of instruction, is the method of teaching the construction of language by the means of symbols. Each character denotes a particular part of speech, and by a series of modifications is also made to represent inflections of language, comprehending nouns and pronouns in their several cases, adjectives in their various degrees of comparison, and verbs in their various forms. Their use is to show the artificial arrangement of words in language, after a knowledge of the meaning of single words has been acquired. It is said that this method is exceedingly ingenious, and has been attended with great success. The following are mentioned as some of the most important changes and improvements effected in the institution since the last year.

1. A small library adapted to juvenile reading, and a philosophical apparatus to illustrate truths in physics and astronomy, have been procured.
2. The number of pupils has been increased by nearly one-third, and two additional professors have been employed.
3. A full supply of large slates, of the same quality as those heretofore in use, has been imported from Wales.
4. An excellent set of models for drawing has been received from Paris, and instruction is given to a class weekly in this useful art.
5. The debt incurred for the erection of the building has been extinguished.
6. The lawn in front of the edifice has been improved by planting trees and laying out walks for the purpose of providing a promenade and play ground for the pupils.

Courses of lectures are also now given in six departments of knowledge under the direction of a professor.

"The lectures are given three evenings in a week, during hours which are allotted neither to study nor mechanical operation, and they are so arranged in point of time and duration as neither to be too burdensome to the professors, nor to be regarded by the pupils in the light of a task. The departments of instruction embrace the following subjects:

1. Those branches of science which treat of nature, and of which the object is to discover the properties and relations of all bodies.
2. Description of the mineral, vegetable and animal kingdom.
3. Rise, progress, and present condition of the arts, commerce and agriculture.
4. Geography, physical and political.
5. History, ancient and modern, sacred and profane.
6. The science of government.

Each lecture is reduced to writing in order that the subject matter may be referred to and studied by the pupils at their future convenience. These intellectual exercises are not embraced within the limits of a common education; and besides exciting new interest in the pupils by varying the monotony of their ordinary pursuits with a mixture of more attractive subjects, they cannot fail to be in the highest degree

instructive, by opening to their investigation sources of knowledge hitherto unexplored, and of the value of which they can have formed no estimate. Too much praise cannot be accorded to the principal and professors, in whose zeal and devotion this essential improvement, involving great labor on their part, had its origin."

Advices from Vera Cruz to Feb. 18th, state that a *conducta* of \$1,290,000 had just arrived there from Mexico. Gen. Barragan, Minister of War, and Garay, Minister of Finance, had both resigned.—[Jour. Com.]

[From a Correspondent of the Daily Advertiser]

LIVERPOOL, January 7.—The transactions in Cotton this week amount to 15,308 bales of all descriptions, viz:

223 Sea Islands at.....	14 a 21½
30 Stained.....	7 a 12½
6636 Uplands.....	7½ a 8½—(20 a 6)
3940 Orleans.....	7½ a 9½
1006 Alabama.....	7 a 8½
2728 Brazil.....	8 a 11½
110 West India.....	6½ a 7
1130 East India.....	5 a 7½

The market has been heavy throughout the week, and we find it necessary to reduce our quotations for all descriptions of per lb. especially for New Uplands which continues to be pressed upon the market, even at the decline, owing to the scarcity of Egyptian, Sea Islands bring forward full prices, and have rather an upward tendency; 500 of the American were in speculation, and 300 together with 400 Surats, and 300 Brazils for export, and the import of the week is 19,180 bales.

Asbes in very limited demand, and the sales trifling. Nothing done in Naval Stores. Rice, 340 tierces of old, were sold at 11s a 15s 6d per cwt. Flaxseed, 55s per hhd. has been taken for 200 hhd. and 62s per cwt for 20 tierces of new Cloverseed. No change of interest in the Grain market, but sweet Flour in bond is wanted, but holders will not accept the prices offered. Tobacco remains without any alteration of no moment.

LIVERPOOL MARKETS, Feb. 3.—COTTON.—The sales today are estimated at 9000 bags, of which 500 American and Brazil have been taken for export. Prices remain as on Saturday.

Feb. 4.—The market has been extremely dull today. The sales are estimated at from 800 to 1000 bags, and prices are with difficulty maintained.

LONDON MARKET, Feb. 4.—COTTON.—There was a general decline on all kinds last week of 2s per cwt. The reduction has induced holders to withdraw their sales for the present, and though the market appeared heavy yet no parcels are pressed into it.

SUGAR.—The new sugar market continued very steady, sales nearly 3000 hhd. and tierces, being extensive for the season; bright colour descriptions commanded a further advance of 8d. to 1s per cwt.; low qualities heavy, and former prices scarcely could be obtained. This morning the general demand for Muscovades continued unabated. The refined market improving, and prices rather higher. The improvement in Bengals this forenoon is maintained, but there are few sales.

TALLOW has declined 6d. in the cwt.

Agricultural Report for January.—The accounts from all lowland parts of the country, in consequence of the deluge of rain, are most melancholy; the immediate losses sustained are great, and the effects which may too probably be expected of embarrassing the spring culture, must be highly injurious to the farms.

LONDON, Feb. 6.—Consols 88½; do for Accounts, 88½; French 5 per cent. 106½.

LIVERPOOL CORN EXCHANGE—FRIDAY.—Notwithstanding we have rather a limited arrival of grain and flour fresh up since Tuesday, the trade has ruled for all articles extremely dull to-day, and there does not appear to be much confidence on the part of buyers at the same time. The late large supply is not forced upon the market, and we can therefore hardly quote any reduction in prices, though the dullness so generally existing would most likely induce holders in partial instances to give way a little below the currency of Tuesday last.

CINCINNATI, March 12.—FLOUR.—From boats, at \$2.76 a 2.87. From store, \$3 less lid demanded.

WHEAT.—This article has risen a shade since our last. It now sells briskly at 18½. But little in market.

PORK BACON & LARD.—There has been no change in these articles since our last.

Pork, Mess.....	10 00 a 10 25
—Prime.....	8 00 a 8 25
—Corgo.....	5 00

CHARLESTON, March 13.—The Market.—[Semi-weekly Report.]—COTTON.—The weather, on Monday and Tuesday, was so unfavorable that little business was transacted. Yesterday, however, it became clear and pleasant, and sales to a considerable extent were effected, at the closing prices of last week. We make no alteration in quotations.

RICE.—This article continued very dull. No sales have been effected over 2½. Holders seem unwilling to submit to a further reduction—and we understand some shipments have been made on owner's account.

Those papers with which the *American* exchanges, and in which the following advertisements are inserted, will confer a favor on the subscriber by giving the following a few insertions:

Subscribers who are indebted for the *New York American*, the *Railroad Journal*, *Mechanics' Magazine*, or *New York Farmer*, are respectfully requested to remit the amount by merchants, or other gentlemen visiting the city this spring, and, if possible, in notes of the United States Bank, or its Branches, as the expense of postage and the discount on notes of distant Banks, is a great tax upon the Office.

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in semi-monthly form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the *LONDON MECHANICS' MAGAZINE*, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y. D. K. MINOR, Proprietor.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published.

D. K. Minor also publishes the *NEW-YORK AMERICAN*, daily, tri-weekly, and semi-weekly.

All Letters and Communications for the above publications, may be addressed, free of postage, to D. K. MINOR.

List of Subscribers to the *Railroad Journal* who have paid in advance to Jan. 1, 1835, —continued from March 8, 1834.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MARCH 29, 1834.

The writer of the following will please accept our thanks for his very acceptable letter. Such favors come, at this time, most opportunely to hand.

The Athens Railroad, to which he refers, cannot fail to attract the attention of business men in this community, although it may not just now meet with such a reception as its importance demands. It is certainly a *second* link in a grand southern chain of internal improvements, from which the South will derive great advantages. It will enable the business man, or the man of pleasure, to perform the journey from New-York to Athens, with ease, in five, and probably in four days.

ATHENS, Ga., March 12, 1834.

DEAR SIR,—I have been very much at a loss how to remit the subscription for the Railroad Journal. I have at last, however, procured notes that will probably answer your purpose,* and enclose my own subscription for the past and present year.

I enclose, also, three dollars, for which you will send the Journal to Mr. Wm. Dearing, of this place; also, to Wm. Lumpkin, and Wm. Williams.

I feel very much obliged to you for the favorable notices in the Journal on the subject of our Athens Railroad. The project is in a pretty fair way to be accomplished, if the proper energy is used. The route is, I think, one of the best in the United States, being formed in a good degree by nature. The distance from Augusta to Athens is about 96 miles by the present road: the railroad survey gives 105 miles only; and not a drop of water is crossed, but one or two very inconsiderable brooks. No inclined plane is necessary, except to ascend the hill on which Athens stands. The esti-

mate is that the whole road, engines, cars, and all, will cost under *ten thousand dollars* the mile. We design using horse power, for the present, which it is believed will reduce the cost to five or six thousand per mile. The very best timber is at hand, and the soil is very favorable, being chiefly, except near Augusta, a stiff clay foundation.

Our purpose is to make this road a part of the great road beginning at Memphis and ending at Charleston; and if the road is ever finished through the whole distance, the profits, with good management, must be incalculable. It will command a large portion of western travel; and the transportation of an immense amount of produce.

Even if the road should stop at Athens, we calculate on a large amount of business from East and Middle Tennessee, North Alabama, and the counties in this state above us. We have near this place inexhaustible deposits of iron ore, limestone, and marble, which will furnish articles of export, in addition to what is now supplied by the cotton planters.

It seems to me that this road must be an object of interest to the people of the city of New-York. The trade of great part of East and Middle Tennessee goes to Baltimore and Philadelphia; but when this road is built, by means of the Charleston road, and steam packets, it will certainly find its way to New-York. Those interested in the prosperity of that city, therefore, would certainly employ their capital to good advantage, independent of the income of the stock, by vesting it in this undertaking. Whether an opportunity of making such investment will be offered, I cannot say. I hope the stock will be all taken at home.

By reference to a map of Georgia, you will at once see the indications of a favorable route for an improvement of this sort. Begin at Augusta; keep the ridge between Little River and the Ogeechee to near Warrenton; thence on the same ridge to Crawfordville, and so proceeding near Greensborough and Lexington, you will see that until we arrive at the river at Athens, not a single bridge will have to be built; and the Engineer reports the excavation and embankment to be very little, compared with what has been done on other routes.

Very respectfully, &c.

P. S.—The officers of our Railroad are :

President—James Camak.

Directors—Wm. Dearing, Wm. Williams, A. B. Linton, Rev. James Shannon, J. A. Cobb, E. L. Newton, John Nisbet, Wm. Lumpkin, W. R. Cunningham, of Athens; John Cunningham, of Greene; R. B. Thompson, A. Jones, of Talliaferro.

Secretary and Treasurer—Wm. Williams.

The Undulating Railway—Resistance from Friction—Resistance of the Atmosphere—Mr. Badnall in reply to S. Y., Junius Redivivus, and Mr. Cheverton. [From the London Mechanics' Magazine.]

SIR,—Seven months have now elapsed since the undulating railway was first introduced, as a subject of discussion, in your Magazine. During that period I have done my utmost, by fair and conscientious argument, to support the cause which I undertook to defend; and the gratification which I now feel in having witnessed your honorable and candid confession of a changed opinion, and in finding myself supported by several of your most able correspondents, far more than compensates for the disappointment which the opposition of "S. Y." would naturally excite, even should it be continued after the publication of this letter, and after the important facts determined by the experiments. I say *disappointment*, because, if still unconvinced, he will, I fear, ever remain unconvinced; and, judging from the occasional piquancy and asperity of his remarks, he is not likely to be more fairly defeated, without losing, in some measure, that evenness of temper which I should be sorry to disturb. If I do him injustice, I apologise for it; but I feel that the time is now arrived when (practical experiments having decided the merits of the question) I have no longer occasion to defend myself by parrying the verbal attacks of my opponents. On the contrary, I waive all further hypothetical discussion on this subject, unless such discussion refer to the result of my late or future experiments. In coming to this conclusion I am not considering my own convenience, but I think your readers in general will agree with me, and with your friend, *Professor Crackwell*, that unless we draw in our horns, the undulating controversy will not only become sickening, but, judging from Mr. Cheverton's last letter, somewhat disgusting. "*Nec lusisse pudet, sed non incidere ludum*," said Horace, and I quite agree with him.

You, Mr. Editor, or an impartial jury of your readers, must judge whether I am led to this train of thinking through *fear* of my opponents, or whether I am not justified in claiming the victory I have contended for. Those gentlemen who have advocated my side of the question—*Saxula*, Mr. Ham, Mr. Sanderson, Kinclaven, Mentor, and Mr. Trebor Valentine, have each and all supported my position by convincing diagrams, appropriate comparisons, or disproved experiments; whereas neither "S. Y." nor Mr. Cheverton have thought proper to substantiate their reasoning by a single particle of corroborative evidence. That both are clever men, I do not for one moment question; but a clever man occasionally errs; and never

* U. S. Branch notes, which are as good to us as gold.—[Ed.]

is he more likely to do so than when inflated with that unhappy quantity of combustible matter,—vulgar abuse, self-sufficiency, and extreme vanity,—which have been so conspicuously displayed in the disjointed lectures which Mr. Cheverton has directed to me on this subject. For those lectures I am indebted to him, especially for the last, which I shall presently take into consideration, and which, I trust, will be headed in your title-page, "THE PROFOUND IGNORANCE OF MR. BADNALL DEMONSTRATED BY THE SUPREME SENSE OF MR. CHEVERTON"!!

My present object is to reply to all unanswered objections which have been raised by my opponents up to this time. In doing this, I may probably introduce some opinions which may appear open to further discussion; but as I fully concur in the sentiments expressed by *p.* (No. 532), as to the frequently injurious effects of a too protracted controversy, I shall feel it an act of duty to your readers to be a silent observer of any attacks upon them. I place them on record as my deliberate and conclusive opinions; and having done so, I turn from *theory* to *practice*, and now present myself to your readers as the defender of the undulating principle in a far more important point of view—I mean in defence of its *complete practicability*.

In thus a second time throwing the glove, allow me to prognosticate what will be the result of another year's experience. Within that period, engineers and mathematicians will have an opportunity of making up their minds upon the subject, and from the expiration of that time *we shall never have another level railway* (whereon locomotive steam force is intended to be employed) *laid down in Great Britain*. The Liverpool and Manchester railway, though it will ever maintain the character of being one of the most important examples of British spirit, British perseverance, and British ingenuity, will, in the eye of posterity, have one dark spot upon its fame—it will be compared to the massive and expensive aqueducts of the ancients. Our forefathers knew not that water would find its own level—and, while we praise their structures, we cannot help wondering and smiling at their ignorance. Thus, however, will posterity smile at us, exclaiming, "*Could you have believed it! They expended, in about thirty-one miles, hundreds of thousands of pounds to make a railroad level, through their disbelief that all bodies descending on a curvilinear arc will rise again to their own level, minus friction!*"

I now turn to "S. Y."—a few words afterwards to Junius Redivivus; and then, in perfect good humor, to Mr. Champion Cheverton.

A desire to remove, if possible, every opposition founded on mathematical reasoning, which has been urged against the undulating theory, induces me to return to "S. Y.'s" first communication. Before doing so, however, I must at once contend against the liberty which he takes in stating that I have betrayed ungentlemanlike conduct by my observation, "that I should have felt hurt that any other correspondent than himself had doubted my proficiency in common arithmetic." The "indignation" of "S. Y." cannot possibly justify such an observation.

In "S. Y.'s" letter, page 181, there is an error in print, afterwards corrected, which rendered his first formula "incomprehensible." I allude to the omission of the decimal dot before the figure 8. In the succeeding column, however, I find this misprint did not occur; I therefore ought to have understood his object better than I did. But allowing that I had fully comprehended it, and that such misprint had not occurred, I observed that the whole formula was founded on false data, and that the position which he took was altogether untenable. I refer now to the saving of friction "*abstractedly*," without allusion to the difference in velocity occasioned by the action of gravity, to which latter point he also frequently alluded,

when he denied that the speed could be greater on a curve than on a level line. With regard, then, to the real difference of friction on the two roads, he gives the following proposition, which I have thought it better to describe by diagram:

Fig. 1.

Fig. 2.

"If A E (fig. 1) be equal to 16, and the depth F B equal to 6, the length of each inclined plane will be equal to 10, and the pressure against the plane; and therefore the friction, according to Mr. Badnall, will be equal to .8 of the friction on the level."

Now "S. Y." must have misunderstood my diagram, "p. 93, to which he refers, and which was, I think, clearly elucidated. If he *did* understand it, from whom did he draw his conclusion, that I imagined the friction or pressure on the inclined plane E B, whose perpendicular elevation is equal to F B, equal to .8 of the friction on the level?

Let him suppose, then, (reversing the above diagram, as fig. 2,) the plane E B raised upon the base E F, at an elevation of F B. It cannot be doubted (as proved by the parallelograms described in my diagram, page 93,) that if the base line E F represent the pressure (or friction) of the whole weight resting on the plane E B, F B will represent the force of gravity down the plane, or, in other words, as the length of the line F B is to the length of the line E F, so is the pressure or friction taken off the inclined plane E B to the pressure or friction left on the inclined plane; or, to be more explicit, if a body be supposed to weigh 10 tons, and to be placed on the horizontal line E F, no one can dispute that, the line of pressure being vertical, the *whole weight of the mass* must necessarily press upon the rail. If, then, E F were exactly equal to F B, and the weight were removed to the inclined plane E B, the pressure would be reduced *one half*; and thus, in the above diagram, E F being equal to 8, and F B equal to 6, and supposing any weight resting on E B to be divided into 14 parts, $\frac{8}{14}$ of the whole weight would be resting on the rail, and $\frac{6}{14}$ would be taken off the rail.

By this explanation it will be evident that "S. Y.'s" second formula, page 242, is, like to his first, established on wrong data, for he *never takes into consideration the perpendicular elevation of the plane*; and it is this which has evidently misled him, or otherwise he would not consider his argument to hold good for "all lengths and elevations of inclined planes."

"S. Y." considers in both formulæ the pressure to be determined by the *base*, divided by the *length of the inclined plane*: he consequently draws in each case an erroneous conclusion, for there can be no doubt whatever that, *as the perpendicular height of the inclined plane is increased, the pressure or friction of any carriage moving on that plane is reduced.*

* On referring to this diagram I find the length of the level line E A = 22, the length of each inclined plane = 34, and the elevation = 2.5; if, therefore, we deduct 2.5 from the length of F A, we shall find the reduction of friction or pressure nearly one-fifth.

Referring to the preceding diagrams, nothing can be so easy as to determine the *exact* proportion which subsists between the pressure or friction on an inclined plane, and the pressure or friction on a horizontal plane, provided the angle of elevation be given. In the case before us we have the angle F E B. Now, let P be the pressure on the base, or horizontal line F E, and let p be the quantity taken off that pressure, owing to the inclination of the plane, and let a be the angle of inclination: we then have in *all cases*—

$$p : P :: F B : F E$$

$$\text{but } F B : F E :: \tan a : 1$$

$$\text{therefore } p : P :: \tan a : 1$$

$$\text{and, consequently, } p = P \tan a.$$

If, then, the amount of friction or pressure on an inclined plane (speaking abstractedly of friction or pressure) be reduced in proportion to the angle of inclination, it must, I should hope, be evident to "S. Y." that his position is wrong. He, no doubt, will allow that the pressure at an angle of 45° is reduced *one half*. To make myself, therefore, perfectly clear, I will take this angle to prove his formulæ *incorrect*, and the undulating theory, in regard to friction, *perfectly correct*:

Draw the line A B, and divide it into 16 equal parts. From the centre C describe the semicircle A D B. Draw the line C D perpendicular to A B, and from the points A and B draw the straight lines A D, B D.

Now, as before observed, because the perpendicular line C D is equal to the line B C, any weight descending on the line B D will press with exactly half the force with which it would have pressed on the level line A B, the angle C B D being an angle of 45°. Divide, then, the lines B D, A D, into an equal number of parts, each part being equal to $\frac{1}{16}$ of the horizontal line A B = 22. Next suppose a body, weighing 10 tons, to press upon every described part of the line A B, in passing from A to B: we then have 16 × 10 = 160; but if 10 tons press upon each part of the horizontal line, *half that weight*, according to the proposition, will only press upon each part of the lines B D, A D.

We have, therefore,

$$22\frac{1}{2} \times 5 = 112$$

and, consequently, 160—112=48 difference in total pressure.

But it may be argued, that if the semicircle A D B were divided into an equal number of like parts, the total number to be passed over on the curve would be 25.142; but this argument will not obtain, it being mathematically true (see Sir Isaac Newton, Parkinson, Hutton, and others,) that the velocities which bodies acquire in falling either down inclined planes, or curvilinear arcs, are precisely alike, viz. as the square roots of their perpendicular heights; and if the acquired velocities are equal, it is self-evident that the resistance opposed to motion down each line is also equal.

Let us now examine to what result "S. Y.'s" formulæ would bring us.

Let B represent B C

L " B D

n pounds equal to the force of traction on a level at any given velocity.

Then the pressure on the line B D (according to "S. Y.") will be to the pressure on the level as $\frac{B}{L}$ is to 1; and therefore the force of traction required in conse-

quence of friction on the inclined plane, will be to the force of traction on the level as $\frac{B}{L}$ is to n . According, then, to "S. Y.," the entire expenditure of power to move the wheel the horizontal distance on the level will be Bn , and on the inclined plane it will be $\frac{B}{L} \times L =$

Bn as before. Thus he makes, at an angle of 45° , the pressure or friction on the lines A D and B D equal to the pressure or friction on the horizontal line A B; whereas I make the difference in friction as 7 to 10, or $\frac{3}{10}$ ths in favor of the semicircle A D B.

Again, referring to "S. Y.'s" letter (No. 531), wherein he fully explains the bearing of his formulæ, the erroneous view which he has taken of the question is again evident. For, taking 5 ounces (as he suggests) to represent the force of traction on the level, and applying his observations to the angle of 45° , we shall find that the calculation will not be, as it would arise if his formulæ were correct, viz. $10 \times 5 = 80$ on the level, and $22 \cdot 40 \times 71429571 = 15 \cdot 999$, or very nearly 16; consequently, $16 \times 5 = 80$ on the inclined plane, as before.

But, instead of the force of traction on the semicircle being equal to the force of traction on the horizontal line, we should have it as follows:

$$16 \times 5 = 80 \text{ on the level,}$$

$$22 \cdot 40 \times 2 \cdot 50 = 56 \text{ on the curve,}$$

precisely agreeing with the reduction of friction before mentioned, viz. $\frac{3}{10}$ ths in favor of the semicircle.

So much for the question of friction, considered abstractedly, and as commonly understood; but it must be evident to every man who has perused the particulars of the experiments, that the amount of reduced friction, as in this instance considered, according to the angle of the inclination of the plane, cannot be taken as the precise measurement of power saved, by the adoption of the undulations. On these interesting points I trust that some valuable information may shortly be laid before the public in a treatise on railways,* locomotive engines, &c., which Mr. Robert Stephenson, sen., and myself, are preparing for the press. Previously to that time we shall try various experiments, and I have no doubt, from the plans which we intend adopting, and the precision with which the experiments will be made, that the laws of motion and resistance, under various circumstances and velocities, will be more clearly developed than they have hitherto been. The results which I anticipate lead me to quote a remark of Hooke's in the year 1666: "Gravity, though it seems to be one of the most universal, active principles in the world, and consequently ought to be the most considerable, yet has it had the ill fate to have been always, till of late, esteemed otherwise, even to slighting and neglect."

I have no apology to make to "S. Y." for considering L as a proper symbol for the length of the plane, which was ascended with a given velocity, especially as the spaces in most of the experiments varied on every trial. For an error in the last equation I, however, have to apologise, and I must beg "S. Y." to read $L + D$ for $L D$. The word "INVERSE," which he alludes to in his letter (No. 531, p. 23,) was an unintentional omission of mine (see page 222), where, for "is in proportion," I evidently intended to say, "is in inverse proportion." Any person who reads the sentence will, I hope, give me credit for this.

In reply to the observation of Junius Redivivus, (No. 532, page 38,) let me beg him to place a heavy ball upon a plank, then raise the plank to a vertical position—he will allow that, because the weight falls perpendicularly, there is no pressure on the plank. Let him,

then, raise the plank on which the same weight rests to an angle of 45° . He will, no doubt, admit that the weight will descend, and that the velocity of descent on the effect of the force of gravity will be in proportion to the diminution of pressure or friction on the plank. Let him next support the weight on the plank (the latter still being inclined at an angle of 45°), by placing his hand under it, or some machine by which he can accurately measure the pressure: he would, I have no doubt, find that precisely half the weight was resting on the plank, and half the weight upon his hand, or upon the instrument by which he was measuring the pressure. Let him, then, withdraw his hand, and what becomes of the weight? Half is still remaining on the plank, and the other half is suspended in the atmosphere until it reach the earth which attracts it. Surely, on consideration, Junius Redivivus will acknowledge the truth of this reasoning, and in so, he cannot dispute that the greater the angle of the inclination of the plane the less will be the pressure or friction of any body, either ascending or descending, on such plane.

And now for Mr. Champion Cheverton!

The first explanation which I think due from me to your readers, and to which "The Champion" principally alludes, is in reference to the resistance of the air. I stated, in a former letter, that I thought that the resistance of the atmosphere did not (a constant power being employed to urge the body forwards, or, like gravity, downwards,) increase as the squares of the velocity—that the resistance of the air does not act as a greater opposing force (alluding, particularly, to the flight of birds, and to the motion of railway carriages,) at high velocities than at low velocities—that, consequently, the velocity of a train of carriages, supposed to be descending an inclined plane of interminable length, never could in practice become uniform; but, on the contrary, that in theory the uniform acceleration would not begin to cease until the resistance of the air was equal to the force of descent, which it could not be until the body had attained a velocity equal to that at which air would rush into empty space. I further stated, that it was my opinion "that the resistance of the air, when first overcome by any locomotive force which is constantly and equally continued, does not, throughout equal spaces or distances, act as an opposing force with greater intensity at high velocities than at low velocities"; but that, on the contrary, it was my opinion that the total resistance of atmosphere, throughout a given distance, is less at high velocities than at low velocities, from the inclination which all bodies have to rise from the surface of the earth when in rapid motion, and, consequently, from a denser to a lighter atmosphere.

Now, sir, I should have felt not only that an explanation, but that a public apology was due from me, had I published these opinions, without having very strong reasons for believing them to be true. I know they are diametrically opposite to received opinions: so was the undulating railway; but time, and careful experiments, will prove whether I am right or wrong. I will now explain my reasons for believing that I am right.

In the first place, that there are many doubts existing as to the true theory of atmospheric resistance is evident, by the following remark by Hutton: "We conclude (he says) that all the theories of the resistance of the air hitherto given are very erroneous, and the preceding one (alluding to the generally entertained opinion) is only laid down till further experiments on this important subject shall enable us to deduce from them another that shall be more consonant to the true phenomena of nature." Surely this admission is a sufficient apology for the humble attempt which I have made, and for the attempt which Mr. R. Stephenson and myself are now making, to investigate this subject.

I must now request the attention of your readers to the following experiments, tried down inclined planes, by Mr. Nicholas Wood, with a view of measuring the friction of railway carriages. (See his work on Railways, 2d edition, pp. 211–213, &c. &c.)

Mr. Wood, in reference to these experiments, thus writes: "Standing on the end of a carriage, and aided by an assistant, at the end of every ten seconds I made a mark upon the plane where the carriage happened to be, and afterwards measured the distance between those marks, which gave the space passed over in each successive period."

Carriage weighing 9,100 lbs.; wheels, 34 inches; axle, 21; friction, 44·62 lbs.

Seconds.	Feet.	Real space, the descent not being uniform.
In 10 the body fell	6·6	6 feet.
20	26·4	26·4 "
30	59·4	59·8 "
40	105·6	106·2 "
50	165	165 "
60	237·6	242·8 "
70	321·4	326·7 "
80	422·4	424·3 "
90	534·6	525·3 "
100	660	635·5 "

The above experiment was tried at the Kenilworth colliery.

Now, in examining the result of this experiment, if Mr. Wood were correct in his measurement, and upon his correctness I have placed dependence, it is evident that the resistance of the atmosphere did not increase as the squares of the velocity of the moving body, but that, for some reason or other, with which reason the public will soon, if I mistake not, be acquainted, it was equal in effect through equal spaces throughout the entire distance of descent.

We know that if a body fall, in vacuo, a given space in the first second of time, it will have fallen four times the space in the two first seconds; that if it fall 16·1 in one second, it will have fallen 64·4 in two seconds; because $16 \cdot 1 \times 4$ (4 being the square of the times) = 64·4.

Again, if it fall 1608 feet in 10 seconds, it will fall 6432 feet in 20 seconds, or twice the time; because (omitting fractions) $1608 \times 4 = 6432$.

Now it appears, according to Mr. Wood's measured experiments, that in 10 seconds the carriage fell 6·6 feet, and in 20 seconds 26·4.

Now $6 \cdot 6 \times 4 = 26 \cdot 4$, which is in exact accordance with the laws of falling bodies.

Again, in 40 seconds, the carriage fell 105·6, and in 80 seconds 422·4.

$$\text{Now } 26 \cdot 4 \times 4 = 105 \cdot 6$$

$$\text{and } 105 \cdot 6 \times 4 = 422 \cdot 4$$

Again, in 30 seconds it fell 59·4, and in 60 seconds 237·6.

$$\text{Now, } 59 \cdot 4 \times 4 = 237 \cdot 6$$

Lastly, in 50 seconds it fell 165, and in 100 seconds 660;

$$\text{and } 165 \times 4 = 660$$

Now, had the resistance against the rolling carriage increased as the squares of velocity, the descent could not have been in accordance with the laws of bodies falling in vacuo.

I will, however, refer to other experiments, and try the question by another test:

Descent of loaded carriages weighing 9,408 lbs.; wheels, 35 inches diameter; axles, 3 inches.

In 18 seconds the carriage fell 25 feet

28	71·9 "
38	124·6 "
48	205·2 "
58	276·5 "
68	384·7 "
78	506·1 "
88	645·5 "
98	785·3 "
108	939·6 "
118	1081·6 "
128	1256·5 "

Fall, 1 in 104—friction, 41·45 lbs.

Now, in vacuo (taking 16 ft. as the correct measurement in the first second of time), a body in 18 seconds would fall 5210·892 feet, and in 28 seconds 12608·072 feet, and in 38 seconds 23223·852. Now, according to the preceding experiment, the carriage fell 25 feet

* The resistance of the atmosphere, and the cause of that resistance not increasing as the squares of the velocity, will be particularly elucidated in this treatise by careful experiment.

in 18 seconds; 71.9 in 28 seconds: and 124.6 in 38 seconds: Therefore,

$$\begin{array}{l} \text{In open atmosphere.} \quad \text{In vacuo.} \\ 71.9 \div 25 = 2.876, \text{ and } \frac{12608.072}{5210.892} = 2.419. \end{array}$$

$$\begin{array}{l} \text{Again, omitting fractions,} \\ \text{In open air.} \quad \text{In vacuo.} \\ 124 \div 71 = 1.746, \text{ and } \frac{23224}{12608} = 1.842. \end{array}$$

Again, to make the proof more indisputable (relying upon the measurement of Mr. Wood), we find that, according to his experiments, the carriage descended, omitting fractions, 25 feet in 18 seconds, and 1266 feet in 128 seconds. Now, as before observed, a body would fall, in vacuo, in 18 seconds, about 5211 feet, because $18 \times 18 \times 16.083 =$ to the total space; and in 128 seconds it would fall 263503.872 feet.

$$\begin{array}{l} \text{Now } 1266 \div 25 \text{ (in air)} = 50.64; \\ \text{and } 263503 \div 5211 \text{ (in vacuo)} = 50.56. \end{array}$$

How very striking, then, is the proportion which the falling body bears in vacuo to the descending body, when opposed to the resistance of the air! So much so, that Mr. Wood must either have imposed upon the public, which I do not and cannot believe, or his experiments, though not intended to elucidate the theory of resistance, are a death-blow to the previously admitted opinions on this subject.

Again, referring to Mr. Wood's experiments (see page 225), we find a perfect regularity in the descending motions; for instance, the carriage was 29.16 seconds in moving 100 feet, and 58.33 in descending 400 feet.

In other instances:

Time in descending 100 feet.	Time in descending 400 feet.
29.10 seconds	58.10
30	60.41
29.16	58.75
31.95	64.35

and all with different loads, varying from 1,120 to 8,960 lbs.

Again, page 226, when the carriage was loaded with 8,960 lbs. it fell 100 feet in 29 seconds, and 400 feet in 58.

Again, in 29 seconds it fell 57.90 feet.

Again, 29.10 "	"	58.40 "
Again, 29.74 "	"	60.25 "
Again, 31.88 "	"	63.75 "

the weights varying as before.

We will next observe whether the proportions were regular. In doing this we find (page 225) that the carriage, with a load of 1,120 lbs. fell 200 feet in 45 seconds, and 300 feet in 55 seconds. Now, in vacuo, a body would fall in 45 seconds - - - 32568.075 feet, and in 55 seconds - - - 48651.075 feet.

Now $300 - \frac{1}{4} = 200$, the fall in 45 seconds on the inclined plane; and $48651 - \frac{1}{4} = 32434$, showing a difference of only 134 in about 32,000.

In another experiment, with 4,480 lbs., the carriage fell 400 feet in 60.41 seconds, and 500 feet in 67.91 seconds.

Now, in vacuo, a body would fall in 60.41 seconds, 58512.7871523 feet; and in 67.91 " 74315.8133523 "

$$\begin{array}{l} \text{therefore, } 400 + \frac{1}{4} = 500 \\ 58512 + \frac{1}{4} = 73140, \text{ showing} \end{array}$$

a difference in comparative velocity not worth noticing.

Again, with 1120 lbs., in which instance, owing to the lighter weight, the resistance of the air ought to have been the most felt, we find the body descending,

$$\begin{array}{l} \text{In 64.35 seconds, 400 feet} \\ 72.64 \text{ " } 500 \text{ "} \end{array}$$

Now $400 + \frac{1}{4} = 500$, and $66958 + \frac{1}{4} = 83247$, showing a difference which is altogether immaterial; for had the distance traversed been 400 and 510 feet, instead of 400 and 500, the proportions in vacuo and in open atmosphere would have been precisely alike. Surely, then, these 10 feet, considering the variation of friction, by the occasional rubbing of the flanges against the

rail, will be regarded as a difference altogether independent of the resistance of air!

There are many more experiments of Mr. Wood's to which I could have referred in support of my opinion. It is true there are some which show a different result; but the effect might arise from the different state of the rails at different times, and the particular point from which the wind blew. It cannot, however, be doubted, or, if doubted, denied, that the uniformity of acceleration, proved by the experiments herein detailed, *could not have occurred in any instance had the resistance of the air increased as the squares of the velocity.*

I shall, in a further communication, turn to my recent experiments on the Liverpool and Manchester railway, for the purpose of adding additional strength to this argument. Meanwhile I am, sir, with much respect, your very obedient servant,

RICHARD BADNALL.

Manchester, Nov. 11, 1833.

THE NEW YORK AND PENNSYLVANIA CANALS.—According to the *Pittsburg Gazette*, the Pennsylvania Canal was open on the 8th inst., "and but for some repairs necessary to an aqueduct " might have been open a month earlier."

Our Canal will not be opened till 17th April—although the winter has been an unusually mild one. Hence we perceive a positive difference of *forty days*—and a possible one, under ordinary circumstances, of *two months*, in favor of the route to the great West through Pennsylvania.

This is a serious consideration for us in N. York, and should turn the attention of all to the adoption of some settled policy which may enable us to counteract so great a disadvantage. The physical obstacles of climate we cannot overcome, and hence it is certain that the Pennsylvania canals will always be open to navigation *weeks* earlier than ours. But this disadvantage may, we are persuaded, be more than compensated by wise policy on our part. Our first and great aim should be, so to diminish the expense of transportation on our Canals, as in that particular alone to present a powerful inducement to the trade. But how is that to be done? Manifestly by extinguishing as rapidly as possible the Canal debt; so that it being paid, there may be no motive to raise an amount of tolls greater than will suffice to keep the Canals in repair.

We have received the 5th number of a paper recently commenced at Navarino, (Wisconsin Territory,) called the *Green Bay Intelligencer*. It appears to have been about six weeks in travelling from Navarino to New York. The distance by land is 1100 or 1200 miles. Arrangements have been made for running steamboats regularly, the coming season, between Navarino and Detroit. During the last season, the number of arrivals was 34, viz. 5 steamboats, and 29 schooners. An emigrant recently arrived at Navarino thus writes:

The "extent of this settlement" is much more considerable than I had supposed before I came on. The houses are quite thick on each side of Fox River for six miles from its mouth. There are two small clusters of buildings, or villages, Navarino and Menomoneeville, in the first of which, being nearest the mouth of the river, the most of the business is done. In the distance of 3 miles from one village to the other, may be enumerated four wharves, seven warehouses, nine dry-good and grocery stores, besides several small shops, &c. &c. A good grist mill is in operation within one and a half miles of Navarino, and there are several saw mills in the neighborhood. Opposite to Navarino, on the west bank of Fox river, is a Garrison (Fort Howard) of 4 Companies of United States troops.

From "this place to the Wisconsin river" at the "Portage" the distance is 180 miles, following the river, and considerably less by land. Fox river is navigated by boats of 15 tons burthen all the way from here to the Portage; which is 1.4 miles over, and is all the land carriage between this and the Mississippi. This is a great and important thoroughfare. There are 3 settlements on the Wisconsin, besides the one at the Portage where Fort Winnebago stands, viz. Helena, English-Prairie and Prairie des Chiens, which last is at its mouth on the Mississippi. It is

210 miles from this to Chicago, the route is considerably travelled already, and the Government is opening a road the whole distance, also one from here to the Mississippi. The latter is laid out and is to be opened by contract immediately. The other will be surveyed early in the spring.—[*Journal of Commerce*.]

MAGNETIC POLE.—We understand that the position of the Magnetic Pole is now finally ascertained by our adventurous countryman, Captain Ross. He has actually been on the spot where the dipping needle becomes vertical, or points straight downwards; while the horizontal needle, having, as it were, no longer any thing to point towards, remains indifferently in any direction given it.—[*Athenæum*.]

Captain Ross has ascertained beyond question that the Magnetic Pole is nearly in 70° N. lat., and 97° W. long., being 2° of lat., and 3° of long. different from what it was said to be by Captain Parry's observations.—[*Naval and Military Gazette*.]

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

(Continued from page 135.)

Consider two men wrestling together, and then think how various the property of resistances must be: here they are pulling, and the bones are like ropes; or again, they are writhing and twisting, and the bones bear a force like the axle-tree between two wheels; or they are like a pillar under a great weight; or they are acting as a lever.

To withstand these different shocks, a bone consists of three parts, the *earth* of bone (sub-phosphate of lime); *fibres* to give it toughness; and *cartilage* to give it elasticity. These ingredients are not uniformly mixed up in all bones; but some bones are hard, from the prevalence of the earth of bone; some more fibrous, to resist a pull upon them; and some more elastic, to resist the shocks in walking, leaping, &c. But to return to the forms. Whilst the centre of the long bones is, as we have stated, cylindrical, their extremities are expanded, and assume various shapes. The expansion of the head of the bone is to give a greater, and consequently a more secure surface for the joint, and its form regulates the direction in which the joint is to move. A jockey, putting his hand on the knee of a colt, and finding it broad and flat, augurs the perfection of the full-grown horse. To admit of this enlargement and difference of form, a change in the internal structure of the bone is necessary, and the hollow of the tube is filled up with *cancelli*, or lattice-work. These *cancelli* of the bone are minute and delicate-like wires, which form lattice-work, extending in all directions through the interior of the bone, and which, were it elastic, would be like a sponge. This more uniform texture of the bone permits the outer shell to be very thin, so that whilst the centre of the long bones are cylinders, their extremities are of a uniform cancellated structure. But it is pertinent to our purpose to notice, that this minute lattice-work, or the *cancelli* which constitute the interior structure of bone, have still reference to the forces acting on the bone; if any one doubts this, let him make a section of the upper and lower end of the thigh bone, and let him inquire what is the meaning of the difference in the *lie* of these minute bony fibres, in the two extremities? He will find that the head of the thigh bone stands obliquely off from the shaft, and that the whole weight bears on what is termed the *inner trochanter*; and to that point, as to a buttress, all these delicate fibres converge,

or point from the head and neck of the bone, which may be rudely represented in this way.

Fig. 10.

The preceding figure exhibits the head of the thigh bone, and shows the direction of the *cancelli*, converging to the line of gravity.

We may here notice an opinion that has been entertained in regard to the size of animals. It is believed that the material of bone is not capable of supporting a creature larger than the elephant, or the *mastodon*, which is the name of an extinct animal of great size, the osseous remains of which are still found. This opinion is countenanced by observing that their bones are very clumsy, that their spines are of great thickness, and that their hollow cylinders are almost filled up with bone.

It may be illustrated in this manner: A soft stone projecting from a wall may make a stile, strong enough to bear a person's weight; but if it were necessary to double its length, the thickness must be more than doubled, or a free-stone substituted; and were it necessary to make this free-stone project twice as far from the wall, even if doubled in thickness, it would not be strong enough to bear a proportioned increase of weight: granite must be placed in its stead; and even the granite would not be capable of sustaining four times the weight which the soft stone bore in the first instance. In the same way the stones which form an arch of a large span must be of the hardest granite, or their own weight would crush them. The same principle is applicable to the bones of animals. The material of bone is too soft to admit an indefinite increase of weight; and it is another illustration of what was before stated, that there is a relation established through all nature, and that the very animals which move upon the surface of the earth are proportioned to its magnitude, and the gravitation to its centre. Archdeacon Paley has with great propriety taken the instance of the form of the ends of bones, as proving design in the mechanism of a joint. But there is something so highly interesting in the conformation of the whole skeleton of an animal, and the adaptation of any one part to all the other parts, that we must not let our readers remain ignorant of the facts, or of the important conclusions drawn from them.

What we have to state has been the result of the studies of many naturalists; but although they have labored, as it were, in their own department of comparative anatomy, they have failed to seize upon it with the privilege of genius, and to handle it in the masterly manner of Cuvier.

Suppose a man ignorant of anatomy to pick up a bone in an unexplored country, he learns nothing except that some animals have lived and died there; but the anatomist can, by that single bone, estimate not merely the size of the animal, as well as if

he saw the print of its foot, but the form and joints of the skeleton, the structure of its jaws and teeth, the nature of its food, and its internal economy. This, to one ignorant of the subject, must appear wonderful, but it is after this manner that the anatomist proceeds. Let us suppose that he has taken up that portion of bone in the limb of the quadruped which corresponds to the human wrist; and that he finds that the form of the bone does not admit of free motion in various directions, like the paw of the carnivorous creature. It is obvious by the structure of the part, that the limb must have been merely for supporting the animal, and for progression, and not for seizing prey. This leads him to the fact that there were no bones resembling those of the hand and fingers, or those of the claws of the tiger; for the motions which that conformation of bones permits in the paw would be useless without the rotation of the wrist—he concludes that these bones were formed in one mass, like the cannon bone, pastern-bone, and coffin-bones of the horse's foot.*

The motion limited to flexion and extension of the foot of a hooved animal implies the absence of a collar bone and a restrained motion in the shoulder joint; and thus the naturalist, from the specimen in his hand, has got a perfect notion of all the bones of the anterior extremity! The motions of the extremities imply a condition of the spine which unites them. Each bone of the spine will have that form which permits the bounding of the stag, or the galloping of the horse, but it will not have that form of joining which admits the turning or writhing of the spine, as in the leopard or the tiger.

And now he comes to the head: the teeth of a carnivorous animal, he says, would be useless to rend prey unless there were claws to hold it, and a mobility of the extremities like the hand to grasp it. He considers, therefore, that the teeth must have been for bruising herbs, and the back teeth for grinding. The socketing of these teeth in the jaw gives a peculiar form to these bones, and the muscles which move them are also peculiar; in short, he forms a conception of the shape of the skull. From this point he may set out anew, for by the form of the teeth he ascertains the nature of the stomach, the length of the intestines, and all the peculiarities which mark a vegetable feeder.

Thus the whole parts of the animal system are so connected with one another, that from one single bone or fragment of bone, be it of the jaw, or of the spine, or of the extremity, a really accurate conception of the shape, motions, and habits of the animal may be formed.

It will readily be understood that the same process of reasoning will ascertain, from a small portion of a skeleton, the existence of a carnivorous animal, or of a fowl or of a bat, or of a lizard, or of a fish; and what a conviction is here brought home to us, of the extent of that plan which adapts the members of every creature to its proper office, and yet exhibits a system extending through the whole range of animated beings, whose motions are conducted by the operation of muscles and bones.

* For these are solid bones, where it is difficult to recognize any resemblance to the carpus, metacarpus, and bones of the fingers; and yet comparative anatomy proves that these moveable bones are of the same class with those in the solid hoof of the *bellus* of Linnaeus.

After all, this is but a part of the wonders disclosed through the knowledge of a thing so despised as a fragment of bone. It carries us into another science; since the knowledge of the skeleton not only teaches us the classification of creatures now alive, but affords proofs of the former existence of animated beings which are not now to be found on the surface of the earth. We are thus led to an unexpected conclusion from such premises: not merely the existence of an individual animal, or race of animals, but even the changes which the globe itself has undergone in times before all existing records, and before the creation of human beings to inhabit the earth, are opened to our contemplation.

OF STANDING.—This may appear to some a very simple inquiry, and yet it is very ignorant to suppose it is so. The subject has been introduced in this fashion: "Observe these men engaged in raising a statue to its pedestal with the contrivances of pulleys and levers, and how they have placed it on the pedestal and are soldering it to keep it steady, lest the wind should blow it down. This statue has the fair and perfect proportions of the human body; to all outward appearance it ought to stand."

In the following passage we have the same idea thrown out, in a manner which we are apt to call *French*. Were a man cast on a desert shore, and there to find a beautiful statue of marble, he would naturally exclaim, "Without doubt there have been inhabitants here: I recognize the hand of a famous sculptor: I admire the delicacy with which he has proportioned all the members of the body, to give them beauty, grace, and majesty, to indicate the motion and expression of life." But it may be asked, what would such a man think if his companion were to say, "Not at all; no sculptor made this statue; it is formed, to be sure, in the best taste, and according to the rules of art, but it is formed by chance. Amongst the many fragments of marble there has been one thus formed of itself. The rain and the winds have detached it from the mountain, and a storm has placed it upright on the pedestal. The pedestal, too, was prepared of itself in this lonely place. True, it is like the Apollo, or the Venus, or the Hercules. You might believe that the figure lived and thought; that it was prepared to move and speak; but it owes nothing to art—blind chance has placed it there."*

The first passage suggests the conviction, that the power of standing proceeds not from any symmetry, as in a pillar, or from gravitation alone. It, in fact, proceeds from an internal provision, by which a man is capable of estimating with great precision the inclination of his body, and correcting the bias by the adjustment of the muscles. In the second passage, it is meant to be shown that the outward proportion of the form bears a relation to the internal structure; that grace and expression are not superficial qualities, and that only the Divine Architect could form such a combination of animated machinery.

We shall consider how the human body is prepared by mechanical contrivances to stand upright, and by what fine sense of the gravitation of the body the muscles are excited to stiffen the otherwise loose joints, and to poise the body on its base.

* *Demonstration de l'Existence de Dieu, par Fanelon.*

OF SATURN.—The planet Saturn is 79,491 miles in diameter, and performs his revolution round the sun in 10,746 days, 19 hours, 16 minutes, at the distance of 903,690,197 English miles. His motion in his orbit is said to be 18,000 miles per hour; and the time he revolves on his axis 10 h. 16' by some astronomers, and by others only 6 hours.

Saturn is distinguished from all the other planets by a large luminous ring surrounding his body, which was discovered by the celebrated Huygens, about the end of the 17th century. The same astronomer also discovered the fourth satellite, which attends this planet, and on that account is sometimes called the Huygenian satellite. The ring which surrounds Saturn appears double when seen through a good telescope, and is seen to cast a deep shadow on the planet. Dr. Herschel is of opinion that the ring has a motion round its axis; but this is doubted by Schroeter, and some other astronomers. Respecting the formation of this strange phenomenon, astronomers have been very different in their opinions, but the difficulty still remains as formidable as ever.

The annexed figure represents this planet as seen by Sir William Herschel, on various occasions, with his powerful telescope.

To Saturn the sun appears only one-ninth part of the size it does to the earth; and the light and heat which that planet receives from the sun are in the same proportion. But to compensate for the scantiness of light derived from the sun, Saturn has been observed to have no fewer than seven satellites revolving round him, besides the luminous ring that surrounds his body. The Huygenian, or fourth satellite, was the first discovered; the first, second, third, and fifth, were some years afterwards discovered by Cassini; and the sixth and seventh were discovered by Dr. Herschel, in the year 1789. These satellites are all so small, and at such a distance from the earth, that they cannot be seen, unless with very powerful telescopes.

The orbit of the planet Saturn was long considered as the boundary of the solar system, except the cometary orbits, which were always believed to stretch far beyond it. But by the discovery of the planet Georgium Sidus, this system has been extended far beyond the limits formerly assigned it.

OF GEORGIUM SIDUS.—A new planet was discovered by Dr. Herschel, on the 13th of March, 1781, and called by him Georgium Sidus, out of respect to his Majesty George III., but astronomers have given it the names of Herschel and Uranus. This planet is situated far beyond the orbit of Saturn, being at the immense distance of 1,822,568,000 miles from the sun. The time it requires to perform its revolution round that luminary is 83 years, 150 days, 18 hours. Its diameter is about $4\frac{1}{2}$ times greater than that of the earth, or nearly 35,000 English

miles. The distance of this planet from the sun being about double that of Saturn, can scarcely be discovered by the naked eye. However, when the sky is very clear, it may be perceived by a good eye, like a faint star of the fifth magnitude; but it cannot be readily distinguished from a fixed star with a telescope of a less magnifying power than 200. This planet is placed at so great a distance from the sun that it can receive but a very small portion of his light; however, this want is in some measure supplied by six satellites that revolve round it, all of which were discovered by Dr. Herschel. The periodic times of these satellites are as follows: The first is 5d. 21h. 25'; the second, 8d. 7h. 1' 19"; the third, 10d. 23h. 4'; the fourth, 13d. 11h. 5'; the fifth, 38d. 1h. 49'; and the sixth, 107d. 16h. 40'. It is a remarkable circumstance that all these satellites move round the planet in a retrograde order, and that their orbits are nearly all in the same plane, almost perpendicular to the ecliptic.

NEW INK DISTRIBUTOR.—We were lately shown, by WARREN JENKINS, of this town, a new or improved machine, invented by himself, for regulating, with mathematical exactness, the distribution and application of ink to the types. This machine is the first attempt of the kind by the inventor, and, therefore, imperfect in some of its mechanical details; but, in its present condition, it answers the intended purpose very well. We have scarcely a doubt that the principle upon which the machine is constructed is correct, and that a more perfect mechanical construction of all its parts will make it fully to answer the purposes for which it is designed.

Should our anticipations be realized, and there seems little room to doubt that they will, an ordinary pressman, with the assistance of a boy capable of moving the rollers, can take any number of clear, uniform impressions, extending throughout a whole form or a whole book. This machine will, therefore, be no less important to readers who desire beauty and uniformity in what they read, than to printers who are responsible for the quality of their work.

When the machine is once regulated so as to take a suitable quantity of ink, which will be the labor of but a few minutes, the pressman is relieved from further care in relation to the uniformity of the impressions, as the application of the ink to the rollers is entirely beyond the control of the boy who does the rolling. We may also add, that the machine is of simple construction, and of course, little liable to get out of order; whilst the cost will probably place it within the reach of every person owning a press. Several other advantages might be enumerated, but we think enough has been said to entitle it to the consideration of printers.—[Cincinnati Journal of Science.]

STATISTICS OF BREWING IN ENGLAND AND SCOTLAND.—There were 216 brewers in Scotland last year, of which above 33 are in the Edinburgh collection. Argyll has only one. There are 17,070 licensed victuallers in Scotland, which is 1 for every 123 persons, young and old, in the country; and though grocers who

sell beer are evidently included with innkeepers, the proportion is still very great. England, which is a thirsty country, rejoices in 50,800 victuallers, and 30,000 "persons licensed for the general sale of beer," making an aggregate of 81,700 retailers of beer, which is 1 for every 170 souls. England has 1753 brewers, of whom 108 are in London. Of the retailers of beer, 37,000, or nearly one-half, brew their own beer. In Scotland, only 318 out of 17,070, or 1 in 57, brew their own beer. In Scotland, 990,000 bushels of malt were used for brewing in all the 16 collections, of which one-tenth was used by the licensed victuallers; 432,000 bushels were used in the Edinburgh collection; 62 bushels served the two collections of North and South Argyll, containing 100,000 souls. In England, 25,800,000 bushels of malt were consumed in the manufacture of beer: 13,800,000 by the brewers, and 12,000,000 by the victuallers or other retailers. In Scotland, the malt brewed is at the rate of four-tenths of a bushel for each person; in England it is $1\frac{1}{2}$ bushel. Ireland consumed 1,540,000 bushels of malt in her breweries, which is about two-tenths of a bushel for each person. Of brewed liquor, one Englishman drinks as much as four Scotchmen, or nine Irishmen. In 1831, there were 928,000 bushels of malt used for brewing in Scotland, of which 834,000 were used by the brewers, the rest by victuallers. In 1830, the Scotch brewers consumed 740,000, but the paper from which this is taken does not mention the victuallers. The increase in the quantity of malt used by the brewers since 1830 seems to be about one-fifth.

AGRICULTURE, &c.

Early sown Vegetables inferior in Quality and Quantity to those sown later. By H. H. [For the Quarterly Journal of Agriculture, Mechanics, and Manufactures.]

MR. EDITOR.—The season is now approaching us rapidly when we shall be served with a variety of means and methods for procuring early culinary productions for the table. I do not know but there is room for improvement in this respect—doubtless, there is with many; but you will permit me to say that I have not a profound regard for a forced growth with any article in the vegetable kingdom. My reasons for viewing the subject in this light I will give. 1st. Because persons in general cannot make the necessary preparations, and bestow the extra care and service required to secure those early productions, and find themselves remunerated by the article. Persons who cultivate grounds with a view to supply a market may find themselves compensated for their labor in the sale of these early productions, and gentlemen of fortune can gratify their cravings for those premature productions a few days earlier than their neighbors, by applying time and money to that object; but this will not prove that the generality of your readers can adopt this course without a loss of time and money. 2. As far as my own experience is concerned, those forced productions are inferior in point of flavor to those which come in their season; and are often of a sickly quality. They are generally thrown into the market in an unripe state, when they possess scarcely any of the qualities which they obtain in their maturity; and the consequence is, sickness is prevalent in our cities. I recollect to have seen, within a few years past, a remonstrance from the Board of Health in Boston, or from the most eminent physicians of that city, against the practice I am now speaking of, and particular objection was made to the forced growth of the cucumber, and its early sale in

market. This accorded so far with my own limited observation in the country, that I could not but consider it entitled to special consideration. 3. I am well satisfied, by my own observation, that more persons in the country deprive themselves of the luxuries of a good garden every year, by sowing too early, than they do by sowing too late, or not sowing at all. There is one remark almost universal every year with those whose gardens I have inspected during the season—"I sowed my seeds early, and they came up and looked thrifty for a while, but there came on a cold, wet spell of weather, which, with the aid of insects, destroyed them, about every one." There is, however, a remedy for this in almost every instance, in resowing after the destruction of the first sowing, if persons did not generally think that it would avail nothing to resow so late in the season. I have been in the practice, for a number of years, of noting down the month and the day in each year when I committed my different kinds of seeds to the soil, and this I have done on the bottom lands in the Connecticut valley, and on the high lands of New-England, and I find this note appended to my journal for June 15th, 1832,—"I am now fully convinced, that, with the exception of onions, peas, pepper-grass, lettuce, English turnips, and a few potatoes for early use, all kinds of horticultural produce, which are generally cultivated in New-England, will succeed best, nine times in ten, by not sowing until the last week in May." On the 27th of May, 1830, I planted my cucumbers, and they yielded abundantly. May 21, 1831, I planted cucumbers; on the 23d, I planted some more and on the 1st of June planted again. Those planted on the 21st of May failed, and those planted on the 1st June did better than those on the 23d of May. On the 18th of May, 1832, I planted cucumbers, and on the 2d of June I planted some more, and on the 4th of June I replanted where I sowed on the 18th of May, the first planting having failed; the last succeeded well. On the 31st of May of this same year, I replanted early bush beans, where I had planted on the 18th of this month with a failure. And on the 20th of June, I resowed the parsnip-bed, which was first sowed on the 8th of May; and from this last sowing I realized a good crop of parsnips. On the 23d of May sowed carrots, beets, peppers, cabbages, radishes, English turnips, and planted my cucumbers. All succeeded well, whilst most of my neighbors who sowed earlier were cut short in quality and in quantity. I will state in this connection that, in two instances, I have raised the finest onions I have ever raised from sowings in the first week in June, but they will ordinarily succeed better from early sowing. And now, if we will allow for difference of soil, and something for local situation, I will venture to have my position put to the test by the people of New-England, and by all others at the west of us, upon the same degrees of latitude, that, nine times in ten, what is considered *late* sowing will succeed best, with the exceptions I have made. One special reason is, as I conceive, vegetation never progresses rapidly until the soil and atmosphere attain to a certain degree of temperature, and it succeeds best when this is uniform. Cool nights are prejudicial to plants of all descriptions, so far as my experience extends; and to many they are almost fatal: they are so to the cucumber. A

warm sun and a bland atmosphere during the day will put the juices of the plant into circulation, and open the pores; but if the succeeding night is cool, those juices stagnate, the pores close, and the progress of vegetation is suspended, and if this is acted over for many nights in succession, the stock of the plant assumes a sticky hardness, the pores are fast closed, and the channels for the sap to circulate in are contracted so as greatly to impede the progress of the fluids during the day; and although the plant survives the shock, yet it is a sickly plant, its leaves and tendrils are dwarfish and dry, and its fruit is scanty, bitter, and crooked, and indented with dark spots; whereas, the plant that comes into existence later in the season, when the earth is warm and the nights are bland, continues its growth through the twenty-four hours, has a fresh and lively appearance, overtakes and passes by its kindred vine, that has been long struggling with adversity; its fruit is straight, juicy, and abundant. Another reason why

many of those early sown plants fail, is, because those small insects, called black lice, or fleas, prevail most during the cold season in May, and they draw from the plant the little life it derives from the earth, and it yields its life to an ignoble enemy! I would say, then, to my New-England friends especially, be not over anxious to commit your garden seeds to the soil, because you experience a few warm days in the beginning or in the middle of May, except those kinds of plants which experience has shown are the least affected by the cold and wet, and which require the longest season to reach maturity. You may be certain of a cold fortnight between you and summer, during which time, your seeds had better be out of the ground than in; but this you *may* do, and *ought* to do,—improve your *kind* of plants, have your ground well prepared for receiving the seed, and embrace the first sure indications of approaching summer to commit your seeds to the earth and to a beneficent Providence.

Respectfully yours, H. H.

Balance Gate. By D. LAPHAM. [From the Farmers' Reporter.]

SIR,—If the following improvement in the construction of farm gates should be deemed of sufficient value to be of use to the farmers of this country, you are requested to make it known to them through the medium of your valuable paper.

This gate consists of two main posts, set firmly in the ground at the proper distance asunder, in the line of the fence; that part which is above the ground is made about 12 inches square, and the lower part is left round, forming a shoulder at the surface of the ground. These posts have mortices on the exterior sides to receive the rails of the fence. The gate itself is formed of three posts of scantling, 4 by 5 inches square, into which are framed about six strips of 1½ inch boards, 4 inches wide, so as to form a rectangular gate of the length and height required. Upon the top of these posts rests a beam, which extends back far enough just to balance the gate. The heel-post, upon which the gate turns, rests upon the shoulder of the main post, at the surface of the ground, where there is a depression made to receive it, and it is secured at the top by a staple, or hoop of iron, passing around it, (the upper part of the post being rounded for that purpose,) and is fastened into the main post. The latch or fastening is formed by making one of the slats pass through the front post in a long mortice; and the slat being cut in two at the middle post, and secured by a pin, the piece can be raised or lowered in such a manner as to latch and unlatch the gate. The notch is cut out of the main post, to receive the latch in such a manner as to allow the gate to open either way. This gate is much neater, more substantial, and is less liable to get out of repair, than those formerly in use. There are two

gates of this description on the farm where my father resides, in the north part of Champaign county, and he intends soon to have one to each of his fields. D. LAPHAM. Cincinnati, Ohio, Dec. 19, 1833.

STRAW CUTTING MACHINE.—A few weeks ago, we purchased for a subscriber on the eastern shore of Maryland, one of Sinclair & Moore's straw cutters, of the middle size. We this week received from him the following testimony of its excellence, which we publish rather for the benefit of the public, than for that of the worthy manufacturers. By the way, it seems to be universally allowed by all who have tried it, that the saving by the cutting of *all long food* for stock is a very important one. We have noticed the testimony of farmers, of graziers, of dairy-men, and of stage proprietors, all to the same point, and have never heard one state a contrary opinion against it. Those who have tried steaming this cut food, seem to agree pretty unanimously that this operation improves its quality still as much more. Surely these facts are worthy the careful attention of all concerned in the feeding of cattle and horses—but here is an extract from our friend's letter:

"I am delighted with my straw cutter. It will have saved all the money it cost before May-day. The 'meat, drink, washing and lodging,' of each of my carriage horses, cost me the last year at least \$100: by means of the straw-cutter, I can give them better board, keep them sleeker and happier; and (at the present price of produce) *both* of them, the current year, will not cost me more than \$60. I shall be the means of procuring a market for several straw-cutters, at which I rejoice, not on account of the seller, but the buyer.—[Amer. Farmer.]

EXTRACT OF SUMAC.—This substance is prepared in Sicily, and is used for dyeing and tanning skins. It occupies the one-hundredth part of the volume of common sumac. It is dissolved in tepid water.

THE VINE.—Mr. Sidney Weller says, in the American Farmer, that vines, when young, should have the ground kept loose about them, and free from weeds—that they will no more bear neglect in these particulars than corn or other hoed crops.

BLOODY MURRAIN.—A farmer in Madison county, Ohio, had lost several of his finest cattle by this disease, and upon opening them he found leeches in their stomachs, much swollen by the blood they had extracted, and it was also found that leeches were living in the water at which the cattle were in the habit of drinking. Believing that this was the cause of the disease he changed the water, and in future only gave them that which was pure; and for three years his stock had not been troubled with that disease. Although this seems to show very conclusively that leeches are the cause of the disease, yet it requires further investigation before the question can be entirely settled.—[Gen. Far.]

HOW TO MAKE THE MOST OF A LITTLE LAND.—In the spring of 1830, I purchased in this city a house and lot; the lot was fifty by one hundred and twenty feet. One third of the lot was covered by the building. When I purchased, there was not a tree, shrub or plant, on the premises, notwithstanding the house had been constantly occupied for near forty years. I planted the first tree in the spring of 1831. I at that time planted three peach and three gage trees. One of the peach and the three gage trees bore fruit the past season. I have since added three more peach, four choice plum, one choice cherry, one quince, and four choice pear trees, which bid fair to bear fruit soon. I have also three fine grape vines, that will probably bear plentifully next season, judging from their size. I have also about a dozen smaller vines. I raised on the same ground the past season, cucumbers, beets, sallads, citron melons, and nasturtiums, in great abundance for family use and for pickling. I also had a great abundance of cabbage, both for summer and winter use. In addition to the above, I have at least fifty flowering shrubs and bushes, such as roses, syringoes, altheas, lilacs, snowballs, rose acacias, flowering almonds, cape jasmines, &c. &c., with a plenty of the honeysuckle. I have at least two thousand bulbous roots, such as hyacinths, tulips, crocuses, narcissus, &c., with equal that number of annual and biennial plants and flowers, and all of the aforementioned luxuries and necessities are enjoyed from the spot of ground that has laid waste for so great a length of time. There is still another item of profit to be added to the foregoing list: nine-tenths of the labor of cultivation has been performed with my own hands, morning and evening, when not engaged in my own regular business, unquestionably affording me a greater degree of health, and certainly a far greater degree of pleasure, than I should otherwise have enjoyed. I have also a lot in the rear of the above-mentioned, twenty-five by one hundred and twenty feet, on which there is a barn, cowshed, and pig-stye, covering forty by twenty-five feet, leaving eighty by twenty-five feet for cultivation. Around this I have a border of two feet wide, one fourth of which is occupied by currant bushes, one fourth by raspberry, one fourth as an asparagus bed, and one fourth for spinnage, for a cabbage plant bed, for early lettuce, &c. The centre is laid out in three squares of seventeen by twenty-three feet. The first square I plant with early potatoes, the second with Lima

beans, and the third with sweet corn; of the two latter, I have a great supply for my family, and some for my neighbors. Potatoes we have of the finest kind, and in great abundance through the summer season. Last fall we put about four bushels in the cellar from the same patch. We were in the summer nine in family, in the winter eight. The edge of my border I planted with bush beans; and I do not recollect that I paid a single cent for vegetables, except for the articles of green peas, and a few carrots and parsnips, the latter two of which I did not have of my own in consequence of sowing bad seed. I give you the above statement of facts, with the hope that if you should think them worth publishing, some one person may be induced to try the experiment, when he will learn that it will not only afford him a source of profit, but one of great pleasure, to grow his own vegetables; and that, while by beautifying his yard, he is not only adding to his health and comforts, but, in most cases, adding very much to the value of his property.—M. Hudson, Feb, 7, 1834.—[Gen. Far.]

BLIGHT ON APPLE TREES.—Our apple trees here are greatly injured, and some annually destroyed, by the agency of what seems to be a very feeble insect. We call it, from habit or from some unassigned cause, "the American Blight," *Aphis lanata*; this noxious creature being known in some orchards by the more significant name of "white blight." In the spring of the year a slight hoariness is observed upon the branches of certain species of our orchards. As the season advances this hoariness increases, it becomes cottony, and toward the middle or end of summer, the under sides of some of the branches are invested with a thick downy substance, so long as at times to be sensibly agitated by the air. Upon examining this substance we find that it conceals a multitude of small wingless creatures, which are busily employed in preying upon the limb of the tree beneath. This they are well enabled to do, by means of a beak terminating in a fine bristle: this being insinuated through the bark, and the sappy part of the wood, enables the creature to extract, as with a syringe, the sweet vital liquor that circulates in the plant. This terminating bristle is not observed in every individual: in those that possess it, it is of different lengths; and is usually, when not in use, so closely concealed under the breast of the animal as to be invisible. The albumen or sap wood being thus wounded, rises up in excrescences and nodes all over the branch, and deforms it; the limb deprived of its nutriment, grows sickly: the leaves turn yellow, and the part perishes. Branch after branch is thus assailed until they all become leafless, and the tree dies.

This insect is viviparous, or produces its young alive, forming a cradle for them by discharging from the extremities of its body a quantity of long cottony matter, which becoming interwoven and entangled, prevents the young from falling to the earth, and completely envelopes the parent and offspring. This languinous vestiture seems to serve likewise as a vehicle for dispersing the animal. The winds wafting about small tufts of this downy matter, convey the creature with it from tree to tree throughout the whole orchard. In the autumn, when this substance is generally long, the winds and rains of the season effectually disperse these insects, and we observe them endeavoring to secrete themselves in the crannies of any neighboring substance.

The first visit of this aphid to us is by no means clear. The epithet of American blight may be correctly applied; but we have no sufficient authority to conclude that we derived this pest from that country. Normandy, and the Netherlands too, have each been supposed to have conferred this evil upon us; but it bids fair to destroy, in progression, most of the old-

est and long esteemed fruit from our orchards. —I have very successfully removed this blight from young trees, and from recently attacked places in those more advanced, by an easy application: Melt three ounces of rosin in an earthen pipkin, take it from the fire, and pour into it three ounces of fish oil; the ingredients perfectly unite, and when cold acquire the consistence of honey. A slight degree of heat will liquify it; and in this state paint over every node or infected part in the tree, using a common painter's brush. This I prefer doing in the spring, or as soon as the hoariness appears. The substance soon hardens and forms a varnish, which prevents any escape, and stifles the individuals.—[Journal of a Naturalist.]

EARLY CORN.—There are three varieties of corn that every farmer should plant, expressly for using green, without reference to it as a field crop. There are but few people in this country but are fond of boiled green corn; and by a little extra pains the season for using it may be lengthened three or four weeks; that is, it may be procured one month earlier than it generally is by the common field culture.

The varieties which we would recommend are the *Golden Soix*, *Flour Corn*, or *York Cheat*, and the *Sweet Corn*.

Golden Soix is the earliest corn with which we are acquainted; the ear is small but well shaped, and the corn is well flavored.

Flour Corn, or *York Cheat*, is a white soft corn, which comes in soon after the former; the ears are of good size, and it does not become hard and flinty, like common corn, on which account it continues longer fit for use. This will last until the sweet corn is fit for use. This corn was named *York Cheat*, because it was said to have been ground with wheat, in the early settlements of this country, when it could not be detected by the color of the flour. When broken, the inside of the kernel is white and mealy.

Sweet Corn.—This is undoubtedly superior to all other varieties for boiling; is very sweet, and unlike other varieties, it remains soft until it hardens by drying, when it becomes much shrivelled.

Either, or all of these varieties, may be planted in hot beds, or in light boxes of earth, which may be kept in warm situations about a house, until the fore part of May, when the plants may be taken out of the beds or box, and planted in hills in open ground, putting plenty of manure under the hill, and setting the plants pretty deep in the soil, so that if the tops should be killed by late frosts, the roots would not be injured.—[Goodsell's Genesee Farmer.]

ROLLING GRAIN.—We have on several occasions presented to our readers the results or using the roller. We now give another extract—from the Genesee Farmer.

On a careful examination of my wheat fields, the doubts I have felt and expressed in a former communication, of the propriety of rolling wheat in autumn, are now entirely removed. Where the roller had passed no cavities were left, and the surface was rendered so compact and smooth, that the water passed off. But where the roller was not used, many of the cavities have been several times, and no doubt will again be, partly filled with ice, which must unavoidably, by its expansion, destroy many plants by breaking their roots.

The season is so far advanced that we cannot expect, even should there be considerable more snow, that it will remain long on the ground; of course, wheat will be exposed to alternate freezing and thawing. This is out of the power of the farmer to prevent, but he may mitigate its effect by the use of the roller in the spring, as soon as the ground is dry to the depth of three or four inches. This operation will not only press down that which has been raised by the frost, but by pulverizing the surface, cause the wheat to spread, and if grass seed has been sown, the beneficial effect on that will be great.

I have therefore come to the conclusion, that the wheat crop is benefited by the roller both in autumn and spring.

NEAT CATTLE OF GREAT BRITAIN.—We give descriptions of the principal breeds of British cattle :

The long-horned or Lancashire breed of cattle is distinguished from others by the length

of their horns, the thickness and firm texture of their hides, the length and closeness of their hair, the large size of their hoofs, and coarse, leathery, thick necks; they are likewise deeper in their fore quarters, and lighter in their hind quarters, than most other breeds; narrower in their shape, less in point of weight than the short horns, though better weighers in proportion to their size; and though they give considerably less milk, it is said to afford more cream in proportion to its quantity. They are more varied in their color than any of the other breeds; but, whatever the color be, they have in general a white streak along their back, which the breeders term finched, and mostly a white spot on the inside of the hough. In a general view, this race, notwithstanding the singular efforts that have been made towards its improvement, remains with little alteration; for, excepting in Leicestershire, none of the subvarieties (which differ a little in almost every one of those counties where the long horns prevail) have undergone any radical change or any obvious improvement.

The improved breed of Leicestershire is said to have been formed by Webster, of Cauley,

near Coventry, in Warwickshire, by means of six cows brought from the banks of the Trent, about the beginning of the present century, which were crossed with bulls from Westmoreland and Lancashire. Bakewell, of Dishley, in Leicestershire, afterwards got the lead as a breeder, by selecting from the Cauley stock; and the stocks of several other eminent breeders have been traced to the same source.

The short-horned, sometimes called the Dutch breed, is known by a variety of names.

taken from the districts where they form the principal cattle stock, or where most attention has been paid to their improvement; thus, different families of this race are distinguished by the names of the Holderness, the Teeswater, the Yorkshire, Durham, Northumberland, and

other breeds. The Teeswater breed, a variety of short horns, established on the banks of the Tees, at the head of the vale of York, is at present in the highest estimation, and is alleged to be the true Yorkshire short-horned breed. Bulls and cows from this stock, purchased at most extraordinary prices, are spread over all the north of England, and the border counties of Scotland. The bone, head, and neck of these cattle are fine; the hide is very thin; the chine full; the loin broad; and the carcass throughout large and well-fashioned; and the flesh and fattening quality equal, or perhaps superior, to those of any other large breed. The short-horns give a greater quantity of milk than any other cattle: a cow usually yielding twenty-four quarts of milk per day, making three firkins of butter during the grass season: their colors are much varied, but they are generally red and white mixed, or what the breeders call flecked. The heaviest and largest oxen of the short-horned breed, when properly fed, victual the East India ships, as they produce the thickest beef, which, by retaining its juices, is the best adapted for such long voyages.

The Devonshire cattle are of a high red color, (if any white spots, they reckon the breed impure, particularly if those spots run one into another), with a light dun ring round the eye, and the muzzle of the same color, fine in the bone, clean in the neck, horns of a medium length, bent upwards, thin-faced, and fine in the chops, wide in the hips, a tolerable barrel, but rather flat on the sides, tail small, and set on very high; they are thin skinned, and silky in handling, feed at an early age, or arrive at maturity sooner than most other breeds. Another author observes, that they are a model for all persons who breed oxen for the yoke. The weight of the cows is usually from thirty to forty stone, and of the oxen from forty to sixty: the North Devon variety, in particular, from the fineness in the grain of the meat, is held in high estimation in Smithfield.

The polled or hornless breeds.—The most numerous and esteemed variety is the Galloway breed, so called from the province of that name, in the south-west of Scotland, where they most abound. The true Galloway bullock "is straight and broad on the back, and nearly level from the head to the rump, broad at the loins, not, however, with hooked bones, or projecting knobs, so that, when viewed from above, the whole body appears beautifully rounded; he is long in the quarters, but not broad in the twist; he is deep in the chest, short in the leg, and moderately fine in the bone; clean in the chop and in the neck; his head is of a moderate size, with large rough ears, and full, but not prominent eyes, or heavy eyebrows, so that he has a calm though determined look; his well-proportioned form is clothed with a loose and mellow skin, adorned with long soft glossy hair." The prevailing color is black or dark-brindled, and, though they are occasionally found of every color, the dark colors are uniformly preferred, from a belief that they are connected with superior hardiness of constitution.

The Galloways are rather undersized, not very different from the size of the Devons, but as much less than the long horns as the long horns are less than the short horns. On the best farms the average weight of bullocks three and a half years old, when the greater part of them are driven to the south, has been stated at about forty stone, *avoirdupois*; some of them, fattened in England, have been brought to nearly one hundred stone.

LIME AND ANIMAL MANURE FOR WHEAT.—Lime has been found by chemical analysis to compose a very considerable portion of the kernel of wheat. It has also been found that any considerable quantity of animal manure, applied to land where wheat is sown, has a tendency to cause it to grow rapid, and of course the sap bursts out, and it rots, as we call it; and when this takes place the kernel becomes shrivelled, and is rendered nearly useless; and no human means can prevent it, if we enrich our land largely with animal manure. A previous clover crop ploughed in is enough to cause wheat to grow sufficiently large, unless we wish for straw instead of kernel. This cannot always conveniently be had when we wish to sow wheat. In such case it is desirable to place something on the soil which will cause it to grow, and not surfeit it. We learn that in Great Britain, nothing has succeeded so well as lime. The farmers there, within fifteen years, have by the proper use of lime been able to procure 30 or 40 per cent. more of the golden crop than formerly.—[Maine Farmer.]

ATTACK OF WILD ELEPHANTS ON A GRANARY.—A small body of seapoys stationed at an outpost to protect a granary, containing a large quantity of rice, was suddenly removed, in order to quiet some unruly villagers, a few miles distant, who had set the authorities at defiance. Two of our party happened to be on the spot at the moment. No sooner had the seapoys withdrawn, than a herd of wild elephants, which had long been noticed in the neighborhood, made their appearance in front of the granary. They had been preceded by a scout, which returned to the herd, and having no doubt satisfied them, in a language which to them needed no interpreter, that the coast was clear, they advanced at a brisk pace towards the building. When they arrived within a few yards of it, quite in martial order, they made a sudden stand, and began deliberately to reconnoitre the object of their attack. Nothing could be more wary and methodical than their proceedings. The walls of the granary were of solid brick work, very thick, and the only opening into the building was in the centre of the terraced roof, to which the ascent was by a ladder. On the approach of the elephants, the two astonished spectators clambered up into a lofty banyan tree, in order to escape mischief. The conduct of the four-footed besiegers was such as strongly to excite their curiosity, and they therefore watched their proceedings with intense anxiety. The two spectators were so completely screened by the foliage of the tree to which they had resorted for safety, that they could not be perceived by the elephants, though they could see very well, through the little vistas formed by the separated branches, what was going on below. Had there been a door in the granary, all difficulty in obtaining an entrance would have vanished; but four thick brick walls were obstacles which seemed at once to defy both the strength and sagacity of these dumb robbers. Nothing daunted by the magnitude of the difficulty which they had to surmount, they successively began their operations at the angles of the building. A large male elephant, with tusks of immense proportions, labored for some time to make an impression, but after a while his strength was exhausted and he retired. The next in size and strength then advanced, and exhausted his exertions with no better success. A third then came forward,

and applying those tremendous levers with which his jaws were armed, and which he wielded with such prodigious might, he at length succeeded in dislodging a brick. An opening once made, other elephants advanced, when an entrance was soon obtained sufficiently large to admit the determined marauders. As the whole herd could not be accommodated at once, they divided into small bodies of three or four. One of these entered, and when they had taken their fill they retired, and their places were immediately supplied by the next in waiting, until the whole herd, upwards of twenty in number, had made a full meal. By this time a shrill sound was heard from one of the elephants, which was readily understood, when those that were still in the building immediately rushed out and joined their companions. One of the first division, after retiring from the granary, had acted as sentinel while the rest were enjoying the fruits of their sagacity and perseverance. He had so stationed himself as to be enabled to observe the advance of an enemy from any quarter, and upon perceiving the troops as they returned from the village, he sounded the signal of retreat, when the whole herd, flourishing their trunks, moved rapidly into the jungle.—[Oriental Annual.

NEW-YORK AMERICAN.

MARCH 22—28, 1834.

LITERARY NOTICES.

No. XVIII.

Chicago, Jan. 10, 1834.

I have been here more than ten days, without fulfilling the promise given in my last. It has been so cold, indeed, as almost to render writing impracticable in a place so comfortless. The houses were built with such rapidity during the summer as to be mere shells; and the thermometer having ranged as low as 29 below zero during several days, it has been almost impossible, notwithstanding the large fires kept up by an attentive landlord, to prevent the ink from freezing while using it, and one's fingers become so numb in a very few moments when thus exercised, that, after vainly trying to write in gloves, I have thrown by my pen, and joined the group composed of all the household around the bar-room fire. This room, which is in an old log cabin aside of the main house, is one of the most comfortable places in town, and is, of course, much frequented, business being, so far as one can judge from the concourse that throng it, nearly at a stand still. Several persons have been severely frost-bitten in passing from door to door; and, not to mention the quantity of poultry and pigs that have been frozen, an ox, I was just told, has perished from cold in the streets at noonday. An occasional Indian, wrapped in his blanket, and dodging about from store to store after a dram of whiskey, or a muffled up Frenchman, driving furiously in his cariole on the river, are almost the only passengers abroad; while the wolves, driven in by the deep snows which preceded this severe weather, troop through the town after nightfall, and may be heard howling continually in the midst of it.

The situation of Chicago, on the edge of the Grand Prairie, with the whole expanse of Lake Michigan before it, gives the freezing winds from the Rocky Mountains prodigious effect, and renders a degree of temperature which, in sheltered situations, is but little felt, almost painful here.

The bleak winds
Do surely ruffle; for many a mile about,
There's scarce a bush.

The town lies upon a dead level, along the banks of a narrow forked river, and is spread over a wide extent of surface to the shores of the lake, while vessels of considerable draught of water can, by means of the river, unload in the centre of the place. I believe I have already mentioned, that four-fifths of the population have come in since last spring; the erection of new buildings during the

summer has been in the same proportion; and although a place of such mushroom growth can, of course, boast of but little solid improvement in the way of building, yet contracts have been made for the ensuing season, which must soon give Chicago much of that metropolitan appearance it is destined so promptly to assume. As a place of business, its situation at the central head of the Mississippi Valley will make it the New Orleans of the North, and its easy and close intercourse with the most flourishing Eastern cities, will give it the advantage, as its capital increases, of all their improvements in the mode of living.

There is one improvement to be made, however, in this section of country, which will greatly influence the permanent value of property in Chicago. I allude to a Canal from the head of Lake Michigan to the head of steam navigation on the Illinois, the route of which has been long since surveyed. The distance to be overcome is something like twelve miles; and when you remember that the head waters of the Illinois rise within eleven miles of Chicago river, and that a level plain of not more than eight feet elevation above the latter is the only intervening obstacle, you can conceive how easy it would be to drain Lake Michigan into the Mississippi by this route; boats of 18 tons having actually passed over the intervening prairie at high water. Lake Michigan which is several feet or more above Lake Erie, would afford such a never-failing body of water that it would keep steamboats afloat on the route in the driest season. St. Louis would then be brought comparatively near to New York, while two thirds of the Mississippi Valley would be supplied by this route immediately from the markets of the latter. This canal is the only remaining link wanting to complete the most stupendous chain of inland communication in the world. I had a long conversation this morning, on the subject, with Major H., the United States Engineer, who is engaged in superintending the construction of a pier at this place. He was polite enough to sketch the main features of the route with his pencil in such a manner as to make its feasibility very apparent. The canal would pass for the whole distance through a prairie country, where every production of the field and the garden can be raised with scarcely any toil, and where the most prolific soil in the world requires no other preparation for planting than passing the plough over its bosom. The most effectual mode of making this canal would be to give the lands along its banks to an incorporated company who should construct the work within a certain time. The matter is now merely agitated at elections as a political handle.

January 13.

I had got thus far in a letter to you, when several officers of the garrison, to whom I am indebted for much hospitable attention and many agreeable hours, stopped opposite the door with a train of carioles, in one of which I was offered a seat, to witness a pacing match on the ice. There were several ladies with gentlemen in attendance already on the river, all muffled up after the Canadian fashion in fur robes, whose gay trimmings presented a rich as well as most comfortable appearance. The horses, from which the most sport was expected, were a black poney bred in the country, and a tall roan nag from the lower Mississippi. They paced at the rate of a mile in something less than three minutes. I rode behind the winning horse one heat, and the velocity with which he made our cariole fly over the smooth ice, was almost startling. The southern horse won the race; but I was told that in nine cases out of ten, the nags from his part of the country, could not stand against a French poney. In the middle of the chase, a wolf, probably roused by the sleigh-bells from his lair on the river's bank, trotted along the prairie above, within gun shot, calmly surveying the sport. The uninvited presence of this long-haired amateur at once suggested a hunt for the morrow, and arrangements were accordingly made, by the several gentlemen present, for that most exciting of sports, a wolf chase on horseback. I was not present at the assembling of the hunt; and the first intimation I had of the game being afoot, was from hearing the cry of hounds and the shouting of a party of horsemen, as they clattered along the frozen river, with two prairie wolves and one gray wolf, running at full speed, about a pistol shot ahead of them. One wolf was killed; and another had made his escape before I joined the party. But the third, the gray wolf, which had struck off into the prairie, was still fresh, when I came into the hunt with an untired horse. But one of the hunters had been able to keep up with him, and him I could distinguish a mile off in the prairie, turning and winding his

foaming horse as the wolf would double every moment upon his tracks, while a half a dozen dogs, embarrassed in the deep snow, were slowly coming up. I reached the spot just as the wolf first stood at bay. His bristling back, glaring eyes, and ferociously distended jaws, might have appalled the dogs for a moment, when an impetuous gray-hound, who had been for sometime pushing through the snow-drifts with unabated industry, having now attained a comparatively clear spot of ground, leaped with such force against the flank of the wolf as to upset him in an instant, while the greyhound shot far ahead of the quarry. He recovered himself like lightning, but not before a fierce, powerful hound, whose thick neck and broad muzzle indicated a cross of the bull-dog blood with that of a greyhound strain, had struck him first upon the haunch, and was now trying to grapple him by the throat. Down again he went, rolling over and over again in the deep snow, while the clicking of his jaws, as he gnawed eagerly at each member of the pack that by turns beset him, was distinctly audible. The powerful dog already mentioned secured him at last, by fixing his muzzle deeply into the breast of the prostrate animal. This however did not prevent the wolf giving some fearful wounds to the other dogs which beset him; and accordingly, with the permission of the gentleman who led the chase, I threw myself from my horse and gave the game the coup de grace with a dirk-knife which I carried about me. The success of this hunt induced us, upon the spot, to appoint another for to-day.

It was a fine bracing morning, with the sun shining cheerily through the still cold atmosphere far over the snow-covered prairie, when the party assembled in front of my lodgings to the number of ten horsemen, all well mounted and eager for the sport. The hunt was divided into two squads; one of which was to follow the windings of the river on the ice, and the other to make a circuit on the prairie. A pack of dogs, consisting of a gray hound or two for running the game, with several of a heavier and fiercer breed for pulling it down, accompanied each party. I was attached to that which took the river; and it was a beautiful sight, as our friends trotted off in the prairie, to see their different colored capotes and gaily equipped horses contrasted with the bright carpet of spotless white over which they rode, while the sound of their voices was soon lost to our ears, as we descended to the channel of the river, and their lessening figures were hid from our view by the low brush which in some places skirted its banks. The brisk trot into which we now broke, brought us rapidly to the place of meeting; where, to the disappointment of each party, it was found that neither had started any game. We now spread ourselves into a broad line, about gunshot apart from each other, and began thus advancing into the prairie. We had not swept it thus more than a mile, when a shout on the extreme right, with the accelerated pace of the two furthestmost riders in that direction, told that they had roused a wolf. "The devil take the hindermost," was now the motto of the company, and each one spurred for the spot with all eagerness. Unhappily, however, the land along the bank of the river, on the right, was so broken by ravines, choked up with snow, that it was impossible for us who were a half a mile from the chase when started, to come up at all with the two or three horsemen who led the pursuit. Our horses sunk to their cruppers in the deep snow drift. Some were repeatedly thrown; and one or two breaking their saddle girths, from the prodigious struggle their horses made in the snow-banks, were compelled to abandon the chase entirely. My stout roan carried me bravely through all; but when I emerged from the last ravine on to the open plain, the two horsemen who led the chase, from some inequality in the surface of the prairie, were not visible; while the third, a fleet rider, whose tall figure and Indian head-dress had hitherto guided me in the chase, had been just unhorsed, and abandoning the game afoot, was now wheeling off apparently with some other object in view. Following on the same course, we soon encountered a couple of officers in a train, who were just coming from a mission of charity, visiting the half-starved orphans of a poor woman, who was frozen to death on the prairie, a day or two since—the wolves having already picked her bones before her fate became known. One by one, our whole party collected around to make their inquiries about the poor children, and the two fortunate hunters soon after joined us with a large prairie wolf hanging to the saddle bow of one of them.

It was now about eleven o'clock; we were only twelve miles from Chicago; and though we had kept up a pretty round pace considering the depth of the

snow, in coursing backward and forward since eight, our horses generally were yet in good condition, and we scattered once more over the prairie with the hope of rousing more game. Not ten minutes elapsed before a wolf, breaking from the dead weeds which shooting eight or ten feet above the level of the snow indicated the banks of a deep ravine, dashed off into the prairie pursued by a horseman on the right. He made instantly for the deep banks of the river, one of whose windings was within a few hundred yards. He had a bold rider behind him, however, in the gentleman who led the chase, (a young educated half blood, of prepossessing manners, and well connected at Chicago.) The precipitous bank of the stream did not retard this hunter for a moment, but dashing down to the bed of the river, he was hard upon the wolf before he could ascend the elevation on the opposite side. Four of us only reached the open prairie beyond in time to take part in the chase. Nothing could be more beautiful. There was not an obstacle to oppose us in the open plain; and all our dogs having long since given out, nothing remained but to drive the wolf to death on horseback. Away, then, we went, shouting on his track; the hotly pursued beast gaining on us whenever the crust of a deep snow drift gave him an advantage over the horse, and we in our turn nearly riding over him when he came to ground comparatively bare. The sagacious animal became at last aware that his course was soon up at this rate, and turning rapidly in his tracks as we were scattered over the prairie, he passed through our line and made at once again for the river. He was cut off, and turned in a moment, by a horseman on the left, who happened to be a little behind the rest; and now came the keenest part of the sport. The wolf would double every moment upon his tracks, while each horseman in succession would make a dash at, and turn, him in a different direction. Twice I was near enough to strike him with a horse-whip; and once he was under my horses feet, while so furiously did each rider push at him, that as we brushed by each other and confronted horse to horse, while riding from different quarters at full speed, it required one somewhat used—"to turn and wind a fiery Pegasus"—to maintain his seat at all. The racial, who would now and then look over his shoulders and gnash his teeth, seemed at last as if he was about to succumb—when, after running a few hundred yards in an oblique direction from the river, he suddenly veered his course at a moment when every one thought his strength was spent; and, gaining the bank before he could be turned, he disappeared below it in an instant. The rider nearest to his heels became entangled in the low boughs of a tree, which grew near the spot; while I, who followed next, was thrown out sufficiently to give the wolf time to get out of view, by my horse belting as he reached the sudden edge of the river. The rest of the hunt were consequently at fault when they came up to us; and, after trying in vain to track our lost quarry over the smooth ice for half an hour, we were most vexatiously compelled to abandon the pursuit as fruitless, and return to the village with only one scalp as the reward of our mornings labors.

It was with no envious feelings, I assure you, that, on making my arrangements an hour ago to start in the new line of stages which has just been established between this point and St. Louis, I found myself compelled to part with the friend to whom I was chiefly indebted for my share in the glorious sports I have just attempted to describe to you—the four-footed companion of my last six weeks rambles. I remember being once struck with the remark of an ingenious writer, in the Library of Useful Knowledge, when, in discussing the real and the relative value of horses, he observes that, the commonest hackney, if in every respect suiting his owner, is priceless to the possessor. A favorite horse in fact, though his estimation may only depend upon the whim of his master, is one of this world's goods which, like first-love and lost confidence, the Alexandrian M. S. S. and a perfectly fitting coat, can never be thoroughly replaced. It is not, however, when the charge of such property falls exclusively to grooms and others from one end of the year to another, that you feel its value. The stall-fed palfrey which you drive along a turnpike from one hotel to another, and abandon when he falls sick for some other means of conveyance, with as little concern as you would exchange your trunk for a portmanteau, or vice versa, has but little hold on one's feelings in comparison with the hearty animal with which you wander away, where he meets with no care but such as you bestow upon him; and when you in turn become wholly dependent upon him for overcoming distances and difficulties, between places so remote from each other, that not only your comfort but sometimes your personal safety depend upon ac-

complishing the intervals within certain periods—when you push ahead through falling sleet, ford rivers, plunge through snow banks, or cross morasses, where the matted grass spreading its carpet over the shaking slough, embarrasses and wearies the step of your sagacious quadruped while it prevents his feet from sinking into the dangerous quagmire beneath. Those weeks of such intercourse between man and brute, are like those rainy days when one is shut up in a country house with strangers. They cherish a fellowship more cordial than years of ordinary intercourse could engender. It is no little consolation to me that I leave my Bucephalus in excellent hands; nor does this necessary separation so engross my sympathies that I have none to spare for other partings. Upon these, however, I shall not dilate here, though you must not be surprised to find me returning more than once hereafter to characters, scenes and incidents at Chicago, which I have hitherto left untouched. H.

THE PINK TIPPET, JESSAMIE COTTAGE, THE SIMPLE FLOWER, ELLEN'S VISIT. New York, Protestant Episcopal Press.—These are little tracts issued by the Protestant Episcopal Sunday School Union, of which the first named is among the earliest and best in composition, but much inferior to the succeeding ones in its paper and typography. The later ones are, altogether, very creditably got up.

ANGELL'S SERIES OF SCHOOL BOOKS.—We noticed some weeks ago with approbation, founded on our examination rather of the reading than the elementary portions of the work, this series of school books. A teacher who upon the strength of our remarks purchased the series, asks room to express his dissent from our opinion of these books, and to lay his reasons for that dissent before the public. We cannot refuse a request so reasonable, and so well sustained by evidence. We insert below his first number:—

ANGELL'S SERIES OF SCHOOL BOOKS.—Mr. Editor.—The importance of correct elementary books cannot be too highly appreciated. The habits which we acquire in our childhood seem to be so interwoven with our very nature, that, even though we discover them to be erroneous, we find it exceedingly difficult to correct them. The infant mind has been aptly compared to a sheet of white paper, which receives an impression from the slightest touch of the pen, but from which a wrong mark or a blot can never be erased, and leave it fair and smooth for a second impression. Hence it is that we see many well educated men, in the constant practice of spelling and pronunciation which they themselves actually believe to be erroneous.

I have been engaged in teaching for many years, during which time I have examined a great variety of books intended for the instruction of children in the rudiments of orthography and pronunciation. Having seen in the American a favorable notice of Mr. Angell's Series of Books, and being anxious to benefit the children under my tuition by the introduction of every thing that is in truth an improvement, I purchased a set of these books, and have given them quite a careful examination; and I regret exceedingly that my opinion of their merits is at variance with yours; but, Sir, knowing your liberality, I have written my objections briefly, and request an insertion of them in your paper.

Mr. Angell has attempted to form a continuous or collateral series of spelling and reading lessons.—Each spelling lesson is composed of words selected from the reading lesson immediately following it; and these words are thrown together in the spelling lessons without any regard to the greater ease with which one may be spelled than another, or the natural advancement of the scholar, the first three numbers containing as great or a greater proportion of difficult words than the last three. The words are also repeated very uselessly in the different lessons, while other words contained in the reading lessons, a knowledge of which is of the same importance to the scholar, are not in any of the spelling lessons, consequently, the child will never know any thing of their orthography from the perusal of them.

The orthography of these books is in my opinion very objectionable; for, in them, Mr. Angell has not followed the spelling of any standard dictionary, but has sometimes adopted that of Johnson and Walker, sometimes that of Webster, and has frequently spelled words at variance with all of them. In proof of this I will cite a few of the almost num-

berless instances which occur in the different volumes. No 5. page 12, *ensure* with *en*, agreeably to Walker, 208, *insurance*, with *in* agreeably to Webster; 207, *buffeting*, contrary to both; No. 2. 90, *behavior*, 3, 37, *honor*, 55, *parlor*, 4, 213 *labor*, 5, 271, *candor*, &c., without *u* agreeably to Webster; and No. 5, 200 *Saviour*, 261 *ermour*, 188 *rumour*, 2, 86 *colour*, with *u* agreeably to Walker; and 2, 24 *entrusted*, 80 *poney*, 2, 90 *threshing*, 4, 244 *cozzen*, 5, 122 *rein-deer*, 274 *paralyzed*, &c. &c., contrary to Walker and Webster; in none of the volumes is there either uniformity or consistency in the spelling. Not wishing to extend this communication unreasonably, I propose to send you another article in which I will treat of Mr. Angell's want of a system of pronunciation, and of his erroneous and contradictory division of words. AN OLD SCHOOLMASTER.

SUMMARY.

We inserted yesterday, on the authority of a gentleman of the Bar, a short statement of points ruled by the Supreme Court in the case of *Wheaton vs. Peters*. Another gentleman of the Bar informs us that that notice was not exact, and furnishes the following statement.—[National Intelligencer.]

The account of the points decided in the case of *Wheaton against Peters*, contained in the Intelligencer of yesterday is inexact, both in stating that the Court had ruled "every point of law in the case in favor of the appellee, Mr. Peters," and in omitting to state the most important principle of the law of copyright, which was actually settled in the case.

To begin with the omission:

1. The Court has unanimously determined (to use the words of the opinion delivered by Judge McLean) "that no Reporter has, or can have any copyright in the written opinions delivered by this Court, and that the Judges thereof cannot confer on any Reporter 'any such right.'"

2. The Court has not decided that the publication of Mr. Peters' *Condensed Reports* is not an infringement of Mr. Wheaton's copyright in the 12 volumes of *Wheaton's Reports*, so far as respects the general order and arrangement of his book; the oral opinions delivered by the Judges from the Bench, and taken down by Mr. W. in writing; the marginal notes, or abstracts of the points decided; the statements of facts in each case, abridged by Mr. W. from the records; and the analytical indexes to each volume, which Mr. W. claims as author, and which Mr. P. has copied from Mr. W.'s book.

3. The Court has made no final disposition of the cause, but has remanded it to the Court below, with directions to ascertain, by a jury, the facts in dispute between the parties.

The Supreme Court have given judgment in favor of Rowland Stevenson, impleaded with Romington and others, at the suit of James W. Parkins, consequently the bail of Stevenson for the jail liberties, is discharged; and after four months' confinement in jail and about three months on the limits, Stevenson is once more at large.—*Courier*.

APPOINTMENTS, FEB. 19.

Kings—Peter Conover, Wm. R. Dean, Hugh Farrell, Asbury W. Kirk and Harmanus H. Borkaloo, auctioneers. Abraham S. Wright and R. M. Whiting, inspectors of lumber. John Pierce notary public. Joseph Herbert, inspector of sole leather.—States Dorson, inspector of Beef and pork. John Lott, jr. judge of the municipal court for the village Brooklyn.

New York—Peter H. Ryckman, culler of slaves and heading.

We learn that on Saturday night last, a disturbance, which resulted in a serious riot, broke out among the students of the University. The dwelling of the President was attacked, the windows of the Professors broken in, and several fire-arms discharged. We did not learn that personal injury was sustained by any of the parties, nor does our informant know the particular cause of the disturbance, or in what manner it was quelled. We wait with anxiety for the particulars of this disgraceful affair, which will be doubtless furnished by our next advices from Tuscaloosa.—[Mobile Register, 6th March.]

Several lighters have come up from the brig Buenos Ayres, with sugar and rum, to Dr. Rogers & Son. The brig will probably be got off. A gentleman who arrived in town last evening, informs that he left the vessel at 3 P. M. yesterday—that they had put on board of lighters about 80 hhds. of sugar, and 12 puncheons of rum—Four lighters were left along side, sufficient to take in the residue of the cargo; and the brig, it is probable, will get off this morning.

Old Ironsides.—We understand from a source entitled to confidence, that the Board of Navy Commissioners have issued orders that the old *bead*, which is a perfectly plain one, be replaced on the Constitution, and that her stern be also finished in a plain manner. For the honor of that noble ship, we hope the figure head, in regard to which much just indignation has been manifested, will be dispensed with. It will be in time to ornament our vessels with the busts of any man, when History shall have established his character, and pronounced him worthy of such honor.

The Rev. Dr. DUCACHET, of Norfolk, Virginia, has received a unanimous call to the Restorship of St. Paul's, Philadelphia.

IMPORTANT.—The Baltimore American of yesterday morning has this formidable announcement:

The following notice was handed for insertion by the Cashier of the Bank of Maryland, last night, when this paper was about going to press:—

TO THE PUBLIC.

Bank of Maryland, }
24th March, 1834. }

The Board of Directors of this Institution have ascertained with surprise and deep regret, equal to any that the community will feel, that this institution is unable to proceed with its business, and they have resolved to transfer all its effects to a Trustee, for the equal benefit of the creditors of the Bank.

The Board of Directors hope and trust that the assets will be sufficient to discharge the debts of the institution, and their determination to stop its business at once, is from a conviction that to continue it longer would only be attended with loss to the community. Their advice to the creditors, founded upon the best judgment they are able to form, is, not to sacrifice their claims. The debtors of the institution will have the privilege of paying their debts with the notes and certificates of deposit and the open accounts due by the Bank, and these alone they hope will enable the note holders and depositors speedily to realize nearly all, if not the entire amount of their credits.

By order, R. WILSON, Cashier.

Letters from Baltimore, received this morning, state that on the failure of the Maryland Bank, the whole town was in an uproar; all classes of people in motion and commotion; a run on all the Banks; such a day of excitement, one writer says, he never witnessed before. The stockholders in the Maryland Bank, will, it is said, lose all. The following facts are stated in one of the letters—our readers will make their own comments on the use thus made of the public monies.

"This Bank has been circulating vast numbers of its notes in the West; last week a draft from the West for \$150,000 was presented through the Branch Bank—the President Poulteny asked one day. It was granted—an express was sent to Mr. Secretary Taney, who drew on the Branch for \$200,000, thus the draft on the Maryland Bank was paid, and the other \$50,000 were deposited in the Pet Bank, the Union, which has done every thing in its power to sustain Poulteny's Bank, but all in vain, though aided by the Government in the sum of \$150,000."

THE BANK OF MARYLAND.—The failure of this bank, and the alleged aid extended to it by the Secretary of the Treasury, are already, it will be seen, under the consideration of the Senate of the United States. Meantime the President of this bank thus honorably meets the case of possible loss to holders of its notes by a pledge of his whole fortune:—

My confident opinion is that the Bank is able to pay all its obligations, but to obviate any difficulty whatever, and to satisfy the holders of the notes and the special certificates of the Bank, I hereby pledge my whole private estate, whether real, personal, or mixed, to redeem any deficiency that the means of the Bank may, by any possibility, be unable to redeem.

EVAN POULTNEY.

March 25, 1834.

Fire.—We are informed, (says the Albany Evening Journal of yesterday,) that upwards of 20 buildings were destroyed by fire last evening in Troy. All the buildings from River st. to Starbuck & Son's street, were consumed.

Steam Boat Napoleon.—The St. Louis Republican announces the total loss of the steam boat Napoleon,

from Pittsburg for that port, heavily freighted with dry goods, &c. The boat struck a snag in the Mississippi, about twelve miles above the mouth of the Ohio. The snag passed through the bow end up to the hurricane deck, without breaking off. In this situation, by the aid of a keel boat which she had in tow, and of a steam boat, about twenty tons of the freight were got out uninjured. A great portion of the remainder will be lost, as the boat had sunk about twenty feet, and the depth of water is represented to be thirty or forty feet. Most of the goods, it is believed, were insured, principally at Eastern offices—but in one or two cases heavy loss has been sustained by the owners.

The *Canadian Giant*, well known as having exhibited himself in several countries of Europe and America, died at St. Jean des Chailons, about 30 miles above Quebec, on the 28th ult. His name was Modeste Malhot. His height was six feet four inches, and his weight 619 1/2 lbs. The coffin in which he was interred was three feet wide, and two feet and a half deep.

LANDS SOLD FOR TAXES.—The Argus of yesterday says the sales of Monday did not go through the county of Alleghany. Next day the residue of Alleghany was gone through with, and Broome would follow.

THE SUPREME COURT OF THE UNITED STATES adjourned on Wednesday, 19th, after a session of sixty-six days, and having disposed of every case ready for trial. It decided 79 cases and left 41 on the docket.

Melancholy Accident.—On the evening of the 9th instant, (says the New Orleans Advertiser, of the 11th inst.) when some gentlemen were amusing themselves shooting with pistols at the Lake, an inexperienced young man took in his hand a hair trigger pistol, and when in the act of preparing to shoot he touched the trigger—the pistol went off, and the ball passed through the body of Mr. B. B. Butler, a highly respectable gentleman, entering at the point of the third rib, and passing out at the side of the spine. He died of hemorrhage in a few hours after the accident.

The Key West Sentinel, of the 20th ult., contains the decree of Judge Webb, awarding fifteen per cent. salvage to the libellants of the ship Hector and cargo, stranded on the Florida Reef, on her voyage from New York to Mobile. The value of the ship and cargo was estimated at \$70,000.

Alexandria Market.—Flour has improved. Sales were made from stores on Monday at \$4 20 to \$4 25.

FOREIGN INTELLIGENCE.

GILBERT STEWART NEWTON.—It is with the greatest satisfaction we find in the London Courier the following contradiction of the paragraph from the Literary Gazette, published by us yesterday:

There is no foundation for the statement in the Literary Gazette of the death of Mr. G. S. Newton, the Royal Academician. That gentleman has been seriously indisposed, but was considerably better yesterday.—[Courier.]

FROM GIBRALTAR we have, by the favor of Mr. Regalley, of Boston, a passenger in the brig *Montano*, papers to 18th ult., furnishing Madrid dates of the 11th. There is nothing however of importance.

LATE AND IMPORTANT FROM SPAIN—DIRECT.—We are again indebted to Ex-Governor Cabrera for extracts from his private letters down to the 11th Feb. from Cadiz, received by the *Ganges*, at Boston. These tidings are considerably later from Madrid, and also later from Lisbon than the advices received via England; by which it appears that Don Pedro had gained important advantages over Don Miguel.

From Private Letters, dated

CADIZ, 11th Feb. 1834.

By the British man-of-war *Stag*, arrived at our port from Lisbon, we have received letters and newspapers from that capital, as late as the 3d inst. by which we find that three important victories have lately been obtained by the troops of Don Pedro against his opposers. In the afternoon of the 21st January last, in the environs of Pernes, the troops of Don Miguel, four thousand in number, attacked General Saldanha, who repelled them with such vigor and bravery that the whole of the Miguelites were entirely defeated, leaving in the hands of Saldanha more than one thousand prisoners, among them nearly a whole battalion of the

7th regiment, seven pieces of artillery and some banners. Mean while the Duke of Terceira (Villa Flor) was also attacked by another division of Miguelites, in the position of the bridge of Aseca, where the latter were equally defeated, with an immense loss.—Then the Duke sent in the direction of Villada a body of cavalry to punish 700 enemies who had passed the river Tagus from the South to the North side. All this force was entirely cut to pieces and annihilated; the few that escaped from the bayonets of the Pedroites, precipitated themselves into the river, where they were drowned. The Miguelite army, routed on every point, may now be considered as lost; the relics will soon be extinct.

SPAIN.—In Spain, the partisans of Don Carlos, the Pretender, increase every day in Biscay and Navarre, where the Queen has sent a force of 30,000 men. A decree has been issued by the Queen ordering that the rebels taken with arms should be put to death if they are officers, and condemned to hard labor or transportation to Cuba, Porto Rico, or Philippine Islands if they are sergeants, corporals, or private soldiers.

The principal labor that now occupies the whole attention of the Government is the mode of convoking the Cortes or General Assembly of the Nation. The liberals enlist themselves in the ranks of the National Militia everywhere. The province of Catalonia alone has actually 30,000. They are all in expectation of the mode in which the Cortes are to be convoked, and that mode is to decide their conduct. Meanwhile, they resting on their arms, they are indignant at the past, smile at the present, and rejoice at the future. The most striking feature of the present state of the affairs in Spain is, that France and England are endeavoring to repress the general expansion of liberty, while the Captains General of the army, who had been the principal supporters of the dead tyranny, are now at the head of the liberal party.

MISCELLANY.

Laconic Epistles.—There was a celebrated diplomatist, whose time, at one period of his life, was so engaged in matters of political importance, that he could scarcely find a moment to attend to social duties, and a certain facetious colleague used to say that he never dotted his i's or crossed his t's for the purpose of saving time. It is not, therefore, probable that such a man would fritter away his precious existence in writing letters to friends upon subjects unconnected with ambition and party intrigues. He however, broke through this determination, in the following instance. A lady, with whom he was well acquainted, married a young French nobleman, the choice of her heart. Scarcely had the honeymoon passed away, when the husband was attacked with a severe illness, and died. The diplomatist being informed that the affliction of the lady was so intense, that night and day she did nothing but weep—that sorrow would soon bring her to the grave—deemed it an imperative duty to write a letter of condolence. This he performed—but, reflecting that true grief is always laconic, and wishing her to understand how alive his feelings were to the irreparable loss she had sustained, he wrote these words—and they formed the whole contents of the condoling letter: "Ah! Madame!"—Six months passed away, and grief and sorrow passed also away with the fleeting months. The fair lady followed the example of the Dame of Ephesus, and took to herself another husband. No sooner had the writer of protocols heard, this news, than he evinced more than usual alacrity in coming to the conclusion of writing a congratulatory epistle, which was accordingly despatched. He again reflected, that if grief be not loquacious, joy is also laconic—and so he wrote, "Ho! ho! Madame!"

BACKGAMMON—versus CHESS.

I am just come away from a terrible dispute with cousin Kate on the relative merits of backgammon; and to hear us at our argument you would think Bedlam was broke loose outright. I say our argument, because I am a gallant fellow: though, to put modesty on the shelf for once, the ratiocination is pretty nearly all on one side—mine, of course.—Yet, I don't know how it is, I can never bring Kate to my way of thinking—nay, she has not unfrequently the assurance to say that I am the vanquished party. Women are certainly the worst of arguers in the world; they never know when they are beaten. You may assail them with logic, you may batter them with syllogisms—what care they? You think you have got them fairly into a *reductio ad absurdum*—you have driven them to Point Nonplus—you have left them with not so much as a leg to stand upon—and straightway they take up their old position just as if nothing had happened. That's always the way

with Kate, at least. When I have outwangled her till I am nearly black in the face, and she is reduced to a positive nonentity, calmly she spreads out her wings, like a regenerated phoenix (excuse the stale-ness of the simile!) and from those cinders of argumentation, raises up in all the pride of unruffled plumage. This puts me in a pet—well it may, indeed!—and then we get to “high words,” and then Kate laughs; and then I bounce out of the room; and, running to this little den of mine, set to to vindicate myself in an essay.

That's the best way of disputing, after all—the pleasantest, at any rate. You can then give your arguments fair play. If there is a weak point in your adversary's reasoning, what fine tearing work you can make of it! And if a tough objection comes in your way, how easy to misunderstand it, or skip it over altogether! Commend me to your pen argument, there is none to compare with it. It is like a grand field-day and review, where the troops are all on one side: or, if you are obliged, for candor's sake, to give yourself a few heavy lunges, no fear but you will find means to parry them—like the cat in the kitchen, you need not care being tossed head over heels a little, for there is no danger but you will come down on your legs again.

How any one can like chess moves my especial wonder. It is the dullest, the puzzlingest, and the tediousdest game under the sun. There they sit, Kate and James, posing and prosing over those horses' heads and fools' caps hour after hour, night after night. They speak but once or twice in an evening, and then only monosyllabically, “Check!”—and it seems as if a chair or a table had been suddenly endowed with speech. They can't talk themselves, and they can't be talked to. You cannot ask the civillest question but they give you a sulky answer—if, indeed, they condescend to give you an answer at all. They call it *playing at chess*: monstrous perversion:—to me it seems harder work than algebra. It is the most lack lustrous of all games—it is no game at all, in fact—it is a labor, and a labor too, the most irksome that can well be imagined. It is like those “instructional games” invented for children, where they are required to twirl the tee-totum and ascertain the height of John Chinaman in a breath; where the drawing of a card or the throwing of a die leads you to the depth of the Mediterranean or the longitude of Pernambuco. Poor dear children! who could have so miserably mistaken the nature of the play—who could have forged such fetters for their souls! But, bless them, they despised the cheat—they spurned the starved snake—they tore the false sheet into ten thousand tatters—they shivered the tee-totum into ten thousand fragments! But look at the chess-players, motionless as a brace of mummies! And yet they describe their game as “very exciting.” Ha! ha! only observe their faces—not a curl of the lip, not a twinkle of the eye—they have not mustered so much as a smile betwixt 'em this half hour! Once or twice, indeed, they have been “excited” to a most portentous frown; and something very like a half-suppressed “damn it!” has every now and then been heard on James's side of the board. They tell you it is the game of kings—war in miniature. If kings like it, well and good; one seldom hears of them playing at it. I have been a constant reader of the daily papers this—no matter how many years; I have read of his Majesty taking an airing in the Park, playing a quiet rubber at whist, sailing on Virginia Water, and going to look at the harriers at the Devil's Dyke; but I never heard of the king playing chess. As for its being an image of war (no great credit by-the-by,) so is backgammon—so is cribbage—so is fox-and-goose. Query:—do kings ever play at fox-and-goose?

I have mentioned backgammon. Yes, backgammon is a game. What life—what spirit—what merriment—what variety! Rattle, rattle, rattle, go the dice—bang sixes! Brave! take you up—cover my own blot—take you up again, and complete the last point in my own table. Ha, ha! if that is not enough to make any one die with laughing, what is? Throw again—six and three—obliged to leave a blot—four—four, by Jove, you take me—there again—up I go, two men must headed in a moment, and my adversary grinning from ear to ear. Ha, ha, ha!

That's what I like in backgammon. The reverses are so sudden—the ups and downs are as quick as in running hand. You have not time to brood over your ill luck, and your enjoyment is the keener for the shortness of your triumph. It is like a game at fistfence, where you shake hands with your antagonist before you set to, and pledge his health in a bumper when all is over. The other is far more vicious—downright French and English—war to the knife—through “good landing.” In backgammon, you

have not time to be angry; in chess, ill blood must needs grow from so long brooding. I would not willingly walk out in the dark with a man whom I had beaten at chess. You may believe it or not, as you like; but I once knew a young fellow who lost his mistress and forty thousand pounds by indiscreetly taking her queen with one of his pawns; and my uncle, who is as fond of backgammon as I am, assures me that he has heard of a person who, having been stale mated when on the point of winning a long contested game, took it so much to heart that he cut his carotid artery three weeks after. For my part, I never could properly understand chess—it is such in-and-out, three-cornered work. The rooks, bishops, and pawns, I could manage well enough; but those horrid horses' heads, they always perplexed me. And then that *castling the king*, I never could remember, from one time to another how it was done; and never saw the use of it when it was done. Most people, I believe, play at chess because they think it fine to do so; young ladies, because they fancy it argues a masculine mind—young men, because it hides their stupidity—retired tallow-chandlers, because they think it genteel. I was once fool enough to be dazzled by the glitter of the red and white, studied Philidor, and went to see the automaton. But the fit was not of long duration—I soon cut my wisdom-teeth—I soon returned to dear old backgammon; and I wish, reader, you and I could have a hit together at this moment. I can never tire of backgammon. It is like “Sweet Home,” (the song, I mean,) you cannot have too much of it; the appetite here “grows by what it feeds on,” (really our quotations and similes are shockingly antique;) it is like bread and cheese, of which it is said, the more you eat the hungrier you get. It unwearies the mind, and rectifies the spirits. It turns a Nero into an Augustus, and a Cymon into a Cæsar. The very sight of a backgammon-board is enough to put me into good humor. Those stripes of crimson and grey, how pleasant they be, like the glowing clouds of a summer sunset, or the brilliant ceruseations of the Aurora Borealis! How different the arena of the chess war! It always puts me in mind of the symbol on an alehouse window. It deserves no better than to be played on a shutter.

Backgammon is essentially a gay game. It is not to be played with solemn thoughts and sour faces. You ought to laugh every time you throw, and if you have not a jest ready for every “doublets,” you don't deserve to throw doublets again as long as you live. As backgammon is a game almost entirely of chance, it will scarcely be in good taste to make such stand upon your skill. Less is it to be endured that you should be constantly referring to Hoyle, for the maintenance of some vexatious rule or foolish courtesy. If a man stand shilly-shallying over a blot, or hesitates to take one of your men, for fear of consequences, beware how you lend him your money, or entrust him with the title deeds of your house! If a man insults you by pedantically quoting and resolutely maintaining antiquated laws, such as “If you touch a man you must move it, and if you relinquish it you cannot recall it,” shut the board in his face, ring for your slippers, and go to bed. I was once called in to bail a fellow with whom I had long been on terms of intimacy. We played a game or two at backgammon in the spunging house. I threw six times, one on one side of the board, one on the other. He protested it was against the rules of the game, and insisted on my throwing again. I took up my hat, left the room, suffered my friend to go to prison. Did I not serve him rightly?

The only objection I ever heard against backgammon was its want of sociality, only two can play at it. This is the objection of my very good friends, the whist players. But I don't consider it an objection: far from it—it is an advantage. There is seldom more than one person in a company that you are to concern yourself about; a friend, perhaps, or a sweetheart. If a friend, how delightful an opportunity it affords you for a *tête à tête*! You go on playing and joking, rattling the dice, and squibbing off puns, as pleasantly as sunshine in a hayfield. The game no more interrupts your thoughts than a gale interrupts the serenity of the deeps. It is to your discourse what the accompaniment is to a song: it is as animating as a trumpet is to a war-horse, or a view-hollo to a fox hunter, or a pair of bagpipes to a Scotchman. In the case of a sweetheart, the game is positively invaluable. To the lady herself, what opportunities it affords for the display of a well turned arm; how daintily her little fingers curved about among the men; how brilliantly glance her bright eyes, smiling over some lucky throw! And to you a *fete champêtre*, or a fancy ball, gives not half the facilitation. I never was in love but once in

my life, and then I used to pay my addresses through the medium of the backgammon board. Oh! Mary Rose W——! (Mrs. Jacob Jenkinson now,) Oh! Mary Rose! (Rosemary I used to call you in our more playful moments,) what billings and cooings have we had over that mock “History of England” of your old aunt's? What tender things have we said under cover of the dice-box! what sighs have we mingled with the rattling of the men! how very close have we brought our lips (all but kissing) under pretence of disputing about a throw, or ascertaining the length of a six-and-five! How often, too, when your poor aunt has looked up from the “Whole Duty of Man,” and seen us leaving blot after blot, and throwing helter-skelter, and playing into the wrong table, and taking up our own men instead of our adversary's—how often has she started us with her old favorite exclamation, “Hey day! now now?” and how have you blushed, Mary, at being convicted of a sigh or an ogle! and how have I stammered out an excuse for my fingers, which were haply caught playing themselves amongst your jetty ringlets, or for my toe, which was making love to your toe under the little rosewood table! Oh! Mary, Mary! those were happy days! my heart and your heart, Mary——. But, as I said before, you are Mrs. Jacob Jenkinson now, and I mustn't say a word of tenderness in your maternally ear, lest that stockbroking husband of your's should take it into his head to sue for damages. Oh! Mary, Mary, how could you think of marrying into the 3 per cent. Consols,—to be dinned to death with the slang of Capel-court,—to give birth to nothing but bulls and bears?

I have known a game of chess to last two, three or even four evenings. That seems bad enough; but what must one think when it comes to be spun out for as many months,—to be played through the medium of the General Post Office, and hundreds of miles intervene betwixt each move? Madness, madness! I was once challenged to play a game through the Two-penny, but I declined with indignation. The challenger showed me a letter he had that morning received from an adversary in Edinburgh, and he expected another, he said, by the next vessel from India. The Edinburgh letter ran thus: “Dear Phil,—By moving pawn No. 4 one square forward, you will very much oblige.—Dear Phil, your's very sincerely.—John Johnstone.” This fact alone is, in my mind, enough to damn chess.—What affectation! what folly! Did any one ever hear of a game of backgammon being played after such foolish fashion? Never, I'll be bound for it. Then, the airs of superiority the chessites assume over us poor backgammonists, and utter contempt they profess for our game! Why, the fact is, that our game is as superior to their's as silver to saw-dust. In chess two players must either be equal or unequal. If equal, they see through each other's manoeuvres in a minute; and the game (if not prolonged till both parties are heartily sick of each other, and so dropped from mere weariness) is lost at last by an oversight,—the loser not considering himself beaten.—If unequal, a certain number of moves places the weaker party *hors de combat*, and that as often as the game may happen to be renewed.

In backgammon nothing of this sort takes place.—The most practised player may be beaten by the veriest tyro. Old grandpapa may be gammoned by his little curly-headed granddaughter. Luck's all. Fortune governs throughout: conjecture is positively dumbfounded. A chancery suit or an action for libel can scarcely be more uncertain in its results. At backgammon all men are fatalists. Many fine moral lessons are contained in its leafless book. The “Talmud” and the “Koran” are not more full of ethical instruction than those two volumes of anti-types. They teach us how vain are all our calculations of the future—how foolish it is for man to trust to his own predictions in matters over which himself has no control. They counsel us to look with suspicion on present good fortune, yet never to despair in the midst of adversity. Let no man be puffed up with pride; his pride may have a fall; let no man despond at the presence of poverty; he may throw sixes! Backgammon instils into our minds the rudiments of honorable competition: of course, it is no game for the St. Simonians; it teaches us that all mankind are equal,—black and white. It is a microcosm, in which the men represent the brute matter, and the dice the informing principle. If chess is a game for kings, backgammon is a recreation for the immortal gods themselves.

A noble game is backgammon—as I think cousin Kate will acknowledge when she comes to cast her fine black eyes over this most veritable and unsophisticated essay.

CONSUMPTION OF SILK.—The quantity of this material used in England, alone amounts each year to more than four millions of pounds weight, for the production of which, myriads upon myriads of insects are required. Fourteen thousand millions of animated creatures annually live and die to supply this corner of the world with this luxury! If astonishment be ascribed at this act, let us extend our view to China, and survey the dense population of its widely spread region, whose inhabitants, from the emperor on the throne to the peasant in the lowly hut, are indebted for their clothing to the labors of the silk worm. The imagination, fatigued with the flight, is lost and bewildered in contemplating the countless numbers which every successive year spin their slender threads for the service of man.—[Repertory of Patent Inventions.]

A few days ago two Savoyards, travelling the country with two dancing bears, were overtaken by night on the road, and put up at a public house near Dolbe, in Calvados. Having shut up their animals in the stable, they entered the house, and after taking some refreshments, began to count their gains during the day. While thus occupied a stranger came in, and entered into conversation with them. The account being made up, and the money put into a leathern purse, one of the bear-leaders was observed by their new companion, who seems to have had some of the qualities of the fox, but not all his cunning, to carry the purse into the stable, and return empty handed. The hour of rest arrived, the party separated, and each retired. About midnight, however, the traveller, who had watched the visit to the stable, but was not aware of how the stalls were occupied, went furtively there, in hopes of finding the deposited treasure. No sooner, however, had he entered within the door than he found himself in the embraces of a rough and powerful being, with claws that entered his flesh, and so completely destroyed all his discretion that he was forced to cry out lustily for assistance. The fact was, that the bear-leaders, knowing the fidelity of their two rough-coated companions, had followed their usual custom of placing their little treasure between them for safe custody. On the following day the would-be thief was pursued to the house and arrested for a depredation he had previously committed.—[French paper.]

Ludicrous Misunderstanding.—Mr. Crabbe had, I presume, read very little about Scotland before that excursion. It appeared to me that he confounded the Iachcolm of the Frith of Forth with the Icolm-kil of the Hebrides; but John Kemble, I have heard, did the same. I believe he really never had known until then that a language radically distinct from the English was still actually spoken within the island. And this recalls a scene of high merriment which occurred the very morning after his arrival. When he came down into the breakfast parlor, Sir Walter had not yet appeared there, and Mr. Crabbe had before him two or three portly personages, and all in the full Highland garb. These gentlemen, arrayed in a costume so novel, were talking in a language which he did not understand, so he never doubted that they were foreigners. The Celts, on their part, conceived Mr. Crabbe, dressed as he was in rather an old-fashioned style of clerical propriety, with buckles in his shoes for instance, to be some learned abbe, who had come on a pilgrimage to the shrine of Waverley; and the result was, that when, a little afterwards, Sir Walter and his family entered the room, they found your father and these worthy lairds hammering away, with pain and labour, to make themselves mutually understood in most execrable French. Great was the relief, and potent the laughter, when the host interrupted their colloquy with his plain English "Good morning."—[Crabbe's Life, by his Son.]

From two volumes recently published in London, under the title of "The Doctor," in which much clever writing is displayed, and solid instruction on miscellaneous subjects imparted, we have transferred some extracts to our paper to-day:

Love of Country.—Whatever strengthens our local attachments is favorable both to individual and national character. Our home—our birth-place—our native land—think for awhile what the virtues are which arise out of the feelings connected with these words; and if thou hast any intellectual eyes thou wilt then perceive the connexion between topography and patriotism. Show me a man who cares no more for

one place than another, and I will show you in that same person one who loves nothing but himself.—Beware of those who are homeless by choice! You have no hold on a human being whose affections are without a tap-root. The laws recognize this truth in the privileges which they confer upon freeholders; and public opinion acknowledges it also, in the confidence which it reposes upon those who have what is called a stake in the country.

"I don't like morality it doses. * * *
"Nothing excellent was ever produced by any author who had the fear of censure before his eyes."

A Quack Medicine.—"When at any time it happened that one of his eyes was blood-shot, he went forthwith in search of some urchin, whose mother, either for laziness, or in the belief that it was wholesome to have it in that state, allowed his ragged head to serve as a free warren for certain 'small deer.' One of these hexapods William secured, and 'using him as if he loved him,' put it into his eye; when, according to William's account, the insect fed upon what it found, cleared the eye, and disappearing he knew not where or how, never was seen more. * * *

Time is a commodity of which the value rises as long as we live."

The Laws and Lawyers again.—He knew that laws were necessary evils; but he thought they were much greater evils than there was any necessity that they should be; and believing this to be occasioned by those who were engaged in the trade of administering them, he looked upon lawyers as the greatest pests in the country:

Because their end being merely avarice,
Winds up their wits to such a snail-like strain
As helps to blind the judge, not give him eyes.
Lord Brooke.

Bell ringing.—"It would take ninety-one years to ring the changes upon twelve bells, at the rate of two strokes to the second; changes upon fourteen could not be rung through at the same rate in less than 16,575 years; and upon four and twenty they would require more than 117,000 billions of years. Great, then, are the mysteries of bell-ringing! And this may be said in its praise, that of all devices which men have sought out for obtaining distinction by making a noise in the world, it is the most harmless."

Intelligence.—Let me observe, that I never obtained any information of any kind which did not on some occasion or other prove available.

Age.—In age we dislike all changes as natural, and, therefore, no doubt, as fitly, as in youth we desire it.

Local Attachments.—If fifty years' acquaintance did not give us some regard even for stocks and stones, we must be socks and stones ourselves.

Quare in Education.—If I had been born too poor to obtain the blessings of education, or too rich to profit by them.

Advice.—They who cannot swim should be contented with wading in the shallows: they who can, may take the deep water, no matter how deep, so it be clear. But let no one dive in the mud.

Marriage.—The man who is married for mere worldly motives, without a spark of affection on the woman's part, may nevertheless get, in every worldly sense of the word, a good wife; and while English women continue to be what, thank Heaven, they are, he is likely to do so: but when a woman is married for the sake of her fortune, the case is altered, and the chances are five hundred to one that she marries a villain, or at best a scoundrel. * * *

To set about seeking a wife is like seeking one's fortune, and the probability of finding a good one in such a quest is less, though poor enough, Heaven knows, in both cases.

The man who gets in love because he has determined to marry, instead of marrying because he is in love, goes about to private parties and to public places in search of a wife; and there he is attracted by a woman's appearance, and the figure which she makes in public, not by her amiable deportment, her domestic qualities, and her good report. Watery places might with equal propriety be called fishing places, because they are frequented by female anglers, who are in quest of such prey, the elder for their daughters, the younger for themselves. But it is a dangerous sport, for the fair Piscatrix is not more likely to catch a bonito, or a darado, than she is to be caught by a shark.

The Turkish Language.—No people have pretended to so much precision in their language as the Turks. They have not only verbs active, passive, transitive and reciprocal, but also verbs co-operative,

verbs meditative, verbs frequentative, verbs negative, and verbs impossible; and moreover they have what are called verbs of opinion, and verbs of knowledge. The latter are used when the speaker means it to be understood that he speaks of his own sure knowledge, and is absolutely certain of what he asserts; the former when he advances it only as what he thinks likely, or believes upon the testimony of others.

Feelings.—You meet in this world with false mirth as often as with false gravity; the grinning hypocrite is not a more uncommon character than the groaning one. As much light discourse comes from a heavy heart as from a hollow one; and from a full mind as from an empty head.

Eyes.—Mirth sparkled in them, scorn flashed from them, thought beamed in them, benevolence glistened in them; that they were easily moved to smiles, easily to tears.

Confirmed Habits.—Every one knows the story of the tallow chandler, who, having amassed a fortune, disposed of his business, and taken a house in the country, not far from London, that he might enjoy himself, after a few months trial of a holiday life, requested permission of his successor to come into town, and assist him on melting days. I have heard of one who kept a retail spirit shop, and having, in like manner, retired from trade, used to employ himself by having one puncheon filled with water, and measuring it off by pints into another. I have heard also, of a butcher in a small country town, who, some little time after he had left off business, informed his old customers that he meant to kill a lamb once a week, just for his amusement.

Cambridge Anecdote.—Some of my contemporaries may remember a story once current at Cambridge, of a luckless undergraduate, who being examined for his degree, and failing in every subject upon which he was tried, complained that he had not been questioned upon the things which he knew. Upon which the examining master, moved less to compassion by the impenetrable dullness of the man than to anger by his unreasonable complaint, tore off about an inch of paper, and, pushing it towards him, desired him to write upon that all he knew!

Singularity.—Of all things, a wise man will most avoid any ostentatious appearance of singularity.

Woman.—Man hath a fleece about him which enables him to bear the buffetings of the storm; but woman, when young, and lovely, and poor, is as a shorn lamb, for which the wind has not been tempered.

Disquisition in Praise of Order.—Think a moment, I beseech thee, reader, what order is! Not the mere word which is so often vociferated in the House of Commons, or uttered by the Speaker *ore rotundo*, when it is necessary for him to assume the tone of Zeus *ὀψιπτερης*; but order in its essence and truth, in itself and in its derivatives. Waving the orders in council, and the order of the day, a phrase so familiar in the disorderly days of the French National Convention, think, gentle reader, of the order of knighthood, of holy orders, of the orders of architecture, the Linnæan orders, the orderly serjeant, the ordinal numbers, the ordinary of Newgate, the ordinary on Sundays at two o'clock in the environs of the metropolis, the ordinary fates of those who partake of what is ordinarily provided for them there; and under the auspices of government itself, and *par excellence*, the extraordinary Gazette. And as the value of health is never truly and feelingly understood, except in sickness, contemplate for a moment what the want of order is. Think of disorder in things remote, and then as it approaches thee. In the country wherein thou livest, bad; in the town whereof thou art an inhabitant, worse; in thine own street, worse; in thine own house, worst of all. Think of it in thy family, in thy fortune, in thine intimates. In thy affairs, distressing; in thy members, painful; in thy conduct, ruinous. Order is the sanity of the mind, the health of the body, the peace of the city, the security of the state. As the beam is to a house, as the bones to the microcosm of man, so is order to all things. Abstract it from a dictionary, and thou mayest imagine the inextricable confusion which would ensue. Reject it from the alphabet, and Zerah Colburn himself could not go through the chriscross row. How then should I do without it in this history? A Quaker, by name Benjamin Lay, (who was a little cracked in the head, though sound at heart,) took one of his compositions once to Benjamin Franklin that it might be printed and published. Franklin having looked over the manuscript, observed, that it was deficient in arrangement. 'It is no matter replied the author, 'print any part thou pleasest first.' Many are the speeches and the sermons and the treatises and the poems, and the volumes,

which are like Benjamin Lay's book: the head might serve for the tail, and the tail for the body, and the body for the head,—either end for the middle, and the middle for either end; nay, if you could turn them inside out like a polypus, or a glove, they would be no worse for the operation. When the excellent Hooker was on his death-bed, he expressed his joy at the prospect of entering a world of order."

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A29t RM&F

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M'Adam roads. They will save ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1825, by his caveats filed in the Patent Office. Apply, post paid. 31 R J M M & F

INCOMBUSTIBLE ARCHITECTURE.

INCOMBUSTIBLE dwelling-houses and buildings of all kinds devised or built in New-York, or any part of the United States, as cheap as any other combustible buildings. Actual buildings and houses rendered incombustible at a small additional expense.

SHIPS of all sorts, and Steamboats, rendered incombustible, and not liable to sink, at a small expense.

For sale, 10,000 lbs. of **ANTIGNIS**, or Incombustible Varnish, at one dollar per lb.

Apply to **C. B. RAFINESQUE**, Professor of Hist. and Nat. Sciences, Chemist, Architect, &c. in Philadelphia, No. 59 North 5th street. A pamphlet given gratis.

References in New-York.—Mr. Minor, Editor of the Mechanics' Magazine; Messrs. Rushton & Aspinwall, Druggists. Editors in the city or country, copying this advertisement, will receive a commission on any contract procured by their means. 31 R J M M & F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch, 300 do. 1 1/2 do. 40 do. 1 do. 800 do. 2 do. 900 do. 2 1/2 do. soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 4 1/2, and 5 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and incorporated Governments, and the Drawback taken in part payment.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them. 471meowr

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, **WILLIAM NORRIS**, Secretary.

December 2d, 1833. For further information on this subject see No. 49, page 778 of this Journal.

TO STEAMBOAT COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, post paid. 31 R J M M & F

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of **Duffee, May & Co.** offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon dale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, { January 29, 1833. }

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY. The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORNBURN, 347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

Mr. Thornburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine. **MECHANIC'S MAGAZINE** and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by **E. & G. W. BLUNT**, 154 Water street, corner of Maidenlane. J31 6t

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG, Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

In reply to the inquiries respecting the Instruments manufactured by them, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying off rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend, **JAMES P. STABLER**, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. M. GILL, Civil Engineer. Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad., Germant and Norrist. Railroad

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads No. 264 Elizabeth street, near Bloecker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen at that part of the New-York and Harlem Railroad, now in operation. J25 1t

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete. **J8 ROGERS, KETCHUM & GROSVENOR.**

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathe, Presses, and other Machinery. Also, Dr. Not's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. m18

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTTE, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable.

They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER, Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer. Baltimore, May 1st, 1833.

To Messrs Ewing and Heartte.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE, Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any person desirous of perusing the same. m18

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, APRIL 5, 1834.

The writer of the following letter will excuse us, we trust, for publishing it without his consent. The truth is, we are driven, these hard times, to adopt all honorable means in our power to extend its circulation, that we may receive back the money it has cost us. If we can do that, by a collection of what is now due from those who have heretofore taken it, the sale of copies now on hand, and an extension of its circulation, we will never say a word more about having thus far received no compensation for our own services in superintending it. One cannot afford to work for nothing unless his expenses are defrayed: and we should not have been obliged to do so, if all who have patronized, had paid us.

LIVERPOOL, Feb. 20th, 1834.

SIR,—I am requested by Mr. Vignoles to subscribe for a sett of the Railroad Journal, with the back numbers complete, for the Institute of Civil Engineers in London, and another for the Board of Public Works of Dublin, which may both be sent as you have hitherto sent his copies. He says they will all prefer having them in semi-monthly parts, stitched in a wrapper, as you have sometimes sent them; I should also prefer mine in that way. I have, likewise, at the solicitation of Doctor Lardner, to ask you to send two copies of all the back numbers, and to continue him as a subscriber. On seeing my copy, he expressed the utmost astonishment that such a work should be published in America, and I dare say he will be the means of your procuring additional subscribers. You will please to forward me your bill, which shall be immediately paid.

Your obedient servant,

FRANCIS B. OGDEN,
Consul of the U. S. at Liverpool.

ERIE AND KALAMAZOO RAILROAD.—We are happy to learn by the following letter from one of the commissioners, that \$48,000 of the capital stock of this company has been taken, leaving but forty shares of \$50 each, to make up the full amount necessary to make a good wooden railroad from Port Lawrence to Adrian.—[Miami of the Lakes.]

“ADRIAN, March 6, 1834.

“The books for receiving subscriptions to the capital stock of the Erie and Kalamazoo Railroad Company were opened here as per notice, on the 4th instant. On that and the following day there were 960 shares subscribed, which is \$48,000. The stock finds a more ready market than was anticipated by the warmest advocate of the road. This tells well for the intelligence and enterprise of the inhabitants of the counties of Lenawee and Monroe. People of every profession, trade, and business, have taken stock. Can there be any doubt that a railroad will be built, when so many unite their strength and say *it shall go on*? Your favorite theory of wooden railroads will therefore soon be put in practice.”

By a gentleman of this place, recently from Columbus, we are informed that the Wabash and Erie Canal bill had a few days before the time of adjournment been passed by the House and sent to the Senate, where, after some trifling amendments, it also passed, and that there was no doubt that the Senate's amendment would be concurred in by the House without opposition. The bill, as we are informed verbally, provides for the immediate survey by engineers, under the direction of the Commissioners, of both banks of the river from the Indiana line to the foot of the rapids, and also an examination of the bed of the river as low down as the head of the rapids, with a view to a slack water navigation, if it should be deemed expedient.

Three gentlemen to be appointed by the governor, to select and appraise the lands belonging to the canal, which lands are to be brought into market as early as practicable, and sold for cash, provided that none shall be struck off at a less price than \$2 50 per acre, nor less than its appraised value; and no canal land can be entered at private sale until two public sales shall have been held. The proceeds of these sales are to be applied without unnecessary delay to the construction of the canal.

It is expected that the engineers will be on the route as soon as the ground is well settled.

We shall publish the canal bill as soon as we have the good fortune to lay our hands on it.—[Miami of the Lakes.]

Internal Improvements, No. V. By F. To the Editor of the American Railroad Journal, and Advocate of Internal Improvements.

SIR,—Animated discussions have at various times taken place, in relation to the particular plan that is best adapted as a general means to promote and facilitate internal commerce; and although systems have been explained, and theories investigated, in the most lucid and elaborate manner, they have been too frequently characterized by party influence, to produce any other effect than that of exciting animosities to the prejudice of the true interest of the cause.

It is not believed that any one particular plan can with propriety be recommended as most fit to subserve the general interest of the country. The circumstances which should govern the mind in the choice and adoption of such plan are principally of a local character, and entirely independent of general rules. Canals, railways, turnpikes, have each their particular province, their particular sphere of action. Each, according to circumstances, possesses, relatively, certain capabilities and advantages, for which it claims precedence over the other two; and for which alone it should be selected as most likely to conduce to the improvement of the section of country it may be intended to benefit.

One of the main causes of error, and one that has been productive of more injury than any other, may be traced to the prejudice that has so unreasonably existed in the minds of the people, against the employment of men of science in the construction of important public works. It is disgraceful to find the interests of men of this class, even when possessing a large share of practical knowledge, prejudiced by the very thing which ought, in the eyes of an enlightened community, to have advanced them; to find their services slighted and put aside to give place to those who, professing to act independently of all theory and scientific principle, and ignorant of every thing except the few practical rules indispensable in their vocations, happen to enjoy the unenviable distinction of being mere practical men. It is only by the lights of science that we can ever hope to estimate with any degree of accuracy the combined actions of different causes, and by a correct knowledge of its principles that we can avoid making improper applications

of established laws, and be enabled to draw legitimate conclusions from particular premises. It is not imagined by any reflecting person that knowledge of this kind can possibly militate against a correct conception of plans, and a judicious arrangement of details. Were it reasonable to suppose, even for a moment, the encouragement of any such ridiculous notions, many convincing instances might be adduced as evidence to maintain the contrary position,—that without its assistance no engineer can hope to attain to eminence in his profession. Prony, Tredgold, and Smeaton, were all, in some sense, practical men; but to an extensive practice they united a profound knowledge of all the different branches of mechanical science; and who have contributed more than they to the general diffusion of knowledge, under the different heads to which their attention was directed. We are persuaded that it is only from the exertions of such men (and many such may be found in this country), that we can possibly escape falling into the snares that are laid by designing men to dupe the unwary.

So much has already been written on the relative value of railroads and canals, that the subject is indeed well nigh exhausted; and although little or nothing, it is believed, can be adduced further to strengthen our position, but what has been hundreds of times reiterated from every quarter of the Union, still it cannot be passed by, consistently with the object in view and in justice to the cause we uphold, without a brief notice of some of the characteristics by which these formidable rivals, if such they must be considered, are chiefly governed. That of friction, as it has proved a fruitful source of disputation among theorists, claims particular attention, as the basis on which most of the arguments are founded; and although the experiments from which our information on this important topic is derived have been conducted with the greatest care and precision, the results differ so widely in character, and present so many material opposing points, that the laws established from the conclusions drawn from the one have ever been invalidated by those drawn from the other. It was long looked upon as a fundamental principle, that the *friction of rolling and sliding bodies was the same for all velocities*, and consequently, that any body being acted on by a constant force barely sufficient to overcome its friction, together with the resistance of the atmosphere, would, like a falling body acted on by gravitation, proceed with a motion continually accelerated, and increase beyond any assignable limit. However startling this assertion may have been at its first appearance, it yet found many to countenance its introduction, and claim its admission as a truth deserving unlimited credit. Here was a fine field for speculation; and to this apparent paradox may be traced the fountain head from which has emanated all the enthusiastic hopes and extravagant expectations which have characterized the railroad mania during the last few years. Fortunately, however, for the cause of science, men have been found sufficiently sceptical to question the truth of this absurd position. Morin, satisfied in his own mind, that his predecessors, Vince and Coulomb, had been laboring under the effect of some undefinable error, determined to sift the matter until he discovered the cause. Having prepared an apparatus for this purpose, he varied the velocity from the lowest up to ten feet per second; the rubbing surfaces from some tenths of a square inch to nearly five hundred square inches; and the pressures from ninety to twenty-five hundred pounds. All the experiments made within these limits, and they were repeated many times, agree in character, and prove, what is more consistent with our ideas, and reconcileable with our experience, that the friction of surfaces moving on each other is *entirely independent both of velocity and surface, and proportionable to the pres-*

sure. In this experiment, of course, the opposing resistance of the medium through which the body passes is abstracted.

These practical results were still, however, highly satisfactory, as placing the ability to propel carriage on railroads at a suitable speed, for the more rapid dispatch of business, beyond a doubt; and as showing the striking relative difference in the force requisite to produce the same degree of speed upon canals. But before going further, let us examine a little into the nature of this latter resistance. We find this to be governed by totally different laws: that it increases with the square of the velocity. It is the resistance of the medium through which the body passes, and is occasioned by two causes,—the cohesion of the particles and the inertia of matter. Thus, if a body move through a fluid at different velocities, the resistance will increase with the increased number of particles struck in a given time; which, of course, will be determined by the space run through in that time. If, therefore, a triple number of particles be struck, the resistance will be triple; but it increases further with the force with which the body strikes the particles, and this being proportional will be also at a triple rate, making the whole resistance nine-fold: i. e., partly in the ratio of the velocity, and partly in the duplicate ratio of that velocity.

The only apology offered for these tedious and uninteresting details, is the circumstance of their being addressed to the unenlightened—to those whose occupations may preclude them from bestowing much care and reflection upon subjects of this character. It is a desideratum admitted by all who have the interest of the country at heart, that a correct knowledge of fundamental principles be so generally diffused throughout every class of society, that each and every individual member thereof may be enabled of himself to pass judgment on the relative merits and demerits of the various schemes presented for public approbation; and to detect the fallacies of those whose wilful misrepresentations have so often before led into error. Almost every instance that has occurred where serious injury has resulted from ill-advised and ill-concerted undertakings, has been characterized by a total ignorance of the commonest rules of hydro-dynamics. Many unhappy examples might be adduced to illustrate this observation, but we forbear, in the hope that the experience derived from the past will so regulate the actions of the future as to render their recurrence, unless wilful, next to impossible.

But to return to our subject. It appears from the different nature of these resistances, that the rate of velocity on canals is confined to a very low limit, whereas the rate of that on railroads may be increased to any height that will not prove injurious to the road and carriage. On the other hand, however, it is to be remarked that this very principle, which is harped on as an insuperable objection to the further use of the canal, actually endows it with advantages that are altogether unattainable on railroads. We shall endeavor to explain this in as few words as possible. The relative good effect produced at different velocities, in round numbers, stands very nearly thus: One to three in favor of canals at a velocity of two and a half miles per hour; equal at a velocity of five miles per hour; and one to three in favor of railroads at a velocity of ten miles per hour. Now, reasoning from these premises it can be made to appear that a force of traction on a canal equal to one hundred pounds, will be amply sufficient to move a mass equal to ninety thousand pounds. A horse travelling at the slow rate of two miles per hour can draw with ease thirty-tons in a boat weighing fifteen tons. This gives us at once a proportion of one to nine hundred as the amount of resistance opposed to the motion of a vessel through the water at two miles per hour. Now, reducing this velocity to one mile per

hour, the proportion becomes one to three hundred and sixty; and if to a half a mile per hour, one to fourteen hundred and forty; or, in other words, a traction equal in force to 100 lbs. can thus at that rate draw a mass of the enormous weight of 1,444,000 lbs. This astonishing fact does not only exist in theory, but has actually been proved in practice, upon our own lakes. A single horse has been known to draw, at the rate of one mile per hour, a raft weighing two hundred tons. F.

Farther Illustration of the Principle of Mr. Ericsson's Caloric Engine. [From the London Mechanics' Magazine.]

SIR,—The following remarks, in elucidation of the principle of my Caloric Engine, will, I feel confident, not be unacceptable to your many scientific readers.

To arrive at a clear understanding of the advantage gained by the new mode of employing heat adopted in this engine, it may not be amiss to pause for a moment to consider how heat is at present made use of when employed to actuate that universal instrument of mechanical power, the steam engine. Is it necessary to the effect produced, that the heat should be absorbed or destroyed, or in any way diminished in energy? If this question can be answered in the negative, then it will be quite logical to assume that the power of the steam engine forms but a fraction of that which the combustion of a given quantity of fuel is capable of producing.

Well, then, let us suppose a quantity of steam, of known volume and pressure, to be admitted into a vessel containing cold water of a given weight and temperature; the elevation of temperature which will be produced will, of course, afford an accurate measure of the quantity of heat contained in the steam previous to its condensation. Suppose, now, that an equal volume of steam, of equal pressure, as in the first instance, is admitted under a piston, working in a cylinder, and subjected to a proportionate load; that piston will, of course, move until all the steam has been admitted, and by its motion exert a force proportionate to the pressure of the steam and the volume displaced. Let, then, the steam be discharged from under the piston into the vessel of cold water, under similar circumstances as in the first supposition, and it will be found that the *same* elevation of temperature will take place as when the steam was not previously employed to raise the piston. We thus find that *the production of mechanical force by heat is unaccompanied by any loss of heat.**

But, in the steam engine, this remarkable circumstance is not productive of any advantage, for although nearly all the heat generated in the boiler is unquestionably conducted to the condenser, that heat cannot from thence be brought back to the boiler again for the purpose of raising steam, having in the condensing process been diffused amongst a large quantity of matter, and brought to a much lower temperature than the steam.†

On these grounds the inference seems incontestible, that the steam engine is not constructed on a correct physical principle, inasmuch as it consumes a greater quantity of that precious commodity, fuel, than is neces-

* Losses by radiation need not here be taken into account, for they do not affect the theory.

† Of course, every boiler is fed from the condenser, but this produces a saving of fuel of only one-thirteenth part of the whole quantity consumed: hence thirteen-fourteenths of the heat generated is constantly wasted.

sary for the production of the mechanical force obtained.

It is well known that all fluid substances, the gases particularly, expand very considerably by being exposed to the action of heat, and that, if kept in a state of compression previous to being heated, their expansive force will, at a given temperature, be greater, and that in the same proportion as the increase of density. That an engine might be worked by means of such expansion or dilatation, will be readily admitted by any one reflecting on the subject, without referring to the diagram or sketch of the Caloric Engine, given in a recent number of your Magazine. I will, therefore, not detain your readers by detailing the manner in which the motion is practically produced by the dilatation of the heated medium, but confine myself to the theory of the contrivance, by which a nearly unlimited quantity of the impelling medium, (gaseous or fluid,) may be heated to any required temperature, by the consumption of a small quantity of fuel.*

Let fig. 1 (see the accompanying engraving) represent a furnace having a metal tube, y, conducted through the centre of its flue, to be acted on by the heat in its passage to the chimney; let a pair of bellows be attached to the pipe, y, at A, for the purpose of keeping up a constant current of air through that pipe; and let a thermometer be inserted into it at A, and another thermometer at B. Now, suppose a regular fire to be kept up, and the bellows to be regularly worked so as to blow, say 20 cubic feet of cold air into the pipe y per minute: if it then be found that, whilst the thermometer at A indicates 60°, the thermometer at B will continue to indicate 100°, it follows, as a matter of course, that the heat transmitted

by the furnace per minute will be accurately ascertained by calculating what quantity of heat is required to raise 20 cubic feet of air from 60 up to 100°. Now suppose the same furnace, with its metal tube y, to be represented by fig. 2, but instead of having the bellows attached to the metal tube, suppose them to be attached to a pipe, A C, of infinite length, and let this pipe be inclosed in a casing, X; suppose, further, this casing to be surrounded by a perfect non-conductor of heat, and instead of allowing the hot air to pass off directly, as at B in fig. 1, let it be conducted from the metal tube y, through the pipe D, into the casing X, and pass off at B. Then let thermometers be inserted in the pipes at A, C, D, and B, the bellows being worked at the same speed as before, and an equal fire kept up. At the commencement, the thermometer at A and at C will, of course, both indicate 60°, but the thermometer at C will very soon begin to rise, on account of the heat conveyed into the casing X; but any increase of temperature at C will, of course, cause an increase of temperature at D. This again will still further increase the temperature at C, and so on in continued succession, until the thermometer at D indicates a temperature nearly equal to that of the hot air in the beginning of the flue leading from the furnace: any further increase of temperature, of course, cannot take place. Now, since the quantity, or rather weight, of air forced through the metal tube y is the same as in the first proposition, and the power of the fire likewise, this latter proposition, illustrated by fig. 2, incontrovertibly proves that the temperature to which the air may be brought is made perfectly independent of the quantity of heat generated in the furnace.

But the quantity of air to be heated will also be equally independent of the quantity of heat generated: for suppose that, in the first proposition, the draught be checked so as to diminish the consumption of fuel $\frac{1}{4}$, then the 20 cubic feet of air constantly circulated per minute will be raised about 10°, instead of 40°; but apply the contrivance for bringing the heat back, as illustrated in

fig. 2, and the thermometers at C and D will be affected just as above described, except that more time will be required before the temperature at D is brought to the full height, and that less heat will ultimately escape at B. Thus it may be proved *theoretically*, that any quantity of fluid air or gaseous matter can be heated up to a high temperature, independently of the quantity of heat actually generated for that purpose. Although this is apparently a paradox, it is not so; for by referring to the illustration in figs. 2 and 3, it will at once be seen that the circulating fluid is of a high temperature only when passing the point D, and that it gradually diminishes in temperature as it recedes, and gradually increases as it advances towards that point. However, for the purpose of obtaining mechanical force this is quite as advantageous as if the fluid retained its high temperature when it escapes; for at the point D is the heated fluid admitted into the working cylinder, and from thence passed off into the casing X. The manner in which this is done, your diagram of the Caloric Engine, in a former number, fully explains.

Fig. 3 represents the form of an apparatus used in practice; its operation is precisely the same as in fig. 2, and thermometers placed at A, C, D, and B, will indicate temperatures proving the increase of temperature and transfer of heat in a similar manner. The cold fluid is forced into the furnace through a number of small tubes, Z, and the hot air is passed off through the vessel X, called the regenerator. The currents, both in this vessel and in the tubes, are broken in a peculiar manner, so as to produce a constant intermixture of particles, which is absolutely necessary for effecting a rapid transfer of heat. But to such an extent has this object been attained by the contrivances instituted, that hot air, constantly passed at the rate of 6 feet per second, through a pipe $1\frac{1}{4}$ inch bore, fourteen feet long, and entering at a temperature of 300°, has, by a counter-current of equal magnitude, been brought down to 85°, the counter-current at the same time entering at 72°.

I remain, sir, yours, &c.

J. ERICSSON.

Edward st., Regent's Park, Jan. 7, 1834.

[From the Mechanics' Magazine.]

We have received the following communication from the agent of Mr. Harris, respecting his invention, and on the same day the letter from our friend Archimedes. We have often stated that our columns are open to controversy on scientific subjects, if conducted without personalities, and we cheerfully insert both articles. We hope to receive other letters on the same subject.—[Ed. Mec. Mag.]

Harris' new Patent Twin Steamboat. To the Editor of the Mechanics' Magazine.

SIR,—In requesting the favor of you to give Mr. Harris' communication a place in your columns, I beg leave to say that I am only discharging the duty of an agent, without the remotest wish or desire to injure Mr. Burden.

There has not been a dissenting opinion among all those with whom I have consulted, and shown Harris' plans, and some of them are well qualified to judge, that it is superior to any thing yet discovered for velocity.

His invention admits of many advantages not enumerated in the following letter. Among them are, security of the inner wheels in a heavy sea, double wheels for river navigation, &c. A model of the construction may be seen at

* The journal cited in my last communication having, by some strange oversight, mistaken the Caloric Engine for an "Air Engine," it will be well to direct the attention of your readers to the fact, that various gaseous and even fluid substances, capable of considerable dilatation by heat, are equally applicable for using the heat over and over again, and for the reason that the impelling agent may be varied, while, in every case, caloric is indispensable, has the term Caloric Engine been chosen.

my office, where I invite capitalists and others to come and judge for themselves.

D. MALLORY, Chester's Buildings,
No. 1 Dey street.

D. MALLORY, Esq.:

SIR,—Having for some months past observed in the papers notices of "Burden's Steamboat," and of the very great velocity with which she is expected to move, I was induced to institute a comparison between his construction and one which I invented, and have secured in the patent office at Washington; and the result is, that a boat built on my plan must move with greater velocity.

If I can establish the fact—which is the object of this communication—that a boat constructed on my plan, of equal length, and of as much weight as his, possessing a form calculated to move with less obstruction from the water, and to draw considerably less water than his, it must be manifest that my plan is superior, and must supersede his.

Before entering upon a comparison of the two plans, it is necessary that I should give you an idea of the form of my boat. You have only to imagine a boat *extremely long, very narrow*, with a flat bottom, similar to river steamboats of the present day, and *very sharp*, with *fine tapering extremities*, with the stem and stern posts in a curvilinear shape, and both inclined in opposite directions, as in common vessels; but at a very acute angle with the horizon. You have now only to conceive this boat split into equal parts, longitudinally, from stem to stern, down through the keel, and the two halves placed at any desired distance from each other in parallel lines, but joined above water by timbers and deck in the most substantial manner, and you have my plan.

I will now proceed to prove the superiority of such a construction over Burden's boat.

The lines of the figure marked A, present an end view of one of my twins cut across and *entirely through* at the centre, thereby showing the shape of the timbers or model of the twins, at the centre; the side timber, B, being 8 feet long, that is, that portion of it contained between the side timbers B and D. Within this figure is inscribed a circle of 8 feet diameter, representing an end view of one of Burden's twins, severed across at the centre also.

Now, for a clearer perception of the buoyant properties of the two plans, we will suppose that the above circle represents the circumference of a cylinder 108 feet long, which does not have tapering, pointed extremities, like Burden's, but whose ends are of the same diameter as the centre, viz. 8 feet. We will also suppose the lines of the above figure to represent the depth and width of a fabric 100 feet long also, whose ends shall have the same dimensions (8 by 8) and not pointed, as after my plan.

Bearing in mind these forms, we will assume that the weight of 200 tons are requisite to immerse the circular figure 2½ feet in the water, the surface of which is represented by the water line E.

Now, a simple inspection of the two figures will suffice to show that 200 tons could immerse the black lined figure hardly more than half that depth, because, besides immersing an area equal to the segment F, it would have to immerse also the two areas G and H, which, together, are equal to ⅓, and a little more, of the area F.

The limits of the paper forbid entering into an exact mathematical calculation respecting the draft of each construction, but the foregoing figure and explanations must convince you that my plan is superior in respect of draft, and

we know that the less the draft the greater the velocity, other things being equal.

Now, in regard to "other things," they are not equal—the inequality being in my favor. For, with respect to the heads of my boat, I can model them in a manner superior to that of Burden's, for dividing and gliding over the water.

To perceive another advantage which my mode possesses over his, we will imagine that his deck is removed, and that we, being in the air over his boat, look down upon it. It will of course present the following appearance—the twins being 16 feet apart at the centre C C.

I am told that about ¼th of their length is above and clear of the water at each extremity. Therefore, supposing them to be in motion towards A, we at once perceive that a volume of water at B B, about 21 or 22 feet wide, (the distance between D and D being exact 24 feet,) must of necessity be compressed to a width of 16 feet in its passage at C C, and that the greater the power with which you urge the boat, the greater will be the accumulation of water at B B.

My boat viewed from above would present the following appearance:

on which you can of course perceive that the water in its passage between the twins can meet with no obstruction. The two inner sides at A A can be either perpendicular to the surface or inclined toward each other, shown thus by end views:

In either mode the water passes without obstruction. For certain reasons it is thought that inclined inner sides, as in the under figure, are preferable.

My other advantages are, that I can use the holds of my twins, which Burden cannot do with his; and that I can construct a much stronger fabric, capable of withstanding a heavy sea, which cannot be said of his.

It is well known that twin boats have long been in use before Mr. Burden or I ever thought of our plans. The principal point of superiority in mine over all others is, that I dispense with those great obstacles to rapid motion, the *inside bows*, represented by a a in the annexed view of a common New-York ferry-boat.

They (the two inside bows) although as sharp as the two outside bows, it can be seen at a glance, impede a boat's progress vastly more than the two latter.

The keels of my twin boats being of a curvilinear shape, allow the boat every facility required in steering and turning. Respectfully,

CHARLES HARRIS.

P. S.—I will add that, with a rough model 5 feet long, the whole of which, with all her spars and sails, weighed not 10 pounds, having hoisted her sails on the river in a good sailing breeze, I could hardly catch her in a large boat, steered by myself, and propelled by a large sail and two stout oarsmen. She beat me when I used the sail only. If a little model would do

this, what must be the velocity of a large vessel built upon this plan?

N. B.—The cuts intended to illustrate and explain the inventor's plans are so indifferently executed, that but an imperfect idea can be gained from them.

LANSINGBURGH, March 5, 1834.

To the Editor of the Mechanics' Magazine:

SIR,—I wish, through the medium of the Mechanics' Magazine, to offer a few remarks on a communication which appeared in the "Evening Star for the country," of February 28, signed by a Mr. Charles Harris, announcing his discovery of a plan of a boat which is to put Mr. Burden's boat at least into the back ground, if not into oblivion; of which wonderful discovery, Mr. H. has had the prudence to avail himself and heirs, by securing it at the patent office. I should not think proper to notice the above communication, were it not that there are persons possessing both the means and the disposition to patronize valuable improvements, but who have not sufficient acquaintance with mechanical science to enable them to judge with certainty as to the comparative merits of new inventions, until tested by experience. Such persons are liable to be imposed upon by plausible appearances, or to withhold that patronage from real merit which they would cheerfully give, if they knew where and when to bestow it.

With respect to Mr. H.'s plan of a boat, I have no disposition to question the sincerity of his belief, either as to the value of the discovery, or that he is the "true and original inventor;" but I wish to inform him, for his future benefit, and for the benefit of others, that he is as completely mistaken in one point as in the other; and he could not be more so in either.

With respect to his claim as the inventor, I would inform Mr. H. that Mr. Simon Fairman, now residing in this village, built a boat at Middletown, in Connecticut, in the year 1817, in the months of July and August, in all respects precisely on the plan which Mr. H. now claims as his. This boat, or model of a *steamboat*, was 35 feet long, and as Mr. H. very naturally describes it, was a boat split in two, lengthwise, through the middle, and the two approximate or inner sides were straight and parallel.

As it was not large enough, and indeed not intended for steam, he put in a wheel and prepared it to move by human power. It was exhibited at Middletown for some time, and he then, in the month of September, went down the river with it, and round to New-London, where it excited considerable notice.

The speed, however, was not equal to his expectations. Upon strict examination, he found that the water in the straight passage being thrown back by the wheel, left a hollow towards the stern, which caused backwater. He then took out his wheel and built a false swell of considerable thickness on each of the two straight sides, and the result was a gain in speed, with the same power, from four to six miles per hour. After running it with passengers, a number of trips, between N. London and Norwich, he sold it for \$300 to a gentleman who carried it to Denmarara. So much for the originality of Mr. H.'s invention.

As to the superiority of strength his plan possesses over Mr. Burden's boat, the best way to decide the point is to make a strong iron bound barrel of good oak staves, and fill it with some heavy substance, say pork, for instance; and take the same kind of staves and make a square box to hold the same quantity, and bind it with the same weight of iron, and see which will endure the most violence without injury; or, what will amount to the same thing, prove that angles are stronger than arches.

In the advantage which Mr. H. calculates to gain over Mr. B.'s boat by the straight passage of the water through the centre and consequent removal of the angle of resistance in meeting the water, he will thereby add just as much to

the angle, and of course to the resistance on the outside.

I am not the advocate nor the eulogist of Mr. Burden. I am scarcely known to the gentleman, or he to me. But I should be sorry to see any gentleman deterred from encouraging Mr. B. and perhaps injuring himself thereby, and I should be equally sorry to see Mr. H. throw away his money, or that of any one else, under the mistaken idea that his plan is superior. He is certainly entitled to the satisfaction of trying the experiment, and I shall enjoy the satisfaction of having warned him of its inutility.

ARCHIMEDES.

THE NEW YORK CANALS.—The prosperity of these noble works is of such vital importance to the whole State, and to this city in particular, that we shall stand excused in the eyes of all readers for presenting to them so frequently, facts tending to show the great efforts made and making in Pennsylvania, to cut us out from the trade of the West. It is from these considerations we copy the annexed article from the Pittsburgh Gazette of Wednesday last.

It is at such a time as this, when every nerve is strained to throw us out in the race of competition, that our political managers, instead of applying the accumulation of the Canal fund to the redemption of the Canal debt—so that, it being paid, the tolls might at once be very much reduced—are sporting with it in order to prop up the *Safety Fund system*. The two millions of dollars now belonging to that fund might at this moment be remitted to London, and there employed in the purchase of Canal stocks at a rate, little if any thing above par. Instead of that, it is held by the Commissioners of the fund, just as the public deposits are held by the President, as a fund to be used and transferred at pleasure, to reward this or to punish that Bank, according to the more or less political subserviency of its Directors.

And yet the Legislature and the people submit in silence. We, at least, will do our duty in calling attention to the truth as it is, and then, come what may, we shall be free from reproach.

[From the Pittsburgh Gazette, of March 26.]

THE CANAL AND RAIL ROAD are now in full and successful operation. Goods arrived yesterday, in eleven days from Philadelphia. We believe the calculation is to deliver them in ten days, when the arrangements are all completed.

We have been informed that the New Yorkers have contracted to deliver goods at Portsmouth, on the Ohio, by the way of the New York and Ohio Canal, and Lake Erie, for \$2.61.4 per hundred, when their Canal is opened. By the Pennsylvania Canal, goods will be delivered at Cincinnati for \$2.05. By the 1st day of May, this will probably be reduced to \$1.80.

In the time of transportation, we will possess a still more decided advantage. Merchandise will be delivered from Philadelphia at Cincinnati, in 14 or 15 days. From New York to Cincinnati will require 25 days, and frequently much longer. The risk, by the Lake, is very great—by the Pennsylvania Canal and Railroad, almost nothing.

The New York Canal will not be opened for more than three weeks yet—in that time, steamboats may proceed to St. Louis or Nashville, and return to Pittsburgh; and, at the same time, merchandise may be delivered at the Sault of St. Marie, or Chicago. Our prospects in relation to these great improvements, are truly encouraging, if they are not obscured by the folly and madness of General Jackson.

While on the subject of Canals, we annex the following notice from the Argus of a new bill introduced by Mr. Humphrey into the Assembly, "to provide for the improvement of the Canals of this State."

It authorizes and requires the Canal Commissioners to construct a second set of lift locks, on the Erie Canal, from Albany to Syracuse, and all proper works for the purpose of adapting the canal to the use of double locks. Also authorizes them to construct a feeder from the Niae Mile creek in the town of Camillus, to the Jordan level. Also to reconstruct the Rochester aqueduct. Also to construct a navi-

gable feeder, of a suitable width and depth for steamboats, between the Genesee river and Erie canal, and to improve the navigation of that river. The act to take effect on its passage.

INFLUENCE OF COLOR ON THE ABSORPTION OF HEAT AND OF ODOROUS PRINCIPLES.—On the 20th of June, 1833, a paper was read before the Royal Society, "On the Influence of Color on Heat and Odors," by James Stark, M. D., of Edinburgh; of which the following is an abstract.

The author observes, that the only experiments on record relating to the modifying effect of different colors on the absorption of heat from solar light are those of Franklin and Sir H. Davy. In order to investigate this subject, the author employed pieces of wool, silk, and cotton, which were wrapped round the bulb of a thermometer placed in a glass tube; the tube was then plunged into boiling water, and the time which elapsed during the rise of the thermometer from one given point to another was accurately noted. Other experiments were also made with an air-thermometer, of which the bulb was coated with various colored materials, and heat thrown on the ball by means of polished tin reflectors from an Argand burner. The results accord very nearly with those of Franklin and of Davy; the absorbing power with regard to different colors being nearly uniformly in the order of black, brown, green, red, yellow, and white. The author next investigates the differences which occur in the radiation of heat by differently colored substances; a subject on which he is not aware that any experiments have ever been made previously to his own. The mode of ascertaining the amount of radiation was generally the converse of that by which the absorption of heat had been determined: namely, by exposing the colored substances, in contact with a thermometer, to cooling instead of heating processes. The general result of all his experiments was, that the loss of caloric by radiation follows exactly the same order, with regard to the color of the radiating surface, as its absorption. In the second part of his paper the author gives an account of a course of experiments which he made with a view to discover the influence of color on the absorption of odorous effluvia, and more especially in the case of the absorption of the fumes of camphor and assafoetida by woollen cloth of different colors. Black cloth was always found to be possessed of the greatest absorbing powers, and white of the least; red cloth being intermediate between them. Cottons and silks gave, on trial, precisely the same results, which were further confirmed by the different weights acquired by these substances from the deposition of camphor upon them.—[Proceedings of the Royal Society.]

MIGRATION OF FISHES AND BIRDS.—"I fear I am not entomologist enough to follow the life of the May-fly, but I shall willingly have my attention directed to its habits. Indeed, I have often regretted that sportsmen were not fonder of zoology; they have so many opportunities, which other persons do not possess, of illustrating the origin and qualities of some of the most curious forms of animated nature; the causes and character of the migrations of animals; their relations to each other, and their place and order in the general scheme of the universe. It has always appeared to me, that the two great sources of change of place of animals was the providing of food for themselves, and resting-places and food for their young. The great supposed migrations of herrings from the poles to the temperate zone have appeared to me to be only the approach of successive shoals from deep to shallow water, for the purpose of spawning. The migrations of salmon and trout are evidently for the purpose of depositing their ova, or of finding food after they have spawned. Swallows and bee-eaters decidedly pursue flies over half a continent; the scolopax or snipe tribe, in like manner, search for worms and larvæ,—flying from those coun-

tries where either frost or dryness prevents them from boring,—making generally small flights at a time, and resting on their travels where they find food. And a journey from England to Africa is no more for an animal that can fly, with the wind, one hundred miles in an hour, than a journey for a Londoner to his seat in a distant province. And the migrations of smaller fishes or birds always occasion the migration of larger ones, that prey on them. Thus, the seal follows the salmon, in summer, to the mouths of rivers; the hake follows the herring and pilchard; hawks are seen in great quantities, in the month of May, coming into the east of Europe, after quails and landrails; and locusts are followed by numerous birds, that, fortunately for the agriculturist, make them their prey."—[Sir H. Davy's Salmonia.]

OPPOSITION OF IGNORANCE TO THE USE OF PRINTING.—In the 'Typographical Antiquities' of Ames and Herbert, it is stated that the first book printed on paper manufactured in England came out in 1495 or 1496, from the press of Winkin de Worde. Shakspeare—whose chronology is not to be trusted—makes Jack Cade, in the reign of Henry VI., (who was deposed in 1461,) thus accuse Lord Sands: "Whereas, before, our forefathers had no other books but the *score* and the *tally*, thou hast caused printing to be used, and, contrary to the king, his crown, and dignity, thou hast built a paper-mill." The insurrection of Jack Cade was ostensibly for the redress of grievances amongst the people. Shakspeare fixes the complaint of Cade against printing and paper-making some ten or twenty years earlier than the introduction of printing amongst us; but he could not have better pointed out the ignorance of popular violence,—and all violence is the result of ignorance. The best instruments for producing good government, and equal laws for all men, have been the paper-mill and the printing press; and exactly in proportion as the knowledge which they embody has been diffused, have we advanced, not only in our social arrangements, but in every other manifestation of a prosperous and well ordered community. Whatever remains to be accomplished will go hand-in-hand with the continued diffusion of knowledge.

FANNING MILL.—An ingenious wight, named William Gall, has constructed a pair of self-acting fanners, which, without the aid of man, sift wheat, corn, &c. The simplicity of the invention is astonishing. By a funnel of sheet-iron, the wheat descends upon an iron wheel full of brackets; the wheel is so nicely balanced, that the moment the wheat falls the wheel revolves, and throws the wheat into a pair of fanners on the flat below. On the outside of the iron wheel is a wooden one, and over it is a belt attached to the fly wheel of the fanners, which impels them, and so long as a particle of wheat is left, the machine moves and throws it out.—[Sat. Eve. Post.]

REMOVAL OF A STEEPLE.—The Genoa Gazette contains an account of the removal of a church steeple entire, at Crescentino, in Piedmont, from one point to another, at several yards distance, where it was placed on a new foundation. The master mason was so confident of success that he made his son remain in the steeple ringing the bell during the operation.

GAS IN THE RAILWAY CARRIAGES.—We understand that measures are in progress for the introduction of portable gas for the lighting of the railway carriages. One carriage has been already furnished with this illuminating principle.—[Manchester Advertiser.]

Sir John Herschell has sailed on his astronomical mission to the Cape of Good Hope. He is expected to be absent about three years. He went out in the Catherine Stuart private ship, which has also on board Major-General Sir B. D'Urban and staff.

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

(Continued from page 181.)

OF THE FOOT.—Let us take the arrangement of the bones of the foot, according to the demonstration of the anatomists.

They are divided into the *tarsus*, which is composed of seven bones, reaching from the heel to the middle of the foot. The *metatarsus*, which consists of five long bones laid parallel to each other, and extending from the *tarsus* to the roots of the toes. The bones of the toes are called *phalanges*, from being in the form of a *phalanx*.

There are in all thirty-six bones in the foot; and the first question that naturally arises is, why should there be so many bones? The answer is, In order that there may be so many joints; for the structure of a joint not only permits motion, but bestows elasticity.

A joint, then, consists of the union of two bones, of such a form as to permit the necessary motion, but they are not in contact; each articulating surface is covered with cartilage, to prevent the jar which would result from the contact of the bones. This cartilage is elastic, and the celebrated Dr. Hunter discovered that the elasticity was in consequence of a number of filaments closely compacted, and extending from the surface of the bone, so that each filament is perpendicular to the pressure made upon it. The surface of the articulating cartilage is perfectly smooth, and is lubricated by a fluid called *synovia*, signifying a mucilage, a viscous or thick liquor. This is vulgarly called *joint oil*, but it has no property of oil, although it is better calculated than any oil to lubricate the interior of the joint.

When inflammation comes upon a joint, this fluid is not supplied and the joint is stiff, and the surfaces creak upon one another like a hinge without oil. A delicate membrane extends from bone to bone, confining this lubricating fluid, and forming the boundary of what is termed the cavity of the joint, although, in fact, there is no unoccupied space. External to this capsule* of the joint, there are strong ligaments going from point to point of the bones, and so ordered as to bind them together without preventing their proper motions. From this description of a single joint, we can easily conceive what a spring or elasticity is given to the foot, where thirty-six bones are jointed together.

An elegant author has this very natural remark on the joints: "In considering the joints, there is nothing perhaps which ought to move our gratitude more than the reflection, *how well they wear*. A limb shall swing upon its hinge, or play in its socket, many hundred times in an hour, for sixty years together, without diminution of its agility, which is a long time for any thing to last, for any thing so much worked and exercised as the joints are. This durability I should attribute, in part, to the provision which is made for the preventing of wear and tear: first, by the polish of cartilaginous surfaces; secondly, by the healing lubrication of the mucilage; and in part to that astonishing property of animal constitutions, assimilation, by which, in every portion of the body, let it consist of what it will, substance is restored and waste repaired."—[Paley.]

If the ingenious author's mind had been

professionally called to contemplate this subject, he would have found another explanation. There is no resemblance betwixt the provisions against the wear and tear of machinery and those for the preservation of a living part. As the structure of the parts is originally perfected by the action of the vessels, the function or operation of the part is made the stimulus to those vessels. The cuticle on the hands wears away like a glove; but the pressure stimulates the living surface to force successive layers of skin under that which is wearing, or, as the anatomists call it, *disquamating*, by which they mean that the cuticle does not change at once, but comes off in *squame*, or scales.

The teeth are subject to pressure in chewing or masticating, and they would by this action have been driven deeper in the jaw, and rendered useless, had there not been a provision against this mechanical effect. This provision is a disposition to grow, or rather to shoot out of their sockets; and this disposition to project, balances the pressure which they sustain; and when one tooth is lost, its opposite rises, and is in danger of being lost also, for want of that very opposition.

The most obvious proof of contrivance is the junction of the foot to the bones of the leg at the ankle joint. The two bones of the leg, called the *tibia* and the *fibula*, receive the great articulating bone of the foot (the *astragalus*) betwixt them. And the extremities of these bones of the leg project so as to form the outer and inner ankle. Now, when we step forward, and whilst the foot is raised, it rolls easily upon the ends of these bones, so that the toe may be directed according to the inequalities of the ground we are to tread upon; but when the foot is planted, and the body is carried forward perpendicularly over the foot, the joint of the leg and foot becomes fixed, and we have a steady base to rest upon. We next observe that, in walking, the heel first touches the

Fig. 11

ground. If the bones of the leg were perpendicular over the part which first touches the ground, we should come down with a sudden jolt, instead of which we descend in a semi-circle, the centre of which is the point of the heel.

And when the toes have come to the ground, we are far from losing the advantages of the structure of the foot, since we stand upon an elastic arch, the hinder extremity of which is the heel, and the anterior the balls of the toes. A finely formed foot should be high in the instep. The walk of opera dancers is neither natural nor beautiful; but the surprising exercises which they perform give to the joints of the foot a freedom of motion almost like that of the hand. We have seen the dancers in their morning exercises stand for twenty minutes on the extremities of their toes, after which the effort is to bend the inner ankle down to the floor, in preparation for the Bolero step. By such unnatural postures and exercises the foot is made unfit for walking, as may be observed in any

of the retired dancers and old *figurantes*. By standing so much upon the toes, the human foot is converted to something more resembling that of a quadruped, where the heel never reaches the ground, and where the paw is nothing more than the phalanges of the toes. This arch of the foot, from the

Fig. 12.

heel to the toe, has the *astragalus*, A, resembling the key-stone of an arch; but, instead of being fixed, as in masonry, it plays freely betwixt two bones, and from these two bones, B and C, a strong elastic ligament is extended, on which the bone A rests, sinking or rising as the weight of the body bears upon it, or is taken off, and this it is enabled to do by the action of the ligament which runs under it.

This is the same elastic ligament which runs extensively along the back of the horse's hind leg and foot, and gives the fine spring to it, but which is sometimes ruptured by the exertion of the animal in a leap, producing irrecoverable lameness.

Having understood that the arch of the foot is perfect from the heel to the toe, we have next to observe that there is an arch from side to side; for when a traverse section is made of the bones of the foot, the exposed surface presents a perfect arch of wedges, regularly formed like the stones of an arch in masonry. If we look down upon the bones of the foot, we shall see that they form a complete circle horizontally, leaving a space in their centre. These bones thus form three different arches—forward, across, and horizontally; they are wedged together, and bound by ligaments, and this is what we alluded to when we said that the foundations of the Eddystone were not laid on a better principle; but our admiration is more excited in observing that the bones of the foot are not only wedged together, like the courses of stone for resistance, but that solidity is combined with elasticity and lightness.

Notwithstanding the mobility of the foot in some positions, yet, when the weight of the body bears directly over it, it becomes immovable, and the bones of the leg must be fractured before the foot yields.

Smoky Chimneys. By COMFORT. To the Editor of the Mechanics' Magazine.

In the number of your periodical for January, there is an article headed "smoky chimneys," accompanied by rules for their cure, condensed from the works of Count Rumford.

*It may be observed that the improvement in fire-places was proposed by Count Rumford with a view to economy in the article of fuel, and the suffusion through rooms of an increased quantity of heat from any given quantity of fuel. The Count, indeed, observes, that his plan of a fire-place will often act as a cure to smoky chimneys, but his chief object was economy in fuel, and his experiments had this as their chief, if not their sole object.

The result of his studies, scientific and operative, led to the conclusion, in his mind, that four inches is the proper width for the

* From *capsula*, a little case or box.

throat of chimneys, and this will probably be found applicable to as many, or to more cases, than any other, which, as a general standard, could be adopted. It will not, however, be equally applicable to all cases, nor will any general rule, in this respect, apply universally.

The proper width of the throat of a chimney is the least which will admit all the smoke, together with the quantity of rarified air necessary to aid its escape through the chimney. This must be regulated by circumstances, and chiefly by the material of the fuel. Anthracite coal, producing little smoke, would require a throat even narrower than four inches. Coal, of the quality of the Sydney, producing a large volume of smoke, might perhaps require a width of throat exceeding four inches.

The reasonableness of thus narrowing the throat of the chimney for the purpose of yielding an increased heat to the room, will, upon the least reflection, be sufficiently obvious. The smoke, if not impeded by some obstruction, will naturally ascend through the chimney; the heat of the fire, from its affinity to smoke, will ascend with it. Should the volume of air constantly rushing into the room find an over-easy passage through the chimney, the entire, or very nearly the entire, of the heat will escape with it; hence the fact, that persons sitting in a room, in presence of a large fire, often suffer from cold, and even in a degree greater than they would were there neither fire nor fire-place in the room.

A chimney may, however, be so narrow in some part of it, or throughout the whole, that it will not admit all the smoke, a part of which will, in such case, in search of a new channel of escape, make its way into the room. A similar effect will be produced when the chimney is so injudiciously constructed that the smoke cannot escape through it with the required ease and rapidity. A chimney may be so placed in relation to another chimney within the same building, as to cause it to smoke. These different causes of smoky chimneys may require very different remedies. Count Rumford's plan of narrowing the throat of a chimney will often effect a cure, but surely not universally. I propose herein to offer a remedy, which, although not proposed as an universal panacea, will, it is presumed, effect a cure in the majority of cases of smoky chimneys.

It is generally known that by lowering the mantle-piece the draft is increased, and the smoky chimney thus partially or fully cured; but it is also known that this mode will, by increasing the draft, lessen the quantity of heat in the room, and that warmth is in this way dispensed with, to avoid the annoyance of smoke. A plan which would yield the advantage of a lowered mantle without its disadvantages would be a desideratum. This is, perhaps, not to the full desirable extent practicable; it is certainly practicable to a considerable extent. It may be introduced in aid of the Count's plan, where that fails, as a remedy for smoky chimneys, or it may be adopted in cases where mere economy is not an object, or where it would be inconvenient to resort to the Count's plan.

On reference to the cut No. 2, in your Magazine of January, it will be seen, that in order to reduce the throat of the chimney, there is a false back. This is made of solid work, and is extended about six inches above

the breast of the chimney, where the width of four inches is acquired, and is that part distinguished as the *throat*. We may suppose this false back to be in thickness equal to the length of a common brick, say eight inches. If made of the breadth of a brick, there would be a vacant space of four inches between the false and the real back. By turning an arch in the false back, or by an aperture of any other shape, there might be left an opening for the admission of smoke and air into the vacant space between the

A, chimney-piece—B, false back—C, aperture.

backs. This would produce all the effect of a lowered mantle, without producing all the inconvenience. The portion of inconvenience which it might produce would be entirely provided against by a metal casting fitted to the arch-way, and supplied with a door, to be closed or opened as occasion might require.

This contrivance would most probably relieve the occupants of houses, in nine cases out of ten, from the annoyance of smoky chimneys, and from the heavy charges of the chimney doctor.

COMFORT.

METHOD OF DRESSING SKINS PRACTISED IN MAROCCO.—The following account of the method practised in dressing skins in Morocco was transmitted to the Zoological Society by W. Willshire, Esq., a Corresponding Member of that Society, in a letter dated Mogadore, May 5, 1833. Its results are stated to be excellent, as regards the preservation and color of the fur, and the flexibility of the pelt.

Wash the skin in fresh water to deprive it of the salt; as soon as this is done, scrape the flesh off, when take two pounds of alum, one quart of buttermilk, and two or three handfuls of barley-meal, which mix well together, and lay on the fleshy side of the skin equally; fold up and press it together carefully, and let it lie two days. On the third day take it to the sea-side, wash the skin well, and when clean and free from mixture, hang it up to let the water run from it: then take two pounds of alum finely powdered, and throw or spread it equally on all parts of the skin; again fold up as before, and allow it to lie three days, when it will be in a proper state to dry in the sun, laid flat, without taking away the powder. When it is dry, take a pint or two of fresh water, and sprinkle it upon the skin, and again fold it up carefully for about two hours, to imbibe the water; then lay it on a table, and, after scraping it free from the mixture and flesh, take a sand-stone (rather rough) and rub the skin well until it becomes soft and pliable, then hang it in the shade to dry. The process is then complete.

When the skin is perfect, having the head, horns, &c. take off the horns, and fill their cavity with a mixture of equal parts of powdered alum and ashes of charcoal dissolved in water, and expose them two days to the sun. Saturate the trunks of the horns with eight ounces of alum dissolved in water, and fold up with the skin, and apply the same on each occasion when employed in curing the skin. The flesh on the head and jaws to be carefully taken

off, filling the same with powdered alum. It should remain in the sun until perfectly dry.

In addition to the foregoing description of the mode used in Morocco, in dressing skins, as related by the persons employed by Mr. Willshire, it may be well to observe that the process does not take so long at Mogadore, as Mr. W. has often received back skins of the Aoudad and Leopard from the dresser, on the third or fourth, and never exceeding the fifth day, perfectly cured. Allowance has been made by the dresser, in the foregoing description, for the difference in the climate of London.

The skins of smaller animals must not be subjected to so lengthened a process, or they will become harsh, and the pelt impoverished. —[Proceedings Zoolog. Soc.]

RECIPES.—*For an Olive Green.* Let the article be first washed in soap and water, then wetted out in warm water; then boil two ounces of chipped logwood and three ounces of chipped fustic together for half an hour; dip out your dye liquor, and put it into a pan with hot water; put in your goods; dissolve two drachms of verdigris in a teacup-full of warm water, which put into a pan of cold water; take your gown from the dye, and run it through the verdigris water, well handling it for ten minutes; take it out and wash it in clean water, and through the dye liquor, and again in the verdigris water, and so continue this process till you obtain the color required, only taking care to wash it out of the verdigris water before you put it in the dye liquor: dry it in the shade.

For Yellow Cotton.—To make a lemon yellow, first wash your article well in soap and water, then rinse it in warm water. For every yard of stout cotton, dissolve a piece of blue vitriol as large as a horse bean, in boiling water; and when the water is at a hand-heat, put the cotton in, and handle it for half an hour. In the interim take a quarter of a pound of weld for every yard of cotton, and boil it well for half an hour; dip the liquor out in a pan, and handle your cotton through this till it comes to the fullness required; take it out to cool, and when cold, wash it out, and dry it in the air.

TO PRESERVE BOOKS.—A few drops of any perfumed oil will secure libraries from the consuming effects of mould and damp. Russian leather, which is perfumed with the tar of the birch tree, never moulders; and merchants suffer large bales of this leather to remain in the London docks, knowing that it cannot sustain any injury from damp. This manner of preserving books with perfumed oil was known to the ancients. The Romans used oil of cedar to preserve valuable MSS. Hence the expression used by Horace, "*Digna cedro*," meaning any work worthy of being anointed with cedar oil, or, in other words, worthy of being preserved and remembered.—[Greenf. Gaz.]

TO PRESERVE EGGS.—Apply with a brush a solution of gum-arabic to the shells, or immerse the eggs therein; let them dry, and afterwards pack them in dry charcoal dust. This prevents their being affected by any alterations of temperature.

TO MAKE MAPLE SUGAR.—It has been customary to cut a gash in the tree, from which saccharine liquor flows, or to bore a hole, and put in a reed, and, when the liquor ceases to flow, plugging up the hole. Both these methods are injurious, and tend to destroy the tree. In the latter case, the tree roots round the plug to some distance within. The following method is proposed in lieu of these, and has been successfully practised in Kentucky. At the proper season for running of the liquor, open the ground and select a tender root, about the size of one or two fingers; cut off the end, and raise the root sufficiently out of the ground to turn the cut end into the receiver. It will emit the liquor from the wound as freely as by either of the other methods. When it ceases to flow bury the roots again, and the tree will not be hurt.

The Philosopher of Bologna unmasked; or Galvani not the Discoverer of Galvanism.
By R. W. DICKINSON. [From the London Mechanics' Magazine.]

SIR,—It appears to me very singular that no notice should ever have been taken of an experiment made by M. Du Verney, before the Fellows of the Royal Academy at Paris, in the year 1700, and published by their secretary, the celebrated M. Fontenelle, in his Account of the Transactions of the Society for that year. It is there related that M. Du Verney exhibited a dead frog, and on irritating it *with a scalpel* the nerves of the belly, that led to the thighs and legs, trembled and suffered a sort of convulsion. He afterwards cut the nerves in the belly, and stretching them with his hands, a similar convulsion was produced by the *application of the scalpel*. Now, though it may at this distance of time be impossible to adduce positive proof that Galvani was acquainted with this previous experiment of M. Du Verney, I cannot help thinking that it is *quite as likely* he was so, as that he should have come to a knowledge of the fact in the strange way he pretended, namely, through one of his pupils accidentally touching *with a scalpel* the crural nerve of a frog, which was being prepared in the laboratory of the professor, to make a soup for his sick wife. That a *frog* should have been the animal operated upon in both instances, and a *scalpel* the operating instrument, are coincidences pregnant with suspicion. At all events, this much cannot be disputed, that the Bolognese philosopher did at least only discover what Verney had discovered and made known to the world long before; though there is now, probably, as little chance of our seeing the name of *Vernicism* substituted for *Galvanism*, as *Columbia* for *America*.

I am, sir, yours sincerely,

R. W. DICKINSON.

Ilfracombe, Dec. 16, 1833.

AGRICULTURE, &c.

[From the New York Farmer.]

Suggestions relative to Farmers' Work for April. By the EDITOR.

We are under the impression that it would be policy for farmers to sow and plant as largely of the marketable crops, as they would have done had not those public measures been taken which have been so disastrous in their overthrow of confidence or credit. We hardly conceive it possible that Congress will adjourn without adopting some plan that will give to confidence its potency, and thus remove the weight from the elastic spirit of this young and rising nation. If law once more assumes its appropriate influence and its healthful tone, before the energies of the people become sensibly enervated, life and vigor will again pervade the whole system; the rivulets that every where vein our country will be free from their icy fetters, and again swell the streams of prosperity and wealth, carrying down to the cities of the sea the abundant and full-priced harvests. But should derangement stalk abroad over the land until mid-summer, then vain will be all hopes in a joyful harvest for this season. The condition of foreign nations is such that no material stimulus will be given to sales of American produce. Our chief dependence is on prosperity at home.

Ploughing.—Various opinions are given

in respect to the depth of ploughing. As a general rule, we believe the most successful farmers plough no deeper than the soil, or rather the turf, extends. This soil is not generally more than two to four inches; consequently if the plough runs five or six inches deep, the soil, or fertilizing portion of the furrow must become so very much diffused that the plants, particularly when young, will not find sufficient nourishment. This being the case, it would seem that the direction so generally given to plough a sandy loam deep, should also depend on the depth of the manured portion of the soil. The best farmers of the present day direct the utmost pains to be taken to turn the sod so completely that it will all ferment. This is done most effectually by one ploughing only, and some, to keep the sod from being in the least turned up by hoeing and ploughing the corn, pass a roller over, and then harrow the field before planting. On

Oxen.—It is very common, with even good farmers, to keep their working oxen in very thin flesh. This is bad policy; they cannot perform as much nor as heavy work; are not so capable of being substitutes for horses, nor will they last as many years; are fattened for the butcher with greater expense and in longer time. The extra expense in keeping working oxen in good condition does not probably exceed in a whole season the additional work they could thereby do in one month. And when we consider that they consume less food in fattening, and can be moderately worked all the time they are preparing for the butcher, it will be seen that there is economy in keeping a good portion of flesh always on them. Many people are under the impression that oxen in flesh cannot move as fast, nor undergo as much fatigue as they can when they are not much more than skin and bones. This is true with oxen that are well fed and *unaccustomed to labor*; but not otherwise, as many farmers can testify, and as correct reasoning would conclude.

Corn.—In communications from farmers we find that some varieties of corn will yield five pecks of shelled from two bushels of ears, and others but little, if any, more than four pecks. This seems to depend very much on the smallness of the cob. In planting corn, it is recommended to put six to eight kernels in a hill, and then to pull up at the first hoeing all but four of the most healthy spears. See page 98 and 109.

To prevent birds and fowls from scratching up the corn, the seed is covered with tar and wood ashes; and various other methods are adopted, but none that we are acquainted with have any decided advantages.

Skinless Oats.—This kind of oats begins to be considerably cultivated. As yet the seed commands a pretty high price, yet it is advisable, for every farmer who can, to procure at least a few quarts.

Flesh-colored Clover.—It would be well for farmers to furnish themselves with a few pounds, or even a few ounces of this seed, in order to test its merits. It may be of great benefit. See page 10.

Botts in Horses.—This is the season in which these worms are injurious to horses. Horses that have their food frequently seasoned with salt are said to be less liable to injury from them. Since botts seem to be fond of sweet liquids, it may be an advisable precaution to administer molasses with their food.

THE CHINESE MULBERRY.—We should advise every farmer to obtain at least one of the *Morus multicaulis*. It will not cost more than fifty cents; and by taking cuttings, or by laying, he may next spring have some ten or twenty plants.

GRAPE VINES.—Let that farmer who has not a good grape vine about his house, mount his horse and go a journey of some 10, 50, or 100 miles, to obtain an *Isabella*, *Catawba*, or some other choice native vine. It should make a farmer blush, in these days, to be compelled to say he has no vine to sit under. It implies that he is slow in availing himself of the proffered blessings of Providence—that he cannot think much of adding to the comforts and pleasures of his wife and children.

GRASS SEEDS.—It is very probable that the farmers of this country, in confining their attention exclusively to clover and timothy, do not realize as much hay and pasture as they would from a greater variety sown in the same field. In England the quantity sown to the acre for mowing is ten pounds of red clover, two of white do., two of yellow do., and one bushel of annual rye grass. For pasture, four of red clover, six of white do., four of yellow do., and one bushel of perennial rye grass. In this country grass seed is generally sown not later than the 15th of April.

YOUNG TURKIES.—No kind of domestic fowl sell better than fine turkeys; and yet comparatively few are raised in proportion to the numbers hatched. It is recommended to keep them from wet, and to feed them on homony and chopped onions. See page 13.

Forcing Asparagus. By EDWARD SAYRES. [For the New-York Farmer and American Gardener's Magazine.]

MR. FLEET.—After visiting your market at New-York, I am rather surprised at the little attention paid to forcing that useful vegetable the Asparagus, which I deem one of the first importance to the market gardener. The mode of forcing being simple, and the produce generally satisfactory, I trust a few practical remarks on the subject will be acceptable to some of your readers.

As soon as the frost is out of the ground, let a very moderate hot-bed be made, of any convenient size, with hot horse manure; the frame being placed on it in the usual manner, cover the bed three inches thick with earth, whereon the asparagus roots are to be placed, taken from an old bed or nursery rows three or four years old. The roots will require no trimming, but merely placed as thick as possible in the bed, so that the crowns are not placed on one another. This done, they are to be covered three inches with light soil or tanner's bark, when the sashes may be closed to draw the heat; but care must be taken not to let the lights remain on a day after the heat begins to rise, when six or eight inches more of light earth may be covered over the bed. The treatment is simply to give plenty of air in the day, and moderately covering the frame at night; to keep out the frost is sufficient. After the bed has been planted ten or twelve days, the roots will begin to vegetate, when a good watering is to be given every other day; and in three weeks after the time of planting, a good supply of asparagus will appear, and continue, if properly managed from 12 to 15 days.

EDWARD SAYRES.

Hyde Park, March 25, 1834.

Cultivation of Tares and Swedish Turnips.
By S. HAWES. To the Editor of the New-York Farmer.

MR. FLEET,—Having grown during the past season some tares and Swedish turnips, favorite crops with English farmers, I venture to send you some account of the culture and produce of both. About an acre of land in good condition, not having been recently cropped, was ploughed once, harrowed, and then sown with three bushels of spring tares and half a bushel of oats on the 1st of May last. I had not the seed early enough, or the tares should have been sown by the middle of April.

They grew most vigorously, and by the end of June were in flower, producing quite as much herbage as I ever saw them produce in England—indeed abundant; more than twice as much as any clover I had growing at the same time. From the time they were in flower they were cut as wanted, and given to horses, cattle, and pigs, all which ate them readily. Yet I did not think the stock did as well upon them as in England, possibly from the mode of their growth, which, either owing to the soil or climate, was different to what I had before seen. These went on growing freely after the pods were formed, though, commonly, when pods are formed, the whole strength of the plant is directed to perfect the seed, and the stalks soon cease to grow. They grew till the first week in September, when all were cut down, cured, and stacked. The haum or straw was abundant, and is excellent food for sheep. The seed a poor crop, as from half an acre I had only five bushels, which, even allowing for much waste by fowls whilst growing, was too little, as half an acre ought to produce at least fifteen bushels. I intend to sow an acre with them this spring, and hope they may yield better.

For Swedish turnips I had five acres of land, a good sandy loam, ploughed and harrowed repeatedly till clean, then manured with about twelve good two-horse loads of half rotten manure per acre, which was ploughed in, and the turnips sown at different times, from the 15th of June to the 6th of July.

The seed was drilled on the flat surface 22 inches from row to row, and on the 6th of July we began to hoe out those drilled the 15th of June. But those drilled on the 6th of July we began to hoe on the 20th, being only 14 days from the time of sowing. In England I do not recollect any fit for the hoe in less than three weeks; but here vegetation is more rapid, both of turnips and weeds. In hoeing they were left about ten or twelve inches from plant to plant in the rows. They were hoed again in twelve or fourteen days, and afterwards a third time.

The plants soon covered the ground, the tops meeting, and the crop was an excellent one, equal to any I ever had in England. Part of the ground, which was low and not well drained, produced large turnips, but not so sound or sweet as those grown on high ground in the same field.

The whole were pulled early in November and thrown in heaps, then the tops were cut off and thrown to cattle, the turnips carted home and thrown into piles about 6 or 7 feet wide at the bottom, and gradually coming to a point, which was about 5 feet from the ground. Mould a foot thick was thrown over them, leaving at every 8 or 10 feet a

small hole to allow the warm moist vapor to escape, which always arises from the slight fermentation that takes place. No straw was used. The piles have been opened as wanted for use, closing the aperture with an old door and some litter for the time, and we have lost none. Fifteen or sixteen loads were put into an old ice-house for a few weeks, but the stock did not eat them so readily as those which came out of the piles. I doubt whether any cellar will keep roots so well or so sweet as earth alone. The crop was excellent, both in quantity and quality, but no account was kept, even of the number of loads, yet there must have been more than three thousand bushels. Cattle from the first were extremely fond of them; a lot of native wethers were a long time in learning to eat them, but at length did well upon them. My own South-down ewes having been fed on them, had abundance of milk in January, and thus my early lambs will go to grass in good condition. Pigs, old and young, are fond of them, and they need no cooking. In England many store pigs are kept on scraps and bits of Swedish turnips left by cattle.

Of the expense I can give no account, nor have I much faith in such accounts generally. The preparation of the ground, and the sowing, were interrupted by repeated rains, so in pulling them up the men were repeatedly stopped by frost, and had to get them secured as they best could. The culture of tares is nothing, but hoeing turnips is expensive, yet more and better food is yielded by turnips than by any other crop on this loam. On strong soils mangold wurzel would be a better crop, as such soils seldom grow good turnips; but beet, to do well, should be sown in May, and is very liable to be hurt by early frost. Swedish turnips are not injured by even severe frosts, if used quickly after; but freezing and thawing will spoil them.

Yours respectfully,

S. HAWES.

Albany, March 11, 1834.

Mr. Nutt's System of Bee Management. [From a Friend of this distinguished Apiarian.]

It is one of the least interesting pleasures of an editor's duty to record the successful achievement of designs to which he has devoted his helping hand, to place in successful practice and deserved estimation the efforts of inventive genius, to whatever part of the wide fields of research its attention may have been devoted; and multifarious as are the objects which address themselves to his attention, in his varied capacity, as treasurer of scientific improvement and discovery, or dispenser of their benefits, it is ever a source of gratification that those exertions have been requited with merited success.

Since the first promulgation of Mr. Nutt's views, the *Mechanics' Magazine* has been the vehicle for the publication of his plans, and the furtherance of his designs. That they were possessed of originality and merit was evident, by their requiring neither sophistry nor mystery to impress them on public attention, for they claimed regard more from their simplicity than the extension at which they aimed. The pages of this Journal were alike open to the results of his patient investigation and research, as well as the queries of his opponents, and we are confident that, even to those proficient in ordinary modes of Bee Management, or who adhered with per-

tinacity to their usual modes, much good was elicited.

To the *Mechanics' Magazine* Mr. Nutt returns his obligations for the impetus which, through its medium, has been given to his system, the remuneration which he has received for his labors, and the great and extended success which has in every instance attended its introduction.

The system has now become one of facts, which are now sufficiently numerous, not to prove its superiority over all others which have preceded it, but to render its introduction a matter of important, national, economical consideration. To recapitulate individual instances of its success were only to refer to what has been extensively published in this journal. The superiority of the honey and its chemical characters are based upon the same foundation, and we therefore feel that in taking leave of the subject as a theory, or its success as merely problematical, by placing it upon permanent record, it will only be necessary to give such instances of its established success, as will at once silence the objections of rivalry. An inspection of the exhibition of the varied collections this season, at the National Gallery of Practical Science, in Adelaide street, where it has stood the test of the strictest examination, and has been the subject of much attention and inquiry, will sufficiently prove the correctness of this observation. The results of Mr. Nutt's takings, during the present year, from six colonies, has been seven hundred pounds of honey, averaging from one hundred to one hundred and twenty pounds from each hive; nor has he been alone in these marked proofs of success, as a reference may be made to the Apiaries of the Marquis of Blandford, Delabere House, near Reading; Rev. Thomas Clark, Gedney Hill; John Burman, Esq., Wisbech; and J. D. Salmon, Esq., Stoke Ferry, Norfolk, where the average products have been the same.

LIME AS A MANURE.—"Lime," observes Mr. Lambert in his excellent work on Ireland, "is peculiarly adapted to land full of weeds and roots, as it decomposes such."—"It is a better manure for wheat probably than any other crop; and the quality of wheat grown on land where it is applied is much improved, having a thinner skin, a better color, and yielding more flour."—"It may be freely applied to land devoid of much calcareous matter."

Lime should, as much as possible, be kept to the surface-soil; it readily sinks if ploughed in too deep. Though I have mentioned what many may think very heavy dressings of this manure, yet I have known good effects produced from a far lighter quantity; and I should say, it is safer to begin with a moderate dressing, which can always be increased if found necessary, than to over-dose at first. It is essential that the lime should be well slaked, and in a powdery state before spreading. To this end, if the weather chance to be dry, cover up the heaps with mould for a day or two, they will open as fine as if water-slaked.

PLANTING A VINE.—Every proprietor of a house in this city should plant one or more vines in the yard. By so doing he will add, in four or five years, at least ten dollars to his rent. Most people would be induced to give an additional sum in the rent of a house, in the yard of which there is a fine bearing grape vine. The *Isabella* is so certain in its growth, and in its bearing, and so cheap too, that no landholder need be disappointed in realizing the fruit of his labor and expense.

NEW-YORK AMERICAN.

MARCH 29—APRIL 4, 1834.

LITERARY NOTICES.

No. XIX.

Banks of the Au Sable, Jan. 15.

It was about eight o'clock, and a bright cold morning, when a handsome four horse stage coach, built in New York, and placed with more liberality than judgment on a route where a broad tired, low hung and light wagon would be much more appropriate,—drove up to my quarters at Chicago; and having received my luggage, crossed the river on the ice, and was a few moments after travelling through the deep snow over the Grand Prairie. My fellow passengers were, a respectable middle aged female and a smartly dressed young man of amiable appearance, whose handsome broadcloth suit worn as a travelling dress, bespoke the favored beau of some country village, or possibly a thriving young clerk from the city, engaged upon some agency business, and travelling in the style which he thought would best comport with the dignity of his employers. The driver was also accompanied on the box by a well made young half blood Chippeway of about five and twenty, who had come down from Mackinaw to seek employment, and was now going further South for the same object. The air being rather sharp on the Prairie, the lady took her seat between the young gentleman and myself, and thus wedged in together, we contrived to keep very comfortable—though our near neighborhood did not render us more communicative than people generally are after an early breakfast. We merely exchanged the ordinary common places which custom exacts from people thus thrown together; and then, unless when a wolf passing near our track, or a particularly large pack of grouse rising before us, called forth some exclamation, but few words were spoken by any of the company. At length, after having counted six wolves within twice as many miles, we approached a grove of timber, where while the trees grew quite densely in the centre, a few thin rows shot out like a reef of rocks from the shadowy island far into the Prairie. Here on the edge of a deep gully, through which winds the river Au Plain, was the log tavern at which the first stage of our day's journey, being 12 miles, concluded.—The horses were in a complete foam with their exertions in getting through the deep snow drifts across the prairie, and I easily persuaded the driver to abandon the comfortable but cumbersome vehicle which had brought us so far, and hitch his smoking team, which had still 12 miles to go, to a rough but strongly built sled before the door. My fellow passengers approved the arrangement, and subsequent events proved it a very fortunate one, for so deep was the snow on many parts of the road afterwards traversed, that it would have been impracticable to get a wheel carriage along, and it must have been deserted on the prairie. There was much to do however about our new equipage, before we could get started; and while our driver looked after his horses, one of the passengers had to shovel the snow out of the sleigh, another to drive a pin through the tongue, in order to fasten on the leaders, and a third, after filling the bottom with hay, to adjust the baggage, &c. &c. All this, with the aid of the stout Chippeway and the active young eastern traveller, was soon effected; and the former taking his seat with the driver on a board in front, while the latter shared half of my buffalo skins, and stowed himself upon the hay with me in the rear, Madame was well accommodated, with the cushions taken from the stage, on a trunk placed in the middle; and some heated stones being brought from the house and placed beneath her feet just as we started, no grandmother could sit more comfortably in her cushioned pew in old Trinity. A fast drive of 12 miles brought us at noon to another island of timber, where a little piquant girl of 16, with aloe black eyes and glossy locks as dark as night, arranged a plain but neat meal for us, and gave a relish to the entertainment by losing one of the most vivacious tongues I had heard wag in the last three months. Here we changed horses, and a ride of 16 miles more brought

us about nightfall to a place called "Walker's Grave," where two or three log huts were sheltered from the north wind under an island of tall timber, and in one of which we have established ourselves for the night. A pile of bur oak, which makes a capital fire, flames up the enormous wooden chimney before me, and a number of stout yeomen around it, engaged in discussing the price of horses on the Wabash, prevent me, while handling a matter of such moment, from enlarging more upon the few objects of interest which have presented themselves to-day.

Ottawa, January 16.

I was hardly dressed this morning, when my only remaining fellow-traveller—the lady and the half-blood having parted company last evening—called me to the door to "see the cloud of prairie hens before it." I looked out, and there indeed, true enough, the oaks within gun shot of the porch were so loaded with grouse, that they showed more like a flock of pigeons than a covey of game birds. Having broken my gun, however, it was intolerably vexatious to see such capital shots thrown away, while these fine birds in those districts where I was prepared to bag them, were too wild to approach within shooting distance at all. The sleigh soon after came to the door, our driver having diminished his team by two horses, to meet, probably, the reduction of passengers already mentioned, and about a hundred yards from the house, we crossed a broad brook, known as the Au Sable River, and commenced ascending the bank beyond. But the snow was deep, and the heavy drift, having had its surface frozen over during the preceding night, our single span were unable to drag through it the clumsy sledge behind them. They plunged in up to their chests—"Go ahead, Sam!—gie up, Major!" shouted the driver—but Sam was thoroughly stuck fast, while the Major, in trying to sustain his military character by obeying orders, gave one spring, and floundering over the traces, was buried in the snow up to his crupper, and placed, *nolens volens*, in full as quiescent a condition as the already settled Sam. For all of us to get out and take hold of the bits, was the next move—but it would not do. Sam, indeed, seemed a little inclined to make a retrograde movement, by kicking out the foot-board with his heels; while the Major, having gathered new energy for another charge wasted his fire in lifting up his knees as high as his mouth, and ineffectually throwing his fore hoofs in advance on the crustated snow, handling his feet the while much after the manner of the rampant unicorn on a calico stamp, who, unmindful of the motteed garter he treads under his foot, so bravely paws the crown which the complaisant lion is pushing towards him. The driver at last became convinced of the necessity of returning for another pair of horses; and a young colt, called Blackhawk, with a hoary old plough-horse named Judge, were, after a little delay, procured and placed in advance of Sam and the Major on the top of the bank. Poor Sam seemed to dislike having the Judge's fetlocks brought so immediately in contact with his nose, they being nearly on a horizontal line—and he was accordingly inclined to retreat upon his haunches beneath which the snow formed so easy a cushion; but a single crack from the driver's whip sent the Major charging so vigorously upon Blackhawk, that the sable young chief gave a bound which carried us through the difficulty in a trice, and sent our vehicle skimming fast over the prairie. The grove in which we had passed the night soon vanished from sight, and a boundless expanse of snow-covered surface lay like an ocean before us. The arch of the clear blue sky seemed to spring at once from the silvered earth, which shone under the bright January sun with an intensity almost painful to the eye. The blue vault above, and the white plain below, were the only objects that met its glances, as they roamed for miles around: yet no one could complain of sameness in the tints of a picture so vast, a scene so illimitable. The immensity of the prospect seemed to exclude the idea of monotony, and perfect solitude was only wanting in such a scene to make one feel its grandeur. The lively rattle of my companion, however, whose society, after travelling so long entirely alone, I found no slight acquisition, prevented me from realizing its full effect; and when, after riding for about twelve miles, an island of timber hove in sight, while the beautiful sky of the morning clouded over, and the cold wind which began to set in from the west, indicated that the twelve miles we had yet to travel before we should reach the first house across this arm of the prairie would be anything but agreeable, I was contented to wrap myself as closely as possible in my buffalo robe, and join him in a game of prairie loo. Lest you might search

vainly in Hoyle for this pastime, I must inform you, that the game consists merely in betting upon the number of wild animals seen by either party, toward the side of the vehicle on which he is riding, a wolf or deer counting ten, and a grouse one. The game is 100; and you may judge of the abundance of these animals from our getting through several games before dinner—my companion losing me with eleven wolves. Some of these fellows would stand looking at us, within half gun-shot, as we rode by them; while the grouse would rise continually from under our very horses' feet.

Before we had got through the twenty-four miles, the scene enacted at starting, was to be repeated with improvement; for on coming to the edge of a frozen gully, our two leaders, in their anxiety to avoid former difficulties, gave such a spring that they sunk through the ice to their shoulders, on the opposite side; while the wheel horses, being thrown down, were driven by the runners of the sleigh against the sharp edges of the ice thus exposed, and one of them was terribly lacerated. It was the unfortunate Sam, who, poor fellow, not having been watered since the morning, lay quietly on his side in the traces, with his fore legs up the slope, and his hinder ones in the pool, eating the snow thus brought in contact with his mouth, apparently perfectly unconscious of his wounds. Black Hawk and the Judge, of course, came to an anchor when they found such an accumulated weight dragging behind them; while the spirited Major seemed to be thoroughly dejected at this second discomfiture, and allowed us to turn him over and put him on his feet with scarcely the interposition of a struggle. Not far from the scene of this catastrophe we crossed the Au Sage, a narrow stream, with smooth banks, utterly divested of shubbery; and after, in the next 8 miles, encountering two or three tremendous snow banks, where our horses were frequently immersed to their cruppers, and whence nothing but the leaders, from their firm footing beyond, dragging the wheel horses thro' the heavy drift, could have extricated us, we reached a beautiful grove of elms and oaks, and stopped to change our worn-out team.

Entering a log cabin, not at all differing from the usual dwellings of the frontier settlers, I found a choice collection of books, in one corner, a volume of Algermon Sidney's works, in a fine old edition, being the first book I took up, and upon entering into conversation with the occupants of the cabin, I found that degree of general cultivation which, though often met with on the frontier, still always strikes a stranger with novelty: and yet, I know no reason why the fullest expanding of the intellect is incompatible with the handling of an axe, or the most luxuriant development of the imagination with following the plough. The farmer, of all operatives, has, perhaps, the most time for improvement; and when he dwells in a land where, while Nature showers her choicest bounties, man passes toward it from every side, and contributes on his new coming to the general stock of ideas, keeping, by this lively interchange, those already afloat in active circulation, there is everything in his circumstances to make him acute and reflective, and to liberalize his mind, if not to polish his manners.

It would be giving you a wrong impression, however, did I allow you to gather from this, that the oldest western settlers of this country are by any means so familiar with books as the emigrants from the East; for, among the latter there are many persons of altered circumstances, who, having once enjoyed better opportunities for literary culture, carry the traces of their old habits with them into the new scenes to which they so readily adapt themselves. Fluency of language, with an ease and power of expression, which sometimes swells to the dignity of eloquence, and often displays itself in terms of originality, at once humorous and forcible, constitute the conversational resources of the Western man; but as his knowledge is gathered almost altogether from conversation, he wants that exact acquaintance with facts and things which enriches the intellectual armory of his Eastern brother, in a similar situation of life. My opportunities as yet of forming an opinion might, perhaps, be questioned by one who did not know that the southern part of Michigan and the northern sections of Illinois are settled by people from almost every State in the Union. Having now traversed them both, I may venture the above observation, at least with you.

A dinner of grouse at this place came very opportunely after our keen ride of twenty-four miles over the prairie without once stopping; and, by way of varying our customary fare of bacon and corn bread along the road, we purchased a few brace of these fine

birds for twelve and a half cents a head, there being at hand a coop full of them just caught alive upon the premises. It was just sunset when, after riding about thirteen miles over a dreary looking prairie, we came suddenly to one of those *steppes* into which these singular plains sometimes break so beautifully; and, looking down over two broad platforms, which successively projected their flat surfaces and angular edges below us, beheld the Illinois river winding thro' the lowest meadow, and receiving its tributary, the Fox river, opposite the little village of Ottawa. It seemed to repose upon a rich alluvial flat with the rocky bluffs of the Illinois, rising in a regular line to the height of 70 or 80 feet immediately in the rear, while their rugged and varying outline, both above and below, towered oppositely to a much greater height. The warm light of the setting sun resting upon their mossy edges, and touching with freshness an evergreen that sprouted here and there among the cliffs, while the rising mists of evening imparted a blueish tint to the distant windings of the smooth valley below, gave an Italian softness to the landscape. But little in unison with the icy rigors that enchain the streams to which in summer it must owe its greatest beauty. A mile or two further brought us over the frozen river to the comfortable frame house from which this letter is dated.

Ottawa, which is situated a few miles above the head of steamboat navigation on the Illinois, is, from its central situation, gradually becoming a place of some commercial importance, though still a mere hamlet in size. It was within six miles of this place that the worst of the Indian horrors were perpetrated during the difficulties with the Sacs and Foxes in 1832. You must remember the newspaper accounts of every member of two families being butchered, except two young girls, who were carried into captivity, and afterwards recovered from the Indians.—There was a singular fatality attending this melancholy affair, which makes it worth while to recall some of the particulars. According to my informant, the heads of both families, who lived in the same or adjoining houses, had more than once removed their wives and children into Ottawa, upon false alarms of the approach of the Indians, and one of them, from some new warning on the very day on which the event took place, was again moving the united establishment in wagons to the same place of security, when he met the other, who so opposed and ridiculed the idea, that they returned together. An hour or two after they were at work within a few yards of the door when a band of Indians appeared, and with a triumphant yell surrounded the house in an instant. Armed only with their tools of husbandry, they did not hesitate to make an attack upon an enemy that outnumbered them, so as to make the attempt to get into the house and reach their rifles perfect madness. It is needless to add that they were shot down, tomahawked and scalped in an instant; not, however, as some say, before they had witnessed some of the atrocities practised upon the feeble members of their families. These, both before and after death, are too shocking, I may say too awful, to mention. "Why, sir," said an Illinois man to me, who was on the spot shortly afterwards, "those Indians behaved most *ridiculous*. They dashed children's brains against the door posts; they cut off their heads; they tore —" but the detail to which my informant applied so quaint an epithet is one that I would not think for a moment of giving you. I must not forget to add, that the two surviving females, after losing every near blood-relative in this horrible manner, have lately found legal protectors, and are now settled in life as respectable married women. I had previously even as far north as the borders of Michigan in Indiana, seen stockades erected in the open prairie as a place of refuge for the settlers, with other similar marks of the late border strife, but had no idea till this evening that I was approaching the seat of the bloodiest acts of the unhappy contest. The neutral Indians, who disappeared from this part of the country at the time, are now, I am told, dispersed again in large numbers over the neighborhood. They are perfectly harmless; but, though treated with great kindness by the new emigrants, there will probably never again be much confidence between them and the old settlers. The latter somehow seem to have long regarded the Indians as hereditary enemies, and the events of 1832 have given new vigor to dislikes which seemed to be gradually losing their rancor. A man who has to plough with a heavy rifle ready-loaded slung to his back, day after day, while he fears even to send his child to the spring for a pail of water, may be well excused for being warm upon a subject which must thus fill his thoughts and harass his mind throughout each hour of the day. It is, therefore, useless to argue with an

Illinois "Indian Hater." What cares he for the "lean famine, quartering steel, and climbing fire," which you tell him often beset the redman's wigwam before his ancestors made good their footing on another's land. He thinks but of the frantic outrages he has witnessed in his own day. He thinks of his often abandoned husbandry "while that the coulter rusts" corrupting in its own fertility. He thinks of his butchered friends and neighbors, and asks bitterly how you could

"Look to see
The blind and bloody savage with foul hand
Defile the locks of your shrill shrieking daughters:
Your fathers taken by the silver braids
And their most revered heads dashed to the walls;
Your naked infants spluted upon pikes,
Whilst the mad mothers with their howls confused
Do break the clouds."

An accumulation of horrid images which shows with what fearful fidelity Shakespeare would have painted Indian warfare had these wild tragedies of our day been acted in his.

Of books we have several, but not a word in their behalf to say, till after the election.

FOREIGN INTELLIGENCE.

LATE FROM FRANCE.—We have our Paris papers of 15th ult. inclusive, by the *Rhone*, from Havre.—From Spain and Portugal we have later accounts direct. From London the dates are to the 11th. Mr. O'Connell had demanded an investigation, by the House of Commons, of the charge against Mr. Shiel. The result of the demand is not stated.

The Gazette de France of the 15th inst., has this paragraph, of painful interest to Americans.

"General Lafayette is still confined by serious illness. He does not leave his bed, and his physicians forbid all but his intimate friends to enter his apartment."

PARIS, Feb. 14.—The Customs' Bill, presented to the Chamber of Deputies is at length published by the *Moniteur*, in Supplements, occupying 20 columns.—The following are its principal provisions:—The Bill proposes to admit raw spun cotton at 8fr. per kilogramme for single twist, and 10 fr. for double twist; gold and silver watches at 6 and 10 per cent.; Russian skins at 6fr. a piece; chromate of lead and potash at 90fr. and 180fr. for 100 kilogrammes; foreign rum, arrack, and ratifia, at the same duties as other *liqueurs*. The duty proposed on wool in the mass is 10 per cent., and combed wool 30 per cent., *ad valorem*, without fixing any minimum. The actual duties on iron are reduced 1.5 from July 1st 1835, but the reduction will be effected in five years, at 4 per cent. per annum. The only concession to cast iron is the reduction of the minimum of the weight of pigs to 25 kilogrammes. There are greater or less reductions of the duties on a great number of dyewoods, spices, drugs, &c. The productions of China, Cochinchina and the Philippines, imported direct, will obtain a drawback of a fifth of the duties as established for the most favored foreign arrivals. Sugars from Pondicherry, are assimilated to sugars from Bourbon.—The tariff of arms in commerce is left to be fixed by Royal Ordinances. The charge for each seal (plomb.) affixed at the Custom House, is reduced to 25 cts.

PARIS, Feb. 14.—On the 7th of next month, Constant Polari, alias Carrara, the person accused of having stolen the diamonds of the Princess of Orange, will be brought to trial before the Cour of Assizes for South Holland.

The French Chambers were occupied upon the Civil List. We perceive nothing in the debates worth noting.

The Constitutionnel of the 14th of Feb., states that on the preceding day, after long and fatiguing discussion the Chamber of Deputies had voted the law, (so warmly contested) for the liquidation of the old civil list.

Advices from Algiers are to the 30th of January. An expedition against some refractory bands of Arabs, had been successful—without hostility. After explanations from the French, the Arabs desisted from hostile acts, and promised to live in peace and harmony.

The Paris Times assails the Ministers—arguing that this is not a Representative government, where the Ministers represent the King's will before the Chambers, instead of the will and voice of the people.

ENGLAND.

The London papers are yet discussing the subject of what they term "The Irish Row," kicked up in the House of Commons by Mr. O'Connell. They attribute to O'Connell a design to destroy Shiel, as

the only member of his tail whom he has reason to fear as a rival.

Numerous petitions have been presented to Parliament, from the Disenters, praying for liberty to register their own births and marriages, and for exemption from marriage fees.

LONDON, Feb. 10.—The following circumstances have appeared before the Portsmouth magistrates this week: The ship *Marianne*, Classen, master, having on board 212 Polish refugees, bound to the United States, has been detained in this port, wind bound, five weeks. The ship was taken up by the Prussian Government, for the purpose of conveying these men from that country to America, under an agreement that on their arrival they were to be paid a sum of about sixty dollars each.—The ship was obliged to put into this port by stress of weather, and the Poles appeared to be very comfortable, and expressed their willingness to proceed to America, until Sunday last, when a Polish officer arrived from London, and communicated to them that the Poles of Harwich and Havre, who were similarly situated, had obtained permission of the French Government to land in France or Algiers, upon which the Poles here refused to proceed to America, and agreed to leave the ship on the following day. The necessary steps being taken on Monday for their leaving the ship, they peremptorily refused either to proceed to America or to leave the ship.

The next day, (Tuesday) the wind being favorable for sailing, the pilot gave directions for heaving the anchor, and as the crew were at the windlass for that purpose, the Poles rushed forward and forced the handspikes from them, stating that they were determined the ship should not proceed. They took possession of the ship; and from their violent and threatening conduct, the Captain applied to the Civil Authorities for protection, as he could not put to sea without endangering his life. Depositions of the fact were taken, and communication had with the Secretary of State, and also with the Prussian Ambassador. Thus the case stands at present.—[Hampshire Telegraph.]

The Duke of Wellington has been installed Chancellor of the University of Oxford. It is stated that he pronounced his Latin address in a most excellent and impressive manner. It was classical in style, and in substance eloquent. He alluded, with much felicity to the occasion when Oxford conferred on him the Degree of Doctor of Law, in company with the Emperor Alexander, the King of Prussia, and their illustrious train, and expressed himself determined to defend the privileges of the University, which had so gratified his feelings in conferring upon him the high office with which he is now invested.

The last despatches from the Court of St. Petersburg give such a positive assurance of a continuance of peace that a reduction of the army is talked of in the higher circles. It is believed, however, that this measure will not take place till after the close of the Congress.

General Sir Colin Campbell, has been appointed to the Staff of the British forces in North America.

SWITZERLAND.

A body of Polish refugees who had been sent out from France, have lately attempted, with such Italians as they could get to join them, to make themselves masters of a fortress in Savoy. They were opposed, however, and most of them taken prisoners, and decrees passed to expel them from the Swiss territory.

ITALY.

Several arrests had taken place in Rome, but they are merely precautionary—to guard against troubles during the Carnival.

SWEDEN.

A Stockholm Journal of the 21st January, proclaims that capital the most prosperous in Europe, and congratulates the King of Sweden on his having relieved the country from the burden of a foreign debt.

TUESDAY, THREE O'CLOCK.—We have our London papers to 26th February, by the *Roscoe*.

Paris accounts are to the 25d—fears are expressed for the stability of the throne of Louis Philippe.—Lyons was in a state of great disturbance, from the workmen standing out for wages. Louis Philippe had issued an edict—foolish, because tending to excite hostility, without answering any effective purpose—to close the theatre at 11 o'clock. The edict is justified upon old usages taken up from the Bonaparte and Bourbon times.

From Spain there are no special news, except the

resolute refusal of the ministry to permit *Mina* to return to Spain.

From Portugal the intelligence is that Miguel's troops were descending the left bank of the Tagus, and might thence annoy Lisbon. The war there is not by any means ended.

The Committee of Privilege, appointed by the House of Commons to examine into the charge against Mr. Shiel, had reported "their deliberate conviction of his innocence in respect of the whole matter," and Mr. Hill, on whose speech at Hull, we believe, the whole accusation was grounded, concurred entirely in the result, and expressed to the Committee "his deep and unfeigned sorrow for ever having given the charge circulation."

Gen. LAFAYETTE was still indisposed at the last dates from Paris.

The London Courier of the 24th contradicts a rumor circulating, that there was a schism in the Cabinet.

LIVERPOOL, FEB. 25.—The Pantaloon arrived at Falmouth on Thursday last, bringing letters from Lisbon to the 9th instant. The following is an extract of a letter dated Lisbon, February 8th:—

"The Miguelites, in great force, (about 3000 men) have marched down from Santarem, on the south side of the Tagus, and have appeared at Aldea Galega, just opposite to this city. I am informed they may be seen; and I do not doubt it. I have been told that some vessels of war have been firing on them all day. If care be not taken they will get possession of St. Ubes, and the fort of Almada, which is directly opposite the centre of the city. Without foreign interference, the war will be interminable; Miguel's troops stand by him, although they are neither half fed nor half clothed. This is not less true than surprising. Miguel has nearly the whole country in his favor."

The fact that Miguel feels himself strong enough to detach three thousand men to advance upon St. Ubes, would seem to argue that he entertains no fears for the safety of Santarem. The United Kingdom steamer disembarked four hundred and fifty Belgian troops on the 7th. They were immediately informed that their pay would be the same as the Portuguese troops, and that the agreement made with them before they embarked would not be abided by. At this they, naturally enough, became very discontented, and protested against their treatment as a dishonorable breach of faith, but to no purpose. About one hundred and fifty British subjects are daily marched through the streets of Lisbon, chained together in parties of about twelve, to work on the roads.—These are the free-born Englishmen who sailed forth to liberate enthralled Portugal from the grasp of an usurper and a tyrant! These rogues in irons have made a happy exchange; they have gone from English jails into foreign hulks. The liberators are converted into galley-slaves, and in this capacity they will certainly be useful in cleaning the streets of Lisbon.

Miguel is said to have offered an amnesty to Pedro's followers, promising to send the whole of the English and other foreign ragamuffins in Donna Maria's service to their respective countries. At the departure of the Pantaloon, this proposition had not been accepted by Pedro. The two principal officers in the Queen's service, the Duke of Terceira and General Saldanha, had quarrelled. The former, on quitting the army, was succeeded by Gen. Stubbs.

[From the London Courier of Feb. 24—evening.]

The French papers, as well as the letters, which have arrived from Paris, begin again to use the language of alarm in relation to the stability of the Government of Louis Philippe and the maintenance of tranquillity in France. The two subjects which at present have chiefly given rise to this uneasiness are, the strike of the workmen at Lyons, and the impolitic edict of the Prefect of Police at Paris to shut up all the theatres at eleven o'clock, which we mentioned on Saturday. When the whole people are ready to take fire, though willing to relapse into tranquillity, how monstrously absurd it is in this Prefect to throw a brand into the combustible heap. His foolish edict, too, comes immediately after the law for suppressing the public criers, which went to deprive the people of much excitement, which was not always mischievous, and to take away from them a source of amusement, in which they had long drank in some pleasure. The Prefect refers too, in his edict, to a variety of ordinances, issued in the hated times of the Bourbons, and under the arbitrary sway of Buonaparte, as the

justification of his measures, as if he thought they were the happy periods which the French ought to bring back. Thus he places that which is personally offensive, upon grounds which are still more offensive to the majority of those whom he undertakes to control. All this is, in our opinion, most melancholy and most contemptible in M. Gisquet, and it tends to confirm our conviction, that the administrators of the laws get into such a habit of looking exclusively into them to find rules for their conduct, that they cannot look beyond them, and never, therefore, acquire that wisdom, which events and circumstances teach. But it is quite clear, that the laws and ordinances of the Bourbon and Buonaparte Prefects of Police, are not calculated for the present state of men's minds in Paris. It is equally clear, that a new order of circumstances is continually arising in society, for which the legislators of the past age could not possibly provide, simply because they did not know, and did not foresee them. Thus the men who, like M. Gisquet, never will look for rules to events and circumstances, but always will look to antecedent edicts and ordinances, and always frame their conduct by the edicts and ordinances of their predecessors, must, of necessity, do a vast deal of mischief. They are the real authors of the painful convulsions which take place in society, inasmuch as they always oppose with violence those gradual and successive changes which, but for them, would probably be brought about calmly and tranquilly, and which society, like every created thing, is continually doomed to undergo. Their great mistake—for we do not impute corruption or guilt, or even a love of tyranny, to them, but ignorance—consists in supposing that their edicts and the edicts of their predecessors determine the events which, we say, they ought to study, in order to obtain the wisdom proper to Statesmen. This is a fatal mistake, which the events of the last fifty years in every part of Europe—for there is not one in which statesmen have not been successively obliged to bend to new and unforeseen circumstances—are well calculated to rectify. We hope that the successor of M. Gisquet, whoever he may be—and M. Gisquet cannot, without greater danger than a hundred Gisquets are worth, be retained—may be wiser, and more disposed to look at existing facts, than at the ordinances of a former period.

LONDON, FEB. 21.—Lord Althorp admits that the property of the church is much less than he imagined, and that from the returns, it only amounts to £3,600,000 a year—

Bishops' incomes	£ 158,527
Deans' and Chapters' incomes	236,658
11,400 benefices	3,621,125

£3,621,125

LONDON, FEB. 24.—A new treaty between Russia and Turkey, very much in favor of the latter was concluded at St. Petersburg on the 27th last month. By this treaty, that of Adrianople is materially modified; the amount of the debt due by the Porte is very much diminished; part of the principalities of Moldavia and Wallachia is to be given at once the Porte, and the remainder is to be given up on the execution of the conditions. The frontiers of Turkey on the side of Persia are to be considerably extended. This information is official.—[Spectator.]

THE TRADE TO CHINA.—The shipowners of the United States are under weighty obligations to the framers of the late orders in council, for the regulation of the British trade to China. These orders, in fact, impose discriminating duties in favor of the Yankees, and against the merchants of England. Were the principle on which they seem to have been drawn up acted upon in reference to our commerce to other parts of the world, the British flag would soon disappear from our docks and harbours. We have just been informed of one instance, which occurred at Liverpool the other day, of the injurious operation of these orders. Some British manufactured articles, for which freight had been engaged on board a British ship to Canton, and which had been consigned to a British house there, have been transferred to an American vessel, and are now consigned to an American merchant. The freight and commission, therefore, which would naturally have fallen into the hands of the English shipowner and merchant, will be pocketed by our American rivals; and the most provoking thing is, that this evil result is brought about by the ignorance and obstinacy of our own rulers.—The influence of Mr. Poulett Thomson must be weak in quarters where his advice ought to be followed for we cannot suppose for a moment that he is blind to the inevitable consequence of the Canton trade orders; although the great majority of his colleagues are incapacitated by their habits and education for a right understanding of the subject.—[Spectator.]

The constitution of the Cortes *por estamentos* not being generally known, our readers may wish to be informed that the Cortes, *por estamentos*, is a species of States General, which was anciently composed of the three Estates (*Estamentos*), or influential classes in the nation—namely, the Nobility, the Clergy, or rather prelacy, and the Deputies from a number of cities and towns which possessed the right of sending Members to this Parliament. Those three orders sat in separate chambers, but the sanction of all was indispensable to give force to any legal enactment; but ever since the subversion of the rights of the Commons by Charles V., the Cortes were no longer the Representatives of the nation, but merely the King's Deputies, called together for a special object, such as to take the oath of allegiance to the heir apparent to the throne, &c. But previous to the reign of Charles V. the Cortes possessed more extensive rights and privileges than are possessed by any Legislative body in Europe at this day. At that time Spain was the greatest country in Europe; but the destruction of the representative system, and consequent introduction of a severe despotism, destroyed all the energies of the people, and all the resources of that fine country, and, from being a powerful empire, has degraded it to a state of misery, and a rank quite below its natural level amongst European nations.—[Herald.]

Mr. SHIEL.—The annexed report was made in the House of Commons on the 14th of February.

It was received with cheers; and was followed by a frank and manly apology on the part of Lord Althorp to Mr. Shiel:

Charge against Mr. Shiel.

Mr. GROVE brought up the Report of the Committee appointed to inquire into the charges against Mr. Shiel. There were cries of "read, read;" and the Clerk proceeded to read it as follows:

"The Committee of Privileges, to whom the matter of complaint was referred, arising out of a paragraph in the Examiner newspaper, dated Nov. 10th, 1833, hereby submit to this honorable House the following report. The paragraph in question, purporting to form a part of a public speech, delivered at Hull, by Matthew Davenport Hill, Esq., is as follows:—"It is impossible for those not actually in the House to know all the secret machinery by which votes are obtained. I happen to know this (and I could appeal, if necessary, to a person well known and much respected by yourselves,) that an Irish member who spoke with great violence against every part of that bill, and voted against every clause of it, went to Ministers and said, 'Don't bate one single atom of that bill, or it will be impossible for any man to live in Ireland.' 'What!' said they, 'is this from you, who speak and vote against the bill?' 'Yes,' he replied, 'that is necessary; because, if I don't come into Parliament for Ireland, I must be out altogether, and that I don't choose.' Cries of 'Name,' and 'No.' Consider for a moment—can I do it? 'No.' 'Yes.' That is a point for my consideration. I have a great respect for every one here; but, if every one in the room were to hold up his hand for it, I would not do it. The secret is not my own. If he had told it to me I would have said, 'Mark, I will keep no such secret as this; I'll publish it to the world.' But if I name the member, I put it into the power of the individual who made that declaration to know the gentleman who told me." Your Committee, on entering upon the delicate and embarrassing duty imposed upon them, ascertained from Mr. Hill that, though he could not admit the entire accuracy of the above paragraph, as part of what he had publicly spoken at Hull, nevertheless, he recollected to have publicly charged an Irish member of Parliament with conduct similar in substance to that which the paragraph described. The Irish member so alluded to was Richard Lalor Sheil, Esq., Member of Parliament for Tipperary, and Mr. Hill states the charge to the best of his belief, to have been substantially as follows:—That Mr. Sheil made a communication respecting the Irish Coercion Bill to a person connected with government and others, with intention thereby of promoting the passing of the Coercion Bill, and having a direct tendency to procure that effect, whilst his speeches and votes in the House were directed to the rejection of the Coercion Bill. Such was the substance of the allegation into which the committee proceeded to inquire. Two witnesses were called before them at the suggestion of Mr. Hill, and others were about to be examined, when Mr. Hill himself, finding the testimony different from what he had expected, freely and spontaneously made a communication to the committee that he had come to the conclusion that the charge against Mr. Shiel, of having directly or indirectly intended to communicate to government any opinions in opposition to those he

had expressed in the House of Commons, had no foundation in fact; that such charge was not only incapable of proof, but that, in his sincere belief, it was totally unfounded; that he was induced to make mention of it in a hasty and unpremeditated speech, under a firm impression that he had received it on indisputable evidence; but that being now satisfied of the mistake into which he had fallen, and being convinced that the whole of the charge was wholly untrue, he came forward to express his sincere regret at having given it circulation. Mr. Hill added that if there was any way, consistent with honor, by which he could make reparation, and heal the wound he had inflicted, he should be happy to do so. The Committee felt highly gratified that they could exculpate the honorable member from the charge in consequence of the voluntary statement of the honorable member for Hull. Neither of the witnesses who appeared before the Committee deposed to facts calculated to bear out the allegations against Mr. Sheil, nor did the statement go to impeach his character and honor in any way, nor in any manner whatever. The committee have no hesitation in declaring their deliberate conviction that the innocence of Mr. Sheil, in respect to the whole matter of complaint referred to their investigation, is entire and unquestionable. The Committee feel bound at the same time to declare that the statement of Mr. Hill was made under a sincere but mistaken persuasion—they derive this confidence as well from his character as from his candid admission, and the evident anxiety to avoid exaggeration or misstatement which he observed throughout his statement."

The only additional item with respect to Portugal is, that the *Duke of Terceira* had been displaced from the command of the army before *Santarem*, by reason, it was conjectured, of the jealousy entertained of him by the Count Saldanha. General Stubbs, an Englishman, was his successor.

PARIS, FEB. 21.—Our legitimate journalists have been strongly excited at the despatch or despatches which informed them of the reception given to Marshal Maison by the Emperor of Russia, simultaneously with the arrival of the current reports of Prince Metternich's. The Prince, like the Emperor, regards the King of the French as the only efficacious guarantee for the peace of Europe, and the only powerful barrier which can preserve society from the invasions of anarchy.

General Lafayette is still indisposed. At the funeral of M. Dulong, which the old General wished to attend on foot, his fanatics, or perhaps his enemies, made an attempt to carry the hero of the two worlds in triumph. The old General did not seem to relish this. The enthusiasm of the surrounding multitude appeared to him rather equivocal, and he was well pleased when a picket of the Municipal Guard released him from the premature apotheosis. The circumstance, however, has shaken him much and though not in immediate danger, he is in a languishing state, and at his advanced age every excitement is dangerous. His death would be an event of importance, and his obsequies might give rise to scenes of disorder, if the excellent spirit of the National Guard of Paris did not afford a guarantee for the preservation of public tranquility.

From Portugal accounts to the 20th Feb., direct, are received at Boston, by a vessel from St. Ubes.—An express reached the latter place—distant not more than twelve or fifteen miles—from Lisbon, that a battle had been fought with the Miguelites, in which they were routed with great loss.

The last accounts, via England, were that a detachment of Miguel's troops were marching down the left bank of the Tagus, and were nearly opposite Lisbon—hence the greater probability that the St. Ubes rumor is true.

SUMMARY.

CITY OF BROOKLYN.—The bill constituting Brooklyn a city, which has passed the Assembly, has been for some time discussed warmly in the Senate. On Friday, (according to an Extra from the Albany Argus,) the Senate being in Committee on that bill, Mr. Van Schaick proposed the following clause:

"But the personal property of any person or persons occupying a counting house, warehouse, office, store or shop, and transacting his or their business in the city of New York, and whose property shall lie in the said city, or be a part of his business trans-

actions therein, although he may lodge or have his dwelling house in the city of Brooklyn or elsewhere, shall be assessed and subject to rateable taxation in the city of New York, in the same manner as other personal property is by law assessed and taxed therein."

In introducing his amendment, Mr. Van Schaick read the report to the Comptroller of the city of New York, in regard to the nature of the improvements at Brooklyn, being dwelling houses of a good class, occupied principally by merchants and dealers lodging in the village of Brooklyn at night, and coming over to New York in the morning, entering their stores, transacting their business during the day and returning to Brooklyn at night, and by this means escaping taxation on personal property, lying in the city of New York, to a large amount.—Mr. V. S. observed that the evil was increasing to such an extent, that its importance would force itself upon the public attention, and he alluded to individual cases. It would not be endured that persons carrying on a regular business in the city of New York, and making large sums of money in trade, should enjoy the benefit of an expenditure of \$200,000 per annum for streets, lamps, watch, fire department and courts of justice, and the ample protection of their property in trade, and should in consequence of having their dwellings in Brooklyn, escape making any contribution whatever to the public burthens of the city, while every trader and mechanic was assessed and paid his share of the taxes.

There were instances of persons escaping taxation on many hundreds of thousands of dollars, and in the course of twenty years, it might be very possible that with an increased number of ferries from Old Slip and other places to the new part of Brooklyn, one quarter or one third part of the business population of New York, residing in the first ward, would become the residents or lodging population of Brooklyn. Would such a state of things be endured? Is it consistent with any principle of justice? The first ward pays more than a fourth part of the whole taxation of the city. Are we to give up a large portion of this revenue, for the purpose of fostering the commercial rival, as some call it, which you are going to create? It must not be done. The upper wards of the city would feel themselves sorely oppressed by a decision which would lead to that result.

[Mr. V. S. supported his amendment with great zeal, and read several letters in relation to the subject, which he had received from the committee of the corporation of New York.]

The amendment was adopted.

On Saturday this amendment was reconsidered, and though warmly sustained by Mr. Van Schaick, was eventually rejected.

Mr. Van Schaick renewed his proposition in the Senate, but only four ayes supported it.

LEGISLATURE OF NEW YORK.

Six Million Loan.

Mr. Morris, from the Joint Committee to which was referred the Special Message of the Governor, made a Report, responding to the charges of the Governor against the United States Bank, and concluding with a bill providing for the creation of a five per cent. STATE STOCK amounting to Six MILLIONS OF DOLLARS, redeemable within twelve years. Four Million of Dollars of this Stock is proposed to be loaned to the Banks in the city of New York, and Two Millions to be sent to the Loan Office in the different parts of the State, to be loaned when the Supervisors of the respective Counties determine that they are in need of such aid. The \$4,000,000 given to New York, is to be loaned to the City Banks.

The bill creates a Board of Officers to manage this Stock, consisting in part of State Officers, and of persons to be appointed by the Governor and Senate.

Mr. Morris also introduced a bill allowing the Banks which may borrow this money, to discount upon it as additional capital.

THE SIX MILLION LOAN.—By the bill "to loan the credit of the State to the people thereof" for Six MILLION DOLLARS, it is left discretionary with the Commissioners whether or not to issue the stock.—The bill will unquestionably pass. The Commissioners named by the bill, are the Comptroller, the Attorney General, the Bank Commissioner appointed by the Governor, and three other persons to be appointed by the Senate on the nomination of the Governor. The Act is to go into effect immediately on its passage.

Steamboat Cause.—The Superior Court, before

Judge Hoffman, was occupied on Tuesday and Wednesday, with the trial of the suit brought by *Henry K. Fountain*, against *Robert Dunlop*, proprietor of the steamboat *Dewitt Clinton*, for the value of the petiaugre *Hudson*, owned by the plaintiff, and which was sunk on the evening of the 9th of November last, in the North River, near Catskill landing, in consequence of the collision of the two vessels in the dark. The jury yesterday morning returned a verdict of \$600 for the plaintiff. Another suit is pending against the same defendant for the value of the *Hudson's* cargo of oysters, which belonged to Mr. Simondson, the master.—[Courier.]

APPOINTMENTS by the Governor and Senate, Mar. 25.

New York—Phineas Lockwood, pilot by way of Hell Gate; Gabriel Winter, commissioner of deeds.

Kings—Zachariah Cooper, auctioneer.

Queens—Henry J. Hagner, surrogate; Benjamin W. Strong, first judge; Joseph Dodge, judge of county courts; Robert Mott, Isaac Wright, Edward Starkins, Warren Mitchell, William M. Weeks, Samuel Mott and Samuel Lowerre, auctioneers.

The Common Council of Troy have voted a suit of Colors to the new ship *Troy*, in compliment to the name she bears. The *Troy* is a very fine ship, of five hundred and thirty tons burthen, belonging to Josiah Macy & Sons. She is furnished with a beautiful cabin though designed for the general carrying trade between this country and Europe.

Fatal Accidents.—On Thursday last, Mr. Dear of Hanover, Pa. in approaching this city with his team, was thrown from the saddle horse, in consequence of the horse taking fright by the flying of a kite, and the unfortunate man fell in such a position that both wheels of the wagon passed over his body, occasioning his death in about an hour.

On Tuesday, a child of Mr. John Wilson, of Mountjoy township, Adams co. Pa. aged about 3 years, was found dead in a spring near the dwelling of the family. He had a small bucket with him, and it is thought that in attempting to dip up water, the child lost his balance and fell into the spring—where, no one being in reach to save him, the consequence was loss of life. When discovered, it was supposed that the body had been nearly an hour in the water: all attempts to resuscitate it, were therefore vain.—[Balt. Patriot.]

The estate of the late D. McCornick in Wall street, just above Pearl, sold yesterday by auction for \$46,500. The estate is 36 feet on Wall street, and from 69 to 81 feet deep. The building is of no value.

This estate a few months ago, would have sold for nearly fifty per cent. more. Fifty thousand dollars has been more than once refused for it.

The body of a man was picked up off Sewell's Point, on Friday, by the revenue cutter *Jefferson*, Capt. Webster, which appeared to have been in the water 5 or 6 days, and is thus described by Capt. W.:—Height about 5 feet 5 or 6 inches; dark complexion, large black whiskers—dress, a blue jacket, yellow oil cloth trousers, a red shirt over a white one, the latter marked *J. Perry*; the figure of a ship of war, the word *Liberty* and the initials *T. C.* marked on one of the arms in Indian ink. There was a hole in the forehead of the deceased between the eyes, apparently made by a pistol ball, and two smaller ones on the side of the nose, supposed to have been caused by shot—also, a severe bruise on the temple. The body was interred by Capt. Webster on Sewell's Point.—[Norfolk Herald, 31st ult.]

Sheep killed by Cats.—The last Lancaster Examiner says:—"Incredible as this may sound, we have good authority for saying the deed has actually been perpetrated in this county. Several cats, of the common species, with their progeny, have for three or four years past made an old stone quarry in Martine township their abiding place, and in that time it would seem have relapsed to the wild state and acquired the ferocious and predatory habits natural to their tribe. A short time ago, some of them were seen in pursuit of a full-grown sheep belonging to the flock of Mr. Martin Herr, of that vicinity. They soon overtook it, dragged it to the ground, and before the person who witnessed the scene could reach the spot, they succeeded in so lacerating the poor animal's throat that it bled to death in a short time. It required considerable exertion to drive them off. A dog, subsequently sent in pursuit of them, caught one, but would probably have been himself worsted in the conflict that ensued, had not the owner come to his rescue. It is said they also pursued a small boy some time ago, and followed him a considerable distance, as is now supposed with deadly intent.

THE DEATH-BED OF WILLIAM WIRT.—The Richmond Compiler of the 17th inst. contains the affecting account of the last illness of Mr. Wirt, written by a gentleman who attended him during that illness. We proceed to extract the principal part of it.

"On the evening of Saturday, the 8th instant, he was in playful spirits, and sanguine of the success of an argument which he was to make in Court on Monday. He felt better satisfied with his preparation, he said, than with any he had made for years before. On Sunday, he walked to the Capitol to Church—it was a damp chilly day, and the Representatives' Hall was crowded and warm. To go immediately from it into the cold, damp air, and walk slowly, as he did, a mile to his lodgings, might have been deemed imprudent in one whose health was less precarious than his then seemed.

"That night he complained of a slight indisposition, and in the family worship of the evening, prayed with an unusual fervor, and seemingly a forboding spirit, which he communicated not save to his God. But even this was sufficient to excite vague apprehensions in a family always ready to note and to dwell upon whatsoever might seem to bode danger or safety to a friend so dear.

On Monday he was confined to his room; no serious apprehensions were entertained, but a physician was called in—it was only a cold. On Tuesday he was worse, but we feared not the result. He complained of stiffness of the muscles of the throat and swelling of the glands—milk poultices were applied to his face, but they gave no relief. On Wednesday he was much worse, so much as to excite alarm; on the evening of this day, it was first discovered that the disease was Erysipelas, "a new enemy," of which Mr. Wirt then expressed his fears. "It was not the foe with which he had been so long accustomed to contend."

His constitution was too weak, as the physicians apprehended, to stand the vigorous treatment which would have been most efficient in destroying the disease. By Friday, the alarm had become very serious—the door was crowded by anxious inquiring friends, and those who met in the street asked from each other the latest intelligence. The affliction of the family was extreme, but still there was hope. On Saturday, his daughter and son-in-law arrived from Baltimore, and were shocked to find the case so much worse than their worst fears.

Scarcely a glimmer of hope was left to us, but this feeble ray was most anxiously watched and cherished. When over-shadowed by so deep a gloom, the least of the twinkling stars in the firmament is more precious to our sight, than is the sun itself in the noonday of an unclouded day.

Death, from the first day of his illness, had continued to approach with a steady pace, and in a form more than usually hideous. The fine countenance so bright with intellect, so beaming with benevolence, was sadly altered—by the disease partly, and partly by remedies so fruitlessly applied. The eyes had lost their speculation—the eloquent voice was hushed—the divinity had departed from the temple, and its walls were defaced, but life still lingered, loath to abandon a habitation which had so long given to a thing in itself so little desirable and so worthless, beauty, purity and worth.

The attending physicians were Doctors Hunt and Hall; none could have been more anxiously attentive; the latter staid by him every night of the last four or five.

About noon on Monday, consciousness returned; and he had power to speak a few words. Nature had made a last effort to permit him to take leave of his family and friends, to give assurance that he died in Christian hope, and to join them in prayer to his God. The Rev. Mr. Post officiated. In so much of the prayer as related to his family and his own acceptance with Heaven, he seemed heartily to join: but when a petition was offered that he might be restored to health, he audibly dissented—"No, no!" He had done and suffered enough in this contentious world, and was entitled to the release, and the transfer to a higher existence, which the just and good are authorized to expect.

It was now become manifest, even to the most sanguine, that recovery was beyond the remotest probability. He was too shining a mark for death longer to miss. All that was left to us was, to smooth his passage to the tomb—to moisten his dry parched lips and tongue, and perform such little offices of affection as might soothe his hard sufferings.

During the last eighteen hours, he was tranquil as a child. Breathing and warmth were the only evidences of life—no motion, no pain, no consciousness—there lay the wreck of WILLIAM WIRT.

Three friends besides the Clergymen, attended his

bed side during the night—his family, too, worn as they were by nearly a week's watching, could not be induced to take repose. Anguish and affection gave them strength to bear what would have exhausted the strongest men. It was a night long to be remembered—a night of silent, despairing sorrow, which conveys to the heart a language never to be forgot—a language which is not for a pen like mine to transcribe.

Tuesday morning breaks upon the scene still unaltered, save that life flittered more faintly and all pulse was gone. About 11 o'clock the breathing became gradually more distant and more feeble—are suspended or imperceptible—another breath—he's gone? So calmly, so imperceptibly did he make his exit, that the precise moment of his departure could scarcely be marked—without a sigh or a struggle his bright spirit has departed from amongst us, to a state of existence higher, mightier and more glorious.

Upon a highly excited mind, a slight incident will sometimes make a deep and lasting impression. As the last flickerings of life were failing—while his whole family, and the friends who had watched with them, grouped around his bed, and in silent, deep attention to the awful scene, all held their breath, and their hearts and pulses stood still, a few soft, low notes from a pet bird, which had before been so silent that its presence in the room was unremarked, fell with startling sweetness on the ear. Only once before during his illness, had it been known to sing. On the preceding day, at the conclusion of the last act of devotion in which he ever joined, these same soft notes had mingled with the solemn Amen.

Eloquent extract from a Review of the Life and Writings of Fenelon, by Dr. Channing.

The common idea is, that overwhelming emotions, the more they are experienced, can the more effectually be described. We have one strong presumption against this doctrine. Tradition leads us to believe, that Shakespeare, though he painted so faithfully and fearfully the storms of passion, was a calm and cheerful man. The passions are too engrossed by their objects to meditate on themselves; and none are more ignorant of their growth and subtle workings than their own victims. Nothing reveals to us the secrets of our own soul like religion; and in disclosing to us, in ourselves, the tendency of passion to absorb every energy, and to spread its hues over every thought, it gives us a key to all souls; for in all, human nature is essentially one, having the same spiritual elements, and the same grand features. No man, it is believed, understands the wild and irregular motions of the mind, like him in whom a principle of divine order has begun to establish peace. No man knows the horror of thick darkness which gathers over the slaves of vehement passions, like him who is rising into the light and liberty of virtue. There is indeed a selfish shrewdness, which is thought to give a peculiar and deep insight into human nature. But the knowledge, of which it boasts, is partial, distorted, and vulgar, and wholly unfit for the purposes of literature. We value it little. We believe, that no qualification avails so much to a knowledge of human nature in all its forms, in its good and evil manifestations, as that enlightened celestial charity, which religion alone inspires; for this establishes sympathies between us and all men, and thus makes them intelligible to us. A man imbued with this spirit, alone contemplates vice, as it really exists, and as it ought always to be described. In the most depraved fellow beings he sees partakers of his own nature. Amidst the terrible ravages of the passions, he sees conscience, though prostrate, not destroyed, nor wholly powerless. He sees the proofs of an unextinguished moral life, in inward struggles, in occasional relentings, in sighings for lost innocence, in reviving throbs of early affections, in the sophistry by which the guilty mind would become reconciled to itself, in remorse, in anxious forebodings, in despair, perhaps in studied recklessness and cherished self forgetfulness. These conflicts between the passions and the moral nature are the most interesting subjects in the branch of literature to which we refer, and we believe that to portray them with truth and power, the man of genius can find in nothing such effectual aid, as in the development of the moral and religious principles in his own breast. *Genius, intellect, imagination, taste, and sensibility, must all be baptized into religion, or they will never know, and never make known, their real glory and immortal power.*

We learn, says the Baltimore American of yesterday, from an unquestionable source, that large remittances from the Union Bank of Tennessee have

been received within a few days, for the redemption of its notes made payable at the Bank of Maryland, and that these funds have been forwarded to Philadelphia. It is probable that arrangements will soon be made for their proper application in Baltimore.

Naval.—The U. S. ship Falmouth, Capt. Spencer, bound to West Indies, sailed from Hampton Roads 26th inst.

The two Austrian frigates with Polish exiles, to the number of 245, arrived below last Friday.—We have not heard that any arrangements have been made either by the public authorities, or private individuals, for putting these ill-fated exiles, in the way of procuring a living. Indeed, at this moment, when thousands of our citizens, willing and anxious to work, are unable to find employment, we fear that it will be difficult to provide for this new accession.

Commodore Ridgely despatched a barge next morning, offering to these frigates the usual hospitalities of the port.

THE POLISH EXILES, who have come hither in the Austrian frigates, *not only without their own consent* as it is understood, but protesting solemnly against, being forcibly torn from Europe and thrown destitute upon a land of whose language they are ignorant and where they will be without any means of existence, are entitled to the sympathy of this community.

These unfortunate men—as we learn from the writer of the annexed letter, one of their countrymen—were gathered together from different parts of Austria—passed from brigade to brigade down to Trieste, and there, being each furnished with a great coat, a pair of trousers, and one or two other necessities, sent on board the frigates—and thus were brought away forcibly from Europe. They are each to receive here a sum of about \$22: there is only one female, seven or eight officers, and the rest soldiers.

The first steps should be to provide these people with some clothing, and an asylum, so that they may not be obliged to prowl about the streets, or be stripped of their little money by persons taking advantage of their ignorance of our language, &c.—Then time might be taken for making ulterior arrangements.

Among these people are some who have been farriers: they may find employment, we presume, with our blacksmiths. The great mass, however, have only their stout arms to rely upon. Their case, we are sure, will excite the sympathy of our citizens, to whom we commend the annexed appeal of M. Gerard:

To the Editor of the New York American.

SIR—It is in the name of 240 Polish exiles that I ask through your Journal, the opportunity of making an appeal to your fellow citizens. Emboldened by the recollection of the many kindnesses which Americans have lavished upon me, during the eighteen months that I have dwelt among them, I address myself to their hearts, in the full conviction that they will not be insensible to that compassion, which constitutes now the whole dependence of my ill-fated countrymen. May they in their turn experience the blessed fruits of that benevolence, which has so much contributed to ameliorate my condition. Especially, may they be permitted to draw from that source, which the charity of the ladies of New York so abundantly supplies. Soon then would the wretched state of destitution in which they now are, be changed for one less discouraging—and on our part, we Poles, will know how to acknowledge the aid that shall be extended to our misfortunes.

I have the honor to be, Sir,

With the highest consideration,
Your devoted servant,
GERARD,
Antient Polish Officer.

New York, 31st March, 1834.

Subscriptions for the succour of these exiles will be received at the residence of Mr. GERARD, 33 Chapel street.

Since the above was in type we observe, with much

pleasure, that the Common Council have taken steps to ascertain the circumstances, and devise means for the support, of these exiles.]

They have been landed at Castle garden, where they are for the present quartered.

[FOR THE NEW YORK AMERICAN.]
TO M—

That little blossom of the early spring,
Which you so kindly did receive from me,
Is its soft name is ever whispering,
All that I can or ought to ask of thee.
Ah could I feel, in after years of sorrow,
That in thy memory I should hold a place,
From that sweet feeling, my fond love would borrow,
A joy that sorrow's self could ne'er efface.
A gleam 'twould be, of glad and sunny brightness,
And it would come in many a gloomy hour,
To cheer my darkened spirit with its lightness,
And woo it back from Melancholy's power.
Then bid my heart that flattering hope to cherish,
In all the changes of my future lot,
Say that my image shall not sadly perish,
Oh tell me that thou wilt "forget me not."
Wednesday night, March 18.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lanesburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lanesburgh.—August 15, 1833. A29 if RM&F

TO RAILROAD COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, will undertake to build CARS that will carry along their own railway, and may be used on level M'Adam roads. They will save ten millions of money to be wasted on 1000 miles of iron railroads to be laid in the United States within a few years, and dispense with tracks and double tracks. These Cars may be drawn by horses or steam. He claims to have discovered them ever since 1825, by his caveats filed in the Patent Office. Appl. not paid. B1 R J M & F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,	Flat Bars in lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.
300 do. 1 1/2 do. 1/2 do.	
40 do. 1 3/4 do. 1/2 do.	
500 do. 2 do. 1/2 do.	
800 do. 2 1/2 do. 1/2 do.	
soon expected.	

250 do. of Edge Rails of 85 lbs. per yard, with the requisite chairs, keys and pins.
Wrought Iron Pins of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotives wheels.
Axles of 24, 28, 32, 36, 38, 40, and 42 inches diameter for Railway Cars and Locomotives of patent iron.
The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.
9 South Front street, Philadelphia.
Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them. d7imeowr

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.
They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.
The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.
The engine will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.
The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.
All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.
By order of the Company,
WILLIAM NORRIS, Secretary.

December 24, 1833.
For further information on this subject see No. 49, page 778 of this Journal.

STEPHENSON.

Builder of a superior style of Passenger Cars for Railroads.
No. 264 Elizabeth street, near Blocker street,
New-York.
RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J35 if

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscriber at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.
Also, Flange Tires turned complete.
J8
ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS.

Near Dry Dock, New-York.
THOMAS B. STILLMAN, Manufacturer of Steam-Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Non's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. m18

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTZ, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.
For proof of the high estimation on which their Surveying instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Hertz.—Agreeably to your request made some months since, I now offer you my opinion of the instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.
It is with much pleasure I can now state that notwithstanding the instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.
I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require instruments of superior workmanship.
JAMES P. STABLER,
Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.
These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.
WILLIAM HOWARD, U. S. Civil Engineer.
Baltimore, May 1st, 1833.

To Messrs Ewing and Hertz.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.
B. H. LATROBE,
Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any person desirous of perusing the same. m18

TO STEAMBOAT COMPANIES.

PROFESSOR RAFINESQUE, of Philadelphia, offers his services to render steamboats incombustible, and not liable to sink, even by the bursting of boilers, or striking against snags, sawyers and rocks. This will save many boats, much property, and the lives of hundreds every year. Those who neglect this easy improvement, deserve to be neglected and deserted by the public as unmindful of safety. Apply, post paid.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Esq. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York; }
January 29, 1833.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.
Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORNBURN,
347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* Mr. Thornburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine; MECHANIC'S MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality, warranted.

Leveling instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street, corner of Maiden lane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of instruments in his profession, warranted equal, if not superior, in principle of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new; among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Geolometer, with two Telescopes—and a Levelling Instrument, with a Geolometer attached, particularly adapted to Railroad purposes.
WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested:
Baltimore, 1830.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Geolometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying out rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.
Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.
E. M. GILL, Civil Engineer.

German town, February, 1833.
For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.
HENRY R. CAMPBELL, Eng. Philad.,
German and Norristown Railroads.

m18

FOREIGN VARIETIES.

Chinese Mode of Computing.—The Chinese method of computing is by a kind of abacus, which they call a *Suampuan* "counting board." It consists of a frame of wood, of various sizes, divided into two, unequal compartments, by a bar placed crosswise at about one-third the length from the top. Through this bar, at right angles, are inserted a number of parallel wires, and on each wire, on the lower compartment, are five moveable balls, and in the upper two. These wires may be considered as the ascending and descending powers of a numeration table, proceeding in decimal proportions; so that if a ball on any of the wires in the larger compartment, be placed against the middle bar, and called unity or one, a ball on the next wire above it will represent ten, and one on the next one hundred; so, also, a ball on the next lower, one hundredth; and the balls on the corresponding wires in the smaller compartment will, in the same manner, represent five, fifty, five hundred, five hundredths, &c. the value or power of each of those in the smaller division, being always five times as much as those in the larger. In China almost every trade has a distinct system of secret numbers, that is, instead of using the proper characters for designating prices, they adopt other characters, by which they arbitrarily express their meaning, so as to be understood only by persons of the same trade.—(From Montgomery Martin's History of the British Colonies, Vol. I., Asia.)

Mr. Picken.—Mr. Andrew Picken, the author of the *Dominie's Legacy*, and other popular works of fiction, whose premature loss we mentioned with regret several weeks ago, had prepared for the press before he began his last published work, *On the Legends of Ancient Families*, an historical novel, called the *Black Watch*, which has since been published by his son. It is, we have heard, the only legacy which, at his unexpected death, the author could leave to his orphan family, and, though a great addition to his own literary reputation, can only be made productive as a pecuniary inheritance to his children by the favor of the public. We ourselves have neither space nor time to enter upon a detailed examination of its merits, but we can safely recommend it as one of the most interesting and graphic specimens of the kind of composition to which it belongs. It is founded on the history of the first raised Highland regiment, (called the Black Watch, afterwards the 42d), which was marched from Scotland to London in 1743, and which mutinied, on being ordered, contrary to its engagements, to proceed to the colonies. The author's minute knowledge of the Highlands of Scotland and of the Highland character, joined to his assiduous study of the manners, political sentiments, and social condition of the south at that epoch, has cast the air of historic truth round one of the most powerful and pathetic fictions which has recently appeared. Those who have perused the former works of the author will easily give the preference to the *Black Watch* above them all, though its reader had not, in addition, the melancholy satisfaction of assisting his bereaved and disconsolate family.

[From the Morning Herald.]

It would seem, from what took place, last week at the Westminster Sessions, as well as on a previous adjournment-day, that the game of "Cheating the Justice" is not confined, as might have been imagined, to the low tap-rooms of the metropolis, but is actually played upon, and acted in the presence of their Worshipships themselves. We allude, as most of our readers must be aware, to the truly farcical and disgusting proceedings relative to the indictment against a gang of gamblers in St. James's, who appear to have "Cheated the Justice" in the most open, barefaced manner, and that without in any degree exciting the smallest Magisterial ire, while all that the parish of St. James gets by the prosecution is a heavy lawyer's bill to pay, and the mortification of being laughed at for their pains. It is very easy for professional persons probably to define, and, after their manner to justify the quirks and quibbles by means of which this disreputable result of a criminal proceeding is brought about; but to plain apprehensions it admits of but one solution, and that is, that persons having money enough know how to purchase the means of extrication from the maze in which the less fortunate, in point of wealth, find themselves irredeemably involved. This, we regret to say, has been, at all times, from the imaginary age of *Peckham* and *Lockit*, and probably long before it, down to our own, but too frequently the case. On the occasion in question the process is described to have been a very simple one—viz., witnesses who were bound in recognizances of 20l. each to appear, were paid 100l. each to stay away, which amounted

to a premium of 400 per cent. in addition to an exemption from exposure, and from that badgering which they naturally enough expected to undergo. But we put it to the good sense of those who have the regulation of such matters, whether such a state of things should be allowed to exist, as that one of the most offensive and audacious of crimes should thus be allowed to purchase for itself impunity, and the solemn finding of a Grand Jury be thus rendered nugatory and ridiculous? There is, at least, we should imagine, one very obvious way of lessening this chance of escape by taking much higher recognizances for appearance. In answer to this we shall probably be reminded of excessive bail being contrary to Magna Charta and the Bill of Rights; but, strictly speaking, bail was never contemplated after the finding of a Grand Jury, and both policy and justice require that in such cases the trial should be immediate, or, if postponed to accommodate the accused, should be upon security at least commensurate with the punishment if found guilty; and what is 20l. to the keeper of a modern hell, who frequently clears by his system of plunder 1000l. at a sitting? But if the law, as now administered, is not found strong enough to reach this growing and frightful evil, is it not high time that it was rendered so? We are not great admirers of the summary powers invested in Magistrates—at least to the extent to which in modern times they have been carried, and should be therefore slow to counsel their extension; but, feeling as we do, how much the general welfare is compromised in the continued existence and increase of the description of houses so aptly termed "hells," in this metropolis, we should certainly say that the same power which can consign a mere suspected person to imprisonment, without trial, might be permitted to deal in some such summary way with those open public robbers, and corrupters of public morals. This, however, is merely upon the presumption that the law, as it now stands, cannot be made available for that purpose. This impression we rather gather from the result than from our own conviction of its unavoidableness. For ourselves, we greatly doubt the earnestness of those who have hitherto taken it in hand. Justice, they say, is blind, and "blindman's buff" may only be another name for "Cheating the Justice."

Each Nation a Distinct Skull.—While traveling in foreign countries I made a collection of the skulls of different nations, (the greater part of the collection I had the pleasure of presenting to the Asiatic Society Museum, at Calcutta, where they may now be seen,) and it is exceedingly curious to observe what a marked configuration the crania of diverse people exhibit, even among nations with scarcely a perceptible natural boundary between them. The most striking example noticed was the difference between the Bengalee and the Burmese; the skull of the former possesses a greater occipital protuberance than that of any people I have ever met, it is, in fact, semiglobular, and the whole skull extraordinarily small, divested of any angular or rugged projections, and of remarkably thin laminæ; (these observations are founded on examinations of hundreds of the Bengalee skulls;) the cranium of the latter (Burmese) possesses what I have never found in any other nation—a perfectly flat occipital bone, so much so, that any Burmese skull will rest on a broader and firmer base when placed with the face upwards, than any other position. As if to compensate for the flatness of the occipital bone, the parietal or side walls of the skull bulge out in an extraordinary manner; the brain case (unlike the Hindoos) is very large, and the lining extraordinary thick.—Among my Burmese specimens were the mutilated skulls of Burmese soldiers, found near Rangoon, some of which were clove in twain by the prowess of British soldiers.—[From Montgomery Martin's History of the British Colonies.]

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in semi-monthly form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. Minor, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will

be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y. D. K. MINOR, Proprietor. Jan. 22, 1834.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published.

Also, the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

Also, the PLOUGH-BOY, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

All Letters and Communications for the above publications, may be addressed, free of postage, to

D. K. MINOR.

NOW READY,

AN INTERESTING AND USEFUL MAP.

Upon which is delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It may be had either in sheets, price \$1 25, or put up in Morocco for pocket maps, price \$1 50, or on rollers at \$2 25, in any quantity, by applying to the subscriber. D. K. MINOR, 35 Wall street. New-York, April 2, 1835.

FOR SALE.

ATLANTIC OCEAN AND FRIEND OF KNOWLEDGE—A Quarterly Journal, by Professor Kane, of Philadelphia, begun in the spring of 1832, with wood cuts, &c. devoted to Historical and Natural Sciences, Botany, Agriculture, &c. at one dollar per annum.

MEDICAL FLORA OF THE UNITED STATES, in 2 vols. with 10 plates, containing also the economical properties of 300 genera of American plants, \$5.

MANUAL OF AMERICAN VINES, and Art of Making Wine, with figures, 25 cents.

FISHES AND SHELLS OF THE RIVER OHIO, 1 dollar.

AMERICAN FLORIST, with 36 figures—price 25 cts.

* * * * * Orders for these works, or any other of Professor Kane's, may be received at this office. A. J. M. & F.

PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the sub-ventured Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as in England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory, for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. L. Brown, 222 Wall street, New York; A. M. Jones, Philadelphia; T. Janvick, Baltimore; Legrand & Smith, Boston.

AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 35 WALL STREET, NEW-YORK, AT THREE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

D. K. MINOR, Editor.]

SATURDAY, APRIL 12, 1834.

AMERICAN RAILROAD JOURNAL, & c.

NEW-YORK, APRIL 12, 1834.

We publish the following letter from our esteemed correspondent and friend, E. L. Miller, Esq., of Charleston, S. C.

D. K. MINOR, Esq.:

Dear Sir,—I send you enclosed, the amount of my subscription for the Railroad Journal for the current year, and as it may not be altogether uninteresting to you, annex a brief statement of the performance of a locomotive steam engine, recently built under my direction by Mr. Baldwin, of Philadelphia, and now running on the Charleston and Hamburg Railroad. She started from Aiken, 120 miles from Charleston, on Thursday morning last, at 15 minutes past 7 o'clock, with 11 cars loaded with cotton; at Blackville, 90 miles from Charleston, another load was added; at Midway, 72 miles from Charleston, 2 others were added; and at Branchville, 62 miles from Charleston, a fourth load was added—making in all a train of 15 loaded cars. This immense weight, not less than 80 tons, including engine and tender, was delivered in Charleston, at 7 o'clock 15 minutes, in the evening of the same day, notwithstanding delays on the road, at the different stations, of $4\frac{1}{2}$ hours—making the running time $7\frac{1}{2}$ hours only, for the distance of 120 miles. Numerous ascents of 20 to 35 feet per mile, were overcome with this load, and what is of most importance to those interested in railroads, is, that the greatest weight on either wheel of the engine does not exceed $1\frac{1}{2}$ tons. Respectfully, yours,

E. L. MILLER.

THE RAILROAD.—A single track of the railroad between this city and Columbia was finished last week, and on Sunday the first horse car arrived from the latter place. On Monday, three horse cars with passengers, left this city, and arrived at Columbia [distance about

11 miles by the railroad] in an hour and a quarter. Yesterday the locomotive, with its tender, and four passenger cars in train, started from the depot in Chesnut street, to make the first trip with steam power.—[Lancaster (Pa.) Examiner, April 3.]

[From the Baltimore American.]

The Legislature of Louisiana, which has just adjourned, adopted a very severe, and, we trust, efficient law for the regulation of steamboats, so as to secure them from explosion. The number of fatal accidents on the Mississippi—particularly the disastrous one by which Senator Johnston lost his life—imperiously called for some legislative interference to secure care and fidelity in the management of engines, and every practicable assurance of their soundness. The new law manifests great anxiety to establish minute precautions against accident, as well as misconduct, and imposes heavy penalties on the agents and owners in every case of damage, which any possible care might have prevented. To make the law more effective, it has been sent to the Executive of all the States bordering on the Mississippi, and its tributaries, for similar action.

The law establishes the office of State Engineer for the port of New Orleans. The duty of the engineer is to examine, once in three months, the strength of the boilers of steamboats plying within the waters of the State; to test them by hydraulic pressure to three times the weight of steam they may be supposed capable of carrying; and to furnish each boat with a certificate specifying the weight of steam which may be safely used.

In case any accident happens on board any boat, not possessing the proper certificates, neither captain, owner, nor agent, can recover any claim for freight or insurance; the owner or agent is made responsible to the shipper, to the full amount of all damage, and the captain is further subjected to a fine, not less than \$500, nor more than \$2000, and to imprisonment for not less than three months, nor more than three years. If lives are lost, the captain is to be adjudged guilty of manslaughter.

The same penalties to the several parties, are provided in case of any accident in navigation, from over loading, racing, carrying higher steam than the certificate allows, or any accident "that may occur while the captain, pilot, or engineer is engaged in gambling or attending to any game of chance or hazard.

The same penalties are provided in case of any accident, from gunpowder, shipped without a written notice of the fact being posted in three conspicuous parts of the boat.

Shippers are made liable to a fine of \$200 for shipping gunpowder, without notice to the master or clerk, and also made liable for danger that may happen by any accident therefrom; and in case of loss of life are adjudged guilty of manslaughter.

In passing on the river, the descending boat is commanded to shut off steam and float down when within a mile of an ascending boat—the latter to assume the responsibility of steering clear of the other, and being liable for all damages.

Other minute directions are given, but the above

form the principal enactments of the law, which appear to be drawn up with a determination to enforce rigorous penalties against any carelessness in the management of steam engines on the Mississippi, within the limits of the State of Louisiana.

THE FARMERS' & MECHANICS' BANK with other Banks in Albany, have, as we hear, taken the Chenango loan of \$900,000 at 6 1/2 per cent. premium for a 5 per cent. stock—irredeemable till 1845.

The following extract, from an English paper, shows some of the important reasoning urged against Railroads. It contains others, also showing their great importance from a source entitled to great credit.

Mr. VIGNOLES addressed the meeting as follows: I present myself before the meeting at the request of the directors of the London and Windsor Railway Company; but I beg that the gentlemen present will do me the favor of expressly understanding that I do not come here in any way connected with them personally. They have called upon me in my professional capacity to lay before them a certain report; with that request I have complied; it is in their hands, and ready for distribution, if they think proper. They consider, however, that it would be more satisfactory, both to this meeting and to themselves, if I would attend here, for the purpose of giving a *viva voce* explanation to many gentlemen who perhaps have not had an opportunity of perusing that report, which I beg the meeting will distinctly understand is simply a professional report, on the comparative merits of two lines of section, I not having seen the contrary, nor having had an opportunity of knowing any of the parties connected with this undertaking, until within the last few weeks. The line of country between London and Bristol consists chiefly of two valleys, the principal one of which is that of the Thames. A bare inspection of the map will at once satisfy any gentleman that Windsor lies in the direct road towards the first principal town where it will become necessary to quit the valley of the Thames; that town is Reading. In fact, it is perfectly well known that any line of road proceeding in this direction, and much more a railroad from London to the western part of England, must pass through Reading. The question, then, was what part of the intermediate country should be included in the line, that through Windsor being in a perfectly straight direction? I am well aware that this was only one of many points of consideration. In arranging a matter of this nature, direction and straightness are no doubt very leading characteristics; but the levels and the expense are other objects requiring no less consideration.

The engineer of the company, Mr. Gibbs, lodged his plan and section in the proper parliamentary office, agreeably to the standing orders of the House of Commons, in which the different levels were specified with great minuteness; the engineer of the London and Bristol Company did the same, and these two Parliamentary sections were sent to me, accompanied by the necessary maps. The maps of which I speak were on a sufficiently large scale to show, with great minuteness, the property of every individual along the projected line of road; and this being a subject with which I am perfectly familiar, I became as well acquainted with the nature of the proposed line of road, from an inspection of the maps, as if I had lived on the ground. I went through the usual necessary calculations, and I can now state, that I have ascertained that in point of levels, in point of expense, and in point of general direction, any railroad from London to Reading ought to pass through Windsor. (Cheers.) There cannot be a doubt of it in a professional point of view. (Hear, hear, hear.) It would only be taking up the time of this meeting unnecessarily if I were to enter into any minute detail. My report has been made, and if the directors, after my looking over it, should deem it advisable to print it for distribution, I am quite willing that my professional reputation should stand or fall by that report. (Renewed cheering.) I have had the honor either of being employed upon or consulted in the progress of almost every railroad of importance which has been sanctioned by the House of Commons during the last eight or ten years; and I am now engaged in the construction of some of the most important that have yet been projected. It is almost unnecessary for me to say, that with the pecuniary question, or the discussion of local interests, I have nothing to do on the present occasion. I have been requested by the directors, however, to add a few popular remarks on the nature of railways in general, which, if the meeting will not consider it obtrusive, I will now subjoin, for the information of those gentlemen who have not had an opportunity of seeing these new modes of communication. (Hear, hear.) A railway, to speak familiarly, is a perfect road. We all know that a level road is the best, and we also know that roads are best in summer, or when they are constantly dry and hard, being then of course easier for travelling. A railway is a road carried to perfection: it consists of bars of iron, supported at intervals on stone blocks, and otherwise so as to form a hard and uniform surface, on which the wheels of the carriage roll, the wheels of the carriages being prevented from running off the rail by means of an angular piece of iron, which was called the flanche. The surface of the country over which the railroad passes is reduced by cuttings and embankments, to a line as nearly horizontal as possible. In the railway from London to Reading through Windsor, this reduction will be such that no elevation will exceed from five to six feet in the course of a mile—that is to say, if the road be constructed upon the plan submitted to me by the London and Windsor Railway Company. (Hear, hear.) The line from London to Reading, through Windsor, is infinitely preferable to that which is projected through Maidenhead, because in some cases the elevations on the latter line of road are as much as 18 feet in a mile. (Cheers.) The road having been levelled is then formed, and the rails, supported, as I mentioned just now, by blocks at intervals of a yard, are placed upon it, and firmly secured, the roadway being well drained. By these contrivances the resistance which a wheel generally meets with upon a road, particularly in bad wintry weather, is reduced in fact to nothing, and by means of peculiarly constructed wheels and axles, the friction there is reduced also, so much so, that a weight or force of eight pounds will, on a good railroad, draw a ton; whereas it requires a force of at

least fifteen times as much to drag the same weight over a common road. We are thus enabled to convey heavy goods, by means of a railroad, at a price which appears to those who are unacquainted with the subject, almost ridiculously small. A charge of three halfpence per ton per mile will pay interest on capital invested in railroads. They are enabled to convey goods at this rate by means of the locomotive engines. On the Liverpool and Manchester railroad the tonnage is only one penny per ton per mile. This, perhaps, will be an answer to those gentlemen who doubt the cheapness of railways in this respect.

Mr. Pocock.—That is more than what that gentleman (Mr. Holdsworth) stated.

Mr. VIGNOLES.—These are the maximum rates on coal. It must be borne in mind too, that upon the Liverpool and Manchester railway there are some severe inclinations—there are two, each of fifty-five feet in a mile. These inclines of course increase the expense of carriage; as the whole quantity of goods have to be lifted as it were up the railroad, in order to attain the upper level. According to the plan of the committee, this part of the expense will be so small in the present instance, that I may venture to say the cost of the company for the conveyance of goods could not exceed, for the moving power, three-eighths of a penny per ton per mile.

Mr. Pocock.—Three-eighths of a penny?

Mr. HOLDSWORTH.—Just a farthing and a half.

Mr. Pocock.—That is considerably more than what Mr. Holdsworth stated. A waggon load of dung will weigh four ton. Now he said that we could have that moved for sixteen or eighteen miles along the railroad for the same expense as we now bear for carrying it three miles. Now, on a common road, I can get that carried three miles for 2s. 6d. (Hear.)

Mr. VIGNOLES.—Yes, and along the railway you could get it conveyed 16 miles for 16d. ("Hear, hear," and laughter.)

Mr. Pocock.—The laugh is against me now, but you will remember that it is not one ton but four; and four times 16d. is 5s. 4d. (Hear, hear.)

Mr. VIGNOLES.—Excuse me, but I don't think you are very likely to find any waggons in this neighborhood which will weigh four tons.*

Mr. Pocock.—Yes, I can. I have seen them many a time at Mr. Ramsbottom's there. ("Hear," and laughter.)

Mr. VIGNOLES.—To return to my statement. I have little doubt either in saying that it is almost as easy and as cheap for a railroad company to carry one thousand passengers as six hundred. Successful as the locomotive engines have been, I fully believe that power to be yet in its infancy, although even now it has been carried to an extent almost incredible to gentlemen who have not had an opportunity of witnessing its effects. Its operation is so familiar to me that it has ceased to be a wonder. Conceive, however, what I myself have seen at Manchester—conceive an engine conveying 200 people at the rate of 20 miles an hour with perfect ease, and ask yourselves if it can be doubted for a single moment that this same tremendous power must speedily be brought into extensive operation in other parts of the country? On the Stockton and Darlington road, before the formation of the railway, there was no traffic at all; by means of the railroad 200 or 300 persons traverse that road every day, who, by a saving of one half the time, and one half the money, enjoy four times the facilities of travelling which they formerly possessed. The establishment of a railway, in fact, must increase the traffic. It is but reasonable to suppose that the man who can travel down to Windsor in an hour, transact all his business, and return home again

* Since the meeting took place, we have been informed by Mr. Vignoles, that the average price of farmers' carting all over England is not less than 6d. per ton per mile.

for one third of the sum he has been in the habit of paying, will visit it three times as often as he used to do. Having made these observations, I will not detain the meeting any further. With reference to details relating to individual landowners, I can give no information whatever, but I shall be exceedingly happy to answer any questions that may be put to me upon the subject of railroads in general. Before I sit down, I have been requested by the committee to state clearly the difference between the line projected by the London and Windsor Committee and that proposed to be adopted by the directors of the London and Bristol Railway. I should say, speaking from the estimate of this company's engineer, which I believe to be perfectly correct, although I have thought it my duty to increase the estimated expense in making my report, that the cost of the railroad between London and Reading, passing through Windsor, would not average more than 13,000l. per mile, while the average expense of a railroad between London and Reading, passing by Maidenhead, would be 25,000l. per mile. (Loud cries of "hear.") I need hardly say that if a railroad can be made at a reduced expense of one-half, the conductors of that railroad can afford to carry goods and passengers for much less than they otherwise could. I, however, as I have already hinted, have increased the estimate of the company's engineer to 16,000l. per mile; which, I believe, will finish it effectually and completely. I have had some experience, and I feel justified in saying that at all events this railroad will cost, taking all its expenses, at the very utmost, 16,000l. per mile, and not 25,000l. per mile. (Hear, hear.) I should also mention that the Bristol Company propose to have a considerable length of tunnel on their line of road, which is always objectionable, but more especially on railways, in consequence of the noxious atmosphere which is necessarily engendered by the locomotive engines in so confined a place, where it cannot be dispelled by an adequate supply of fresh air. The amount of cuttings and embankments, too, according to the plan proposed by the committee, will be very small. I will illustrate this position in rather a striking manner. Between Windsor and Reading the quantity of material necessary to be removed is 400,000 cubic yards; between Ashmill and Reading, via Maidenhead, it is upwards of 2,000,000 cubic yards. (Cheers.) These, gentlemen, are the facts on which I have formed my inferences, these are the grounds on which I have drawn up my report. I have retained the meeting by this statement, with the view of drawing the attention of gentlemen to the subject, and if any of those who are now present would be interested by reading the report in detail, I again say that I can have no objection to its distribution. (Mr. Vignoles resumed his seat amidst considerable applause.)

Mr. VIGNOLES.—Perhaps you will favor us with a list of the failures, sir, and I will answer you. (Much cheering and laughter.)

Mr. PAYN.—It can easily be proved—easily. Certainly, gentlemen, Mr. Vignoles has very eloquently expatiated on the great benefits arising from railroads, but you will have the goodness to recollect he is a superintendent of railways. (A laugh.) The currier says there is nothing like leather; the bug-destroyer prides himself upon his specific for destroying that obnoxious insect, and the superintendent of railways tells you that railroads are very excellent things. It is all very well, but I do not think it any reason why we should have our lands cut through.

Mr. VIGNOLES.—I was not aware when I was expressing what I considered to be an impartial opinion as to the comparative merits of two lines of road, that I should draw down upon myself such an animadversion as the gentleman sitting on the green cloth (Mr. Payn) has cast upon me.

Mr. PAYN.—No, no.

Mr. VIGNOLES.—I beg your pardon, sir, you have been pleased to call me an inspector of railways. Now, I have the honor of being a civil engineer, in considerable practice, and it is all the railroads in the kingdom went to the bottom of the sea to-morrow, I should have quite enough to do; I have been told, too, that if this projected railroad is proceeded with there are some gentlemen who would lose some very good situation or other. (Much laughter and cheering.)

Mr. Pocock.—I don't know anything about situations. If you take my land away, I can't farm it.

Mr. VIGNOLES.—Now, with respect to the 44 acts of Parliament which the same gentleman (Mr. Payn) has alluded to, I beg most decidedly to dissent from his statement. There may have been some 44 acts for the establishment of tramroads, which were in vogue some 30, 40, or 50 years ago, which have gone to decay, and have been ruinous speculations, simply because they proceed on erroneous principles; but it is quite clear that all those modern constructions which we call railroads, which are adapted to the use of the locomotive engines (and those I more particularly advocate), have been quite successful, so far as the experiment has yet been tried, particularly the Liverpool and Manchester Railway, which was opposed, as I believe the hon. gentleman very well knows, tooth and nail by every land owner, on the ground that the railway would injure their interests. That railway, however, having been obtained—ay, in spite of their teeth, is so far successful that another railway establishment between Liverpool and Manchester is now about to be projected, and it is generally understood under the patronage of the very same landed proprietors who combined and conspired, I would say, against the former one. With respect to the number of railroad acts that have been passed I can undertake to say that there are not above six or seven which relate to these modern railroads. The Stockton and Darlington was the first public act: that was successful, and 1000 shares in that company are now selling in the market for 300l.; and shares in the Liverpool and Manchester railway, originally of the value of 100l., are now worth 200l. With reference to others, all I can say is, that they are selling at respectable premiums. Upon the subject of the patronage of his Majesty's government, all I can say is, that I had the honor of speaking to a member of the ministry on Monday last on the subject, and that so far from the government feeling any opposition to railways, its members individually are decidedly in their favor. (Hear, hear.) I speak of them in their individual capacity, because it would be contrary to parliamentary practice if they afforded any one an opportunity of explaining their sentiments as a body on such a subject, for it is a part of the admirable spirit of the English government to let capital fight its own way, it being well understood that English enterprise and speculation, when left to itself, exerts itself in a manner which is most beneficial for the country at large. Before I sit down, perhaps I may trouble the meeting with one more observation, to which I more particularly beg the attention of landholders—viz. the effect of railways in reducing the poor-rates. (Hear, hear.) Along the whole line of road between Liverpool and Manchester, a very large sum is contributed by the company towards the poor-rates, so much so that a reduction of them to the extent of 25 per cent. has taken place in one parish alone. (Cheers.) At all events, the proprietors of this railway, which is 30 miles in length, pay nearly 4,000l. a year for poor-rates in the various parishes through which that line of road passes. (Renewed cheers.)

Mr. Pocock.—Will you have the goodness to tell us, sir, how they are assessed?

Mr. VIGNOLES.—In proportion to their profits, according to the beneficial enjoyment—in

the same manner as canal companies, I have again to beg pardon of the meeting for intruding upon their attention a second time, but really when a professional gentleman attends for the purpose merely of giving an explanation, he being personally indifferent to the success of either scheme, it is rather hard that his conduct should be animadverted upon as mine has been. I am as much interested in the success of canals as I am in the well-being of this species of undertaking. I have the honor of being consulted upon the navigation of one of the most important rivers in Ireland, and with the management of various public works—such as bridges, docks, and canals, and therefore I say again, I am not dependent on railways. (Cheers.)

Mr. Pocock.—You have said that the landed proprietors are all in favor of a second rail-

way between Liverpool and Manchester. Is it for the improvement of their land, or the investment of capital, in the hope of getting a profit?

Mr. VIGNOLES.—In either case it showed their conviction that they could not pursue a better course, and that a railway could not do them any harm. (Hear.)

Mr. Pocock.—As you are so scientific, I should like to know how a railway improves the land?

Mr. VIGNOLES.—By affording facilities for the conveyance of goods to and from market.

Mr. Pocock.—We have got them already—I have for one.

Mr. VIGNOLES.—Then, all I can say, sir, is, that you are more fortunate than your neighbors.

HANCOCK'S STEAM-CARRIAGE "AUTOPSY."—We give an engraving of Mr. Hancock's last new steam-carriage, the "Autopsy,"—the same which performed the journey to Brighton and back, with so much success, about three weeks ago, and which has been running daily, during all the present week, between Finsbury square and Pentonville. We have witnessed its performances repeatedly, both as passengers and as lookers-on—and only re-echo the general opinion, when we say that it works admirably. The machinery, which is constructed on the unproved plan, for which Mr. Hancock's last patent was taken out, will be found fully described in a subsequent communication from Mr. Hancock himself.

The quantity of coke expended in each journey of (about) two miles, scarcely exceeds a bushel; so that even supposing the wear and tear were to be as great as in the case of Mr. G. Stephenson's engines on the Liverpool and Manchester Railway, or even twice or thrice as great, the returns from such a carriage, running between the City and Pentonville or Islington, must be sufficiently ample to afford a very handsome profit. According to the following calculation, with which we were favored by a fellow-passenger, there would be a clear gain, during a period of 365 days, of nearly cent. per cent.

CAPITAL REQUIRED TO BE INVESTED.	
Cost of steam-carriage	£700
Spare ditto, to use when the other is under repair,	700
	£1,400
Dr.	
Wages—engineer 40s. per week, steers-	
man 30s. assistant 20s.	£234
Repairs	150
Tolls 4d. each journey × 12 × 365	73
Coke 6d. per journey × 12 × 365	109
Water	50
Rent of coach office and coach house	100
Clerk	50

Premium to the patentee, at the rate (say of 1d. per passenger) 12 × 24 × 365	438
Reserve Fund to replace carriage when worn out—probably in 3 or 4 years	175
	1,452
Dividend of £84 on £1,400	1,176
	£2,628

By twelve journeys per day, and twelve passengers each way, at 6d. each, 12 × 24 × 365, - - - - - £2,628
[London Mechanics' Magazine.]

Mr. Rutter's New Mode of Generating Heat—Successful Application to Gas Works. [From the London Mechanics' Magazine.]

SIR,—I beg you will not impute my long-continued silence to any other cause than incessant occupation during the last three months. I am not indifferent to the opinions of some of your correspondents, nor am I insensible to the kind wishes which have of late been expressed towards me, in reference to my process for generating heat.

To dislodge prejudice is no easy task, especially when it has become venerable by age, or respected through the influence of great names. Truth will eventually prevail; but its progress bears no analogy to that of the glowing meteor. May it not rather be compared to the twilight of the morning, that melts imperceptibly into the dawn of perfect day?

It was once the fashion, I believe, to devise ingenious theories, and then endeavor to make practice conform to those theories. This seems to have been beginning at the wrong end. A more natural process is now adopted,—a process in which experiment supplies the materials for constructing theories and illustrating first principles.

Arrangements have accumulated so heavily upon me that I scarcely know where to commence. If I pass over any of the observations of your

correspondents which appear justly entitled to notice, I hope you will believe the omissions are unintentional. Until Colonel Macerone (No. 529, page 453,) republished his letter of November 25, 1826, I was wholly unacquainted with his views respecting the use of liquid fuel. I do not remember that I had ever seen, or heard, or read, anything relating to the subject until the summer of 1832, and then my information extended no further than that coal tar was employed in heating gas retorts.

Mr. Cheverton (No. 531, page 28,) first made me acquainted with the name of Morey, whose 'American water burner' was very kindly and opportunely described (No. 533, page 52,) by Mr. W. H. Weekes. That experiment was new to me. I have since tried it, but, I must confess, without any perception of its being rendered "applicable, in many cases, in place of a furnace."

Mr. Cheverton implies a doubt as to the possibility of decomposing water economically. He admits, however, that "our knowledge of light, heat, and combustion, is very obscure, and that experiment is our best guide in the absence of perfect theory." I fully agree with him.

Almost all that was formerly known about the conditions of decomposing water by heat, seems to have related to effecting it in close tubes or vessels, heated externally, the hydrogen being liberated through the agency of readily oxidizable surfaces. The conditions of my process are very different from those just mentioned.

That water is decomposed when employed in conjunction with certain carbonaceous fluids, may be doubted or denied. It is one thing to deny, another to disprove: seeing, with some persons, is not always co-existent with belief. But truth is unalterable, whatever differences of opinion may prevail respecting it. In physical science, fact and experiment constitute the only safe guides to theory. Theories may be constantly changing, or they may be altogether false: not so the laws which govern the elements of the material universe. We may be ignorant of those laws, but are they on that account the less uniform and invariable in their results?

Mr. George Bayley (No. 533, page 52,) has my thanks: were he to see my memoranda of last May and June, he would be amused at the coincidence of our views respecting the use of tanks for stowing tar and preserving the trim of vessels. Will Mr. Bayley permit me to set him right in a trifling matter? The specific gravity of coal tar is *greater* than that of water.

The communication of your Salistury "correspondent" was almost a verbatim copy of my own printed statement. I have no intention of interposing between "Correspondent" and "An Old Gas-maker," neither of whom are known to me, excepting in your pages; yet I may perhaps be permitted to say a few words to the latter, in reply to his remarks, No. 537, p. 125.

It never was intended to set forth that 17,100 cubic feet of gas could be obtained from a chaldron of Newcastle coal *only* through the agency of my heating process. It would be mere trifling to say that heat, externally applied to retorts, whatever may be the kind of fuel employed, could materially affect the internal process of distillation. All other conditions being the same, I produce an equal quantity of gas from a given quantity of coal, whether the fuel employed be coal, or coke, coal and coke combined, or coal in conjunction with fluid materials. I will not say that an equal amount of work may be done in the same time, and at the same cost with solid fuel, as with solid and liquid together. In the former case it is more difficult to preserve the same uniformity of temperature than in the latter; and it is impossible, by any ordinary means, to obtain an equal quantity (or intensity) of heat from equal weights of solid and of liquid fuel.

The most startling part of 'Correspondent's' (or rather my statement), in the view of 'An Old Gas-maker,' seems to be that which relates

to the density of the gas. An increased quantity of gas, and at the same time "an increased specific gravity," is "so much at variance with the generally received opinions of the present day," that "An Old Gas-maker cannot but conclude that there must be some error in that part of the statement." I have great pleasure in assuring him that there is not the slightest error. During the week last past, I have made from 31 bushels of Newcastle coal (80 lbs. per bushel,) 40,590 cubic feet of purified gas = 18,036 feet per chaldron = 14,028 per ton. Average sp. gr. 0.535.

These workings may not be in accordance with "the received opinions of the old school." I cannot be answerable for that. Experiment, not opinion, has been my guide. I only exhibit facts as I find them. By experiment I would have it understood that I mean not a mere experiment, which may rather be viewed as an exception than adopted as a rule. The manipulations of the laboratory are very often at variance with those of the manufactory. All my experiments have been conducted in the ordinary course of practical workings, and the results have been verified in the course of successive days, and weeks, and months.

At a neighboring station my mode of working has been successfully adopted. Last March the maximum product per chaldron on that station was 13,000 feet. In October, from the same kind of coal, 16,500 feet were made.

It has been said that it is impossible to make 18,000 feet of gas from a chaldron of Newcastle coal, since it involves the absurdity of getting more out of the retorts than had been put into them. This is assertion without proof, and is as much deserving of credit as the received opinions, that quantity and increase of sp. gr. are always in a direct inverse ratio.

To comfort an Old Gas-maker, I can assure him that the retorts I am now heating, by means which he is pleased to designate 'a new combination of the fiery elements,' are in excellent condition—and the furnaces stand well. The same retorts did almost all the work of the station here, during the last winter.

I am not sure that I have yet attained to the maximum product of gas from a given quantity of coal. After making 18,000 feet per chaldron, I find there are sufficient materials to make probably 4 or 5,000 feet more gas. At present I have no means of appropriating these materials for gas-making economically. With the same retorts, and the same apparatus that I am now working, I required, in Nov. 1832, to produce 46,580 feet of gas, 136 bushels of coal. In Nov. 1833, I have made an equal quantity of gas from 92½ bushels of the same kind of coal.

A question in which every practical gas-maker should feel interested, is, whether it be best to keep up a large fire principally for the purpose of making tar and coke, and ammoniacal liquor, or whether that fire may not be more profitably employed in generating gas?

It would extend this paper beyond all reasonable limits, were I now to enter more fully upon details. It would, moreover, be anticipating the proposed publication, in a different form, of my views and experiments connected with this subject. 'An Old Gas-maker' will, I hope, exercise a little patience; and if I appear to him somewhat slow in my movements, let him remember that I am neither an old gas-maker, nor a gas-maker by profession. All I do in that, or any other department of science, is during the few interstices of leisure that occur amongst more important engagements.

Will Mr. E. Walker, No. 536, p. 107, be so good as to inform the readers of the *Mechanics' Magazine*, by what means he has ascertained that coal gas, when used in close apartments, is a *deadly poison*? Is it absolutely necessary, when this gas is so used, that it should be permitted to escape into the room? What are the properties of the respective products of combustion resulting from purified coal gas and long ten tallow candles?

That I am deeply interested in these questions, Mr. Walker will perceive, when I tell

him that I use gas in my bedroom instead of rush candles. I have done it because gas is cheaper than candles, and much more convenient.

J. O. N. RUTTER.
Lymington, Nov. 27, 1833.

Mr. Rutter's New Mode of Generating Heat.
[From the *London Mechanics' Magazine*.]

SIR,—Mr. Rutter says, with truth, that his invention is never likely to be used where fuel is cheap, for according to his statement, although tar is but three-pence per gallon, it is still dearer than coal, the account standing thus:

4 cwt. 0 qr. 20 lbs. of coke at 25s. per ton,	5s. 2½d.
27½ gallons of tar at 3d.	6s. 10 d.
	12s. 0½d.

And coal may be had at from 7s. to 12s. per ton.

Besides, as the demand for tar increases, so must it increase in value, and thereby operate still further against its general adoption. Then, as regards originality, without wishing to detract one iota from the merit of Mr. Rutter, I think it but right to say that, at the gas-works here, tar has been consumed for some years past, not for the sake of economy, but merely to get rid of it, and, as I take it, in a manner somewhat analogous to that proposed by Mr. Rutter, viz.: over a certain measure of coke are thrown two cans of water, and one of tar; but from the effluvia arising from its combustion, this admixture cannot be used.

In commenting on the new mode of generating heat, Mr. G. Bayley, page 51, has been hurried, by an inconsiderate admiration, to wander far from the truth, and that, principally, through confounding weight for bulk. Want of "stowage" can only be understood to imply want of room, and a chaldron of coal and a chaldron of coke must occupy equal spaces; but as the former weighs 26, and the latter only 18 cwt., "stowage" cannot possibly be found in the same vessel for an equal weight of each. The comparison of volume and weight will therefore stand thus—

	cwt.	qr.	lbs.
A chaldron of coke.....	18	0	0
110 gallons of tar.....	10	3	6
	28	3	6

Which, multiplied by 3, will be equal to 86 cwt. 1 qr. 18 lbs. of coal.

Taking the specific gravity of coke and tar as equal, it gives 1-599 chaldron of the compound, and 3-064 chaldron of coals, or the effective quantities rather less than two to one, instead of three to one, as stated by Mr. Bayley.

As regards stowage, water of course need not be taken into account; but in estimating the comparative cost, 15 or 16 cwt. of water being required for every ton of coke, some allowance ought to be made on account of the labor, &c. necessary to remove it from alongside into the reservoir for supplying the fire. I will take leave of the subject at present, with noticing two minor errors: first, Mr. Bayley states the fluid required is withal of less specific gravity than water; while Mr. Rutter states the tar to be 11 lbs., and water is but 10 lbs. per gallon. Again, in stating the comparative economy, he says, 1½ gallons of tar at 1½d. per gallon, is a 1½d but this is no doubt a press error. Yours, respectfully,

TREBOR VALENTINE.

Application of Mr. Rutter's New Mode of Generating Heat to Steam Vessels. [From the *London Mechanics' Magazine*.]

SIR,—My remarks, in No. 533, page 32, appear to have excited the displeasure of your talented correspondent, Trebor Valentine, on account of my "inconsiderate admiration" of Mr. Rutter's new method of generating heat, which, he says, had led me to wander far from the truth. This is a grave charge, and were it not made by a person in a mask, I might be induced to take it in high dudgeon.

How far I am justly liable to the charge of "inconsiderate admiration" of the process, is known only to myself. Not having a copy of my former letter at hand, I am unable to refer

to the precise terms I then employed; but I have a distinct recollection that my "inconsiderate admiration" was chiefly referable to three points, viz., the saving of stowage, weight, and expense. It so happens that I have had some experience in building and navigating steam-vessels, and may, therefore, without presumption, lay claim to so much practical knowledge as to be qualified to express an opinion upon the desirableness of Mr. Rutter's method of generating heat.

I have often felt the want of convenient stowage for coals, notwithstanding there were many vacant spaces low down in the vessel, each containing a few cubic feet, in which small tanks for coal-tar might have been advantageously placed, but which were either unsuitable or inconvenient for the stowage of coal. The trifling weight of coke, compared with an equal bulk of coal, renders it much more convenient for stowage on board a steamer than coal, as it can be safely and advantageously stowed where it would be highly imprudent to stow coal, on account of its greater weight. Mr. Rutter's plan allows of the division of the fuel into small masses, so that, by due arrangement, it may be stowed in such a way as to lower the centre of gravity, and thus increase the stability of the vessel. Whether I have bestowed "inconsiderate admiration" on Mr. Rutter's plan, in this respect, I leave to you and your readers to decide.

With regard to the diminution of weight, I took Mr. Rutter's data, and, on reference to my former communication, think that it will be found that the difference is 3 to 1 in favor of Mr. Rutter's plan. Even on Trebor Valentine's own shewing, it is 2 to 1, which is sufficient advantage in point of weight to secure the "inconsiderate admiration" of persons like myself, who have found ourselves greatly impeded in our progress by the great weight of the coals we were compelled to take on board to supply the engines. But our "inconsiderate admiration" goes yet farther on this head, because the fluid admits of being stowed away in tanks, fitted to the vacant spaces near the bottom of the vessel, so as to bring the centre of gravity lower down than it usually is in steam-vessels worked with coals in the ordinary manner. This alteration in the centre of gravity would greatly increase the stability of a steamer, and lessen the labor of the captain and crew in trimming her upright when heeled either way, by the shifting of the passengers, or by the pressure of the sails. It is also very desirable to keep the vessel in as nearly the same trim as possible, that the paddle-wheels may act with their maximum effect. Mr. Rutter's plan offers the advantage of being able to dispense with half the weight we are now obliged to carry, and thus offers another attraction to call forth the "inconsiderate admiration" of the captains and engineers of steamboats.

It appears that I have made a blunder as to the specific gravity of the tar, and I stand corrected. I had no intention to misrepresent the fact, but having, as I thought, observed that coal tar floated on salt water, I considered its specific gravity to be rather less.

I took the cost of the tar at 1½d. per gallon. I formerly purchased it at one penny per gallon, and not knowing its present price in large quantities, I thought that I had made sufficient allowance by stating it at three halfpence; and your correspondent, in No. 543, page 211, fully bears me out in my estimate being rather above than below the mark. Why Trebor Valentine should charge me with having wandered far from the truth, I cannot conceive, seeing that, for the purpose of convicting me of an error, he has at least doubled the cost of the ingredients in Mr. Rutter's plan for generating heat. Surely his "inconsiderate" prejudice, or something else, has led him far from the truth here, in order to decry a plan which, to say the least, is worthy of our approbation, for having suggested a method of applying to practical purposes a mode of generating heat which has hitherto been confined to the laboratory of the experimental chemist.

My calculation of the expense was made, as may be seen, upon the data furnished by Mr. Rutter, as to the quantities of fuel required to produce a certain effect. If he has erred in the proportions, my results are erroneous; but from the knowledge which I possessed of the cost of the articles, my impression was, and still is, that he had rather overrated the cost than otherwise.

If the cost of generating heat, upon Mr. Rutter's plan, should prove to be as great as by the present method, yet its saving of stowage and weight is sufficient to call forth the "inconsiderate admiration" of every one who has the charge of navigating a sea-going steamboat.

Trebor Valentine appears to have fallen into a very common error, viz. that if a certain weight must be carried on board a steam-vessel, it is of no consequence where it is put, whether on the deck or low down in the vessel's hold. Every nautical man knows that, with the same weight, a vessel may be either put into a good trim or be rendered utterly unseaworthy, according to the manner in which the weight is distributed, with regard to the centres of gravity and floatation.

It is a source of gratification to find that my views of the utility of the tanks for stowing tar coincide with those of Mr. Rutter; and I shall be glad to find that his plan is in actual operation on board some sea-going steamers; and I hope that you will not fail to give your readers the earliest information, with ample details of the results. To none will the information be more interesting than myself, for, although now unconnected with maritime affairs, I do not cease to feel a lively interest in every thing that relates to navigation and naval architecture. I am, yours, &c.

GEORGE BAYLEY.

RESISTANCE OF FLUIDS TO BODIES PASSING THROUGH THEM.—The following notice has recently appeared of a paper entitled "An Account of a Second Series of Experiments on the Resistance of Fluids to Bodies passing through them," by James Walker, Esq. F. R. S. Civil Engineer; which was read before the Royal Society on June 6th, 1833.

The author, in a paper read to the Society in the year 1827, and printed in the Philosophical Transactions, gave an account of some experiments showing that the resistance of fluids increases in a ratio considerably higher than the square of the velocity, and that the absolute resistance is smaller than had been deduced from the experiments of the French Academy. In the present communication he states the results of his further inquiries on this subject.

His experiments were made at the East India Docks, on a boat twenty-three feet long and six wide, with a stem and stern nearly vertical; one end being terminated by an angle of forty-two degrees, and the other of seventy-two degrees; and the resistance to the boat's motion being measured by a dynamometer. The results are given in tables; and it appears from them that in light vessels sharpness is more important in the bow than in the stern; but that the reverse is the case in vessels carrying heavy cargoes. From another series of experiments the author infers that the resistance to a flat surface does not exceed 1.25 lb. for each square foot, at a speed of one mile per hour; increasing for greater velocities, in a ratio considerably higher than the square of the velocity. The author concludes with some observations on the results lately obtained in Scotland, where great velocities were given to boats moving on canals, without a proportional increase of resistance.—[Proceedings of Royal Society.]

MALT AND TEA.—It is a curious fact, that the consumption of malt in England and Wales has been stationary for nearly half a century, though the population has more than doubled during that period. [McCulloch's Commercial Dictionary, p. 723.] The tables, however, show that the public brewers, since 1787, have contrived to manufacture *one-third more strong beer out of the same quantity of malt!* So that both the quantity and quality of the national beverage have declined. The consumption of genuine tea has also been steadily declining, compared with the population. The sales of the East India Company show that the average consumption per head of *their* teas in 1801, was 1 lb. 13.6 ounces; in 1831, per head, 1 lb. 9.2 oz. showing a decline of full 17 per cent. during the last thirty years. As the fashion of tea-drinking has certainly not declined, it may be concluded, even after allowing for the increased consumption of coffee, either that the decoction has been made weaker, like beer, or that the shops have sold something else in place of the Chinese plant. The numerous convictions of persons having adulterated tea in possession favor the latter conclusion. Monopoly and high duties have operated unfavorably on public morals. "Lovers of tea or coffee," it is truly remarked, "are rarely drinkers;" and Raynal ascribes the sobriety of the Chinese to the use of these grateful beverages, which produce all the good, without the evil consequences, of more powerful stimulants.—[History of the Middle and Working Classes, second edition.]

METEOROLOGICAL RECORD, KEPT AT AVOYILLE FERRY, RED RIVER, LOU.

Red River rose this month 2 feet 3 inches—below high water, 5 feet 6 inches.

CAPACITY OF BODIES FOR WATER.—As it may be interesting to many to know the comparative as well as the positive absorption of water by various bodies, we subjoin the following table, the details of which were made with care. The weight of each substance was ascertained before immersion; next, when the water ceased running and began to drop; and, lastly, when all dropping had ceased, and the bodies were in that state in which they may be supposed to be full of moisture.

	Dry.	Dripping.	Done dripping.
Flannel.....	144 grs.	1553 grs.	700 grs.
Woollen Cloth..	56 "	370 "	191 "
Linen	375 "	2110 "	1050 "
Calico.....	115 "	1150 "	450 "
Cambric Muslin.	95 "	883 "	307 "
Very fine do..	54 "	715 "	297 "
Glove Leather..	106 "	1170 "	677 "
Kid do.	172 "	770 "	481 "
Shoe do.	95 "	194 "	177 "
Sponge.....	185 "	2440 "	2070 "

From these data the following table may be constructed, to show in the first instance the absorbing powers, and, in the second place, the retaining powers, for moisture, of the various bodies thus experimented upon:

Flannel absorbed 11 and retained 5 times its weight of water	
Woollen Cloth 6½	3½
Linen Cloth 5½	3
Calico 10	4
Cambric Muslin 9	3½
Fine Muslin 13	5
Glove Leather 11	6½
Kid do. 4½	2½
Shoe do. 2	2 less a fraction
Sponge 13	11

From these results, it may be seen that, although some substances, in the first instance, take up an equal or nearly an equal quantity of water with the sponge, such as the flannel, fine muslin, and glove leather, yet their powers of retaining the same are very far inferior.

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

(Continued from page 196.)

We shall proceed to explain how the knee joint and hip joint, independently of the exertion of muscles, become firm in the standing position, and when at rest; but before we enter upon this, let us understand the much-talked-of demonstration of Borelli, who explained the manner in which a bird sits upon a branch when asleep. The weight of the creature and the consequent flexion of the limbs drawing the tendons of the talons so as to make them grasp the branch without muscular effort.

Fig. 13.

The muscle A passing over the joint at B, and then proceeding to the back of the leg, and behind the joint at C, and so descending behind the foot at D, it extends to the talons; and the weight of the bird bending the joint B and C, produces the effect of muscular effort, and makes the claws cling.

But why should the anatomist have recourse to this piece of comparative anatomy, when he has so fine an example in the human body? And one which is much more interesting, as, in fact, it is the foundation of reasoning upon the diseases and accidents of the limb. If this beautiful arrangement in the healthy and perfect structure of a man's limb be not attended to, it would be easy to prove that many important circumstances in regard to disease and accidents must remain obscure.

The posture of a soldier under arms, when his heels are close together and his knees straight, is a condition of painful restraint. Observe, then, the change in the body and limbs, when he is ordered to stand at ease; the firelock falls against his relaxed arms, the right knee is thrown out, and the tension of the ankle joint of the same leg is relieved, whilst he loses an inch and a half of his height, and sinks down upon his left hip. This command to "stand at ease" has a higher authority than the general orders. It is a natural relaxation of all the muscles, which are consequently relieved from a painful state of exertion: and the weight of the body bears so upon the lower extremity, as to support the joints independently of muscular effort. The advantage of this will be understood when we consider that all muscular effort is made at the expense of a living power, which, if excessive, will exhaust and weary a man, whilst the position of rest which we are describing is without effort, and therefore gives perfect relief. And it is this which makes boys and girls, who are out of health and languid, lounge too much in the position of relief, from whence comes permanent distortion. This figure represents the bones of the leg.

Fig. 14.

The plumb line shows the direction of the gravitation of the body falling behind the

head of the thigh bone. Now, if it be understood that the motions of the trunk are performed on the centre of the head of the thigh bone, it must follow that the weight of the body in the direction of the plumb line must raise the corner of the haunch bone, at A. From this corner of the bone, a broad and strong band runs down to the knee-pan, B, in the direction of the dotted line. The powerful muscles which extend the leg are attached to the knee-pan, and, through the ligament at C, operate on the bones of the leg, stretching them and preventing the flexion of the joint; but, in the absence of the activity of these muscles, the band reaching from A to B, drawn, as we have said, by the weight of the body, is equivalent to the exertion of the muscles, braces the knee joint, and extends the leg; and we have before seen that the extension of the leg fixes the ankle joint. Thus the limb is made a firm pillar under the weight of the body, without muscular effort.

When the human figure is left to its natural attitudes, we see a variety and contrast in the position of the trunk and limbs.

Fig. 15.

This position of the body resting on the lower extremities throws the trunk into an elegant line, and places the limbs in beautiful contrast, as we see in all the best specimens of sculpture.

Now, that we have understood that the lower extremity becomes in some positions a firm pillar, it is the more necessary to observe the particular form of the head of the thigh bone. (See fig. 16, next column.)

It is here seen that the head of the bone A stands off from the shaft by the whole length of the neck of the bone B; the effect of this is, that, as the powerful muscles are attached to the knobs of bone C, D, they turn the thigh bone round in walking with much greater power than if the head of the bone were on a line with the shaft. They, in fact, acquire a lever power by the distance of D from A, as, during the action of these muscles, the limb is stiff; the rolling

Fig. 16.

of the thigh directs the toe outwards in walking.

When the weight of the body is perpendicular over the ball of the great toe, the whole body is twisted round on that point as on a pivot. This rolling of the body on the ball of the toe, and consequent turning out of the toes in stepping forward, is necessary to the freedom and elasticity of the motion. The form of all the bones of the leg, and the direction of all the muscles of the thigh and leg, combine to this effect. So far is it from being true, as painters affect to say, that the turning out of the toes is the result of the lessons of the dancing master.

A certain squareness in the position of the feet is consistent with strength, as we see in the statues of the Hercules, &c.; but the lightness of a Mercury is indicated by the direction of the toes outwards. In women there would be a defect from the breadth of the pelvis, and a rolling and an awkward gait would be the consequence; but in them the foot is more turned out, and a light elastic step balances the defect arising from the form of the pelvis. Any one may be convinced of this by observing people who walk awkwardly, especially if they walk unequally. Look at their feet, and you will see that one foot goes straight forward, whilst the other is turned outwards, and that when they come upon the straight foot, they come down awkwardly, and have no spring from it.

Observations on the Prevailing Currents of the Ocean and their Causes. [From the United Service Journal.]

There are few branches of science, connected with the phenomena of the surface of the globe, which have hitherto received less consideration than those oceanic currents which every-where prevail more or less in the great body of the waters; and it seems surprising, that in a country situated like our own, and so intimately connected with the element which forms our rampart, as well as the great medium of our wealth and greatness, so little has yet been done to trace this continued circulation to its true and proper source.

Much expectation on this subject was lately excited by the announcement of Major Rennell's work "On the Currents of the Atlantic;" and it was but natural to expect, from the pen of so able and experienced a writer, some elucidation of this hitherto obscure subject. The expectations entertained

as to this posthumous work have in many practical points been fully answered; the *existence* and *effects* of many important currents have been explained in a manner that cannot fail to be highly useful to every practical man. But in tracing the *cause* of this mysterious movement, Major Rennell seems merely to have followed the usual track that had before been taken by all former writers on the subject, and has thus been led to attribute to the *winds*, effects which owe their real origin to the main cause of these very winds themselves.

It has long been known, that the prevailing currents, both in the air and in the waters, have a regular set within the tropics, from east to west; and as atmospheric currents in these latitudes, under the name of the *Trade Winds*, have been justly attributed to the rotatory motion of the earth on its axis, it has been incautiously adopted as a principle, that the currents of the ocean arise from the action of the prevailing currents of wind, both in the tropics and in other parts of the earth.

"The winds," says Major Rennell, "are, with very few exceptions, to be regarded as the prime movers of the currents of the ocean; and of this agency, the trade winds and monsoons have by far the greatest share, not only in operating on the larger half of the whole extent of the circumambient ocean, but by possessing greater power, by their constancy and elevation, to generate and perpetuate currents; and although the monsoons change half yearly, yet the interval during which they continue to blow in each direction is long enough to produce effects *nearly similar to the constant trade winds*;" that is, although the winds do not always blow from east to west, but are, during one half of the year, *north-easterly*, and for the other half, *south-easterly*, yet the currents in the open ocean, within the tropics, are *constant*, from east to west, and thus do not follow the direction of the winds from which they originate. "The winds, then," concludes Major Rennell, "operating incessantly on the *surface* of the ocean, cause, in the first instance, a gentle but general motion to leeward, (as is proved by ships being always to leeward of their reckoning in the trade winds;) and the waters so put in motion form by accumulation streams of currents."—[Rennell on the Currents of the Atlantic, p. 6.]

Setting out, then, upon this principle, in his account of the existing currents of the ocean, as far as they are at present known, it cannot excite surprise, especially if this theory of the origin of the currents can be proved to be erroneous, if many facts are stated in the work of Major Rennell which are utterly at variance with the theory itself; and the consequence naturally is, that, however distinct and instructive the information may be with respect to the individual currents, and the best mode of combatting their influence, we rise from the perusal of the work more than ever uncertain as to the true cause of those remarkable streams which are known, in numerous instances, to run in the very face of the steady and prevailing winds which are here stated to be the occasion of them.

In these observations upon Major Rennell's work, we must not be understood, however, as detracting in any way from the highly useful tendency of it in a practical point

of view, for which it was chiefly intended but we beg to offer a few remarks as an attempt to elucidate this obscure but interesting subject, which, like other questions relating to an extended system, must first be viewed on a great and general scale, before we can safely venture to account for the minor portions of it, which come within our more immediate and personal observation.

It appears strange, that while the aerial currents of the atmospheric fluids within the tropics have been so long attributed to their proper cause, it should never have occurred that the same cause might probably have the same effect upon the aqueous fluids which cover so large a portion of the globe, and that the currents of the ocean might thus be mainly attributed, like the trade winds, to the rotatory motion of the earth upon its axis. The more powerful and constant of the currents of the tropics having a general tendency from east to west, might be supposed likely to suggest this idea. But if suggested, and put to the proof by actual observation on a limited scale, it is probable that the theory would be rejected as inconsistent with the facts, for while the trade winds are found to be in a great degree constant, like the cause which produces them, and only varying a few points to the north or south, according to the season, and the position of the earth with regard to the sun, the streams of the ocean are found to set in various directions, and frequently in *opposition* to the supposed cause; we could not, therefore, feel surprised if some other cause was immediately sought for.

In order, however, to set this point in a proper light, we have only to examine with attention the effects produced by a rapid and rocky descent on the small scale of a river or brook. We here find the general tendency of the stream taking, *as a whole*, a decided course, (say from east to west;) but if we confine our view to the minor parts of this stream, and watch the movements of any small floating substance, as it follows the various eddies and countercurrents occasioned by the rocky impediments in the bed of the river, we shall with difficulty bring ourselves to believe that the general tendency of the whole stream is from east to west, as we frequently find the floating bodies taking a direction from *west to east*, and, at some particular points, even from north to south. This is taking a limited view of what ought to be considered on a wider scale, and may serve as an illustration of what actually takes place when we form a theory for the whole currents of the ocean, by merely observing some particular portions of it.

What takes place in a fluid on a small scale will assuredly occur also on a larger, as both are subjected to the same general laws; and because the trade winds are not so subject to opposition, and consequently to eddies and counter-currents, as the equatorial streams of the ocean, we are not, therefore, to conclude that both fluids are not originally set in motion by the very same cause, for it is obvious that, though their general tendency may be (as indeed it really is) from east to west, the numerous interruptions opposed to a regular movement in that exact direction may often occasion an extensive re-action in a direction to all appearance opposite to it.

Let us for a moment suppose the earth to be a body *at rest*, or at least without rotation

on an axis; and let us further suppose no dry lands to exist above the surface of the waters, with which latter the sphere would thus be entirely covered. Let us also in idea remove its atmospheric envelope, that all friction or pressure may be removed between the two fluids of air and water: what, then, could we expect to find under such an arrangement? We could not look for any circulation in the watery covering, under such circumstances. Every thing would remain in perfect repose; and unless the waters were preserved in purity by some principle not now in existence, they would soon become corrupted and unsuitable to the nourishment of organic life. But let us now suppose a sudden impulse of rotation to be given to the sphere with its fluid covering; and let us consider what would be the effect of the rapid rotatory movement upon the circumambient waters. If a plate or other shallow vessel containing water be impelled in any direction horizontally, the fluid, participating but little in the impulse, is left behind on the spot whence the movement began; it cannot keep pace with the motion of the solid. In the same manner the globe would revolve upon its axis, while the superficial waters would remain nearly stationary, and would have all the appearance of moving in opposite directions, *seeming* to transport floating bodies from east to west, while, in point of fact, the earth was passing them from west to east. Thus we perceive that, in the supposed case which we have now put, the steady movement of the solid ball would be imperceptible, while floating bodies on the surface of the water would visibly become more distant in an opposite direction. This apparent movement would naturally be greatest in the equatorial regions, being the outer rim of the revolving wheel; while towards the axis the waters would be little, if at all, affected by the rotation.

Let us now, for a moment, suppose our globe to be surrounded with its atmosphere, or envelope of fluids of a different nature. Without rotatory movement in the solid, there could be no semblance of regular movement in this aerial fluid, and we could therefore have no trade winds. Other partial winds there would be, it is true, occasioned by heat acting on the elasticity of the air, and by a constant succession of expansion and contraction arising from various degrees of temperature. But if we suppose, as before, a revolving and rapid motion to be given to the sphere thus surrounded with its airy envelope, a similarity of cause would immediately occasion a similarity of effect. The *trade winds* would be produced in the equatorial regions, while the circulation of the atmosphere in the more temperate and frigid latitudes would be carried on by the changes of temperature in the same manner, or nearly so, as if there had been no rotatory motion at all.

The effect of the trade winds, and, by analogy, of the oceanic currents, may be simply illustrated by the example of a well-mounted horseman in a calm day. While he remains still, not a breath of air blows. He moves slowly, but produces little effect in deranging the quiet of the atmosphere. The more rapid his course, however, the more violent will be the *current of air* which seems to blow in his face whichever way he goes; and even in the case of a moderate breeze, he may "outstrip the wind," and make it seem to blow in an opposite direction.

It must be obvious, then, that the effects of the revolving motion of our globe must be the same, both upon the *fluids of the air*, and upon the *fluids of the ocean*, and consequently, that the regular *trade winds*, and the regular *equatorial currents*, proceed each separately from this cause, and would equally exist even in the absence of the other. But it may be urged, that the trade-winds are much more constant to their course than the equatorial currents, and it therefore seems difficult to imagine that they can both proceed from the same cause. The reply to this objection is extremely simple, when we look a little deeper into the nature and circumstances of the two fluids. The atmospheric fluid is above the surface of the solid, and is but slightly deranged by the asperities and interruptions it may have to encounter, in the form of the islands, continents, or mountains of the earth. Some derangement actually does take place, however, from these causes, but it bears no comparison to the counter-currents and eddies which are found in the ocean, arising from the numerous and insurmountable obstacles which are thrown in the way of the regular equatorial streams. In the supposed case, which was before put merely for illustration, we considered the globe to be entirely covered with the waters. Such is not, however, the reality now, although this preternatural effect has certainly existed, on one most memorable occasion, the evident traces of which attest the fact on every part of the surface of the globe. Such is not, however, the usual state of things; on the contrary, the ocean occupies about two-thirds of the whole surface, while the remainder is broken into a thousand dispersed fragments, each opposing its solid form, as the sphere revolves, to the regularity of the oceanic movements. If the smooth and polished wheel of the turner be made to revolve in water, the movement, however rapid, produces little or no commotion in the fluid; but let the polished wheel be changed for one having a toothed or unequal edge, and we shall instantly perceive a very opposite effect. The effects of the paddles of the steamboat on smooth and tranquil waters will also bring this subject home to the mind of every one. We cannot then look for the same regularity of movement in the equatorial currents of the ocean that is perceptible in the equatorial currents of the atmosphere.

AGRICULTURE, &c.

[From the New York Farmer.]

Suggestions relative to Florists' Work for April and May. By the EDITOR.

Although the edible productions of the vegetable kingdom are regarded as the substantial bounties, and flowers as the smiles, of Providence, yet we cannot dispense with the latter. We should seek our bread in sorrowfulness were no flowers strewed in our path. Did we not meet the animated and cheering countenances of our fellow creatures, did we not see much in all our journeying through life, to remind us that more than Eden bowers await those who make their fellow creatures smile, how miserable should we be! How kind is Providence! Though we may not have it in our power either to feed the hungry or to clothe the naked, yet we can all produce that effect on the countenances of others, that is so lovely and beautiful, and so reciprocally cheering to the heart. But alas! how many

are they who despise this blessing; and instead of laboring to diffuse smiles around them, cause sorrow to corrode the heart, and distress to disfigure the countenance. And how many there are, who, like our Father in Heaven, have abundance to feed and clothe, and to smile on others, and yet, alas! unlike Him, do neither. But let us all endeavor to unite our efforts with those of lovely spring, to make all nature smile. This is peculiarly the province of the fair sex.

SOIL.—As a general rule, flowers require a sandy loam, made rich by fermented manures, particularly by rotted leaves or vegetable mould. The ground should be well spaded and rendered as fine as possible. If the seeds are put in pots the soil should be sifted.

SITUATION.—Very few flowers require the sun for any length of time. They succeed better when in a slight shade the greater part of the day, particularly when the heat is most intense. Light and pure air are requisite.

TIME OF SOWING.—From the latter part of April to the first of June flower seeds are put in the ground. The depth, if the seeds are small, should not exceed from one fourth to half an inch. If dry weather is apprehended, a board laid on the drill for two or three days will prevent the moisture from being evaporated. Flower pots are used for the same purpose.

PLAN OF ARRANGEMENT.—Neatness, simplicity, and convenience, should be the characteristics, particularly of small gardens. Ovals and other easy unstudied figures are preferable to squares, diamonds, hearts, and triangles. The plants should be arranged according to their height, so that the high ones do not conceal the others.

PROPAGATION.—Every lady should know how to propagate plants by layers, cuttings, divisions, and offsets. Many of the most valuable plants are increased much more readily by these methods than by seeds.

DOUBLE FLOWERS.—Linnaeus calls these *monsters*, a term very inappropriate, to say the least of it, for such beautiful productions of nature. Most double flowering plants do not produce seed, consequently they are increased by other methods. The less completely double they are, the more seeds they contain. Double flowers are produced by fertilizing half-double varieties, by cutting out the anthers, by fertilizing or crossing with different colors, and by single plants set out among those nearly or quite double. The seeds of these are then sown, which will probably produce some double flowers.

VARIABLENESS OF FLOWERS.—Exposure, culture, soil, &c. have a tendency to vary the color and size of flowers.

CURRENTS.—The currant is one of the most useful of all our small fruits. As soon as their size will answer, they are made into pies, so that they are in use from June until September. They are great and constant bearers, and will grow upon all varieties of soil.

Although the white and red currant are claimed as natives of the Island of Great Britain, yet they flourish much better in the northern part of the United States than they do in that country.

As the currant is useful, the bush may be rendered quite ornamental in gardens, if proper pains are taken with them at first.

Those who are wishing to have a good supply of fruit, and at the same time have their bushes ornamental, should procure as many straight well proportioned sprouts, of the last

year's growth as he wishes to cultivate. Let these be cut off a couple of inches above where they commenced the year's growth, or where the buds become regular; with a sharp pen-knife scallop out each bud beginning at the bottom, and proceeding up, at least one foot, or so far as you wish the stem of your bush to remain clear of limbs. In doing this be careful that not one bud is left, on what is designed to go into the ground, or on what is designed for the body of the bush. Stick the sprouts thus prepared in the ground, either where they are to remain, or they may be set one year in nursery form, and afterwards transplanted. Bushes properly prepared in this manner are as sure to live as those that have roots, and never will sprout from that part where the buds were taken from.

Every one, who has attempted to train a correct bush, as a standard, knows well what a task it is to keep down the sprouts from the bottom, which if left render it very unsightly. When bushes are trained in this way, the tops may be kept open, so as to admit the sun and air, and the currants will not only be larger, but better flavored.—[Goodsell's Gen. Farmer.]

IMPROVEMENT OF WOOL.—How far the farmers of this country may find the following article, from the London Farmer's Magazine, serviceable to them, we are unable to say; but it strikes us that the salve recommended would be beneficial to sheep, if applied after they are sheared.

MR. EDITOR.—From the increasing demand for white wool, many of the store farmers of this country have of late years allowed their flocks, even in high and exposed situations, to winter without a salving of any description whatever. This practice, except in some very peculiar situations, can seldom with propriety be continued above a year or two, as under this treatment both the quantity and quality of the wool invariably fall off, and seldom fails to produce a *hemphy* fleece, or, in other words, the wool gets imbedded with dead white hairs, which renders it only fit to be applied to inferior purposes, and thereby materially reduces the value of the fleece. Various salving mixtures have been recommended and adopted, but in few instances have any of them met with the approbation of the manufacturer; and when it so happens that the wool has been so heavily laid that it cannot be submitted to the process of manufacture without being previously scoured, much labor and expense are thereby incurred, and consequently the price of the wool considerably increased. Wool after having been scoured is much more liable to get discolored during the manufacturing process, and ultimately an article of less purity in color than goods which have been produced from the material as shorn from the sheep's back. Some wool growers, with anxiety to produce a fleece in a very slight degree removed from that which has been allowed to remain perfectly free of any salving whatever, have applied a greasing of animal or vegetable oil, but without the necessary precaution of adding a slight proportion of the refined spirit of tar, consequently the wool is of a yellow tinge, which renders it in a great measure unfit for the manufacture of white goods, and therefore a very considerable depreciation may be said to have taken place on the value of the material, in consequence of the injudicious application of oiling. Several of the most extensive sheep farmers in Peebles-shire, some of them indeed in the very highest and most exposed situations in the county, have for the last two years salved their flocks with powdered crude white arsenic and black soap, in the proportion of one pound of arsenic to three of soap, which are mixed up with seventy bottles of water, and this is considered sufficient for three score and ten sheep, being at the rate of a bottle for each, the expense of which does not exceed sevenpence a score. Of all salving hitherto

used in this county for the producing of white wool, this is allowed to be decidedly the best. The moment it is applied, all vermin of whatever description die instantly, and are never again to be found upon sheep which are salved with this composition; and it is the opinion of some of the most experienced in sheep farming, that stock under this treatment will in a very great measure be exempted from the louping-ill, a disease which kills thousands annually. From the nature and properties of the composition, many of the diseases which unsalved flocks are liable to be infected with, are at once eradicated or prevented by the application of this salve, which also destroys all inclination for rubbing against foggy or grassy banks, and thereby prevents the wool from getting imbedded with impurities, which are not unfrequently found to such an extent, that the wages of the laborer in picking it sufficiently adds so much to the price, that too often the manufacturer is obliged to apply it to an inferior purpose; and even when the material has been carefully looked over by the most discerning eye, previous to its being submitted to the process of manufacture, it frequently happens that thousands of these impurities make their appearance in the finished article, which in a great measure renders it unfit for the purposes for which it was intended. Sheep salved in this manner are seldom or never found to die in consequence of falling awl, or the wool to pell or fall off previous to clipping time. However, in place of soap and water, I would with much confidence recommend that the arsenic should be mixed with butter and cocoanut oil, and only to that extent which is necessary to give fixity to the arsenic, which, with a slight addition of the refined spirit of tar, is a salve which I have no hesitation in pronouncing is calculated to produce wool of the purest possible description. Under this treatment the fleece will not only be considerably finer, but very materially increased in quantity, independent of any additional weight that may be added by the application of the butter and cocoanut oil, and will be found to possess in a much greater degree the felting properties; consequently much more valuable as a clothing wool, or indeed for the manufacture of any description of goods to which the material can possibly be applied. Wool salved with this composition is also admirably adapted for mixing with skin wool, which has been removed from the pelt by the application of lime; and it is a well known fact, that when manufactured by itself, it is extremely liable to gild or get discolored during the hot days of the summer. After the necessary process of oiling has been performed, a very slight admixture of the salve material acts as a complete security against the skin wool getting discolored in the least degree, throughout all the various stages of manufacture; and even in scouring, the quantity of soap generally required would be considerably reduced by adopting the mixing system here recommended.

Your giving a place to the above in your paper will oblige your most obed't serv't, X.

MR. COKE—DEVON CATTLE.—Those who are exerting themselves to improve the husbandry of the country should not, on reading the following remarks of one of the best judges of cattle in England, the Rev. Henry Berry, be discouraged:

It is now about forty-two years since Mr. Coke, very properly considering the difficulties he had to encounter on his light poor soil, began to breed Devon cattle, and it is not a little creditable to his judgment that he has, during that period, scarcely referred to anything which may, properly speaking, be called a cross—certainly, to none of which he could permanently avail himself—and yet his Devons, take them altogether, are by far the best I have

ever seen. I much doubt whether, the county of Devon can produce such an animal as one of Mr. Coke's bulls. I am totally free from prejudice on these matters, and, therefore, candidly admit the ox in question to have been, in my judgment, at the time I saw him, the most complete I ever put my hand on.

The dairy of Devon cows appears to be, and I am assured is, highly productive, each cow, no matter what her other excellences, being rejected which proves a bad milker. They present great uniformity of character, with all the genuine distinctions of the pure North Devon cattle, and, with great aptitude to fatten, possess precisely the compact bodies and short legs, which constitute the *multum in parvo* I have so often advocated. Much as I admire the Norfolk husbandry—much as I have seen to admire in the zeal of Mr. Coke's tenantry to evince their gratitude and respect, there are two things which I must censure and deplore. While the judicious and spirited improvements in tillage of this great landed proprietor have been forcing conviction, and obtaining adoption, his efforts as to the stock of the country have been comparatively vain, and he stands alone, a solitary instance of a man who for forty-two years has produced proof, and invited investigation into the merits of his Devons—has offered and committed costly sacrifices to carry his useful object, without, except in few instances, being able to induce his tenantry to adopt a profitable breed of cattle, for an unprofitable one—a system of economy devoted to the most useful end, in lieu of a system of extravagance, purchasing its advantages at a rate beyond all chance of remuneration. With, as I said before, few exceptions, the miserable and unthrifty homebreds are the cattle kept; generally speaking, little or no regular stock of cattle is maintained, and during the present year, in the month of September, short-horns, (so called,) and every wretched specimen conceivable of all that is bad, were consuming oil-ake in the yards, for the purpose of converting the straw to manure. On this subject Mr. Coke feels, and well he may, much disappointment, but it is not confined—this blindness to their true interests—to the article of cattle alone. In sheep it is the same; and prepared as I am to show, hereafter, that no breed in the island now equals, in profit, that of Holkham, I shall only here observe, that so far behind the rest of the world are the majority of Norfolk men on the subject of stock, that they appear to select with a view to obtaining those qualities which well-informed men would pronounce bad, and invariably reject.

WEeping TREES.—Mr. William Anderson, Curator of the Botanic Garden at Chelsea, writes as follows to the Prussian Gardening Society. Fascicles or bundles of shoots are often observed on trees, which resemble birds' nests at a distance; but, when examined, they prove to be a cluster of small twigs. Such bundles are observed on different trees, but more frequently on the white or common birch tree. In the year 1808, I observed such a bundle on a *Cratægus* (*Mespilus*) *Oxyacantha*, (hawthorn,) and grafted young thorns with them, which, in two or three years, produced beautiful weeping branches. About the same time I observed such a bundle on *Ulmus campestris* (common elm,) eyes of which were budded on healthy young trees, and every one produced a long hanging shoot. According to this observation, it would be very easy to produce a large collection of drooping or weeping trees. Our gardeners, however, multiply no species so numerous as the *Fraxinus excelsior* var. *pendula* (weeping ash); which variety often retains its hanging character when raised from seeds. We possess several such trees, of about ten feet in height, which were raised from seed of the original tree, obtained in 1790 from a nurseryman, who found it a few years previous to that in the neighborhood of Newmarket, in Cambridgeshire.—[Hort. Reg.]

NEW-YORK AMERICAN.

APRIL 6-11, 1834.

LITERARY NOTICES.

No. XX.

Boyd's Grove, Illinois, Jan. 25th. 1834.

It was so long since I had seen a stone at all deserving the name of a rock, that I took a good deal of satisfaction in scaling the bluffs of the Illinois, and traversing the adjacent ravines, before getting out on the prairie the morning that I left Ottawa.—In one of these rocky gullies—which run generally at right angles to the river, and with their precipitous walls in one place, and cavernous passages beneath the jutting limestone in another, often form some picturesque dell, or afford a romantic glimpse of the open country beyond—I saw the first cascade I have met with since leaving Pennsylvania. The fall was not more than ten feet, but the column of water being frozen in a solid sheet as white as the purest porcelain, presented a very singular appearance as it raised its pale glistening front beneath a canopy of stunted cedars, whose green branches impended from the rocks above. Our sleigh after winding for sometime among this broken ground, and passing over one or two small but beautiful pieces of bottom land lying among the ravines, reached at last the top of the bluff, where, instead of descending on the other side, the level prairie extended as far as the eye could reach beyond. A few hours drive brought us to a log cabin, which was our place for dining and changing horses, and here we found that owing to the newness of the route, arrangements were not yet completed for the stage going farther. Hearing a stranger speaking in terms of enthusiasm of the fine view from "Starved Rock"—a detached crag some 200 feet high, on the banks of the Illinois, where one band of Indians were surrounded and starved to death by another (I refer you to "Flint's Valley of the Mississippi," for the legend)—I made arrangements to visit the spot in the morning. A chill north-easter swept over the bleak prairie as my travelling companion and myself, mounted upon two miserable nags, neither of which were shod, struck on an Indian trail, that brought us in an hours ride to the craggy and precipitous banks of the Vermillion river, which it was necessary to cross. A sickly looking, but rather interesting woman came out of a poor looking log hut, beside which, housed under a few boards, stood a handsome barouche—to direct us where to descend the bank; and my friend on foot leading his horse, mine followed, trembling, after him, and notwithstanding the steep path was glazed with ice, we descended the first pitch in safety. Pausing here for a moment, the confused masses of rock with trees and shrubs of all kinds growing in their crevices, reminded me as I looked around, of more than one scene of the kind in the river counties of my native State. It was now my turn to lead down the next pitch, which led to the frozen bed of the river. Upon gaining the edge I perceived that the descent was a perfect glare of ice, and pausing a moment to hand a loaded gun, which I carried, to my companion, lest it might be discharged in the accident which I anticipated: my horse lost his footing even as I turned in the saddle, and falling flat over upon me, down we slid together. I had not gone two yards, however, before a small jutting rock brought me, but little bruised, to an anchorage, while my unfortunate consort, after sliding over a part of my person, went, though struggling fearfully to regain his feet, slipping to the bottom.—He landed at last erect, with his face up the ascent, and though now on the level ice of the river, the poor brute seemed to think he was still midway on the declivity he had been hurried over so roughly—for without looking at all behind him, he stood trembling for an instant, and then in spite of all the outcry we could raise to keep him back, commenced ascending to where we stood, and actually persevered till he had gained the place from whence he had started.—The only way now to effect our purpose, was for one to go below and the other to drive the horses down to him. This we indeed did, and I do not know when I have been more amused, than upon seeing my worthy Bucephalus, as if taught by past experience, quietly—when he found he must go—placing himself upon his haunches, and sliding down the little hill with a degree of coolness and skill, that would have been envied by the boldest schoolboy on *Flattenbar-reck*. Crossing the Vermilion we were compelled to drive our horses in the same way up the bank on the opposite side, and by catching hold of the branches of trees, drag ourselves after them as we best could. Once on the height nothing but a level plain of rich prairie land lay between us

and the bluffs of the Illinois. It was crossed here and there at intervals of a few miles, with Indian trails, about a foot in width, and worn as deep as if they had been trod for centuries. They ran in various directions, and were generally as straight as the flight of an arrow. A heavy rain throughout the previous night had swept all the snow from the prairie, and these black lines drawn over its brown surface, were now perceptible at a great distance. A long reach of woodland immediately before us, indicated our approach to the Illinois bottoms, but on entering the timbered ground, where the snow still lingered in considerable quantities, we found ourselves on the slippery bluffs, a hundred feet above the level of the river opposite, without the possibility of descending to its bed. These bluffs were divided about every half mile by the romantic ravines, already described; and having now discovered that we had entirely missed the road to "The Starved Rock," it only remained for us to attempt descending through these passages, and find the place by a route of our own. We led the way by turns, and urging our unwilling horses down the frozen beds of the little streams, which impart their coolness in autumn to these sequestered dells, we tried three ravines in succession, without attaining our object. One would bring us up against a dead wall of limestone, in the crevices of whose base the rill we had been following suddenly disappeared, a second carried us to the abrupt edge of a precipice, about fifty feet above the river, whose rich bottoms, extending far away below, reminded me, with the occasional copses and detached clumps of trees which studded them, of points of views in the valley of the Mohawk. Nothing, on so small a scale, could be more picturesque, than the nook to which the third ravine led us. It was to the upper edge of a double cascade, over the second fall of which an arch of rock projected, so as to shut out from view the basin into which the water finally fell below. The passage through which we reached the spot, was a mere fissure in the side-hill; and when, not wishing to get my feet wet, I urged my horse to the brink of the little cascade, the long icicles pendant from the hanging rock above were almost within reach of my riding-whip. A number of gnarled and stunted cedars, "moist trees, that have outlived the eagle," fling their dusky branches over the chasm, and when summer foliage glitters on the tall stems, whose naked boughs project above them, the sun must be wholly excluded from this cool retreat.

Our horses were so fagged out when we extricated ourselves from this ravine, that we did not think it well to try another; and my companion being afraid of freezing his feet, which were wet from his having dismounted at the most difficult parts of the descent, I was sorry to be compelled to give up the search and return to our lodgings, after an eight hours' ride, without having seen the interesting point we had taken so much trouble to attain.

The stage proprietor resident at Chicago had arrived at the farm house during our absence; and hearing that two gentlemen were detained upon the road, had, with great politeness, at once taken measures to send us on the next morning. The room, too, in which we had slept before—four in two beds, and three on the floor—had now been vacated by five of its occupants, and my companion and I each appropriated a couch to himself. We were hardly warm under the cover, however, before the tramping of horses, with the sound of travellers' voices, was heard without; and the good dame thrust her head into the room in the vain expectation of showing them an unoccupied bed. My companion pretended to be in a sound sleep; and I intimated that I should betake myself to my buffalo robe and the floor, in case a bed-fellow were thrust in upon me: whereat, the kind lady was exceedingly misfitted; and we could hear her through the board partition a moment afterwards, expressing herself after this amiable fashion; "Ugh! great people, truly!—a bed to themselves—the hogs!—They travel together—and they eat together—and they eat enough, too—and yet they can't sleep together!" Here the husband, an intelligent middle-aged man, who did everything to make our situation comfortable during the thirty-six hours we spent at his cabin, interposed, and silenced his better half; and the new comers, wrapping themselves in their cloaks before the fire, in a few minutes all became still about the establishment.

The good dame, who must have been a fine looking woman in her day, and was, I believe, in spite of her scolding ways, really well disposed towards us at heart, gave us a capital cup of coffee, and a kind farewell in the morning. A four-horse wagon,

with an active driver, quickly accomplished a mile of rough road through the grove, and brought us once more to the edge of the smooth prairie. I can conceive nothing more desolate than the appearance of that boundless plain. The fires had traversed it in the autumn as far as the eye could reach, and the snow having now disappeared entirely from the upland, the black and charred surface was all that met our vision wherever it wandered. A dark sullen sky which lowered over head added not a little to the gloominess of the prospect; and the day being excessively cold, our ride for the next fifteen miles over this dreary plain was anything but agreeable. At last we came to some broken ground, dotted here and there with a handful of shrubbery, from which every moment a pack of grouse, and occasionally a bevy of quails would rise. The little village of Hennepin—called after father Hennepin—next hove in sight; though it lay so sheltered along the banks of the Illinois, that we were nearly upon the hamlet before its vicinity was discoverable.

After stopping an hour or two to dine and feed our horses, we left the driver to get down the steep bank, which, though not rocky, is about 50 feet high, and very precipitous on that side of the river, while my friend and I descended to the ice, and walked over the river, which was here a broad and noble stream, with some beautiful alluvial islands on its bosom. The difference of temperature here and on the bleak prairie above, was astonishing; and when I sat down upon a fallen tree among the tangled vines of the rich bottom opposite to Hennepin, and watched a flock of green paroquets fluttering among the witch-elms, which here and there skirted the shore, while the sun for a moment piercing his murky veil touched with gold the icicles that glazed their drooping branches, I could fancy myself transported to a different climate. The driver overtook us at last, and then we commenced making our way through a timbered bottom, which, for appearance of rank fertility, excelled any spot I have ever beheld. The trees, which were of enormous size, seemed chained together at every point, by the huge vines which clambered to their very summits, locking the stately stems in their ponderous embrace, and clasping each outer bough with some twining tendril, which, having thus secured its prey on one tree, seemed like a living animal to have bounded to another, and fastened its eager grasp upon some limb as yet untouched. Beneath the whole an interminable growth of under-wood, protected by the woven canopy above, and flourishing rankly in its living fetters,

"Like prisoners wildly overgrown with hair,
Put forth disordered twigs."

A half hour's ride carried us through this teeming region to the foot of a steep and open-wooded hill, which, ascending with some difficulty, we came out once more upon the prairie, and found the change of temperature instantaneous. The road over the dry, grassy plain was very good, however, for the first six or eight miles, and as the evening began to close in intensely cold, we rattled them off in a very short time. At last, we came to a deep frozen gully, in crossing which our leaders bruised themselves so badly by breaking through the ice, that when we reached a spot of the same kind, but rather worse, a mile or two in advance, the frightened animals recoiled from the place, and refused to cross it. Our driver, a doughty little chap about five feet eleven, who rejoiced in the name of Sampson, and was a capital whip, by the bye, after using every exertion to get his whole team over, was at last compelled to give up the point, and proceed to detach the leaders from the wheel horses. This, with our aid, was soon done; and my companion remaining with the leaders on one side, Sampson and I made a dash at the frozen brook, and, breaking through in the midst, the horses gave such a spring to free themselves from the wagon, that the swingletree bolt snapped, and had not the heroic little champion held on to the reins as tenaciously as a certain criminal judge in your city to his office, we might have been left a prey to the next drove of Philistinean wolves that should rove the prairie in quest of a supper. Sampson, however, was true to his name; and with a mighty arm bringing up his foaming steeds all standing, we crawled over the head of the rampant wagon (the hind wheels only had gone through the ice) and sprang to the firm ground. The swingletree was soon tinkered fast again; but now came the difficulty of getting the unwilling leaders over, who, it is presumed, had been no uninterested spectators of what had just been going forward; coaxing and whipping availed nothing; and we at last succeeded only by buckling two pair of reins together and passing them over the brook, two of us pulling on the horses mouths, while the third applied a smart castigation

behind. One of the poor animals again broke in, and floundered dreadfully before he reached a firm footing on the other side. But this was not the worst; our poor little Sampson in attempting to jump, plunged in himself to his knees, and suffered much inconvenience from it afterwards. The evening was indeed so cold that our wheel horses, who were coated with ice, their long tails being actually frozen solid, were in danger of freezing to death, had we been compelled to delay much longer. But, placing now the leaders on the firm ground beyond them, one smart pull served to extricate the wagon from the hole, and deliver us finally from our quandary. We had five or six miles still to go before reaching a house, and feeling some anxiety about Sampson's wet feet, we urged him to put the horses—nothing loath when once started—to the top of their speed. He did indeed drive furiously; but when we arrived at the house whence I write, the poor fellow's feet were frozen. Rushing at once to the fire, he would doubtless have lost them, had there not chanced to be a physician present, who directed us what to do. The good humored little patient was removed without delay to the back part of the room, and we commenced pouring water into his boots until they melted from his feet, the temperature of the water being gradually heightened till it became blood-warm, while a bucket of ice-water stood by for the sufferer to thrust his feet in whenever the returning circulation became too violent for him to endure. In the morning, though his feet were dreadfully swollen, he was enabled, by tying them up in thick horse blankets, to move about, and even return with his team. To the simple and judicious suggestions of the travelling physician present, our little hero was in all probability indebted for escaping a most awful calamity: a settler in this neighborhood having lost both legs a few days since by an exposure similar to Sampson's.

I am now staying at the house of a flourishing farmer, whose sturdy frame, bold features, and thick long black hair, would, with his frank address, afford as fine a specimen of the western borderer as one could meet with, and never allow you to suspect that ten or fifteen years ago he was a New York tradesman. He lives, like all other people of this country, in a log cabin, which has many comforts about it however, not usually found in these primitive dwellings. Having a large family, with no neighbors nearer than ten miles on one side and twenty on the other, he maintains a schoolmaster to instruct his children: the room I occupy at night being fitted up with desks and benches as a school room. His farm, which lies along the edge of a beautiful and well watered grove, supplies him with almost everything that he wants; and having once pursued a different mode of life, he seems now to realize the full independence of his situation, &c. more even than those who have always been brought up as farmers. I told him this morning, as he sallied out to chop, with his two sons axe in hand, all clad in their belted capotes and white woollen hoods, that I should like to meet his sun-burnt features and independent step in Broadway, to see how many of his old acquaintance would recognize the pale mechanic in the brown backwoodsman. He promised me, if he came in winter, to appear with the guise in which I then beheld him, adding in western phraseology, "The way in which I'll do that, Squire, will be a caution."

After being detained here some days, waiting for the St. Louis stage, and losing my travelling companion, who, having bought a horse, has gone on by himself, I have concluded that it would never do to go out of this country without visiting Galena and the mining country: and as there is now a stage running thither, I shall take the first opportunity to go with it. I have amused myself for the last three nights in watching for wolves by moonlight, at the edge of the wood, a few hundred yards from the house. They came howling round the house after nightfall, and if one is 'in luck' at all, are easily shot. But last night, after leaving my position but for five minutes, I heard the report of a rifle, and hastening to the spot, where a lad staid to fill my place for a moment, I found that a gray and a black wolf of the largest kind had approached suddenly within two or three yards of the muzzle of his gun, and startled him so, that he missed them both. In the confident hope of their return—for the bait that we had thrown about the place was still there—I took the little fellow's place, and wrapping myself in my buffalo skin, lay watching on the ground till nearly daybreak; and the enemy then not making his appearance, I was glad to creep shivering to bed.

Upon entering my room, which contained three

beds, I observed, after striking a light, that the one opposite to mine was occupied by a new-comer, while a sheet suspended from the ceiling near the head of the other, and concealing the phrenology of its occupants from view, was evidently meant as a caveat against reconnoitering that part of the apartment.

Two gentlemen and a pretty young woman, who I was told was a bride on her way to St. Louis, breakfasted with us the next morning. And how was I shocked and horrified to see Madam, after wrapping herself in a handsome cashmere shawl, while their sleigh was getting ready, raise her white lace veil and place the stump of a pipe between her rosy lips! Can you conceive a more legitimate cause for divorce? Whose love would not end in smoke at witnessing such an awful phenomenon? 'An American bride smoking a pipe!' What a subject for Cruickshank to illustrate, by way of frontispiece to the next edition of Captain Hamilton's 'Men and Manners'! Genius of Trollopism, shield and shelter us! If a woman must smoke anything less ethereal than a jest, let not the accursed vapor steal their dew from lips so fresh. Let not her 'piping time' arrive so soon. Let not—I can no more.

You shall hear from me next at Galena. Till then, farewell. H.

WRITINGS OF WASHINGTON.—In noticing some weeks ago these admirable volumes, published by Mr. Sparks, we referred to some of the early papers of Washington. Among these, written in his own hand, is a series of maxims under the head of "Rules of civility and decent behavior in company and conversation." Of these there are 110. The only specimens published we extract, and agree with Mr. Sparks in the opinion, that "whoever has studied the character of Washington, will be persuaded that some of its most prominent features took their shape from the rules thus early selected and adopted as his guide."

1. Every action in company ought to be with some sign of respect to those present.
2. In the presence of others, sing not to yourself with a humming noise, nor drum with your fingers or feet.
3. Sleep not when others speak, sit not when others stand, speak not when you should hold your peace, and walk not when others stop.
4. Turn not your back to others, especially in speaking; jog not the table or desk on which another reads or writes, lean not on any one.
5. Be no flatterer, neither play with any one that delights not to be played with.
6. Read no letters, books or papers in company, but when there is a necessity for doing it you must ask leave. Come not near the books or writings of any one so as to read them, unasked. Also, look not nigh, when another is writing a letter.
7. Let your countenance be pleasant, but in serious matters somewhat grave.
8. Show not yourself glad at the misfortune of another, though he were your enemy.
9. When you meet with one of greater quality than yourself, stop and retire, especially if it be at a door, or any strait place, to give way for him to pass.
10. They that are in dignity or office have in all places precedence; but whilst they are young, they ought to respect those that are their equals in birth or other qualities, though they have no public charge.
11. It is good manners to prefer them to whom we speak before ourselves, especially if they be above us, with whom, in no sort, we ought to begin.
12. Let your discourse with men of business be short and comprehensive.
13. In visiting the sick, do not presently play the physician, if you be not knowing therein.
14. In writing or speaking, give to every person his due title, according to his degree and the custom of the place.
15. Strive not with your superiors in argument, but always submit your judgment to others with modesty.
16. Undertake not to teach your equal in the art himself professes: it savors of arrogance.
17. When a man does all he can, though it succeeds not well, blame not him that did it.
18. Being to advise, or reprehend any one, consider whether it ought to be in public or in private, presently or at some other time, also in what terms to do it; and in replying, show no signs of choler, but do it with sweetness and mildness.
19. Take all admonitions thankfully, in what place ever given; but afterwards not being culpable take a time or place convenient to let him know it that gave them.

20. Mock not, nor jest at any thing of importance; break no jests that are sharp biting, and if you deliver any thing witty and pleasant, abstain from laughing thereat yourself.

21. Wherein you reprove another be unblameable yourself, for example is more prevalent than precept.

22. Use no reproachful language against any one, neither curses nor revilings.

23. Be not hasty to believe flying reports, to the disparagement of any one.

24. In your apparel be modest, and endeavor to accommodate nature rather than procure admiration. Keep to the fashion of your equals, such as are civil and orderly with respect to time and place.

25. Play not the peacock, looking every where about you to see if you be well decked, if your shoes fit well, if your stockings sit neatly, and clothes handsomely.

26. Associate yourself with men of good quality if you esteem your own reputation, for it is better to be alone than in bad company.

27. Let your conversation be without malice or envy, for it is a sign of a tractable and commendable nature, and in all causes of passion admit reason to govern.

28. Be not immodest in urging your friend to discover a secret.

29. Utter not base and frivolous things amongst grown and learned men; nor very difficult questions or subjects among the ignorant, nor things hard to be believed.

30. Speak not of doleful things in time of mirth, nor at the table; speak not of melancholy things, as death and wounds, and if others mention them, change, if you can, the discourse. Tell not your dreams but to your intimate friends.

31. Break not a jest where none take pleasure in mirth. Laugh not aloud nor at all without occasion. Deride no man's misfortune, though there seem to be some cause.

32. Speak not injurious words, neither in jest or earnest. Scoff at none, although they give occasion.

33. Be not forward, but friendly and courteous; the first to salute, hear and answer, and be not pensive when it is a time to converse.

34. Detract not from others, but neither be excessive in commending.

35. Go not thither, where you know not whether you shall be welcome or not. Give not advice without being asked, and when desired, do it briefly.

36. If two contend together, take not the part of either unconstrained, and be not obstinate in your opinion; in things indifferent be of the major side.

37. Reprehend not the imperfections of others, for that belongs to parents, masters and superiors.

38. Gaze not on the marks or blemishes of others, and ask not how they came. What you may speak in secret to your friend, deliver not before others.

39. Speak not in an unknown tongue in company, but in your own language; and that as those of quality do, and not as the vulgar. Sublime matters treat seriously.

40. Think before you speak; pronounce not imperfectly, nor bring out your words too hastily, but orderly and distinctly.

41. When another speaks, be attentive yourself, and disturb not the audience. If any hesitate in his words, help him not, nor prompt him without being desired; interrupt him not nor answer him till his speech be ended.

42. Treat with men at fit times about business, and whisper not in the company of others.

43. Make no comparisons; and if any of the company be commended for any brave act of virtue, commend not another for the same.

44. Be not apt to relate news, if you know not the truth thereof. In discoursing of things you have heard, name not your author always. A secret discover not.

45. Be not curious to know the affairs of others, neither approach to those that speak in private.

46. Undertake not what you cannot perform; but be careful to keep your promise.

47. When you deliver a matter, do it without passion and discretion, however mean the person may be you do it to.

48. When your superiors talk to any body, hear them, nor neither speak nor laugh.

49. In disputes be not so desirous to overcome as not to give liberty to each one to deliver his opinion, and submit to the judgment of the major part, especially if they are judges of the dispute.

50. Be not tedious in discourse, make not many digressions nor repeat often the same matter of discourse.

51. Speak no evil of the absent for it is unjust.

52. Make no show of taking great delight in your victuals, feed not with greediness, cut your bread with a knife, lean not on the table, neither find fault with what you eat.

53. Be not angry at table whatever happens, and if you have reason to be so show it not, put on a cheerful countenance, especially if there be strangers for good humor makes one dish a feast.

54. Set not yourself at the upper end of the table, but if it be your due, or the master of the house will have it so, contend not lest you should trouble the company.

55. When you speak of God to his attributes, let it be seriously in reverence and honor, and obey your natural parents although they be poor.

56. Let your recreations be manful not sinful.

57. Labor to keep alive in your breast that little spark of celestial fire called conscience.

FOREIGN INTELLIGENCE.

THREE DAYS LATER.—By the packet ship Europe, Capt. Maxwell, we have received London papers to March 16th, and Liverpool to the 15th (Saturday,) inclusive.

There have been fresh disturbances at Madrid.—The dates from that capital are to March 7th.

LONDON, SATURDAY, MARCH 15.—Consols, which left off at 81 5.8 3.4 this day sen'night, opened on Monday at 91 1.2, since which time they have not been higher than 91 1.2 5.8, nor lower than 91, closing last night at 91 3.8 1.2.

Money has not been near so plentiful; and the Bank of England has been making the Westminster Bank feel its power and influence, in making large offers of money on loan, in sums of not less than £2,000 on India Stock, and Exchequer Bills, at 3 per cent. 5 per cent. interest is now required for money in the city; and very lately it might have been obtained at 3 per cent. with ease.

LIVERPOOL, MARCH 15.—The splendid new American ship Kensington, which was stranded on the Welch coast, during the late gales, while on her first voyage from New York to Liverpool, has been raised by Messrs. Seddon and Leadley, and towed into Carnarvon Bay. She will shortly be brought round to Liverpool.

LONDON, MARCH 14.—Last night Mr. Ripton moved for leave to bring in a bill "for relieving the Archbishops and Bishops of the Established Church from their legislative and judicial duties in the House of Peers." After a discussion, attended by rather remarkable circumstances, to which we have elsewhere alluded, the motion was negatived by a majority of 67—the numbers being 125 and 58.

LONDON, MARCH 15.—Last night the North American Postage Bill went through Committee, was reported, and ordered to be read a third time on Monday.

Mr. Buckingham gave notice, that on the 26th of May he would move for leave to bring in a bill for the prevention of duelling; and also for the appointment of a select Committee to inquire respecting the vice of drunkenness.

Lord Althorp stated that he intended to propose that the House should adjourn for the recess from Wednesday, the 26th instant, to Monday, the 14th of April.

AMSTERDAM, MARCH 10.—The Handelsbald says:—"Constant Polari, alias Carrara, was to day found guilty by the Court of Assize of a forcible entry at night, and robbing in an uninhabited house, and condemned to stand on a scaffold at the Hague for half an hour, to be confined in a house of correction, and to the payment of costs, with orders for an extract of the sentence to be posted up at the Hague and at Brussels, and that the articles, as many of them as are in the hands of justice, shall be restored to the owner."

"In the course of yesterday Polari narrated all the circumstances that preceded, accompanied, and followed the robbery of the diamonds; he repeated his previous declaration, that he was the sole person in the robbery, and that it was suggested to him by the gold ornaments, which he thought he could distinguish from the street in the palace of the Prince; that he never had any communication with any person in the Palace."

[From Galiznani's Messenger.]

"DISTURBANCES AT MADRID.—We have received from Madrid by express the Gazette, the Age, and the Bulletin of Commerce, of the 4th inst. The Gazette has the following:—"In the night of Sunday last, symptoms of disorder were observed in a house named El Paradiso, in the street called Toledo, and at length it arose to a great height, the peo-

ple within uttering seditious cries. But before the magistrates and troops could arrive, many of the respectable inhabitants of the neighborhood, of their own accord, assembled to suppress the disturbance, giving evident proofs of their zeal and resolution to maintain the laws and legitimate cause of the Queen Isabella II. Two of the disorderly persons were killed on the spot, and all who offered any resistance to the troops or attempted to make their escape were wounded and immediately conducted to the royal prison, with all who appeared to be their accomplices, the neighbors continuing to lend their assistance to the authorities. However scandalous and criminal this conduct was, it did not extend sufficiently wide to interrupt the public tranquillity, nor was it even known at any distance from the place where it took place.

The Age gives a much more serious character to these events, and represents Madrid to be in a state resembling anarchy, stating that several inhabitants, whose names it gives, have been attacked in the streets by the Carlists, and compelled to take up arms in their own defence. Many arrests have taken place, it says, and most of those who have been taken to prison are friends to the Queen. Groups of Carlists pretend to be the night patrol, and go their rounds accordingly. Under the date of 7 in the evening, it adds—"The danger is imminent; the insurgents are firing in the quarter Arapias." This journal concludes by urging the Government to use the utmost severity.

The Bulletin of Commerce accuses the Royalist Volunteers of being the authors of what has taken place. It states that the disorder has existed for several nights, and that at last a party of the perturbators had come to the point of firing upon the partisans of the Queen, in the quarter of the Cabada, shouting "Charles V. for ever!" They afterwards retired to a house in the street called Toledo, which they invested with the name of the Castle of Charles V., and where they made a desperate resistance, till 5 or 6 of them were killed, and about 30 wounded and taken to prison. Some of the troops were also wounded, missiles of all kinds having been hurled at them by the rioters. The Bulletin also concludes by recommending that no mercy should be shown to the rebels.

The following is an extract of a letter of the 4th instant, from Madrid:—"Several members of the Royal Court of Madrid have been dismissed as Carlists. On account of the dissatisfaction occasioned by the decree relative to suburban militia, it has been repealed. A royal order of Charles V., countersigned by the Bishop of Leon, his Minister of Justice, orders the Carlist troops who support his cause to shoot all that may be found fighting for Isabella II. However, adds the decree, the august persons of the Queen and the two Princesses her daughters shall be respected."

The Indicateur of Bordeaux of the 8th inst. gives the following from St. Sebastian of the 5th—"On the day before yesterday the rebels of Biscay were surprised at Omate by Brigadier Espartero, at the moment they had piled their arms, and were sitting down to their meal. They were completely routed, 900 of them having left their muskets behind them, and their loss in killed, wounded, and prisoners, amounting to 200. The commander of the Chincha Queen's volunteers having arrived opportunely at Elosno, fell upon the fugitives, and killed a great many more of them. A few days ago the whole of the insurgents of Biscay, forming a force of 7,000 men, with a few bands from Guisasaosa and Alva, besieged Guernica, and the Queen's garrison, notwithstanding it had been reinforced by 1,300 men, was obliged to give up the position for want of ammunition and provisions. In retiring, however, they made about 30 prisoners, amongst whom is the commandant Barron. After their defeat at Omate, the rebels, it is to be presumed, cannot for a long time assemble in any great numbers.

A letter of the 7th inst. from Bayonne announces that the Spanish ex-Minister, M. Zea, has taken his departure for Rome, but it is not believed that he is charged with any mission.

There had been a disturbance in Saragossa on the 27th ult. and some fighting in the streets, by which several lives were lost; but it is not very distinctly stated whether it originated in a Carlist insurrectionary movement.

The Memorial Bordelais of the 8th inst. has the following—"We learn from St. Sebastian that the decree for organizing the Urban Militia has been publicly burnt in that town, without the authorities being able to prevent it. An express was immediately sent off to convey this news to Madrid. According to the last accounts from the Capitol, extreme effervescence

prevails there. The people loudly call for the dismissal of Ministers, particularly of Burgos and Zarco del Valle. The discontent has become general, and if the Queen's government does not pursue a different course, a revolution will break out at all points, and blood will be shed in abundance."

LIVERPOOL COTTON MARKET, March 11.

Since our report last week the cotton market has continued depressed, and the prices we then quoted are no longer obtainable: we reduce them 1d per lb on Bowed, Alabama, and Orleans: about 1d on Brazil, and 1d on Sea Island. Speculators have taken 300 American and 300 Surat, and Exporters 700 Surat. The import this week is 23,413 bags, 110 Sea Island and 141d to 20d—20 stained to 11d—3,610 Bowed 8d to 9d—3,400 N Orleans 8 1/2 to 9 1/2.

SUMMARY.

LIBERAL COURTESY.—By the annexed correspondence, it will be seen, that the British Government, propose to present to each of the Institutions in the United States, enumerated below, a copy of a very valuable publication now in progress in England. This country is indebted much to Mr. O. Rich, an agent for the purchase of books in London, for his participation in this matter—and in the act of the British Government, we see with satisfaction a liberal and enlightened feeling of comity towards the United States.

London, Feb. 21st, 1834.

SIR—In consequence of your suggestion, that the Record Commission were desirous of presenting copies of their valuable publications to some of the Literary Institutions of the United States, I have the honor of enclosing herewith, a list of the principal Libraries where they would be most acceptable, and to which I shall have great pleasure in forwarding copies. I have numbered them according to their relative importance, in order that the Commissioners may be the better enabled to judge which to send to. Some of the latter numbers are inserted more on account of their locality, there being other Libraries of more importance, but situated in the immediate neighborhood of the Institutions mentioned in the first part of the list. It will be a great gratification to me to be the medium of transmitting to the United States, this noble mark of the liberality and good feeling of the British Government towards my Country, and I feel confident that it will be productive of the happiest effects in drawing together the bonds of union between two nations more closely allied by natural ties than any other two on the face of the Globe.

With sentiments of respect and esteem, I have the honor to be, very sincerely, your humble servant,

O. RICH.

C. P. COOPER, Esq.

Secretary to the Record Commission, &c. &c. &c.

PUBLIC LIBRARIES.

1. The Philadelphia Library, Philadelphia, Pennsylvania.
2. The Boston Athenæum, Boston, Massachusetts.
3. The New York Society Library, New York.
4. The Charleston Society Library, Charleston, South Carolina.
5. The Baltimore City Library, Baltimore, Maryland.
6. The New York State Library, Albany, New York.

UNIVERSITY LIBRARIES.

14. The Library of Bowdoin College, Brunswick, Maine.
11. The Library of Dartmouth College, Hanover, New Hampshire.
7. The Library of Harvard University, Cambridge, Massachusetts.
12. The Library of Amherst College, Amherst, Massachusetts.
15. The Library of Brown University, Providence, Rhode Island.
8. The Library of Yale College, New Haven, Connecticut.
16. The Library of the College of New Jersey, Princeton, New Jersey.
- The Library of the University of Virginia, Charlottesville, Virginia.
17. The Library of the University of North Carolina, Chapel Hill, North Carolina.
10. The Library of the College of South Carolina, Columbia, South Carolina.
18. The Library of the University of Georgia, Athens, Georgia.
19. The Library of the University of the State of Alabama, Tuscaloosa, Alabama.
13. The Library of Transylvania University, Lexington, Kentucky.
21. The Library of St. Louis University, St. Louis, Missouri.

20. The Library of the University of Ohio, Athens, Ohio.

NEW BOSWELL'S COURT, LINCOLN'S INN,
February 22d, 1834.

SIR—Being assured that his Majesty's Government and the Record Commissioners entertain sentiments in all respects corresponding to those which you recently stated to me were entertained by the United States towards the British Isles, I have had no hesitation in instructing his Majesty's Printers to prepare sets of the Record Publications for the *whole* of the American Libraries, mentioned in the list accompanying your letter of yesterday.

I am, Sir, your obedient humble servant,
C. P. COOPER.

O. RICH, Esq.

These Public Records, of which the cost for each set is about *Two hundred pounds sterling*, consist of "the Statutes of the Realm," "Domesday Book," "Rymer's Collection," and other rare and ancient public documents, which, considering our descent, cannot but be of great value here, as consulting books.

APPOINTMENTS BY THE PRESIDENT,

By and with the advice and consent of the Senate.

WILLIAM M. PRICE to be Attorney for the Southern District of New York, in the place of James A. Hamilton, whose commission has expired.

JOHN P. HALE to be Attorney for the District of New Hampshire, in the place of Daniel M. Durell, whose commission has expired.

JAMES W. EXUM to be Marshal for the District of West Florida, reappointed.

GEORGE K. WALKER to be Secretary for the Territory of Florida, in the place of James D. Westcott, whose commission has expired.

DESTRUCTION OF THE PACKET SHIP NEWARK.

This vessel, lying out in the North river, waiting a wind to proceed to *New Orleans*, and having on board a very valuable cargo, took fire last night at half past 11 o'clock, and burnt to the water's edge.—Boats from the shore and from the Austrian frigates put off to her as soon as the flames were discovered.

THE MEAT OF DISEASED CATTLE.—An investigation of an interesting character has recently engaged the attention of the faculty in Paris. In consequence of the supposed custom among the butchers, of exposing for sale the flesh of animals that had died of various diseases, it was determined by the government to ascertain, if possible, what diseases, in animals intended for the butcher, are capable of communicating to their meat deleterious qualities. The result of the inquiry, which was pursued with great diligence, was, that only one of the diseases of cattle possesses a contagion for the human subject, that is not destroyed by the process of cookery: this disease is *malignant pustule*. Vast numbers of cattle, it appeared, were constantly sold for slaughter while laboring under other complaints, but no authenticated case could be discovered in which harm had resulted from the use of their meat. Thousands even of the cattle slaughtered while laboring under the contagious typhus that prevailed among them so extensively in 1814, 1815, and 1816, were used as food without any discoverable injury. Singular as this fact may seem, it appears to be well established by this investigation.

On the whole, the conclusion drawn in the report is, that butcher's meat is deleterious to man in two conditions—1st, When spoiled by too long keeping; and 2d, When the animals slaughtered were affected with malignant pustule.

Although the process of cooking may prevent any injurious consequences from the eating of a diseased animal, yet it is very unpleasant to know the fact that the beef on our table is from cattle sick with typhus, with liver complaint, with inflammation of the lungs, and many of the disorders incidental to such animals, and the only dependence is on the integrity of the butchers, who will not give such meat to their customers, knowing it to be diseased. One great advantage which the Mosaic law and Rabbinical institutions have over

all modern customs, is blending religious, with political regulations, purifying both soul and body at the same time. The beef exposed in our markets with leaden seals must necessarily be free from all or nearly all the impurities in cattle complained of above. An experienced person, who has studied the anatomy of the beast, is commissioned and paid by the congregation to kill all kinds of butcher's meat. The animal is not stunned with blows, producing stagnation and congestion of the blood; the throat is cut with a remarkably sharp knife, and all the veins and arteries are emptied; the lungs are searched with the hand; if the liver is attached to the ribs, or there are impurities, malformation, or any apparent disease, it is condemned, and the leaden seals are not attached to the meat. It is thus that the observance of ancient laws by this ancient people give them great protection against feeding on diseased animals, and our old New-Yorkers, of all religious denominations, who understand the object, generally give a preference to the meat with leaden seals.

FANNING MILL.—An ingenious wight, named William Gall, has constructed a pair of self-acting fanners, which, without the aid of man, sift wheat, corn, &c. The simplicity of the invention is astonishing. By a funnel of sheet-iron, the wheat descends upon an iron wheel full of brackets; the wheel is so nicely balanced, that the moment the wheat falls the wheel revolves, and throws the wheat into a pair of fanners on the flat below. On the outside of the iron wheel is a wooden one, and over it is a belt attached to the fly wheel of the fanners, which impels them, and so long as a particle of wheat is left, the machine moves and throws it out.—[Sat. Eve. Post.]

Lines occasioned by the following notice taken from the Baltimore Gazette, and reprinted in the American during the prevalence of the Cholera. Died on Thursday last, at Hospital No. 3, Sister Mary Frances, one of those Angels in human form, who are found, not in the shade of luxury, but in all our hospitals, supplying the wants, and ministering comfort and consolation to the sick and the dying, regardless of personal danger, and rejecting all temporal compensation. "The deceased was found in the morning attending as usual to the patients in the hospital, with the smile of peace and serenity on her countenance; she sickened about 8 o'clock, and by 7 in the evening was a corpse."

TO THE SISTERS OF CHARITY.

For you, ye heaven-sent Sisters, pure and meek,
No idle, flattering accents I intend—
I know, full well, no earthly need you seek;
Above all mortal praise your thoughts ascend.
Undaunted intimates of death and pain!
You heed no minstrelsy of earth—strung lyre:
The softest siren notes would sound in vain
To ears impatient for the heavenly choir.
But who that treads life's rough and weary way,
If some fair prospect open on his sight,
Seeks not his fellow wanderers' step to stay,
And make them partners in his new delight?
Turn then, all ye who, with indignant mind,
Behold the villainess of this mortal state;
Where craft and guile on ev'ry hand you find,
With all the forms of selfishness and hate—
Here let your misanthropic brow unbend,
And warmest feelings of the heart expand;
For, if to earth some gleams of Heaven descend,
They were must light upon this sacred band.
And ye who sport beneath the golden beams
That o'er youth's jocund morning shed their light,
To whom the downward path of life still seems
Immeasurably distant from the sight;
Oh! think me not a censor cold and stern,
A frowning foe to all that's bright and gay,
If, for a moment, I would have you turn
And see these Sisters tread their holy way.

I would not have fierce superstition's power
Bear down your minds, in sullen gloom to grope;
I would not overcloud one radiant hour,
Nor crush one rising bud of youthful hope:
Yet, stay awhile, nor all your moments waste
For joys inconstant as the vernal sky:
You here may deep, though silent, pleasure taste,
Whose impress on the soul shall never die.
For how can earth present a goodlier scene,
Or what can waken rapture more refin'd,
Than dauntless courage, silent and serene,
With maiden gentleness and love combin'd?
Behold in yon receptacle of woe,
Where victims of disease assembled lie,
That gliding form, with noiseless footstep go,
From couch to couch, her angel task to ply:
She dwells mid sounds and sights of pain and death;
The feeble plaint, the involuntary cry,
The fierce convulsive throw, the insect-like breath,
The heaving groan, the deep-drawn burning sigh.
Oh! child of frolic, in whose giddy brain
Delusive fancy's ever on the wing,
Think you this grimé maid feels nought but pain?
That in her path no lovely flowers spring?

Gay visions round your pillow nightly throng—
The morning ramble, and the evening dance,
The rout, the feast, the soul entrancing song,
The dattler's whisper, and the lover's glance.

Around her couch no brilliant phantasms play:
No airy spectre of past pleasure flies;
Burdens of mercy which have mark'd the day
Give tranquil slumber to her tear-stain'd eyes.
They're precious gems, those tears that wet her cheek
Worth more than all that earth or ocean know:
The noblest language of the heart they speak;
From high and holy ecstasy they flow.
Her feelings ye alone can understand
Whose deeds have wak'd the sufferer's grateful prayer;
Who've felt the pressure of the dying hand,
The rich reward of all your pious care.

No sad or strange reverse her pleasures dread;
Of time and chance, they mock the strong control.
Her heaven-aspiring virtues ever shed
A cloudless light upon her peaceful soul.

The folios that command this world's esteem,
Within her spirit find no resting place;
Like idle motes that cross the solar beam,
They serve its bright and changeless way to trace.
Yes! such this sacred band, such peace in their
Unchang'd when days shine bright, or tempests lower
Through life they pass, unstained by its cares;
When death draws near, they gladly hail his power.
And then, like birds that seek a better clime,
On swift untiring wing their spirits rise,
And gladly leave this turbid stream of Time,
To take their homeward progress thro' the skies.

SILVIO.

[From the Calcutta Quarterly Magazine and Review.]

THE SONG OF THE FORGE.

Clang, clang,
The massive anvils ring
Clang, clang,
A hundred hammers swing,
Like the thunder rattle of a tropic sky
The mighty blows still multiply,
Clang, clang,
May brothers of the dusky brow,
What are your strong arms forging now?

Clang, clang—we forge the coulter now,
The coulter of the kindly plough;
Sweet Mary mother, bless our toil;
May its broad furrow still unbind
To genial rains, to sun and wind,
The most benignant soil.

Clang, clang—our coulter's course shall be
On many a sweet and sheltered lea,
By many a streamlet's silver tide,
Amidst the song of morning birds,
Amidst the low of sauntering herds,
Amidst soft breezes which do stray
Through woodbine hedges and sweet May,
Along the green hill's side.

When regal autumn's bounteous hand,
With widespread glory clothes the land,
When to the valleys from the brow
Of each resplendent slope, is roll'd
A ruddy sea of living gold.

We bless, we bless THE PLOUGH.
Clang, clang,—again, my mates what glows
Beneath the hammers' potent blows?
Clank, clank,—we forge the giant chain,
Which bears the gallant vessel's strain
Midst stormy winds and adverse tides;
Secured by this, the good ship braves
The rocky roadstead, and the waves
Which thunder on her sides.

Anxious no more, the merchant sees
The mist drive dark before the breeze,
The storm cloud on the hill;
Calmly he rests, though far away,
In boisterous climes, his vessels lay,
Reliant on our skill.

Say, on what sands these links shall sleep,
Fathoms beneath the solemn deep:
By Africa's pestilential shore,
By many an ice berg, loan and hear,
By many a palmy western isle,
Basking in Spring's perpetual smile;
By sterny Labrador.

Say, shall they feel the vessel reel
When to the battery's deadly peal
The crashing broadside makes reply;
Or else, as at the glorious Nile,
Held grappling ships, that strive the while,
For death or victory?

Hurrah—clang, clang—once more, what glows,
Hark brothers of the forge, beneath
The iron tempest of your blows
The furnace's red breath?

Clang, clang—a burning shower clear
And brilliant, of bright sparks, is poured
Around and up in the dusky air,
As our hammers forge the sword.

The sword!—extreme of dread; yet when
Upon the freeman's thigh 'tis bound
While for his altar and his hearth,
While for his land that gave him birth,
The war drums roll, the trumpets sound,
How sacred is it then!

Whenever for the truth and right
It flashes in the van of fight,
Whether in some wild mountain pass,
As that where fell Leonidas;
Or on some sterile plain and stern,
A Marathon, or a Bannockburn;
Or amidst crags and burning rills,
The Switzer's Alps, grey Tyrol's hills;
Or, as when sunk the Armada's pride,
It gleams above the stormy tide;
Still, still, where'er the battle word
Is Liberty, when men do stand
For justice and their native land,
Then Heaven bless the sword!

THE PILGRIMS OF THE RHINE.—We have seen in the hands of Wm. A. Colman, a copy of this new work of Bulwer. It is eminently beautiful in its typography and plates—of which latter there are twenty-seven.

The **SENTRY BOX**, engraved by Danforth, from *Leslie's* picture, is also to be seen at the same place, and is well worth looking at.

[From the *St. Louis Republican*, March 10.]

THE MORMON DIFFICULTIES.—A late number of the *Enquirer*—a paper just started at Liberty, Mo.—contains a military order from Governor Dunklin to the captain of the "Liberty Blues," commanding him to hold himself and his men in "readiness to assist the civil authorities in apprehending and bringing to trial the persons offending against the laws, in November last, in Jackson county, in conflicts between the Mormons and a portion of the other citizens of that county." He is commanded to attend the court in that county, during the trial of the cases, and execute such orders as may be given him by the Judge or Circuit Attorney. Under these orders, and at the request of Judge Ryland, who stated that a number of Mormons wished to testify before the Grand Jury, Captain Atchison marched his company into Independence, on the day appointed for holding court, having a number of Mormons under his protection. After a stay of about three hours it was concluded by Judge Ryland, the Circuit Attorney, and Attorney General Wells, that "it was entirely unnecessary to investigate the subject on the part of the State, as the jury were equally concerned in the outrages committed, and it was therefore not likely that any bills would be found." The Captain was therefore directed to return to Liberty and to discharge his men. "To see a civil court (the Governor says) surrounded by a military force, is well calculated to awaken the sensibilities of any community," and the Governor charges his subordinate officer to perform his duties in the mildest manner possible. It is certainly a new thing in this country, to see the military called in to protect the civil authorities in the exercise of their just powers; and goes far to prove how far we have relaxed in virtue and a regard for the laws which ought to govern us. Every patriot must hope, that the occasion may seldom arise when it shall be necessary to surround a judicial tribunal with such guards. It is a pernicious example, but rendered, perhaps, necessary in the present case by the extraordinary circumstances attending the conflict.

FOREIGN INTELLIGENCE.

APRIL 5TH.—At a late hour we received by the Liverpool packet, *Pacific*, our London files to the 5th ult.; and we are indebted to the kind consideration of the *Matte of the Pacific*, for the London Times of the 10th March, and the Liverpool Standard of the 11th for which he will accept our thanks. These are also due to Mr. Hope, the Pilot, who finding our boat unable to pull up against a strong head wind, made a signal for his pilot boat, the William Bayard, to take her in tow, and bring her up to the Narrows.

In the House of Commons Mr. Hume's motion for a repeal of the corn laws, by substituting a fixed duty, was defeated on Friday 7th, after two nights' debate, by a majority of 312 to 155.

On the same day Lord Althorp introduced a bill to repeal the House tax.

Paris dates are to the 8th of March; Madrid and Lisbon to the 1st. Disturbances of a serious nature, but without loss of life, occurred in Paris on Sunday, the 23d of Feb. They were undergoing judicial inquiry. In the Chamber of Deputies they had also been discussed. Gen. Jacqueminot, the Commander of the National Guards, said

The National Guard, I do not hesitate to say it, is tired, fatigued, and discontented (murmure), and in fact, gentlemen, the position of the citizens composing it is become intolerable, for they are continually under the necessity of taking up arms to defend their shops and warehouses. The citizen, instead of taking his wife out to walk of a Sunday, is obliged to shoulder his musket. As for myself, I am thirsting after that repose of which I have been deprived for the last three years. As for the bludgeon men, I abhor them as much as M. Barrot himself can abhor them.

Of general news there is nothing important.

Burgos had not resigned his seat in the Spanish Cabinet.

The *Foreign Intelligence* by the Pacific—of which we gave an outline on Saturday—though much later than before received, is in truth of very little interest; and our columns are at this moment too much crowded with matter of near and pressing importance to leave us room for miscellaneous extracts.

In England, affairs look well enough. The rejection of Mr. Hume's proposition for a repeal of the corn laws, and for allowing the importation of foreign corn at a fixed rate of duty, together with the failure of a previous motion by Sir I. Ingoldsby to abolish the excise on malt, (which amounts to near £5,000,000 sterling per annum), encouraged Ministers to repeal the house and window taxes—two vexatious and not very productive sources of revenue.

A petition had been presented to Parliament from the shipping interests, praying that the practice of *impressment* for the Navy might be abolished. It had not been discussed, but Lord Grey had intimated incidentally his doubts of the expediency of complying with it.

The Reverend Mr. Gleig, author of the *Subaltern*, and the deer-up of Lord Londonderry's military campaigns, and who, though a clergyman, had distinguished himself by his zeal, in opposition to the Reform Bill—had received from Lord John Russell the appointment of chaplain to the Chelsea Hospital. The appointment is badly viewed by the whole Ministerial press.

A plethora of money, or superabundance of capital seems to be complained of generally in England. Mr. Alexander Baring, said in his place in the House of Commons—that if the twenty millions which are to be paid to the slave owners in the colonies, instead of being funded, were issued in the shape of floating debt—that is, if, instead of stock redeemable at a distant period, (in which, according to Mr. B., there is now less confidence than there used to be) Exchange bills were issued—they could be negotiated at an interest not exceeding two per cent. per annum—that is, about the rate of our monthly interest in these times.

In France, Louis Philippe goes the whole against the liberty, or possibly the license of the press. The law for the suppression of publications sold by criers in the streets, was followed by the condemnation of M. Cabet, a member of the Chamber of Deputies, for a publication tending to bring the King's government into contempt. We annex a brief notice of the trial.

COURT OF ASSIZES.—SITTING OF FEB. 28.

Trial of M. Cabet.—A strong military force was stationed in the Palais de Justice and the environs; troops of the line were bivouacked in the area opposite the Court of Accounts, and the whole companies occupied the Salle des Pas Perdus and the galleries of the Court of Cassation. Military patrols and a multitude of police agents circulated in all the passages and avenues.

The court was crowded, principally by persons of note, including many deputies, among whom we observed Messrs. Dupont de l'Eure, Berard, Arago, Lafitte, Garnier Pagès, Georges Lafayette, Legendre, d'Argenson, de Ludre, Cormenin, Odillon Barrot, Laboussiere, Maille, Corcelles, Puyraveau, Mauguin, Comte, General Bertrand, &c.

The Registrar read the authorization to prosecute, granted by the Chamber of Deputies, and other papers of mere form, and then proceeded to read the two articles inserted in the *Populaire* of January 12 and 19, upon which the prosecution was grounded. The first was entitled *La République dans la Chambre*. The other article was entitled *Crimes des Rois contre l'Humanité*, after censuring Louis Philippe for repelling the Poles, in obedience to Nicholas, represents his system as counter-revolutionary, anti-national, and anti-popular, and himself as the enemy of the patriots of all countries. Both these articles were signed "Cabet." The Registrar then called Messrs. Lafayette, Arago, Dupont de l'Eure, Lafitte, Odillon Barrot, and Bernard, the witnesses summoned on the part M. Cabet.

The Procureur General, however, objected to their being examined, as the prosecution was for offences against the laws of the press.

M. Cabet maintained his right to have them heard, on the ground that one of the passages complained of was, "the evil is in Louis Philippe," and he

wished to prove that it was he alone who governed, and who in particular had chosen Prince Talleyrand and other personages of the same description, but he concluded by renouncing his claim to interrogate witnesses.

M. Persil then addressed the jury, at considerable length.

M. Marie, counsel for M. Cabet, addressed the Court and jury on behalf of his client.

M. Garnier Pagès having obtained leave of the Court, delivered an energetic speech in defence of M. Cabet.

M. Persil, in reply expressed his regret that the law against the associations had not been presented 18 months ago. Either the associations must be dissolved, or the monarchy of Louis Philippe must fall. "We (added he) fought against Charles X., and we will fight against the republic, if it must be so."

M. Marie spoke briefly in reply, after which,

Mr. Cabet addressed the Court and the jury. He made a profession of his political faith, declaring that he wished not for a revolution, but for the people to obtain their rights by the force of public opinion. The year 1793 was a tempest that might have arisen under a monarchy. The best Republicans were those who wished for blood the least.

The President then summed up, and the Jury retired, and after three quarters of an hour's deliberation, returned and delivered a verdict of guilty upon the second count.

The Court in consequence condemned M. Cabet to two years imprisonment, interdiction of civil rights for two years more, and a fine of 4,000f.

LAFAYETTE is spoken of in a late letter from Paris, in the Times, as about soon to resume his seat in the Chamber.

We do not see in the disturbances at Paris or Lyons, any indications to justify the alarm expressed by some of the London papers, respecting the duration of Louis Philippe's government.

In Spain all goes on slowly and doubtfully. Difficulties occur about convoking the Cortes, and the delay tends to alienate the liberals from the Queen's government. The Queen Regent is spoken of slightly as to her private deportment, as though another Godoy were to be raised up in an obscure favorite she has found.

In Portugal the quarrel endures, and will endure, apparently, for notwithstanding the decisive advantage gained by Saldanha over the Miguelites on the 18th February, Miguel still at the latest dates from Lisbon, (1st March,) held *Santarem*—while misunderstandings prevailed among Pedro and his generals.

Of the Northern powers little is said, and of their movements and plottings less appears to be known.

THREE DAYS LATER FROM ENGLAND.—The ship *Lotus* arrived last evening, sailed from Liverpool on the 16th ult., and we are indebted to Captain Watts for the Liverpool Mercury of the 14th, the only paper he brought.

LIVERPOOL, March 13.—The sales of Cotton for the week ending this evening, amounted to only 9000 bales, and prices declined 1.4d. per pound. The arrivals were only two from the U. States, and one from Brazil. Our corn market was dull, and prices rather declined.

LONDON, March 13th, (correspondent of the Liverpool Mercury.) Public matters to day have not been mixed with any intelligence, or domestic occurrence. Proceedings in Parliament do not appear to excite any interest whatever, and the prevailing impression appears to be that this Parliament will separate without doing any thing whatever. The Bank of England has now offered to lend money in sums not less than 2000l. on India Bonds and Exchequer Bills, at three per cent. Money is again very plentiful, and of easy discount. The issue of the debate on the corn trade continues to be the subject of conversation and disappointment amongst all classes of the citizens, and next to the budget nothing has excited them so much.

The money market has been heavy today; Consols have declined to 91 1/4 from 91 1/2, the price at which they opened. Spanish and Portuguese are much at the price of yesterday, but very little has been done, and the tendency of the money market is drooping.

The Colonial Market is without interest; the demand continues limited, and the market is but scanty.

ly supplied; the imports are very fair, but we think that as the season advances prices will decline; most of the quotations are merely nominal, and the principle article, Sugar, is selling about 300 hhds. daily at 50s. for brown, 52s. to 54s. 6d. yellow, and fine 68s. to 68s. 6d.; Mauritius, 4707 bags went by public sale this day, at 44s. to 56s. 6d. for low brown to fine yellow, being former prices. Oils—There is still a very good demand for all sorts of seal and fish at higher prices.

FALMOUTH, Sunday morning, 11 o'clock.—The Pike has this morning come in, having left Lisbon on the afternoon of Tuesday last. The account she brings is of a much more cheering character to the Constitutional cause than what has lately been received. An engagement took place on Sunday morning with the outposts of the two armies, which brought on a general engagement, the report of which was a complete defeat of the Miguelite force that lay outside of Santarem. The few that remained from the effects of the dreadful slaughter retreated within the walls of the city, upon which it was expected an immediate attack would be made, as Don Pedro left here yesterday, accompanied by the Duke of Terceira, for the army. I have no time to say more, as other expressions are about leaving.—[Courier, March 10.]

NOW READY,

AN INTERESTING AND USEFUL MAP.

Upon which is delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It may be had either in sheets, price \$1 25, or put up in Morocco for pocket maps, price \$1 50, or on rollers at \$2 25, in any quantity, by applying to the subscriber.

D. K. MINOR, 35 Wall street.

New-York, April 2, 1835.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary.

December 24, 1833.
For further information on this subject see No. 49, page 778 of this Journal.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly, either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer, Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania. Hudson, Columbia county, New-York, January 29, 1835.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for shive. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A29t RM&F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,	Flat Bars in lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splitting plates, nails to suit.
300 do. 1 1/2 do. do.	
40 do. 1 3/4 do. do.	
800 do. 2 do. do.	
soon expected.	

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rails of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 24, 28, 30, 32, 34, 36, and 38 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. BALSTON,

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & G. W. BLUNT, 124 Water street, corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.
For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,

Germant. and Norrist. Railroad

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads No. 264 Elizabeth street, near Blacker street, New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation. J33 tf

RAILROAD CAR WHEELS, BOXES AND

AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. No. 1 Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. m18

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTTE, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833

To Messrs Ewing and Heartte.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark; by my self, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them upon application, to any person desirous of perusing the same.

Dip, Declination and Variation of the Needle in the United States. By A. CITIZEN OF NEW-YORK. [For the Railroad Journal.]

If the manufacturer of compasses in Birmingham, England, will be so polite as to send to Doct. Smith, 28 Water st., New-York, two of his needles, that stand alike in their directive course for three days successively, he will then answer the question put by him in the Railroad Journal, of March 22d, 1834; for he never has seen two needles, which were imported from England, that stand alike for that length of time.

THE BRAZILIAN BAMBOO.—"Among the trees which attracted our attention," says Dr. Walsh in his travels in Brazil, "were the different species of bamboo, some of which were of enormous size, and some of singular beauty. Of the first kind were many that measured two feet in circumference, sending out large lateral branches, and so tall as to resemble forest trees. Others, of equal magnitude, without any branches, shot out in a single stem divided into regular joints, smooth and tapering to a point, till they attained an immense height. Some were not so thick, but ran up till they became so slender that they bent down, gradually tapering to a very fine point, as thin as a horse hair, and waving across the road like long fishing rods. I cut one of them, which had shot up from the valley below, about the middle, where it was not quite so thick as my wrist. After carrying it some time in my hand, where it felt lighter than a cart whip, I laid it along the road and measured its length, and found it fifteen yards long, so that the entire plant must have been ninety feet, tapering, and polished the whole way with the most exquisite finish." Another kind was so prolific that it covered the whole surface of the forest, climbing to the tops of the highest trees, and clothing them with the most exquisite verdure. Sometimes it ran from tree to tree, covering the whole sloping surface of a glen with a level uniform curtain of the richest drapery. This vegetable surface is called "grass of the thicket." It yields the cattle a supply of green and wholesome fodder at all seasons.

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in semi-monthly form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y. D. K. MINOR, Proprietor. Jan. 22, 1834.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published.

Also, the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

Also, the PLOUGH-BOY, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

✧ All Letters and Communications for the above publications, may be addressed, free of postage, to D. K. MINOR.

PATENT RAILROAD, SHIP AND BOAT SPIKES.

✧ The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

✧ All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

✧ Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy: J. I. Brower, 223 Water street, New-York; A. V. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practical, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

J23 1am

H. BURDEN.

TO CIVIL ENGINEERS.

The Western Railroad Company, incorporated by an act of the General Assembly of the State of Tennessee, for the purpose of constructing a Railroad from the town of Jackson, in the county of Madison, by the most practicable route to the Mississippi river, wish to employ one or more persons as engineers to survey the route and superintend the location and construction of said road. Gentlemen who wish employment in the above capacity, will forward to the undersigned on or before the 3d day of June next, the terms upon which they are willing to engage, also the most unquestionable testimonials of good character and scientific and practical skill in works of the above description. An election of an engineer will not take place before the 3d of June.

By order of the Free't & Directors.

JOS. E. TALBOT, Cash'r & Sec.

Jackson, March 18, 1834.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, APRIL 19, 1834.

It is much to be desired that the bill mentioned in the following notice may become a law :

SURVEY OF THE NEW-YORK AND ERIE RAILROAD ROUTE.—A bill providing for this survey through the southern tier of counties, at the expense of the State, under a principal engineer to be appointed by the Governor, is now before the Legislature.

INTERNAL IMPROVEMENT.—A project for connecting, by a sloop and steamboat canal, the great western lakes and the Hudson river is on foot, and seems to command great attention from the inhabitants of the interior of our State as well as those of Michigan and Ohio. The plan is to render navigable the Oswego, Cayuga, Oneida, Seneca, and Mohawk rivers, the Oneida lake and Wood Creek. We give the following proceedings of the Executive Council of the Territory of Michigan. The project is one of great importance, and we trust will be found practicable.—[Standard.]

EXECUTIVE DEPARTMENT, }
March 7th, 1834. }

RUDOLPH BUNNER, Esq.,

President of the Convention at Oswego, N. Y.

SIR,—In accordance with the resolution of the Legislative Council of the Territory of Michigan, I have the honor to transmit herewith their resolutions, concurring "in the views adopted at a meeting of the citizens of the county of Oswego, New-York, on the 12th Dec. 1833, relative to the formation of a navigable communication on the American side between Lakes Erie and Ontario."

I have the honor to be, very respectfully, your obedient servant,
G. B. PORTER.

COUNCIL CHAMBER, }

Detroit, March 1st, 1834. }

Resolved, by the Legislative Council of the Territory of Michigan, That the efforts made in the western part of the State of New-York and elsewhere, to effect a navigable communication, on the American side, between Lakes Erie and Ontario, are highly laudable, and meet with the entire concurrence in this House.

Resolved, That this enlightened enterprise, if successful,

will be of vast usefulness to this Territory, and the whole country bordering upon the great lakes.

Resolved, That such improvement is the more imperiously required, in consequence of the rapid advance of our neighbors in Upper Canada, and, in the event of future wars, would be of the utmost importance to the security and defence of this frontier.

Resolved, That we concur in the views contained in the memorial and resolutions on this subject, adopted at a meeting of the citizens of the county of Oswego, New-York, on the 12th of December, 1833, which have been communicated to this House.

Resolved, That the Governor of this Territory be requested to transmit a copy of the foregoing resolutions to Hon. Lucius Lyon, Delegate in Congress from this Territory, and to Rudolph Bunner, Esq., President of the Convention at Oswego, referred to in the previous resolution.

JOHN McDOWELL,

President of the Legislative Council.

(Attest,) John Norvall, Secretary.

TRENTON, April 12.—*Delaware and Raritan Canal.*—The water, let into the feeder week before last, continues to flow and gradually increase in the main Canal; there will soon be sufficient, if no breach occurs, for boating hence to Princeton. The main Canal is of sufficient capacity to contain 8 feet in depth and 60 feet wide at the surface.—[State Gazette.]

The following Report, relative to the use of Railroads in Pennsylvania, will be found interesting to many of our readers :

Report relative to the Use of the Pennsylvania Railroads—MR. KEATING, Chairman—Read in the House of Representatives, March 4, 1834.

The Committee to whom was referred, on the 9th December last, so much of the Governor's message as relates to the transportation on and use of the railroads of this Commonwealth, report—

That they have investigated the subject committed to them, with all the deliberation which it required, and that they herewith submit a bill embracing the result of their inquiries.

The novelty of the subject, and the difficulties which surround it, will at once appear from the fact, that, in the course of their investigations, the committee have met with no parallel case to which they could look for conclusive information. All the railroads in this country, and all those in Great Britain, (so far as your committee know,) are owned by private companies; and no information was within their reach, in relation to the railroads on the continent of Europe, which could be availed in this case.

Having, therefore, no precedent to guide them, in relation to railroads made by a state

or government, the committee were obliged to confine themselves to the investigation of the general principles applicable to the case, to the analogies to be derived from the experience of private companies, and to the opinions of enlightened and experienced men.

The first general principle they considered, was, what was the object of these works? Whether intended to benefit a large trade, carried on a long line of public work; or to facilitate the intercourse between points not far distant from each other? Thus, the first inquiry is, undoubtedly, was the Philadelphia and Columbia railroad made to benefit the great trade between the east and west, between the Alleghany and the Lakes, on the one side, and the Delaware on the other; or was it chiefly intended for the readier and cheaper transportation to the market of Philadelphia of the various produce of the rich counties of Chester and Lancaster? After it shall be decided which of these objects is the most important, to the accomplishment of that object the plan must be made to conform. Upon this point the committee believe there can be no doubt. The great resources of the State could not have been appealed to. Three millions of the public money would not have been expended to facilitate any intercourse of a local and limited character. If a state is ever justifiable in undertaking a great work of this kind, it can only be where the benefits are to be general, and where the advantages of them can be felt in the remotest corners of her territory. In looking back to the history of our public improvements, we obtain proof that this was really the object first had in view. The public-spirited citizen, who for so many years devoted his time and his best abilities to the promotion of the improvement of the State, and who has, in a measure, identified his name with them, appears to have been the first who brought the subject before the Legislature. In H. R. vol. 1. 1826—7, we find that on the 21st of March. Mr. Lehman introduced the following resolution :

"Whereas the State of Maryland has incorporated a company, with a view of intersecting the Pennsylvania canal, for the purpose of conveying the trade of Pennsylvania to Baltimore. And whereas, &c.—Therefore,

"Resolved, that the committee on inland navigation and internal improvement be instructed to consider the expediency of requiring the board of canal commissioner to make suitable examinations, within the present year, with a view to the aforesaid objects, and to make report early in the ensuing session of the Legislature; and also to make report in relation to the practicability and probable cost of a railway along the valley of the Susquehanna, from the Pennsylvania canal to Columbia, and

from thence through the city of Lancaster to Philadelphia."

And in their report of December 28, 1827, the canal commissioners observe, that they believe that a communication from Columbia, by railway, to Philadelphia, is decidedly preferable. Regarding this railway as an important feature in the system of improvement, they have been gratified to find, that from the bank of the Susquehanna, (for surmounting which a stationary engine will be required,) the limit of graduation for locomotive machinery may be preserved the whole distance to the city of Philadelphia.

Thus, it is evident that this road was undertaken with a view, principally, to facilitate the great eastern and western trade, and that no system should be adopted which can, in any manner, impair its usefulness in this respect; and the great object being the reduction of the price of transportation for heavy and bulky articles of comparatively little intrinsic value, but carried from remote parts of the State, no regulation should be made which may in the least create a tax upon this trade, by increasing the price of transportation upon the railroad. It behoves the Legislature to bear in mind, that the lumber, the coal, the iron, the grain, the flour, the salt, the whiskey, &c. &c. of the west, are all articles of comparatively low price, many of which now struggle with difficulty in the port of Philadelphia, against the importation from eastern or transatlantic ports—and that any regulation tending to check or to impede transportation, or to raise the price of freights, is a direct tax upon the trade, upon the industry, whether agricultural, commercial or manufacturing, of Pennsylvania, injuring our means of competition with foreign industry, both at home and abroad. It is a bounty given to the foreigner, without any equivalent to ourselves. Let us, therefore, in the system of management of our road, discard every prejudice, whether resulting from preconceived ideas, or from local interests, and view the question in its broadest light, as one affecting the whole industry of Pennsylvania.

The great objects of transportation are economy, rapidity, and certainty; and to these three items all others should be made to yield.

1. What kind of power should be used on the road?

2. Whether it should be a high road or not?

3. By whom the motive power should be owned?

4. By whom the cars should be owned?

After which, we shall be able to arrive at safe conclusions as to the provisions of a law to regulate transportation on our roads.

The first question is, as to the power? Two kinds may be used, animal or mechanical, horse or steam power. If we examine the profile of the Columbia railroad, we will find its grade constantly varying; part of it ascending and another part of it descending; varying through every grade, from a dead level to an inclination of forty-five feet per mile. This naturally leads us to the conclusion that the power must be such that it should pass with equal facility (though with varying rapidity) through all the changes of grade, of an ascent of forty-five feet per mile, or a descent of the same steepness; and it is evident that no horse power can effect this. He cannot drag up hill the same weight that he can drag down hill, unless the load be much less than a maximum, in which case there is a great loss of power, and great additional expense. It has been suggested that the power might be increased, by having spare horses stationed along the line, at such points as would present additional resistance; but this is inapplicable in a road presenting so many and such varieties of grade as the Columbia railroad.

Again. It is well known that scarcely can two horses be found possessed of the same speed. All the horses must be made, however, to travel at a uniform rate upon a railroad, and as the load cannot be shifted according to the ever-varying strength of each, it follows that

the average will occasion great injury to the weaker horses, while the stronger ones will not work at their maximum of strength, which of course produces an additional expenditure.

This evil is more sensibly felt in proportion to the increased length of the road; as the engine (while supplied with fuel and water, and well oiled,) continues to work for any reasonable time without injury or impairment of its effect, while the power of the horse is constantly impaired by the fatigue of his muscles, until at last it becomes necessary to relieve him, which occasions much loss of time. In point of speed, likewise, great advantages are derived from the use of locomotives, since their rate of travelling on such a line as the Columbia railroad, with the heaviest load, need not be under ten miles an hour, when a horse should not, when loaded, travel faster than two and a half miles to produce his maximum of effect.

Reasoning from analogy and theory, we conclude that horse power should not be used where locomotive engines can work with safety. Experience confirms this position.

There is scarcely a railroad of any extent, admitting the use of steam power, in which it is not chiefly or wholly used. In England, the Liverpool and Manchester, the Stockton and Darlington railroad, and others, the St. Etienne and Lyons road in France. In the United States we have, as instances, the Baltimore and Ohio, the Baltimore and Susquehanna in Maryland, the Petersburg and Roanoke in Virginia, the Charleston and Hamburg in South Carolina, the Newcastle and Frenchtown in Delaware, the Camden and Amboy in New Jersey, the Hudson and Mohawk, and the Schenectady and Saratoga railroads in New-York, and in our own State the Philadelphia, Germantown, and Norristown railroad, and the Little Schuylkill railroad,—on almost all of which horse power was at first used, and on which it has since been in part, or wholly, replaced by locomotive engines with great advantage. It is understood that on all these roads, engines will be used exclusively in preference to horses as soon as the necessary arrangements can be made to dispense with the latter.

Upon this point the committee are also permitted to refer more at large to the experience obtained on a road in this Commonwealth, upon which a large trade was carried last summer, and experiments carefully made, with a view to ascertain the comparative expense of transportation by engines and by horse power, and in which there was a decided advantage in favor of the former, even after making large allowances for the expense of repair to the road and of deterioration to the engines. Although the committee would not feel themselves at liberty to exhibit, in a report of this kind, facts which were communicated to them for their own information, in relation to the operations of a private company, they are enabled to state that, after making all reasonable allowances, the expense by horse power is at least one-third greater than that by engines, and that after the improvements suggested by experience shall be introduced, the economy will probably be much greater. The road does not suffer materially from the use of the engines, and the transportation is more regular, systematic, and under control.

The opinions of experienced men have been obtained upon this point, and while it would be easy to adduce the authority of many persons, they will be satisfied with referring the House to the letter of Moncure Robinson, Esq., addressed to a committee of this House last year, and which is attached to this report, and to the opinion of the canal commissioners, as expressed in a special report lately made to the Senate.

The single item of economy in the making and keeping in repair of the horse-path, is an object worthy of attention. The making of the horse-path on sixty miles of double track is estimated by the canal commissioners at eighty-five thousand dollars; and the annual expense of repair of horse-path is estimated by Mr. Gay at three hundred dollars per mile per

annum, or a yearly expenditure of upwards of twenty-five thousand dollars, which will be rendered entirely unnecessary by the use of steam power.

Nor is there any reason to apprehend that the curves on the Columbia railroad will interfere with the security of engines, as the curves between the two planes are larger than those on other roads upon which such engines are successfully used.

The next inquiry is, whether they should be considered as high roads or not? The committee come to the conclusion, that the high way principle is entirely inapplicable on a road upon which a large trade is intended to pass, and that the exclusive use of locomotive engines makes it inexpedient as well as improper to open it as a high road. Upon this point, the committee are aware that an impression has existed with many, that the high way principle is the old and established system, and that the attempt to restrict it is an innovation. This is entirely an erroneous impression. If railroads were in every respect analogous to turnpike roads or canals, the opinion might be correct; but differing as they are entirely in their construction and use, the position is untenable. We are, on the contrary, justified in asserting, that no railroad of any great length, or of great travel, has ever been so considered. In England all the railroads in use, except the Surry and Croydell, are used exclusively by the companies that own them. It has not been in our power to procure the charters of many of the railroad companies of this State, but we can cite many in which the exclusive principle is distinctly admitted; and these will be found to include most, if not all those which are now extensively used: such, for instance, as the Baltimore and Ohio, and the Baltimore and Susquehanna railroads, the Newcastle and Frenchtown, the Petersburg, the Chesterfield, the Charleston and Hamburg, the Mohawk and Hudson, the Saratoga and Schenectady, &c. Moreover, the same principle is distinctly recognized in the Mad River and Lake Erie railroad company's charter, and in several others before us. We are, therefore, warranted in the assertion, that the legislation, not only in Great Britain, but also in New-York, Ohio, Delaware, Maryland, Virginia, and South Carolina, distinctly recognise the impossibility of admitting the high way principle. The committee refer the House to the previously published opinions of the canal commissioners, of Mr. Gay, &c. and would chiefly invite the attention of the House to Mr. Robinson. In practice there is no road of any length which has been found to answer on the high way principle. The best instance is unquestionably the Minehill and Schuylkill Haven railroad, whose length however is only ten and a half miles; and which being used only for a descending coal trade, horse power offers no analogy with a great State improvement like the Pennsylvania railroads. In England, we know of but one road that is a high way—it is the Surry and Croydell, which is a tram road, (not a railroad,) and which has never been either productive or valuable.

On the high way principle it would be impossible to secure a constant, expeditious, and cheap transportation for all goods coming to Columbia. Transporting companies might probably be formed, who would attempt to carry the whole produce from Pittsburgh to Philadelphia, and whose object and interest it would be to drive off all competition. The great out-lay of money required to keep up a constant line of engines and cars on the road, would soon throw the business into very few hands, over whom there would be neither check nor control. All the evils of a monopoly would exist, without any of its advantages—while all the evils of competition might still continue; an occasional understanding between companies would produce great fluctuations in the prices of freight and transportation, coming on suddenly and taking the distant unawares. This is not a gratuitous supposition—we have seen

these fluctuations upon every high way in the United States. The accidents which occasionally occur on our turnpike roads, by the racing of stage coaches, would recur with the more frequency on our railroads, on account of the greater dangers resulting from carelessness or inattention. The strictest police could not guard against them; as it would be impossible to determine, with precision, the causes of accidents, and the persons through whose agency they had occurred. Instances might be mentioned, from the personal experience of your committee, in which trains of cars travelling in the same direction, on the same road, and belonging to the same owners, have, by the inattention of their drivers, been suddenly brought into contact, occasioning loss of property and death to horses, or damage to engines. Such cases are more likely to occur where the property would be owned by different individuals.

An attempt at a strict police, on a high way, would be in truth ineffectual; but it would be attended with a great deal of petty litigation, of heart-burning, or real or alleged injustice or oppression.

By placing the business under one management, the utmost economy could be obtained; and of course the trade of Pennsylvania would be benefitted, and the travelling on the road greatly increased.

Having come to the conclusion that the use of horses ought not to be permitted, and that the highway principle is inadmissible; the committee proceed to inquire, in the third place, by whom should the motive power be owned? Two plans have been offered, both deserving of great consideration. The one, to place it in the hands of the agents of the State; the other, to farm it out to contractors. At the first blush, it would seem that the former were the more desirable. It strikes the attention, as the fairer and the more efficient mode: that which keeps the control of the road most in the power of the State. If there must be a monopoly, all would be disposed to yield it rather to the State than to an individual. But the advantages are rather apparent than real—the plan is more plausible than substantially good. On the continent of Europe all agencies of an analogous character are in the hands of government. In Great Britain they have with more propriety been placed in those of a contractor; and in this country we have, in cases nearly parallel, found great advantage in farming out such undertakings. No better instance can be found than in the post-office department. It was at one time thought, and we believe attempted, to have the mail transported entirely by the United States. It was soon found, however, that all the advantages resulting therefrom would more readily attend short contracts, say for 4 years. There is more economy. Individuals working on their own account, under a strict supervision, are obliged to pay more attention to it than could be obtained from salaried officers. The difficulty of the selection of proper officers, the dangers from an increase of patronage, the want of a balancing or checking power to prevent injustice, are among a few of the evils incident to the conferring this duty upon salaried officers. For such men, there would be no motive (exclusive of a sense of duty) to produce an increase of travel on the road; since the more frequently it was used, the greater would be their duties, without any additional compensation.

With a contractor, the case would be different. To him the increased travel or transportation, would be a source of increased gain. It would be his duty to procure assistance on the best terms, and of the best kind. His own interest would soon satisfy him that no imperfect cars or engines, no new and untried inventions, green from the brain of the inventor, could be advantageously applied on such a road. In the hands of such a contractor, it would become a matter of business, not experiment. Closely superintended in the execution of his contract, by a proper officer appointed by the

canal commissioners, under the sanction of the Governor, there would be every desirable security for the proper use of the road. The State engineer would act as an umpire between the public and the contractor, and his decision might be with or without appeal. In order to make this plan unexceptionable, it merely requires that the duties of the contractor should be carefully pointed out to him, and that the execution of the contract should be strictly enforced. The amount to be charged per ton per mile, for all kinds of goods, being specified in the contract, and he being bound to carry it for all on the same terms, a maximum price of transportation might be obtained, advantageous to the whole state. Having the exclusive use of the road, it would be made his duty to keep a register, in which all goods should be entered, in the order in which they were presented for transportation; and he should be bound to transport them in the same order, and within a certain time fixed in the contract; which would insure impartiality and celerity to the transportation of goods. Any neglect or omission would be reported to the engineer, whose duty it would be to see justice done and the contract duly executed, or the penalties thereof enforced.

There is in such a contract, offered to the highest bidder and open to all applicants, no injustice or hardship to the community at large. It is consulting the public good, to establish such regulations as will make the road most useful. Such a contract would be analogous to a mail contract, of which no one complains as an arbitrary measure of government. There is as yet no common law in relation to the use of railroads—there can be no rights acquired at common law to provide for. The State has made a railroad at an immense expense, and has a right to say in what manner it shall be used.

4. The next question is, by whom the cars should be owned? It has been recommended, and from respectable sources, that while the motive power could not be in the hands of every one, the cars might be owned by individuals. This the committee regret to dissent from. Nothing could be more unjust, than to throw either upon the Commonwealth or upon individuals, the expense of dragging cars which were not made of the best materials or in the best manner. Any one acquainted with railroads and cars must know that the power required to draw one car, sometimes is two or three times as great as that required for a car of apparently similar construction, and coming out of the same shop. If the cars belong to the owner of the motive power, it will be his interest to find out and correct the deficiency of the hard running car—but if they belong to individuals, no such interest exists; and provided the inspection on the road can be passed, each will be anxious to make cars after his own peculiar notions of economy or fitness. The inspection of a car, when finished, is not an easy thing—nor can it be a satisfactory one, unless it be taken to pieces. It must be an inspection of parts; an inspection of materials before they are used; an inspection of workmanship as it proceeds in the shop, which can alone insure a good running car. If the owner of the motive power also own the cars, he may have his own shops, his own foremen, and insure a proper construction of cars.

Again, nothing is more injurious to a road than a badly running car. It may press against the curves—it may injure the rails, &c. If the cars belong to the owner of the motive power, the inspection and control of the state engineer becomes easier and more effective; but if his attention be divided by numberless petty workshops along the road, his superintendence must of course be less efficient. Again, suppose an accident occurs in the breaking of an axle or wheel, on the road, while travelling at great rapidity with steam power, on whom is the loss to fall? It may have resulted from the wilful use of inferior, but cheaper materials, which the sordid economy or ignorance of the maker

of a car may have told him was "strong enough" for the purpose, while no other person would have thought of using it. Such accidents may occur—much property may be injured—lives may be lost—the road materially impaired—while the unconscious individual was merely trying an experiment as to the sufficiency of some iron in his shop.

If the cars belong to the owners of the motive power, there is a remedy. Let him be made, by his contract, the insurer for the safe delivery of all goods entrusted to his care—the insurer against all risks whatever, whether from accidents of the engines, from combustion of the goods, from damages by the breaking of cars, from robberies or neglect on the road. It will be his interest then to avoid such accidents.

Such are general principles which in the opinion of the committee should guide in making a contract of this kind. The duration of the contract is a matter of doubt; they have fixed it at the shortest possible period, say three years, with a clause, that if at the expiration of that time a new contractor should outbid the former, or if the state should refuse to continue to let the road out, then the new contractor or the state should be bound to take the property in the possession of the contractor, such as engines, cars, &c. at a fair valuation or appraisement, if he should so require it. Such terms are in all mail contracts, and present no novelty.

Were the road finished and of established character, and could we hope to get at once good proposals for it, the committee would cheerfully have extended the lease; but as the first term must necessarily be an experimental one, it has been thought best to make it as short as possible, consistent with obtaining any bids. The committee doubt not that there is already forming, in this country, a class of men experienced in the use of railroads, who, backed by some friends, will become regular bidders for such contracts hereafter, in the same manner that a class of experienced and respectable mail contractors has been formed in every part of the country. While we admit the propriety of having almost all public works done by contract, as being the cheapest, most satisfactory manner, the committee do not see why the use of railroads alone should be exempted from this system.

The bill which they herewith report, differs but little from that reported by a select committee, and which passed this house last year, but was lost in Senate, from the lateness of the season.

It makes it the duty of the Governor to advertise for proposals, and should he receive satisfactory ones, to execute a contract for the use of the road, with the highest and best bidder—the terms of the contract to be previously prepared by an experienced engineer, to be appointed by the canal commissioners, and to be thrown into proper legal form by the Attorney General; the whole being revised and approved of by the Governor. Should the Governor, however, receive no satisfactory bids, (of which he is left the sole judge,) then he is to appoint one or more agents of transportation, whose duty it will be to provide the necessary engines, cars, &c., and attend to the transportation, on such terms as the canal commissioners, under the direction of the Governor, shall fix and determine.

In the meanwhile, the bill authorizes the canal commissioners to consult some experienced railroad engineer, as to the location of water stations, warehouses, &c., and under his direction to cause the same to be erected; and also authorizes them to purchase or contract at once for the manufacture of six locomotive engines, to be completed as soon as possible, and which, when completed, they are to transfer to the contractor at cost, should any contract be made.

The committee were aware of all the difficulties with which the subject is beset, and they have endeavored to steer clear of the most

formidable ones. They have trusted to experience, wherever its results could be obtained. They have consulted the most eminent engineers in the country, and they now submit the whole subject to the Legislature, conscious that as no perfect scheme can be advised at first, it is best to adopt, in the outset, such a plan as, in its future modifications, will involve least sacrifice of private property, and fewer claims for remuneration for damages to the same.

AGRICULTURE, &c.

Description and Drawing of Hussey's Grain Cutter. Communicated by the INVENTOR.

[We have seen one of Mr. Hussey's grain cutters, manufactured in this city by Messrs. R. Hoe & Co. It is a simple, substantial machine, and from its construction and the perfect manner of cutting a little artificial field of grain, we would add our own recommendation to that of the respectable names in the certificate. The inventor is about taking it into the grain regions of the western part of the state, to exhibit its operation at the next harvest.]

This machine consists of a frame of good oak or ash, sustained by two wheels forward, and one wheel or roller in the rear, and is constructed in the following manner: Two sills are connected by several cross rails; on these sills are fixed four posts; two top rails are framed to the tops of the posts, parallel with the sills, and connected also with cross rails, as seen in the plate. To the forward posts is hung the main axle, with journals running in metal boxes: on this axle the wheels are fixed with square boxes: these wheels sustain the forward part of the machine, and furnish the cutting power. Across the rear ends of the sills is fixed a plank floor of good pine, extending several feet beyond the right wheel. This floor is horizontal, and its distance from the ground will be the length of the stubble. On the front edge of this floor is fixed a row of iron teeth, pointing forward horizontally, forming a comb: the teeth are formed of two parts, one part above and one below, and joined at the points, forming a range of mortices, through which runs a saw with the teeth sharp on both sides: this saw is moved by a crank which receives its motion from the main axle.

Two horses are attached to the machine and driven on the stubble, when the teeth are presented to the standing grain, which they receive between them, as the saw with a quick motion cuts it off, the morticed teeth forming a bearer above and below the saw. The velocity of the machine, while cutting, gives an impulse forward to the butts of the straws, causing the grain to fall backwards on the floor. As it accumulates on the floor, it is deposited or pushed off in heaps with a rake formed for the purpose, by the operator, who rides on the machine.

H. Huxley & Co., 81 Barclay st. New-York, are agents for selling the above machine.

This may certify, that we, the undersigned, members of the Agricultural Society of Hamilton county, state of Ohio, at the request of Mr. Obed Hussey, attended an exhibition of a machine for cutting grain by horse power, invented by him. The experiment was performed at Carthage, in this county, about the first of July last, before a large company of spectators, composed of farmers of the neighborhood, the citizens of Carthage, and several from Cincinnati, who appeared to be united in the expression that it was a valuable improvement in agriculture. In our opinion the experiment was completely successful, although several impediments occurred during the exhibition by the breaking of some weak parts; these obstructions were plainly to be attributed to the imperfect manner in which the machine was made, it being a first experiment, and experi-

ence not having yet taught how to proportion the strength of the several parts to meet the stress which each part might be subject to, on its trial, some pieces being of wood, which should have been of iron; but we have no doubt but all these imperfections can be remedied in a second machine. We were satisfied that the impediments referred to were not to be ascribed to any defect in the principle, for, while the machine was in operation, the performance was complete, until some part broke by the violence to which it was subjected, it having two horses attached to it, and they several times driven on a brisk trot; at this speed the grain was cut as well, or better, than when the horses were driven slow. The machine performed well, both at the rate of two and a half and five miles per hour; and although the horses were several times urged, they were not driven so fast at any time as to determine at what speed the machine might be moved, and do good work. The wheat was found to be cut much cleaner, and to be left in better order for binding, than when cut by the cradle. The saw which cuts the grain was made without a temper for cutting, consequently would not continue sharp long at a time; but no difference was perceived in the execution, the grain being cut equally clean, and fast, whether the saw was dull or sharp. This was attributed to the peculiar construction of the cutting apparatus. With regard to the quantity of grain which the machine is capable of cutting in a given time, we can only say, that we saw the machine move at the medium rate of three and a half or four miles per hour, cutting a swath five feet three inches wide; and we have no doubt but the machine may be extended with advantage to a half a rod in width on ordinary smooth ground. In this case the machine would pass over one acre in going the distance of one mile. From the general satisfaction expressed at the exhibition alluded to, and our own impressions, we would recommend Mr. Hussey's grain cutter to the notice of all grain growers, being satisfied ourselves, that if future

trials should equal the first experiment, it will be a valuable improvement to all large farmers.

D. C. WALLACE, Sec'y of the
Hamilton Co. Ag. Soc.
J. D. GARRAND,
CALVIN CARPENTER.

I was present at the exhibition of Mr. Hussey's grain cutter, and concur in the statement of D. Wallace and others. The impediments referred to by them were in one instance caused by the loosening of a cog wheel by loss of the wedges, the other by the breaking of a two-inch wood screw, where a strong bolt should have been used. But for these two casualties, I am of the opinion that the machine would have performed without interruption. The performance of the machine while in operation was complete and satisfactory. I have since that time seen a machine on the same principle, constructed by Mr. Hussey, in a strong and durable manner. I have no hesitation in recommending it to be a valuable improvement.

T. B. COFFIN.

[From the New York Farmer.]

LANDSCAPE GARDENING.—From the Report of the Visiting Committee of the New-York Horticultural Society for 1823, we make an extract. The subject still needs the encouragement of the Society.

"With regard to landscape gardening, the Committee have to report that, from the examination which they were able to make in the vicinity of this city, they are of opinion this part of horticulture is yet in its infancy among us as an art. The art of laying out grounds, so as to display all their beauties and conceal their defects, is a subject of much interest in Europe, where large sums are expended in embellishing the grounds surrounding the dwellings of the proprietors. There the profession of landscape gardener is common, though almost unheard of among us; a pro-

fession requiring the practical gardener's skill, with a knowledge of the qualities and nature of forest trees, their capacity for picturesque effect, either separately or in groups, a correct taste in selecting natural or creating artificial beauties, and a practised eye in discriminating the varied features of natural scenery. With these qualifications, the landscape gardener has tracts of land of considerable extent and diversity to operate on, assisted by all the resources which the wealth and taste of the proprietor can supply. The grounds attached to the country residences of our citizens are usually too limited to give much opportunity for the display of this style of gardening, and are generally appropriated to the more useful and profitable purposes of the kitchen garden, or the orchard, a small portion near the dwelling being reserved for parterres. There are, however, many beautiful sites in the neighborhood of our city, particularly those which border on our waters, in which a fine effect might be produced, by a proper application of the principles of this branch of horticulture. For improvements in this, as well as in the preceding departments, we must depend upon the greater diffusion of wealth among us, and the consequent greater leisure and opportunities for devotion to the pleasures of such pursuits. It is the legitimate province of our society to accelerate the progress of improvement in this respect; and the committee would beg leave to recommend the subject to their attention, as worthy of the same encouragement which the Society offers to the other branches of horticultural skill.

A. HALSEY, Chairman.

"New-York, January 27, 1829."

MAPLE SUGAR.—We give the following on this subject, although for the present the time for making the sugar will be past before this number reaches our subscribers :

"In the northern and western sections of this state, particularly in the counties of Jefferson and Lewis, the inhabitants are very laudably engaged in transplanting these trees into orchards, and along the lanes and roads. In the town of Lowville, one farmer has an orchard of six hundred trees. Those growing on low, wet lands, are not as productive of sugar as those on upper lands. The latter may be known by the roughness of the bark, and by growing to a larger size.

"The trees are tapped when about eight or ten inches in diameter, and will, at this period, produce from three to six pounds of sugar each season. Very large trees have been known to produce fifteen pounds. The sap or juice of these trees may be converted either into sugar or well flavored molasses. The best method of obtaining the sugar is to have the buckets perfectly clean; and when sufficient quantity of the sap is collected for boiling, it should be strained through a woollen cloth into the evaporator. The best evaporating vessel should be about four by six feet long, and eight inches deep; the bottom of sheet iron, and the sides of wood, set in mason work, so as to protect the sides from injury by fire. The advantages of this construction are, rapid evaporation, by having the surface of the fluid very great in proportion to its depth, consequently a saving of fuel, and preventing that blackness which is communicated to the sugar when boiled in a vessel entirely of iron. After the fluid is boiled to the consistence of West India molasses, it is allowed to cool, and then strained through fine flannel. It is again put over a gentle fire in a clean vessel, with a quantity of fresh blood well mixed with it. The blood will coagulate, and rise with the impurities to the top, which are carefully skimmed off. After this, a slow evaporation is kept up, taking care not to burn the sugar, until it is sufficiently done to granulate, which may be known by its granulous effect on the tongue. Most people, however, have various and peculiar methods of ascertaining its crystalline state.

It should now be removed from the fire, and stirred until cool, when it will be composed of large sparkling grains. The sugar made by this process is found to be far superior to that made in the common way of running it into moulds or cakes, and is susceptible of high refinement."

ASPARAGUS.—There are several varieties of the garden asparagus, as the large German, the red and green topped, the Battersea, Dutch, large Reading, &c. The large German red, and green topped, are considered preferable.

Asparagus is propagated from seed, but is often increased by offsets from the old roots. Beds are thought to succeed best when set with young seedling plants; but the shoots will not be ready for use as soon as when set with offsets. The seed should be sown early in May, on a bed of light rich garden soil.

They may be sown quite thick, and allowed to grow in the bed one summer.

In the fall, or early in the spring, a bed should be formed in some part of the garden, where it is intended it shall remain, by trenching it eighteen inches deep, and mixing with a suitable quantity of manure. Some prefer beds of only two and a half feet wide, calculated for two rows, set at eighteen inches distant; others form their beds four feet wide, and set three rows at the same distance. But of whatever width the beds are made, the roots should be placed at least eighteen inches distant from each other, and should be placed nearly on a level with the walks between the beds. After the roots are placed upon the beds they should be covered over about four inches deep with fine loose mould. The first year after setting, asparagus should be allowed to grow without cutting, and in the fall, after the frost has killed the tops, they should be cut off, and the bed covered over three or four inches thick with stable manure. In the spring following, the manure should be made loose with a fork, but allowed to remain upon the bed, that the young shoots may be blanched a greater length. The soil and litter should ever be kept six or eight inches thick over the crown of the roots. When good strong plants are set they will produce shoots fit for cutting the second year after setting. The young shoots may be cut until the middle of June, after which they should be allowed to grow up for seed. In selecting plants for setting, none should be used which have not a good crown or bud, as the lateral roots, or those destitute of buds, will not sprout, although they will remain in the ground many years without rotting.

In cutting asparagus, care should be taken not to injure the buds upon the crown, which are close to the lower end of the shoot; for this purpose a knife with a narrow point should be used, which should not be allowed to go as deep as the buds. When a bed of asparagus is well planted, it will continue to produce well for twelve or fifteen years, and when it is found that the shoots decrease in size, a new bed should be formed before the one is taken up, that the family may be constantly supplied with this wholesome vegetable.—[Goodsell's Genesee Farmer.]

GRAFTING AND SETTING OUT TREES IN THE SAME SEASON.—In the spring of 1830, I bought thirty trees of a different size to set in my orchard. In digging up the thirty large ones, we dug up a considerable number of small crooked things that were not worth any thing to the owner; I therefore obtained about

sixty from the nursery. They were of all sizes, from the bigness of a pipe-stem to that of a man's thumb. I carried them home and put them in a barn. The next day being rainy, I went to work and grafted them. As soon as it was fair weather, I had them set out in rows, each kind by itself. The result was, that upwards of fifty grew and did well. The large ones were set out, and I engrafted them; some the same day, and some a few days after, and they did as well as any scions that I ever set.

Let trees be properly set, and I would then graft them and warrant them as cheap as I would any trees whatever. Z. SARGENT. Gardiner, March 2, 1834.—[Maine Farmer.]

CANKER WORMS.—Mr. Goodsell: Permit me, through the columns of your paper, to communicate a simple and easy method of destroying the effects of that great enemy to our orchards, the canker worm. Six years since, while walking in the forest and examining the capsules of the *Castanea Americana*, or chesnut burr, the idea struck me that they might be applied to advantage in preventing the effects of the canker worm. I took a piece of strong twine and sail needle, and made a band of them, placing all the backs one way, which caused the spines to project in all directions; I tied it round the trunk of an apple tree in the centre of an orchard that was much injured the year before, which bore abundantly without the leaves being injured in the least, while those around were all ruined for that year.

I have since tried it several times with entire success. A set of bands will last many years if taken off when the insects have done ascending, and secured in a dry place. I have usually put the bands on the trees about the middle of March.

In sections of the country where chesnut burrs are not easily obtained, I would recommend the use of the *dipsacus fullonum*, or fuller's teasel; although I have never tried it, I have no doubt it would make a sufficient barrier to prevent the ascent of the canker worm. NATHAN RUGGLES. New-Haven, (Ct.) Feb. 26, 1834.—[Goodsell's Farmer.]

TO PREVENT BEER FROM BECOMING ACETOUS.—There is a way to prevent beer from getting acetous, or what is called hard, which is as simple as it is efficacious. Reasoning on the plain principles of chemical science, we were led to try it, and have this summer found its truth and advantage. It is nothing more than to suspend a knob of marble by a piece of tape from the bung hole to near the bottom of the barrel, upon which, being pure carbonate of lime, the acid quality of the beer acts on its incipient formation: it consequently becomes neutralised, and thus is kept from turning hard or sour. In our experiment the marble was considerably eaten away, except where the tape encircled, and the beer remained sound and fresh to the last drop. We mention this discovery as being a point of some consequence to householders, and especially to farmers and their laborers in harvest time; for it is more likely that weak beer should become sour than strong; it is much more healthy to drink it fresh than ever so little turned off, and, in the way of economy, many barrels might be saved, which are every year thrown into the hog-tub from becoming undrinkable. It will do good, however, to every species of beer, and, we expect, to any kind of home-made or even foreign wines in cask, which have or are likely to become tart or sour.—[Oxford Journal.]

HAMILTON'S SAWING AND BORING MACHINE.—This machine is designed for sawing and boring wood or timber, and is claimed by Colonel Hamilton in his specification to be "*an improvement in the mode of sawing felloes of wheels, circular and curved segments, mitre joints, tenons, and also boring of felloes and hubs of wheels;*" and generally for sawing circular, curved, and plain surfaces.

The machine is propelled by a two horse power steam engine. Animal or water power may be applied for the same purpose. The particular form required is sawed out of the timber with perfect accuracy and great expedition, by means of one or more thin narrow saws moving up and down. There is also belonging to this machine a horizontal saw for cutting segments of circles their proper lengths, and with proper inclinations for joints, tenons, &c. &c. Hubs of carriages are bored with perfect precision. All these operations are effected by the changing position of the material, accommodating itself as it comes in contact with the saw or auger, so as to receive the exact form, inclination, &c. required. Every thing is done, without marking or laying out, with mathematical accuracy by means of scales, which are distinctly laid down on the machine.

The machinery which guides and steadies the material in its movements may be readily varied, so as to form segments of wheels of greater or less dimensions; and the boring may also be more or less inclined. The scale indicates the exact position which the part of the machine that guides the material required to form a wheel,—for instance, of greater or less circumference. Slat and legs of chairs may be made of various lengths, and thicknesses, and shapes, as fashion or utility may dictate.

This machine affords a happy specimen of labor saving, and may be advantageously applied to a variety of useful purposes. It occupies but little space, only a part of a small room. No skill is required in using it. A mere laborer, or a boy, can learn in a few hours to use the machine, and to produce the article as perfect as the most skilful machinist. Like many other labor saving ma-

chines, it performs that part of the labor which the accuracy and strength of the human hand are incompetent rapidly, and with precision, to perform; it, in fact, does the work which is the most difficult and toilsome to the laboring manufacturer.

The expedition with which materials of small value, and with very little waste, are converted into articles of comparatively much greater value is entitled to particular notice. Chair backs sawed from our native curled maple are worth from *eight to twelve and a half dollars* per hundred.

By the aid of this machine, which costs only about *three hundred dollars*, a common laborer may do the work of twenty or thirty mechanics. The merit claimed by Colonel Hamilton consists chiefly in the facility and accuracy with which the material is adapted to the saw, so as expeditiously and uniformly to produce the exact form which is wanted.

METHOD OF DRESSING SKINS PRACTISED IN MAROCCO.—The following account of the method practised in dressing skins in Morocco was transmitted to the Zoological Society by W. Willshire, Esq., a Corresponding Member of that Society, in a letter dated Mogadore, May 5, 1838. Its results are stated to be excellent, as regards the preservation and color of the fur, and the flexibility of the pelt.

Wash the skin in fresh water to deprive it of the salt; as soon as this is done, scrape the flesh off, when take two pounds of alum, one quart of buttermilk, and two or three handfuls of barley-meal, which mix well together, and lay on the fleshy side of the skin equally; fold up and press it together carefully, and let it lie two days. On the third day take it to the sea-side, wash the skin well, and when clean and free from mixture, hang it up to let the water run from it: then take two pounds of alum finely powdered, and throw or spread it equally on all parts of the skin; again fold up as before, and allow it to lie three days, when it will be in a proper state to dry in the sun, laid flat, without taking away the powder. When it is dry, take a pint or two of fresh water, and sprinkle it upon the skin, and again fold it up carefully for about two hours, to imbibed the water; then lay it on a table, and, after scraping it free from the mixture and flesh, take a sand-stone (rather rough) and rub the skin well until it becomes soft and pliable, then hang it in the shade to dry. The process is then complete.

When the skin is perfect, having the head, horns, &c. take off the horns, and fill their cavity with a mixture of equal parts of powdered alum and ashes of charcoal dissolved in water, and expose them two days to the sun. Saturate the trunks of the horns with eight ounces of alum dissolved in water, and fold up with the skin, and apply the same on each occasion when employed in curing the skin. The flesh on the head and jaws to be carefully taken off, filling the same with powdered alum. It should remain in the sun until perfectly dry.

In addition to the foregoing description of the mode used in Morocco, in dressing skins, as related by the persons employed by Mr. Willshire, it may be well to observe that the process does not take so long at Mogadore, as Mr. W. has often received back skins of the Aoudad and Leopard from the dresser, on the third or fourth, and never exceeding the fifth day, perfectly cured. Allowance has been made by the dresser, in the foregoing description, for the difference in the climate of London.

The skins of smaller animals must not be subjected to so lengthened a process, or they will become harsh, and the pelt impoverished. —[Proceedings Zoolog. Soc.]

THE PRESS IN CHINA.—There is but one journal in the Chinese language in the whole Chinese empire; it is published at Peking, and is called the *King Pao*, or "Messenger of the Capital." It contains all the ordinances submitted to the Emperor for approval by the six ministers of Peking, and the various authorities of the provinces, as well as by the commandants of the military corps. The amount of subscription is a liang and an ounce of silver (about equal to twelve francs) per annum. The inhabitants of the capital alone have the advantage of receiving the paper every day at a regular hour; for, as China has no such establishment as a post-office, the country subscribers get their papers only as occasion may favor; consequently, those living at a considerable distance from the capital receive them very irregularly.

CAUSES OF INDIGESTION.—Among the chief causes of indigestion (says Dr. Wilson Philip, in his treatise on this disease,) which act directly on the muscular fibres of the stomach, are narcotic and other offensive substances received into it. I have found that although opium applied to the external surface of the alimentary canal and heart produces no sensible effect on their muscular power, applied to their internal surface, it produces the same effect as when directly applied to the muscular fibres themselves, impairing their power, unless the quantity be extremely minute, and instantly destroying it if the quantity be considerable. It is probable that other offensive substances acting on the stomach—tobacco, distilled spirits, strong peppers, those of an acrid or putrid nature generated in the stomach itself, &c., may also in the same way immediately affect the muscular fibres. It is not uncommon for a fit of indigestion to be induced by taking suddenly considerable quantities of iced fluids. Violent and repeated vomiting also debilitates the muscular fibres of the stomach. But of the causes which immediately affect them, the most frequent and powerful is morbid distention, the most common cause of which is eating too fast; another frequent cause being high seasoning and great variety of food, or such as particularly pleases the palate, by which we are induced to eat after the appetite is satisfied.

WISWALL'S YOKE CUTTER FOR DRESSING SPOKES OF WHEELS.—By means of a circular saw operating in connection with the cutter wheels, the timber is squared and cut to any length that may be required, and the tenons of the spokes are then formed of any required dimensions. The spoke being presented to the action of the first cutter, or ten-

on wheel, by hand, the tenon is formed in less than a minute, and the body of the spoke is dressed into shape and smoothly finished, first on one side and then on the other, by two operations, in another minute, more perfectly than it could be by any mere hand tool, though used by the nicest operator. No means of forming the round tenon which is to be inserted in the rim was exhibited. This, it is obvious, must be effected by a fourth operation. The whole machine is evidently capable of a more perfect construction than that examined by the committee; but such as was exhibited in operation is evidently a useful improvement, and a labor saving machine of great profit. It saves all the time which an operator by hand necessarily expends in judging by his eye of the exactness of the shape given, and to be gained by his tool, and may be operated in artificial light, when the laborer by hand would be scarcely able to judge of his own work. There is therefore much gained by the art of making wheels, which artists in that branch of mechanics will find profitable to themselves, as they can employ their journeymen more usefully on other parts of the wheel, and in adjusting them to each other.

EVERY NERVE APPROPRIATED TO ITS FUNCTION.—From this law of our nature, that certain ideas originate in the mind in consequence of the operation of correspondent nerves, it follows—that one organ of sense can never become the substitute for another, so as to excite in the mind the same idea. When an individual is deprived of the organs of sight, no power of attention, or continued ef-

fort of the will, or exercise of the other senses, can make him enjoy the class of sensations which is lost. The sense of touch may be increased in an exquisite degree; but were it true, as has been asserted, that individuals can discover colors by the touch, it could only be by feeling a change upon the surface of the stuff, and not by any perception of the color. It has been my painful duty to attend on persons who have pretended blindness; and that they could see with their fingers. But I have ever found that by a deviation from truth in the first instance, they have been entangled in a tissue of deceit; and have at last been forced into admissions which demonstrated their folly and weak inventions. I have had pity for such patients, when they have been the subjects of nervous disorders, which have produced extraordinary sensibility in their organs—such as a power of hearing much beyond our common experience; for it has attracted high interest and admiration, and has gradually led them to pretend to powers greater than they actually possessed. In such cases it is difficult to distinguish the symptoms of disease from the pretended gifts which are boasted of. Experiment proves, what is suggested by anatomy, that not only the organs are appropriated to particular classes of sensations, but that the nerves, intermediate between the brain and the outward organs, are respectively capable of receiving no other sensations but such as are adapted to their particular organs. Every impression on the nerve of the eye, or of the ear, or on the nerve of smelling, or of tastes, excites only ideas of vision, of hearing, of smelling, or of tasting; not solely because the extremities of these nerves, individually, are suited to external impressions, but because the nerves are, through their whole course, and wherever they are irritated, capable of exciting in the mind the idea to which they are appropriate, and no other. A blow, an impulse quite

unlike that for which the organs of the senses are provided, will excite them all in their several ways; the eyes will flash fire, while there is noise in the ears. An officer received a musket ball which went through the bones of his face: in describing his sensations, he said that he felt as if there had been a flash of lightning, accompanied with a sound like the shutting of the door of St. Paul's. On this circumstance, of every nerve being appropriated to its function, depend the false sensations which accompany morbid irritation of them from internal causes, when there is in reality nothing presented externally; such as flashes of light, ringing of the ears, and bitter tastes or offensive smells. These sensations are caused, through the excitement of the respective nerves of sense, by derangement of some internal organ, and most frequently of the stomach.—[Bell's Bridgewater Treatise.]

ARABIAN HORSE.—Perhaps the most remarkable point about the Arabian horse is the extraordinary smallness of the head and mouth,—so small, indeed, is the latter that you would think they might use a common tumbler for a water bucket.

Observations on the Prevailing Currents of the Ocean and their Causes. [From the United Service Journal.]—Continued from p. 216.

In considering the origin of the currents of the ocean, it must be kept in mind that they proceed from two distinct causes, and thus exhibit one of the most wonderful and provident effects to be seen in the order of the works of the Creator. Water and air, if left stagnant, soon become corrupt and unwholesome; and it is evidently a wise provision of the Almighty, which has furnished the laws by which a constant circulation and movement are kept up in both. In the case of the atmosphere, the circulation occasioned by the winds takes place, partly by means of the revolutions of the earth on its axis, and partly by the expansive nature of air when affected by the heat of the sun. The lower beds of the atmosphere are elevated into the higher regions by heat; and other portions of the fluid, rushing in to fill the vacuum, occasion streams of wind of various degrees of force. The seasons of the year, and the duration of the effects of summer and winter in various latitudes, also occasion similar currents of air more or less durable, according to circumstances. But in the case of the currents of the ocean, there are but two causes from which constant currents can primarily arise: one from the rotatory motion of the earth, from west to east, which causes an apparent current from east to west in the open seas near the equator; the other cause arises from the inclined position of the earth with regard to the sun, by which a greater evaporation takes place from the waters of the sea within the tropics, than in the more temperate and frigid zones; and on the other hand, a proportioned condensation of this vapor (in the form of rain, dew, and snow,) takes place in the latter regions, greatly superior in quantity to what falls, during the whole year, in the former. These effects of temperature are so vast, when viewed upon the scale of the whole earth, that the balance of the ocean would be deranged by them, thus losing water in one region and regaining it in two others. This want of equilibrium is, however, obviated by constant currents in the ocean, from the poles towards the tro-

pics.* In figure 1 of the following plate, (where the outer line denotes a supposed boundary to the atmosphere,) we see the vapors rising from the equatorial regions, and passing towards the poles, where they return to their parent deep, in the form of dew, rain, and snow. Thus restored to the ocean, they flow towards the tropics, and there chime in with the prevailing currents, in their course to the westward. In the central part of the same figure an idea may be formed of the effect of an intervening continent, in opposing its solid form to the fluids through which it is rapidly and constantly passing, with greater velocity than those fluids can possibly follow it. At 1, the equatorial current meets an opposing cape, which divides it into two parts: one flows pretty freely from the north-west, being kept, however, in its place by the north polar currents pressing towards it. It meets another projection at 7, still farther to the north; and after passing it, the stream is forced into its more natural position near the equator, and proceeds in its westerly course, after forming a great counter-current or eddy in the sheltered gulf at 6, where navigators would fall in, for days together, with what would appear, if viewed on a small scale, totally opposed to the theory now under explanation. Returning to the Cape at 1, we find the other half of the northern equatorial stream proceeding to the south-west, where it fills the deep gulf, or sea, at 3, and keeps up the waters there at a high level, on a principle which will immediately be explained. It cannot, however, make its escape in a body or current from this gulf, but, being confined by the southern division of the equatorial stream, a variety of eddies on a considerable scale are produced at 2. It is unnecessary to explain the figure further, by proceeding to the southern hemisphere, where similar effects are produced by nearly similar causes at the points 4 and 5; we may therefore proceed to explain upon what principle the level of the sea in the gulf at 3 is kept up at a higher level than the same surface in the bay at 6, an effect which is known to exist in several remarkable instances on the globe, and which, according to the theory, ought to exist in every situation similarly situated.

By fair analogy, we find that, in this, as in other parts of nature, what takes place on a small scale may also be looked for on a larger. Proceeding then upon this principle, and considering minutely the rapid and rocky course of a brook or river, we find that, so long as the water flows over a smooth and equal bed, the depth and surface of the stream are in all places alike, as in figure 2 of the plate. But when, on the other hand, a fixed and solid opposition is encountered, in the form of a projecting rock, derangement in the level instantly takes place, to a degree proportioned to the bulk of the opposing ob-

* It is probable, perhaps even certain, that heat has also a very considerable influence in keeping up the movement and circulation of the waters, but it is not likely that currents of great extent are set in motion by this cause. Water, like air, expands by heat, and contracts by a certain degree of cold, not, however, so low as the freezing point, for at that temperature ice is formed, and the formation of ice is always accompanied by violent expansion, so great, indeed, as to burst the strongest vessels, and to cause explosions like cannon, in the lofty glaciers of Alpine regions.

As warm water rises above the colder, (except in the extreme case of ice, which always floats,) and as currents and counter-currents are always acting horizontally, and then intermixing the fluids from the poles and from the tropics, it is obvious that an interchange must also be constantly going on vertically, in the waters of the ocean, and thus completing the circulation of which the great superficial currents, already described, are the leading cause.

Fig. 1.

Theory of the General System of the Currents both of aqueous and aerial Fluids.

Fig. 2.

Unopposed Current.

Fig. 3.

The Consequence of Opposition.

ject. An accumulation or rise in the water takes place on the upper side, until the current finds a vent at one or both extremities, and without this vent, the accumulation increases until the water flows over the top, when the difference of level above and below the object is at once apparent (see fig. 3). But supposing the impediment to be small, in every case, a change of level must be the consequence; and the recovery of tranquillity is only completed at some distance below the object, where it, at length, falls again into the general inclination. Beneath or behind this opposing rock, then, there is a sheltered nook, upon which the stream can only act in the form of an eddy; and in such nooks buoyant objects are often kept, as it were, imprisoned by the force of the stream on each side, and floating round in one continual circle. These eddies of the smaller rivers are equally well known to fish and fishers, as both are there sure to find their wished-for prey. Now, all these effects are to be expected on the great scale of the ocean current, as well as in the smaller instance of an inland brook. The streamward side of these mighty rivers will always be found on a higher level than the eddy side; and consequently the inland gulf at 3, (fig. 1,) ought to be considerably higher than the

waters in the bay at 6, which remains sheltered from the powerful action of the current. Thus the level of the Red Sea, which is filled and kept up by the action of a powerful stream across the Indian Ocean, was found, by the French engineers, to be so considerably higher than that of the Mediterranean, that much difficulty and expense would have been incurred in the canal which was once projected across the isthmus of Suez, in order to facilitate the communication with India by this route. A second instance of this effect no doubt exists in the gulf of Mexico, compared with the level of the north Pacific on the western coast of Mexico; but the actual difference of level has not yet been ascertained. A remarkable instance, however, of this difference of level, obviously arising also from the above cause, has been kindly communicated to us by Sir H. Douglas, who was then governor of New Brunswick, where it was found that, in a proposed canal intended to have been cut from the top of the Bay of Fundy to Bay Verte, in the Gulf of St. Lawrence, (a distance by land of only fourteen miles,) the difference of level of the two seas was no less than sixty-three feet,* the rise of the tide in Bay Verte being

* Surveyed by Mr. Francis Hall, and reported upon by Mr. Telford.

only seven feet, while that in Cumberland Bay, of the Bay of Fundy, exposed to the full force of the Gulf stream, was seventy feet. The Bay of Fundy is kept at this high level in consequence of the projecting peninsula of Nova Scotia impeding the current which rushes along that coast towards the north, and which, from the bend of the coast towards the north-east, is carried in that direction, leaving the gulf of St. Lawrence as a sheltered eddy or nook.

We may now proceed to a cursory view of the whole existing system of the currents, as far as the observations of navigators have made us acquainted with them; but in the rapid sketch which is alone consistent with the limits of a paper of this description, it would be impossible, and even injudicious, to be led from the general outline into any notice of the innumerable minor currents of which seamen have frequently made mention, and which may often be looked upon as eddies and counter-currents, produced by the main body of the stream,† and being occasioned by a variety of changing circumstances, may not again be found in the same exact position.

As it is necessary in this circuitous course to start from some particular point, which may be considered as it were a commencement of the circle, we may adopt as the most proper the western line of the continent of America, whereby the circle is more nearly broken, from pole to pole, than by any other of the dry lands of the earth. Setting out then from this point, and viewing more especially the equatorial line of currents, we enter the immense expanse of the North and South Pacific, where every account that has touched upon the currents tends to establish the fact of their westerly course; and as the force of these currents must there be more steady and equal than on any other part of the globe, from their being unopposed by any thing more important than clusters of small islands, we should not expect them to assume that dangerous and impetuous power by which they are frequently distinguished in the Chinese sea, and in the Atlantic. Mr. Mariner, and other navigators, have given us some interesting proofs of the existence of westerly currents, in the adventures of parties of natives, passing from one island to another, being carried to a distance of many hundred miles, and being found on islands from whence they were utterly hopeless of ever being able to regain their native shores. Of this portion of the globe, however, it must be admitted that we as yet know but little with regard to the currents. But if we find in the Indian Ocean, and in the Atlantic, a series of well established facts in support of the system now under consideration, we have a full right to extend it, by analogy, to the less visited parts of the globe, especially when corroborated by the few but striking facts just alluded to. Proceeding then in a westerly course, and having reached the western bounds of the Pacific, with the Chinese islands and shores on the one hand, and the continent of New-Holland on the other, we hear of a succession

of powerful currents from the eastward, forcing their devious courses through the crowded archipelago, and pointing towards the east coasts of Africa. Here the currents on both sides of the equator, being confined in a much smaller space than in the Pacific, and being forced by the form of the land out of that position which is naturally given them by the rotatory motion of the earth, become more violent, and consequently more obvious. In their efforts to retain their position north of the equator, they act with great force against the shores of the seas of Bengal and of Arabia, occasioning in the former the well known and formidable surt of Madras. Finding no vent in a northerly direction, the united stream is forced to the southward, along the east coast of Africa, and if left at liberty, it would follow the southerly impetus thus given to it, and flow into the southern ocean. In this, however, it is opposed by the south polar currents, and it therefore no sooner arrives at the Cape of Good Hope than it doubles that point, in the well-known Lagullas stream, and, running in a north-westerly direction, hastens to regain its natural position on each side of the equator. The force of this current off the Cape is so great, that nothing but a prevalence of westerly winds at some seasons could enable outward-bound ships to make head against it; and even with these favorable winds, ships are constantly found driven to the westward in the very face of the wind.

In following out the course of the equatorial stream across the Atlantic, we find it in part crossing the equator obliquely, and this great moving mass of waters, striking upon the eastern point of Brazil, is divided into two streams, one driven to the southward by the form of the coast of South America, until it is forced round Cape Horn, as it had before doubled the Cape of Good Hope, and joins in with the waters of the Pacific; the other, taking a north-westerly course towards the Caribbean sea and the Gulf of Mexico, passing with considerable force amongst the islands of the West Indies. Having reached the Gulf of Mexico, which opens its extended arms, as it were, to receive it, the current is there brought to a full stop, being precluded from advancing to the westward, or northward, by the form of the lands, and the waters being in consequence accumulated into a higher level than perhaps in any other known position of the whole globe. This elevation has often been supposed, and has even been shown to be demonstrably certain, without, however, any good reason having even been assigned for the phenomenon. We here, therefore, find a natural, and even necessary cause, upon the same principle as has been already explained by fig. 3 of the plate. The high level of the sea in the Gulf of Mexico cannot, however, pass a certain boundary, and the swell of waters at length finds relief by the only possible, though tortuous course, that is left open for its issue. The stream then rushes with a violence proportioned to its late confinement, round the south point of East Florida, and here, taking the name of the Gulf Stream, it proceeds to the northward, along the coasts of the United States to Newfoundland, where it encounters the Great Bank, and becomes again divided, one portion continuing towards the north and east by Iceland and the coast of Greenland, until again stopped by the north polar currents; and the other, bending to the east and south, is terminated in an

immense vortex in the centre of the north Atlantic, where it accumulates on the surface prodigious quantities of the *fucus natans*, or Gulf-weed, which is known to flourish in the warm waters of the Gulf, and to be carried by the stream into the Atlantic, and there covers the surface for hundreds of miles, together with floating timber and other bodies; washed out by the rivers of America. In this great eddy, then, the famous Gulf Stream may be said to terminate; but not so the other portion of the current which had passed on towards the north: when met by the north polar currents from the arctic seas, it is headed back towards the south, along the coast of Norway, and into the North Sea. We here feel its effects upon our own coasts, especially of the north of Scotland, and of Ireland, where floating substances from southern latitudes are frequently found. A minor branch passes through our channel, and rejoins the greater stream across the Bay of Biscay; and the whole at length becomes blended once more in the equatorial current off Cape Verde and the coast of Africa.

In an interesting work which has recently appeared—the Narrative of Capt. Owen's Voyages for the Survey of the Coasts of Africa—we have a distinct proof of the great obscurity which still overshadows the subject of the currents. In the observations on the results which have been gained by this long, interesting, and most fatal expedition, we find the greater part of the subject connected with the currents summed up in the following passages at the end of the work.

“As in the foregoing narrative but few observations have been introduced respecting the currents, and as it is a subject of much speculation and interest, at least to those connected with navigation, the following remarks from Capt. Owen's Journal may be considered worthy of publicity.

“It is a well known fact, as regards the African seas, that there is a perennial current which sets into the Atlantic Ocean, round the entire southern extreme of that continent; this current varies in its velocity in different situations, and at different periods, from five miles to one mile an hour. Some writers have supposed that, with reference to the Great Ocean, the Atlantic may be considered as a kind of mediterranean sea, the evaporation from which, together with winter frosts to the northward, must be supplied from the Southern Ocean, in like manner as the Mediterranean is fed from the Atlantic; and this hypothesis is borne out by the strong perennial currents about the shores of Cape Horn, and through the islands in its vicinity. But it is remarkable that these currents never appear to extend more than twenty leagues beyond the common deep-sea soundings, while their velocity is much decreased when near the shore; from which it may be understood that the depth is much diminished, and the stream broken by projections of bank and sand.

“Ships are frequently carried to the westward, quite round the Cape of Good Hope, even against the strongest north-west gales, by this current.”

Capt. Owen then proceeds to state the dangerous nature of the short though high waves produced by the currents and wind being in opposition, and the most effectual course by which the danger may be avoided. It is quite clear that every thing here

† Major Rennell's work on the currents is accompanied by a laborious and valuable volume of charts, which, if any objection could be made to them, might be considered so minute as to produce confusion. It appears that the courses of the minor eddies have been laid down wherever any naval authority could be produced for their existence, although it is more than probable that a large proportion of them may not again be found in the same position by future navigators.

stated is strictly in accordance with the theory here advanced. He bears witness to the *constancy* of the current from east to west; and in other parts of his work, when treating of the east coasts of Africa, and those of Madagascar, he mentions the rapid nature of the currents *passing down from the northward towards the Cape*, by which, in one instance, the *Leven*, in making the point of Mombas, was driven so far to the southward, that it took her *six days* to regain what she had lost by the *failure* of the wind for about *three hours*.—[Vol. II. p. 150.]

It is known also that, off the Cape, ships have been driven to the westward, at the rate of sixty or seventy miles per day, *even against* a strong westerly wind.

The only part of Capt. Owen's statement which in any degree stands opposed to what is now advanced, is the allusion to the constant currents at Cape Horn. These are not *stated* to run to the eastward, or *into*, instead of *out of* the Atlantic, but that fact is implied by the theory of *evaporation* from the Atlantic, which is counter-balanced by *entering* currents at both capes.* This is opposed by the general reports of the navigation of Cape Horn; it is opposed also, most distinctly, by the much better attested facts of currents *out of* the South Atlantic towards the north. For if evaporation took place on so great a scale as to produce *entering* currents at the two great capes, we must admit that an *entering* current should also flow from the colder latitudes of the north, which is not the case. As to the fact of the current at the Cape being little felt *close in shore*, and gradually diminishing in force as it extends to the open ocean, a hundred miles or more from land, it is in every way consistent with the whole theory of inland rivers. In the case of a projecting bank or rock in a river, the actual point of contact is exposed to great violence, but every other point of the stream exhibits the phenomena described by Capt. Owen off the Cape. Under the most projecting rock or point, comparatively smooth water is generally found close to the side; while the main body of the stream drives past with a distinct and rippling outline, diminishing in force, however, as it spreads out into the expanding pool below.*

We have thus passed in review the great and leading course of this wonderful and most admirable system by which the waters of the ocean are kept in that continued movement so necessary to their purity, and by which, also, it is highly probable that many important ends are effected, in regard to the amelioration of the climates of various parts of the earth. The land and sea breezes of the hotter climates are now well known, and also their causes. We may na-

* Major Rennell gives many interesting instances of bottles and other bodies carried by the currents. In one case a bottle was thrown overboard from the *Osprey*, of Glasgow, on the 17th of January, 1822, in 6° 13' south latitude, and 15° 35' west longitude, and it was found on the 27th of July of the same year, in Mayard Bay, in the island of Trinidad.

In another case, still more remarkable, a bottle was thrown from the American ship *Lady Montague*, on the 15th of October, 1820, two leagues north-east of the island of Ascension, and was picked up on the west coast of *Guernsey*, the 6th of August, 1821, and notice of it sent to the Admiralty. It is certain that this bottle must have passed, in ten months, over the whole course of the Gulf Stream, and from thence be carried (probably by the coasts of Iceland) into the North sea, and through the English Channel. We cannot, however, decide from this, or almost any instance of floating bodies, as to the *rapidity* of the current, for we cannot tell how long it may have been detained at various points, nor how long it may have remained on the spot where it was eventually discovered.

turally suppose this wholesome interchange to be powerfully affected by streams of current from the cooler latitudes; and we also may be assured that the heated waters of the Gulf Stream must carry along with them into the Frozen Ocean a degree of warmth which cannot but materially affect the rigidity of those latitudes. Even in our own country, we are well aware, from continued experience, of the mild effects of a westerly wind. We have no particular warmth to look for from the *lands* to the westward of us; on the contrary, the winters of Labrador and of Canada are well known to be unusually severe. But when we find that a vast reservoir of heated water, and consequently of *warm vapors*, exists in the Atlantic, we can no longer find a difficulty in naturally accounting for the mild and humid effects of our westerly winds, which, even in winter, produce on Ireland and the west coast of Britain the verdant growth of a milder season.

It is scarcely necessary, in conclusion, again to revert to the theory of the winds being the prime movers of the currents; for besides the arguments already adduced, by which we trust it has been shown that ocean currents could not but exist, even if there were no winds whatever, we have only to examine the numerous instances mentioned even by Major Rennell, of ships being drifted far to *windward*, in the very teeth, not of transient breezes alone, but of settled and heavy gales. "One ship," says he, "was carried 10° of longitude (*equal to 570 miles*) to the westward, between Cape Verde and the Cape of Good Hope, and yet had been subjected to the south-east trade wind. Another was driven 220 miles, between the Canaries and the coast of Brazil. Another in the equatorial current, in June and July, was set 297 miles to the westward, in *five following days*, between 3° north and 4½° south, and yet had entered the south-east trade wind." Such, and numerous other instances, well known to all seamen, are sufficient to show that the currents must be set in motion by some much more powerful and less *superficial* cause than the mere *friction* of the winds, however fixed or severe. That the winds agitate the *surface* of the waters no one will attempt to question; but that this agitation can extend to the vast depths at which the law of fluids above explained must operate, we have not the slightest reason to suppose. Major Rennell brings forward, in proof of his theory, the well known fact, that the surface of a canal, or of a lake, is always higher at the *leeward* than at the *windward* side. This fact is at once admitted, but it is one of very small effect, and merely *superficial*, being occasioned by *waves*, and instantly subsiding with these waves. But in order to prove the point, it must be shown, that in a straight canal of several miles in length, with a strong breeze right on end, the force of the winds, near the middle of the distance, (where they must have acquired their full force,) can affect an object of no great weight at the *bottom of the canal, and at a depth of four or five feet*. If this effect takes place in canals, or in large inland lakes, such as those of North America, and also at considerable depths, the theory might be supposed to derive some support from it. But this is not the case; and in inland lakes, of whatever extent, although the surface may be raised on the leeward side, in violent winds, objects deposited at a few

feet of depth lie perfectly secure and unmoved.

The winds would not, therefore, effect the end for which the great circulation of the waters of the ocean is obviously intended; and any theory of the currents, which is mainly founded on so false a ground, however ably it may be treated, cannot but mislead the mind, and in many instances prove injurious, not only in a scientific, but also in a practical point of view.

NEW-YORK AMERICAN.

APRIL 12—18, 1834.

LITERARY NOTICES.

For the first time since we commenced our *Saturday Reviews*, we ask indulgence at the hands of our readers for being unprepared with one. But in very truth we have been too much engaged, heart, mind, and body, during the past week, in what we deem the sacred cause of Liberty and the Constitution, to have had either leisure or inclination for any mere literary labor. The traveller in the far West, too, whose letters add a relish usually to the Saturday paper, fails us—or rather, probably, Mr. Post Master Barry's mail carriers fail us—this week; and we throw ourselves, therefore, on the indulgence of our readers.

SUMMARY.

The Norfolk Herald of onday, is in mourning for the death of Judge *Robert E. Taylor*, one of the most eminent citizens of Virginia.

It is our painful duty (says the National Intelligencer of yesterday,) to announce the decease of the Honorable LITTLETON P. DENNIS, a highly respected and most estimable Representative in Congress, from the State of Maryland. He expired yesterday afternoon, at his lodgings in this city, after an illness of six or seven days.

Charles R. Leslie sailed Wednesday in the Philadelphia for London. The Professorship of Drawing at West Point did not answer his expectations, and duty to his family compelled him to return to Europe.

Last evening, by invitation, Mr. Leslie met a number of brother artists and literary gentlemen, at an entertainment at the rooms of the Academy of Design, who testified to him their admiration of his genius, and their regret that he was not longer to remain among us.

With the exception of Col. Trumbull and Mr. Dunlap, one prevented by illness, the other by the somewhat increasing infirmities of age, all the painters, engravers, and sculptors of the city and vicinity were present, together with *Messrs. Washington Irving, G. C. Verplanck, James Hillhouse, F. G. Hallock*, and other literary gentlemen.

It was a parting tribute—well deserved on the one hand and rendered with taste and feeling on the other.

The following letter from Commodore Ridgely, sets forth the liberal contributions made at the Navy Yard, Brooklyn, in aid of the Poles—the money is in the hands of Mr. George W. Lee, Treasurer of the Naval Lyceum, to be paid over to such Committee as may be raised to assist these exiles.

NAVAL LYCEUM, UNITED STATES NAVY YARD.

New York, April 15, 1834.

I am requested by several of the members of the United States Naval Lyceum, employed and residing at this station, to transmit the within amount of money, \$146.50, to you as a Committee, to be used as you, in your better judgment may think proper, for the benefit of the unfortunate but gallant Poles, who have been lately brought to this country in the frigates of Austria.

I take great pleasure in saying that part of the contribution was made up by the Joiners employed in the yard, and the Seamen and Mariners *aboard*, who voluntarily gave them twenty-five cents each, and

who would have contributed more, had I permitted them. I am Gentlemen, very respectfully,
Your obedient Servant,
CHAS. G. RIDGELY.

It gives us great pleasure to learn that the CONVENTION for the settlement of our claims on Spain, which the President announced at the opening of the present session as in progress, was signed at Madrid on the 17th of February, and may be shortly expected at Washington. We hasten to communicate this information, which to the claimants, is so important, and to the country at large so gratifying, as it furnishes another proof of the success of the just and enlightened policy pursued by our venerable Chief Magistrate.—[Globe.]

IMPORTANT RESOLUTIONS.—The following resolutions have been submitted for the consideration of the House of Representatives of the United States: By Mr. VANCE, of Ohio.

"Be it further enacted, That from and after the passage of this Act, instead of the compensation now allowed by law, there shall be paid to the within named officers the following sums per annum:

"To each of the Secretaries of State, Treasury, War, and Navy, four thousand dollars. To the Postmaster General, three thousand five hundred dollars. To each Assistant Postmaster General, eighteen hundred dollars. To each of the Comptrollers of the Treasury, two thousand dollars. To each of the Auditors of the Treasury, two thousand dollars. To the Solicitor of the Treasury, two thousand dollars. To the Register of the Treasury, two thousand dollars. To the Treasurer, two thousand dollars. To the Commissioner of Indian Affairs, two thousand dollars. To the Commissioner of the General Land Office, two thousand dollars.

"And that there be deducted from the compensation now allowed by law to the Clerks in the Departments of State, Treasury, War, and Navy, including those in the General Land Office, at the rate of thirty-three and one third per centum per annum.

"That from all officers of the customs, by whatever name designated, or in whatever manner employed, there shall be deducted from the compensation now allowed to them by law, at the rate of thirty-three and one-third per centum per annum.

"That from all officers connected with the system of the public lands, either as Surveyors General, Registers, Receivers, or Clerks, there shall be deducted from the compensation now allowed to them by law, at the rate of thirty-three and one-third per centum per annum.

"That from all the Clerks in the General Post Office, Deputy Postmasters, their Assistants and Clerks, there shall be deducted from the compensation now allowed to them by law, at the rate of thirty-three and one-third per centum per annum.

"That from all persons connected with the Indian Department as Superintendents, Agents, Sub-Agents, Interpreters, Agents for removals, Commissioners, or in whatever other manner employed, there shall be deducted from the compensation now allowed them by law or regulation, at the rate of thirty-three and one-third per centum per annum.

"That to the members of the Senate and House of Representatives, instead of the compensation now allowed by law, they shall receive six dollars per day and six dollars for every twenty miles travel to and from the Seat of Government. And that from and after the expiration of the present Presidential term, the salary of the President of the United States shall be fifteen thousand dollars per annum."

The BANK OF WASHINGTON, at Washington, has stopped payment.

The notice of the stoppage of payment by the Bank of Washington, another of the inevitable consequences of "the experiment" which is carrying disaster and devastation over the whole face of the country, was as unexpected to us as it will be to our readers. In the perfect integrity of the administration of that Institution, entire confidence is reposed; and the step which it has taken is doubtless the result of irresistible necessity.—[National Intel.]

ANOTHER AND ANOTHER.—The Patriotic bank of Washington—which it was supposed might, by the aid of the Pet Bank there, escape the fate which three of the banks of the District have undergone—has found that aid not forthcoming, and has accordingly been obliged to suspend specie payment. A public notice from the President and Directors of the Bank avers its solvency notwithstanding.

We regret to hear of the alarming illness of Ho-

RATIO GAFFS Esq., of Montreal, a merchant of high character and great personal worth, and well known by his extensive business relations in the States, as well as in the Canadas. His death (which was hourly expected at the date of our information) will be a severe deprivation not only to his amiable family, but to the city, to the prosperity of which, his enterprise has greatly contributed, and particularly to the numerous visitors from the United States, to whom his courtesies and civilities have been so liberally extended.—[Albany Argus.]

COURT FOR THE CORRECTION OF ERRORS—Tuesday, April 15.

The Chancellor moved that the extra term of the Court be held on the 23d day of August next, at the Capitol in the city of Albany. On motion of Mr. Maisson, the question as to the time and place was divided; and after some conversation between several members of the Court, the time, (23d August) was agreed to. Mr. Kemble then moved a resolution that the term be held at the City Hall, in the city of New York. Mr. Westcott moved to lay the question on the table—Lost. The motion to hold the term at the Capitol in the city of Albany was lost—ayes 13, noes 17, as follows:

Ayes—The President, Chancellor, Justice Savage, and Messrs. Conklin, Edmonds, Edwards, Fisk, Hasbrouck, Hubbard, Macdonald, Stower, Tracy, Van Schaick—13.

Noes—Messrs. Armstrong, Bishop, Cary, Foster, Griffin, Halsey, Kemble, Lansing, Livingston, McDowell, Mack, Maisson, Quackenboss, Seger, Seward, Sudam, Westcott—17.

The motion that it be held at the City Hall in the city of New York was then agreed to. Adjourned to Friday, the 25th inst.

From the Boston Mercantile Journal.

ACCIDENT ON THE RAILROAD.—We learn that a serious accident occurred yesterday afternoon, on the Boston and Worcester Railroad. As the locomotive was returning from Newtown, with a train of passenger cars, when near the Four Corners, H. H. Fuller, Esq. and lady, of this city, attempted to cross the track with a horse and chaise, in advance of the locomotive. Mr. Fuller, it appears, was not aware of the proximity of the Engine, and unfortunately crossed the track at the moment the Engine approached, without perceiving it. The consequence may be anticipated. The locomotive struck the wheel of the chaise, shattered and overturned it. Mr. and Mrs. Fuller are considerably injured, but we are happy to learn not dangerously.

RICHMOND, APRIL 2.—The driver of the Northern mail cart yesterday morning before day, drove over a steep bank, a few miles this side of Hanover Court House, and falling under the horses' feet, it is believed, was trampled to death by them. He was apparently dead when left by the stage. In consequence of this melancholy occurrence, the Northern mail was delayed two or three hours to its arrival in this city yesterday morning.—[Whig.]

[From the Daily Advertiser.]

LATEST FROM SPAIN—Via BORDEAUX.—By the Brig Rome, Capt. Davi, arrived last night, from Bordeaux, having sailed on the 16th March—the Editors of the New York Daily Advertiser have received files of papers to the 11th, containing Madrid dates to the 6th March, and Bayonne to the 9th.

The Capital of Spain continued perfectly tranquil. No change in the ministry had taken place, nor was any talked of. The Northern Provinces were in a very rebellious state. The Carlist party was far from being subdued.—We have only time to make the following translations:

A correspondent writes from Bayonne the 8th March, by a courier extraordinary, which left Madrid the 5th March, we learn that on its departure the capital was perfectly tranquil. The Queen had left for Arangnes. No change in the ministry had taken place, nor was the subject even mentioned.—A movement had taken place, by a party of the Carlists who had been put down, and some 8 or 10 had been killed, and several arrested.

Another courier which left on the 6th, represented that Madrid was perfectly tranquil.

The success of the Queen's troops, at Onati, in capturing 120 persons, 590 guns, and a squadron of mules with munitions of war, belonging to the Carlist party, is confirmed.

Col. Lorenzo had captured a large body of insurgents at Aspetia.

It was reported that the Courier from Paris had been assassinated by the insurgents, near Bedous.

Tolosa and Villafraanca are constantly occupied by the troops of Il Pastor.

Murder of Captain Skirling.—Intelligence has been received of the murder of Captain Skirling, who was engaged under the direction of the Board of Hydrography, in surveying the west coast of Africa. On the 23d of December, 1833, he left his ship early to commence the survey of Cape Roxo, in a boat, accompanied by four men and a boy. On the boat landing, the natives, apparently attracted by the glitter of their instruments, attacked them, shot the cockswain, and then speared the captain. They were so intent upon plunder, that they allowed the rest of the crew to escape. They hid themselves in a bush, and after some time made their way down to the coast, and fortunately signaled the boat of the tender to the Etna. Captain Skirling served under Captain Hewett, in the Fury, in the survey of the North Seas. He then sailed in Captain P. P. King's expedition round Cape Horn, and succeeded Captain Stokes in the command of the Beagle. He was a most charitable and good man, and had left a wife and two children to deplore his early death.

Ignorance v. Knowledge.—Knowledge has the wantonness of a child and the cruelty of an ogre.—He builds up systems in one age, only to overturn them in another; he begets theories in one century, and not only exposes them to perish, but is himself the unnatural instrument of their destruction in the next. He resembles Homer's infant on the seashore, raising castles of sand with pains and perseverance, then with hands and feet demolishing its labors; or he may be likened still better to Titan, devouring, as fast as they see the light, the offspring of his own loins. Now turn we to Ignorance, and what do we behold? Not content with evincing the tenderness of a parent, by defending, like a lion, his own notions and opinions whenever they are attacked, he rushes forward with disinterested courage to the succor of systems and theories with the procreation of which he had nothing in the world to do, the moment he sees them deserted by their natural protectors, and in danger of being annihilated by the ruffian Improvement, or that shocking desperado, Reform. This promptitude to espouse the weak is extremely amiable in Ignorance. Let him but see a principle in any science, astronomy, geology, anatomy, metaphysics, or politics, no matter how philosophical its pedigree, in danger of being roughly handled by what is called the march of intelligence, or the extension of experience; in other words, hustled by a knot of ill-looking facts, like a foot-passenger in Oxford street by a gang of pickpockets, Ignorance at once cries, "To the rescue!"—makes common cause with the doctrine in distress—kneels down one fact with a flat contradiction—floods another with a shout—puts a third "hors de combat" with a horse-laugh, and by this chivalrous conduct not unfrequently extricates his friend, and gives some useful error or venerable prejudice a new lease of its existence. But in the catalogue of the vices of Knowledge, although there be many blacker, there is none so contemptible as his curiosity.—Ignorance, it must be allowed by his best friends, is in some few particulars rather more inquisitive than becomes his dignity; he is sometimes too anxious to discover what his next door neighbor is to have for dinner; or how many thousand pounds the old lady on the other side of the street has got in the Three per Cents; or what business the gentleman, who lives six houses higher up, has with the fat man in a green coat and pink cravat, who knocks at his door every day, except Wednesdays, at five minutes past two precisely; but what of this?—it is only in downright trifles that any body can justly tax Ignorance with curiosity—when was he ever known to meddle with the great secrets of the world?—When, for instance, was he ever caught, like the elder Pliny, peeping into the crater of a volcano? Never; he leaves such low tricks to those Paul Frys, yeelped philosophers. He would have remained in the dark for ever as to the laws of electricity, before he would have stooped to the mean artifice of Dr. Franklin, who, on pretence of flying a kite, insinuated himself into the confidence of a thunder-cloud, made himself acquainted with all its private affairs, and then (to crown his baseness) published them to the whole world. Nature never leaves her wardrobe, or a drawer of one of her scrutiores unlocked, but these dirty fellows, your men of science, take advantage of the oversight to tumble her dresses, read her family papers, and often purloin her trinkets for their cabinets and museums. What are mineralogists but a gang of thieves, who have discovered the secret springs of the chest, in which Nature keeps her treasures? What are phrenologists but pick-locks, who actually boast of having in their possession a key to the whole mystery of the human mind? The mathematician

you may swear is about nothing handsome—he is generally to be found in angles and corners. The astronomer waylays nature by night; the botanist, in wild and sequestered places—

"In wood or grove, by mossy fountain side,
In valley, or green meadow;"

wherever, in fact, she is likeliest to be found asleep, or undressed. Who, then, can doubt the purity of the intentions with which he pursues his cryptogamias and syngenesias? No question, Apollo's pursuit of Daphne was nothing in the world but a botanical excursion:—the divinity only wanted to ascertain the nymph's class and order. Then what have the conchologists and entomologists to say for themselves? The elders in the apocryphal legend, Heaven knows, were filthy old fellows enough; but their obscenity was chastity, compared to the conduct of these men of periwinkles and butterflies; they did not put on their spectacles—at least it is not so written—to contemplate the bathing beauty; they were content to stare at Susannah's charms with the naked eye. Not so the entomologists; not even spectacles are enough for them; they must actually have microscopes, or they think they see nothing.—[Metropolitan Magazine.]

The Poetical Works of the Rev. George Crabbe; with his Letters and Journals, and his Life, by his Son. London: John Murray.

We select the following instance of delicate, liberal, and sincere patronage of destitute genius, unequalled, perhaps, in any age, but, we fear, vainly to be looked for in this. But the great Edmund Burke possessed a fine mind, a feeling heart, and a genius which sympathized with genius wherever found.—The Poet of "The Village" and "Annals of the Parish," sought for fame and fortune in London—the *El dorado* of youthful hope. His hopes sustained repeated and cruel disappointments; poverty progressed upon him, until he was driven to the verge of extreme destitution, though it weakened not his piety nor subdued his dependence upon a protecting Providence: that Providence asserted itself and rewarded him through a suitable agent. When the prospects which he attached to the judgment, liberality, or self-interest of the book-selling tribe, were extinguished, and that he knew not where to find the next day's bread, for manna dropt from heaven in his days no more than in ours, he bethought him as his last resource to write to Edmund Burke, and enclosed him a specimen of his poetry. Hope deferred was not suffered to sicken our author's heart—he received an immediate answer from the great champion of rational liberty and Gospel truth, inviting him to an interview. Mr. Crabbe's son shall tell the rest:

"Mr. Burke was, at this period, (1781) engaged in the hottest turmoils of Parliamentary opposition, and his own pecuniary circumstances were by no means affluent; yet he gave instant attention to this letter, and the verses which it enclosed. He immediately appointed an hour for my father to call upon him at his house in London; and the short interview that ensued entirely, and for ever, changed the nature of his worldly fortunes. He was, in the common phrase, 'a made man,' from that hour. He went into Mr. Burke's room, a poor young adventurer, spurned by the opulent, and rejected by the publishers, his last shilling gone, and all but his last hope with it; he came out virtually secure of almost all the good fortune that, by successive steps, afterwards fell to his lot—his genius acknowledged by one whose verdict could not be questioned—his character and manners appreciated and approved by a noble and capacious heart, whose benevolence knew no limits but its power—that of a giant in intellect, who was, in feeling, an unsophisticated child—a bright example of the close affinity between superlative talents and the warmth of the generous affections."

If our space permitted, we should like to pursue further this period of the poet's life and fortunes—suffice it to say that Mr. Burke took him into his house, placed him at his table, gave him the advantages of his books, and conferred all these favors with a delicacy that never suffered his guest to experience a feeling more painful than gratitude. Although Crabbe had not been regularly educated, Mr. Burke got him ordained by Dr. Young, then Bishop of Norwich, and, by introducing him to other patrons, did not suffer the course of his fortunes to stop until the poor poetical adventurer became the incumbent of two livings, and was enabled to pass the rest of his life in happiness and "learned ease."

Both Houses of Congress adjourned on Tuesday, in token of respect to the memory of the deceased member from Maryland, Mr. Dennis, whose funeral was to take place next day.

Appointments made by the Governor, with the advice and consent of the Senate, April 11.

New York.—John T. Morris, culler of staves and heading.

April 16.—*New York.*—Michael Ushoeffer, Associate Judge of the Court of Common Pleas.

YOUNG MEN PROSCRIBED!—The House of Assembly this day REJECTED the bill incorporating the YOUNG MEN'S ASSOCIATION FOR MUTUAL IMPROVEMENT. This vandal blow will astound our citizens! There is not on record another such act of Legislative proscription and intolerance.

This Association is conferring immense benefits upon the youth of our city. It has grown, under the fostering care of our citizens, into vigor and maturity. It has ample means to perpetuate its usefulness, and only wanted, what has been granted to all other Literary Associations, an act of Incorporation. But this small boon is denied! The Legislature refuses its protection to some fifteen hundred of our Young Men who are associated for Mutual Instruction!

The above paragraph is from the Albany Journal.

SPAIN.—It will be recollected that in the previous amnesty of the Spanish Government, the language was deemed so unexceptionable that many of the exiled members of the Cortes refused to avail themselves of it. We now publish the last, made under the new Minister, which is conclusive, without any qualification or reservation, and such as will be deemed unexceptionable.

OFFICIAL.—Spanish Amnesty.—Decree.

"Considering the reasons which you have laid before me, and complying with the opinion of my Council of Ministers, I have thought proper, in the name of my beloved daughter Donna Isabel Segunda, to extend the Royal Decree of Amnesty to all the ex-Deputies of the Cortes, who may be out of the kingdom in consequence of opinions expressed by them as such Deputies, granting them permission to return freely to the bosom of their country.

"Take notice hereof, and do all that may be necessary for its fulfilment."

Signed in rubric, and addressed to Don Francisco Martinez de la Rosa

Madrid, February 7, 1834.

DEATH OF MR. GATES.—The Montreal Herald, of Saturday last, thus announces this event.

We stop the press to announce an event that occurred last night, and which will be received by the community in general with the deepest sorrow—the death of the Hon. HORATIO GATES, than whom a more honest, upright, just and independent man, never distinguished the annals of mercantile or political history.

Lightning.—The severity of the lightning which accompanied the heavy fall of rain on Wednesday evening was very great. The main-topmast of the U. S. ship John Adams, lying at the wharf at the Navy Yard, at Gosport, was struck; the electric fluid descended the top and main mast to the keelson, splitting and shivering the mast, and then ascending passed out of one of the gangway ports, setting fire to the ship, which was extinguished with but slight damage, owing to the prompt arrival of the engines. The shock of the heavy explosion at 6 o'clock, so much resembling the report of a heavily charged cavalry pistol, was also severely felt in several parts of our towns—a female servant in a family on Town Point, was knocked down and so much stunned that she did not recover for a considerable time. We learn that a small house in a lane near the Steam Mill was struck with the lightning, and a woman and a child, in one of the rooms, for a time rendered insensible.—[Norfolk paper, April 11.]

NEW ORLEANS, SATURDAY, MARCH 29.—Cotton.—The increased difficulty in negotiating Bills on Europe and the North, has suspended operations for the last few days; the reduction in the rate of Exchange has its corresponding effect on prices; and the market, at this moment, and during several days, has been dull, in consequence. We continue to quote at former rates, because no sale at a reduction will authorize a change; but we repeat the remarks of Brokers, who say that the rates last quoted would be very difficult to obtain; indeed, some go so far as to say that they are nominal. The principal operations, prior to the stagnation, are, viz: 700 bales, at 12 1.8; 80 at 11 5.8; 17 at 11 1.4; 68 at 12 1.2; 88 at 14; 31 at 13 1.2; 580 at 13; 28 at 11 1.4; 261 at 11; 134 at 11; 20 at 12; 11 at 13 1.2; 200 at 13 1.2; 150 at 14; 21 at 13; 40 at 12 1.2; 100 at 13; 57 at 12; 65 at 14 1.2; and 35 at 11 3.8—all of Louisiana Mississippi; of Alabama and Tennessee, the following, viz:—168 at 10 3.8; 50

at 13; 90 at 10 1.4; 450 at 10 3.4; 220 at 10 1.2; and 600 bales, rate unknown; choice Cotton has brought a fraction over our highest quotations; and, notwithstanding every thing, this description maintains its price.

Sugar continues to be in the usual good demand—we do not alter our quotations; prices are not steady, but vary from 1.2 to 1 cent, according to the want of the seller or the credit of the purchaser.

Molasses.—The season for this article will soon be at a close—the former good demand still continues without any change in price.

Tobacco.—There is an increased demand for this article.

Flour.—There is a falling off in price since our last publication.

Whiskey.—We have again to remark an exceedingly depressed market.

Coffee remains without any change.

Hides.—The market may be considered rather dull.

Freights.—The rates quoted last week remain without material alteration; we do not, however, as then, say brisk.

CHARLESTON MARKET, April 12.

Home Productions.

COTTON.—Sea Island 25 a 35; Stained 10 a 16.

Maline 22 a 25.

Santee 50 a 24.

Short staple, 10 a 13.

Rice—Inferior to good 9 a 24; prime 24 a 28.

Flour—Philadelphia, Baltimore, and Richmond, 65 a 54.

Corn—56 a 70; Oats 38 a 43; Peas 65 a 70.

Tar—Wilmington \$13; Georgetown, none.

Pitch—\$17. Rosin, \$14 a 15.

Bacon—64 a 74 cents. Hams 9 a 10.

Lard—8 a 9 cents. Soap—Yellow 6 a 7.

Oil—Sperm 90 a 10 cents per gallon.

Lead—In bars, 64 a 65 cts per lb.

REMARKS.

COTTON.—There has been a good demand for all descriptions of this article this week, until yesterday, when in consequence of the inclement state of the weather there was nothing done.—Since the receipt of favorable accounts from Europe, an advance of 1 cent on Uplands has been demanded and in some instances obtained, one very prime lot was disposed of at 134.—The sales down to yesterday morning have been 6151 bales Uplands, as follows:—135, at 134, 107, 184; 517, 13; 963, 13; 18, 12; 443, 12; 695, 12; 106, 12; 631, 12; 188, 17; 343, 11; 193, 11; 633, 11; 24, 11; 509, 11; 213, 11; 50, 10; 493, 10; 52, 10; 103, 10; 15, 10; 77, 10; 30, 10; and 13 at 9 cents.

RICE.—Remains the same as at the close of the last week, and the demand for any quality except strictly prime, very limited.

Flour.—Still remains dull.

GRAIN.—One cargo of about 3,000 bushels good White Corn, brought 70 cts.

MOLASSES.—100 bbls. N. Orleans Molasses brought 31 cents cash.

The China Trade now that the monopoly of the East India Company is done away, is becoming an object of great inquiry and general interest in England. Sir J. Brabazon Urmston, late President of the English factory at Canton, has published, or rather privately circulated, a pamphlet on the subject in London, of which we find the following notice in the London Times.

The extract recommends, it will be seen, the selection of a new trading station in preference to Canton.

Sir J. Brabazon Urmston, notwithstanding the idea which he entertains with others of the impracticable character of the Chinese Government, has directed his pamphlet chiefly to show that Canton is a bad port for carrying on the tea trade; that the British trade ought to be removed to a more convenient station; and that a more convenient station would be found in the island of Chusan, of which he gives the following description:—

"The island of Chusan is situated in latitude 30 deg. 26 min. north, and longitude 121 deg. 41 min. east. It is about nine leagues, or 27 miles, in length, from N. E. to S. W., and about five leagues, or 15 miles, in breadth, from N. W. to S. E. Chusan lies off the provinces of Chekiang, to which it appertains, and is about 10 or 12 miles to the northward of Kit-tow Point, which is the extremity of a long and mountainous promontory of Chekiang province; and the nearest approach of Chusan to the continent of China is at this place. Chusan is the largest and principal of the considerable group generally called the Chusan islands or Archipelago, and is nearly opposite to the river leading to the port and city of Ning-po; and not far from the bay of Hangcheou, which bay terminates in a river called the Tchen-tang-chiang, or otherwise the Cien-tang-keang, leading to the large and important city of Hangcheou, the capital of the province of Chekiang. These cities will be noticed hereafter. The chief town (or city, as it is called) of Chusan, is Ting-hai, which stands about a mile from the harbor, and close to the water's side, at the harbor,

is a village with several houses. It is at this latter place, where we had formerly our factory, as already mentioned. The city of Ting-hai is said to contain 4,000 or 5,000 inhabitants, but I have not been able to ascertain, from any authorities, what the entire population of the island of Chusan is. Ting-hai city is surrounded by a wall, with bastions, and is defended like the generality of Chinese towns—that is, with a few miserable guns."

At this island we had formerly a factory, which was broken up by the jealousy of the Chinese in 1703. It has abundance of excellent water; a harbor completely land locked, protected against all winds, and one of the safest in the world; and being at a very inconsiderable distance from the continent of China, is in the immediate neighborhood of the most flourishing, opulent, and commercial provinces of the empire. It is to this part of the Chinese dominions to which our exports are chiefly sent, though landed at Canton. The opposite coast has several large cities, navigable rivers, and an enterprising and wealthy population.

There can be no doubt that on a comparison of the geographical situation of Chusan with that of Canton, the preference would be given to the former as a British commercial station; but what assurance have we that our author's project would be adopted at the Court of Peking? Would it not require several mere embassies to the Emperor, more successful than any which we have yet sent, to obtain such a change? Would not the whole Hong at Canton, with the Governor and the tax-gatherers, be in an uproar at the very proposition of deserting their port? Our author does not disguise the difficulties of the undertaking, but expresses his sanguine belief, that if we were resolute to make the change, it might be ultimately accomplished.

Sir Richard Church, K. C. H.—Few men have exemplified the instability of fortune or the mutability of human affairs more than this gallant officer.—During the war he embodied and commanded the Greek light infantry corps, with which he materially assisted in the capture of the Ionian Islands, particularly Santa Maura, where he highly distinguished himself. Soon after the general peace he entered the service of his late Majesty the King of Naples and Sicily; here he rose to the highest point of favor with the Sovereign, and honors and rank were liberally bestowed upon him. Nominated to the command of the Calabrias and the Abruzzi, with extraordinary powers, he cleared those provinces of the numerous hordes of brigands and robbers which had long infested them; and his name is yet held in terror by their descendants. In 1820-21 the attempted revolution in Sicily commenced, and Church firmly adhered to the King, amidst many vicissitudes; at length the spirit of intrigue prevailed to so great a degree in the Royal councils, that Church was thrown into prison, from which he refused to emerge unless allowed to exonerate himself before a court martial, upon which he was honorably acquitted. Party ran, however, too high for his stay in Naples, and Church accepted the command, and was appointed Generalissimo of the Greek forces; for some time matters ran on with tolerable success; at last fortune was on the wane, and Church was defeated with great loss in his attempt upon Athens; but continuing to retain the command, he contrived to render important services to the cause in Western Greece, by confining and repelling the incursions of the Turks under Redschid Pacha. Capo d'Istria, jealous of his popularity, thwarted and baffled all his projects, and Church, at length disgusted, resigned the command, and for several years lived in exile at Ægina, neglected and forgotten. On the accession of King Otho the star of his fortune once more reigned in the ascendant, and Sir Richard Church is now Ambassador Extraordinary from Greece to the Court of St. Petersburg.—[*Naval and Military Gazette.*]

From the *London New Monthly Magazine* for March.
THE PARVENU COUNTERS.

"To hold the mirror up to FASHION."

"How is her Ladyship?" asked a little, thin, old woman, bent double with age, and clothed in rusty mourning. "How is her Ladyship?" repeated the poor old creature with a hurried earnestness, and an emphasis so strong, that, like the knock on the Earl of Anketell's hall door which had preceded the question, it seemed impossible that the sound could have been caused by the emaciated and diminutive figure that stood at the portal.

"How is her Ladyship;—well I like that," replied a tall, corpulent servant, whose red swelling cheeks and thick purple lips gave an expression to his mockery somewhat between burly contempt and rage,

at being so seriously disturbed for nothing, and by nobody.

"How is her Ladyship; well, what impudence the common people have come to!"

"My good fellow, I entreat you to answer me," said the old woman, her fine, sharp, and prominent old features, and large grey eyes casting forth an expression of imploring earnestness.

"My good fellow;" well, if I stand this from such as you, I'm ———, muttered this surly porter, slamming the door in the poor creature's face.

The knock was repeated with redoubled energy, and the porter re-opened the door with a visible resolution to get rid of the intruder.

"Give your Lady this," said the old woman, thrusting towards him a sealed letter: "give her this, and I assure you, she will be overjoyed to see me."

"My lady never suffers us to take in begging letters."

"This is not a begging letter; and here is a half-crown for your trouble."

"Well, what impudence you beggars have come to! You are a genteeler beggar than I should have thought by your looks; but, my good woman, it is more than my place is worth to receive petitions from beggars."

"Stand aside! open the door! be quick! Here's my Lord and the Duke of ——— coming down stairs!" said a lad in livery, whose countenance spoke a gentle nature,—that is, a nature not so long in office and authority as that of the surly porter of Lord Anketell's hall.

True it was that the stripling Duke of ———, who had just come into his immense estates after the narings of a long minority, had terminated a pretty long interview with Lord Anketell, and his Lordship was accompanying his Grace from the drawing-room down stairs to the hall, and the servants had not been made aware of his approach. Some confusion and bustle took place; but the folding doors were widely thrown open, six or seven servants, in their splendid liveries, hastily drew up in a double line, bowing profoundly to the peers as they passed between, and holding their breaths whilst his Lordship gave the Duke a shake of the hand,—cordial and sincere in full proportion to his rank and unequalled affluence. It was in this scene of hurry and confusion that the little old woman in black had contrived to slip past the servants through the door without being perceived.

She had flitted, with a witch-like rapidity suited to her strange figure, through the outer hall, had passed the vestibule and the great staircase, and had actually got into the inner hall, and at the foot of the back stairs, without being perceived. Here she met a maid-servant descending with a small silver tray of sandwiches and liqueur glasses, and she immediately began to intreat her to take the letter to her Lady, offering the solitary half crown as an inducement. The maid coolly put the half crown in her pocket, and reading contemptuously the superscription of the letter, threw it into the tray, observing, as she passed, that it should be given to her Lady some time in the day, but she knew it would never be opened, for letters "of that look" never were. It was at the moment when the old woman was sinking upon a bench, overcome with affliction, that the servants of the hall discovered her. They had missed her immediately the Duke had got into his cab; and, after staring in every direction, to their astonishment they beheld her sitting, as they thought, at her ease in the inner hall.

"You impudent old wretch! how dare you get there?" cried the enraged porter, waddling to her, and seizing her by the shoulder to thrust her into the street. He had already pulled her to the foot of the grand staircase, when the woman thrust out her attenuated and withered arm, and grasped with her long thin fingers one of the volutes of a scagliola pedestal which supported a massive ormolu lamp.

"No power on earth shall force me hence! I will see Lady Anketell, or here will I die!" cried the old creature with a tone which almost terrified the servants. There was something dreadfully impressive in it, and it appeared almost supernatural when its energy and resolution were contrasted with the form from which it proceeded.

The porter seized her shrivelled, spider-leg like fingers, declaring, with an oath, that he would wrench them off, or crack her joints, if she did not let go her hold. He suited the word to the action, and evinced no symptoms that he had uttered an idle threat. His thick lips became purple with rage; but his victim firmly retained her hold, and bit her under lip that seemed more like parchment, whilst her eyes stared wildly at him, dilating as in the paroxysm of frenzy.

"For God's sake, Burton, don't break the poor old creature's wrist!—wait and she will give way," said the lad we have before mentioned; and he took hold of the sturdy arm of his fellow-servant to restrain his violence.

"Let go, or I will squeeze your very nails off," said the porter, and she uttered a faint screech, and her face became convulsed, though she seemed to grasp her object with undiminished firmness.

"Burton, she will pull down the pedestal and break the lamp; the noise will disturb his Lordship, and you know his temper when anything goes wrong.—Leave her alone, and I will get a policeman."

These arguments of the lad had more effect than his appeal to humanity. The porter let go his grasp, the lad was sent for a police officer; and the footmen stood in a group; discussing whether it would be better merely to have the woman turned out, or taken before a magistrate.

In a few minutes the boy returned with a police officer. All eyes were immediately turned to the place of recent struggle, and every voice simultaneously cried out, "By—— she is off; she has escaped!"

Where can she have got to?—how could she get away?—it is impossible! and a score of similar ejaculations, seemed to convey the idea that the servants really began to think they had been contending with a witch that had vanished into air.

"Go to!" said the policeman; "why down stairs, to be sure, and she has robbed the house; and escaped, probably, up the area steps."

This idea was adopted by all; each accused the other of stupidity, in not having at first thought of a thing so palpable; and at last all turned with fury on the lad for having prevented the violent ejection of the woman in the first instance. The poor boy stood in speechless terror, overwhelmed with the idea of having been the cause of a robbery in his Lordship's house. At length the policeman assumed the direction of affairs, and having placed a servant at the front and another at the back area, to prevent escape, he descended with a third, in order to search the offices and basement story of the mansion.

The supreme wisdom of all the parties was here entirely at fault. The fact was, that whilst the porter had stood with the outer door ajar waiting for the return of the foot-boy with an officer, and whilst the rest of the servants had got round him to settle the difficult point of simple ejection, or of ejection followed by custody in the station house, and correction by a magistrate, the old woman had almost flown up the grand staircase, and had entered a magnificent ante-room, where she stood gasping for breath, and her senses perfectly bewildered at the dreadful scene she had gone through.

It was with difficulty that she collected her scattered thoughts; but at last she grew sensible of the magnificence around her, and she began to reflect that the splendour seemed to realize, or surpass, all she had read in fairy tales about oriental grandeur and magic treasures. She paced fearfully through the scene, her mind too saddened by one sole object to be attracted by wealth, except through a vision of its power over the affections of nature. She found a door partly opened, and holding her breath, and stopping like a mortal upon the precinct of hallowed ground, she entered a bed-room, so superb as to make the preceding chamber appear almost poor. A painted ceiling, mirrors extending from that ceiling to the ground, buhl cabinets, and tables of enamel and gold, covered with china vases, bouquets, bijouterie, and jewelry of dazzling lustre, might have confused the brain of any person whose mind was sufficiently at ease to be moved by splendor. There was a large bed, with its golden canopy, and royal purple curtains lined with rose satin, and on it was a human figure, but so buried in pillows of down, and shaded by lace, that it was impossible to tell whether it was the person of a child or of an adult. At the side of the bed were two tables of enamel and gold and of buhl, the one covered with new novels, and with poems and books of prints, superbly bound, and the other hid by a profusion of trinkets, rouge pots, scent bottles, perfume caskets, mirrors set in gold, and ornaments beyond an ordinary capacity to name. A golden cauldle cup, on a gold salver, stood in the middle, and its untouched contents showed that the patient had not been disturbed to cloy the surfeited appetite with refreshments. The once decent, but now rusty and somewhat tattered mourning of the old woman, with her humble widow's weeds, formed a singular contrast to the surrounding splendor, as she stood, with a palpitating heart, by the bed-side, gazing on it with a fearful restlessness, as if she dreaded to be seen by the object it supported, whilst at other moments she gazed upon the sleeping figure,

with an affection which seemed too intense to be endured. At last the figure moved, the lady awoke, and raised her beautiful face from the pillows, like a pearl from cotton.

'Oh God! Mary, child!' cried the old woman, as she staggered towards the bed, and made an effort to throw herself upon it, endeavoring to clasp her daughter in her arms, but the bed was by far too high, and the lady put out one of the most delicate and pretty hands ever seen, and shaking her lace ruffle, she beckoned to her mother not to come too near.

'My dear mother,' said she, 'for goodness' sake don't come so near; you don't know the mischief you might do. I have a fever on me, and your clothes are really wet. Why, you have not come through the rain?'

The old woman buried her face in the bed clothes, and sobbed piteously. At length recovering herself, she said, with a hurried tenderness—

'Oh, Mary, tell your poor, old mother, is there any danger?'

'Not exactly danger; but if my Lord were to know that you had been here, it might occasion an unpleasantness between us.'

'But, Mary, child, are you not in danger?'

'Danger, mother, how can I be in danger! am I not legally married, and have my rights; but when a man of Lord Ankettell's rank and estate marries a workhouse apothecary's daughter like me, it is only grateful in me not to mortify him by my family, and in his own house too, and before his servants I trust in goodness you did not announce yourself as my mother?'

A large tear, or rather a continued tear, ran down the pale and withered cheek of the mother. With a tone altered almost to chilling apathy, she cried, 'Mary, I read in the newspaper that you were dangerously ill. You had never written to me since your marriage, and I was content not to mortify you; but when I found your life in danger—I who had nursed you through the cruel diseases of your infancy—I who had—oh God! oh God!—it was too much to let my child go out of the world without kissing her poor face—once, all my own. I have walked to London from — to hear one word of tenderness from my own child; and I find her life not gone; but nature is extinct, and you are the child of pride—not my child.'

'Lord Ankettell's wife, you meant to have said, mother. But I really was ill. I caught a cold at Almack's; but as his Lordship wanted an excuse for not attending the House whilst the — bill is in committee, he got the newspapers to publish that I was dangerously ill. Ha! ha! ha! Pray, mother, reach me that handkerchief, and the eau de Cologne. Your tears, I do declare, have taken all the curls out of my hair, and my wrist, too, is wet through and through. Lord, ma, only see the lace—'

'And you are not ill, Mary,' said the old woman; 'not really ill; and she pressed the fair little hand to her haggard lips—hung over the face of her daughter, regardless of that which alone occupied that daughter's thoughts—the curls and the lace.'

'But, ma, how shabby, how very shabby, and dirty, too, I declare—la, I would not have had my Lord's servants see you for the universe. You will never leave off those odious, unbecoming weeds—and father dead so long. Well, I'm glad to find you still living; and I hope you have been happy, and well—and—'

'Very happy, very well,' said the old woman, wringing her hands and sobbing bitterly.

'La, I thought I heard footsteps; didn't you?—do stop, you make such a noise—no, it is a mistake. Well, ma, I heard of your design about the tombstone in our churchyard and the monument. I was so alarmed—but I knew you hadn't exactly the means to incur such an expense—and so I was comforted, and—'

'Mary, Mary; that monument is already erected to your poor father's memory, and it expresses—'

'Gracious goodness! not that he was the village apothecary, I hope?'

'Yes, that he was for fifty years the doctor of that petty workhouse—the shopkeeper of our petty village—and that he was beloved by the poor, and respected by the rich.'

'Oh, how very unfortunate; for my Lord naturally wishes to avoid all tracing of my parentage, and Burke's Peerage merely says that Lord Ankettell married Mary, daughter of —, Esq., of —, in the county of —, and that reads very well.'

'Oh, Mary, your brain is turned, and it breaks my poor old heart! My last illness cost me all the remains of my little property; even your poor old father's silver watch was sold, and now I—'

'Well, ma, that must have been your own fault, for

never was there a better mother; and had you written one word—but give me that pocket book off the table—no, not the red with the gold clasp, but the purple with the ruby.'

The old woman mechanically handed the pocket book, and the fair lady raised herself on her downy pillows, and began to count its contents, and to decant on the operation, as she turned over leaf after leaf.

'No, that 1264. is for Mr. Taylor's bill, my shoemaker; he has not been paid anything for four years, and must be paid; and this—let me see—what did I put these notes in this leaf for? oh, I remember, 937. for the plumassier; and this 551. is for the perfumer's account; and 371. for the brushes and trifles of that description; but oh, this odious Madame de Tressor, my milliner and dressmaker—6191. in one year, and less than a half—well, my lord's check is not enough—he must settle this bill himself, for I'll have nothing to do with it. But here, my dear ma, I have no occasion to settle Mr. Payne's bill for the brushes and knick-knacks, and so, suppose you take this 371. And the young and beautiful countess stretched out her hand, holding the folded notes slightly-pressed between her thumb and finger towards the old woman, who stood aghast with astonishment.

'Ha! ha! ha! Well, ma, you make me laugh; you may well be astonished when you see such sums, and recollect how the shillings used to be saved, and the broken bottles sold from father's shop, to buy me my winter's cloak and clogs—but take the money.'

The old woman shook her head, and thrust the proffered notes from her.

'Why, ma, I should not offer them to you if they weren't mine. To be sure, when a rich man, or a man of title, marries a poor girl, he doesn't marry the whole family; and indeed it is not exactly honest for a woman to give away her husband's property to poor relations; but his lordship gave me this money for myself, and has no right to know what I have done with it; and if I appear in good style as his wife, and don't get into debt beyond his allowance, what right has he to complain; besides, if a rich old man marries a fine young woman, I don't see that the obligation is all on one side; and besides your are my mother.'

The mother groaned bitterly.

'It is not like helping cousins, nephews, nieces, and a swarm of toad eating, insincere, heartless kindred, so, ma—but, good gracious! the room is haunted, or I did hear footsteps, and a sigh, too. Pray, ring the bell—no, not for the world—the servants would see you—but ma, look all round the room for me. You know how nervous I was when a child. Well, you won't stir? Good heavens! take the money and say good bye, and let me ring the bell, for I begin to be very much frightened. Here, dear mother, take the money, for your clothes are very thin for this bitter weather, and you must want it—indeed you must.'

During all this time, the poor old woman had stood upright and rigid; like a figure of extreme old age suddenly petrified. Her large gray eyes were dilated, and though they glanced upon her daughter they bespoke perfect vacancy, or at least an unconsciousness of the volubility with which she had been assailed. As the daughter again pressed her to take the money, she took the notes in her hand and crumpled them without the slightest alteration of attitude or change of countenance. Lady Ankettell became alarmed, and thought the mother was what she called 'death struck.' 'For God's sake, take the money and go!' she exclaimed with earnestness. The old woman's lips were a little convulsed; she recovered her senses, and suddenly catching a glance at the ball of crumpled notes that she had been pressing in her palm with the grasp of convulsion, she dropped them on the floor, shaking her head, and clasping her hands, she left the room without uttering a word. She appeared like a corpse moving by mechanical contrivance. Lady Ankettell followed her with her eyes till she had got out of the door; and then, taking an oval hand-mirror from her toilette, she began to adjust her curls, lest her waiting woman might see them in their disordered state.

As the mother descended the grand staircase, she was met by Lady Ankettell's waiting woman followed by a footman with a tray and cold fowl and tongue, and decanters of wine. 'I am ordered, Madam,' said the maid, courtesying with the most profound respect, 'to give my Lord's most respectful compliments to you, and to say that his Lordship entreats that you will not leave the house without taking refreshments. His Lordship begs you will remain as long as is convenient, and, above all things, he hopes that you will order the carriage when you feel disposed to return home.' The old woman was startled at these sounds of respect and kindness: they

touched her heart. Unable to speak, she shook her head in token of dissent. She had been recalled to sensation and consciousness: her efforts to conceal her emotion were fruitless: her lips were strongly convulsed, and, putting her hands to her face to hide her feelings, she burst into tears, and hurried out of the house through the line of servants, who bowed to her most respectfully as she passed through the hall. The humility of the servants was a contrast to their previous brutal violence, which could not be surpassed, except by the contrast between the manners of the daughter of the Countess of —, and as plain Mary —, the apothecary's daughter of —, the belle of the village for whom so many shop-lads had once received and given many broken heads and bloody noses.

In fact, the sound of footsteps and the sigh which Lady Ankettell had heard, or fancied she had heard, in the bed room, were not the sounds of a super, nor altogether of an unsaturnal being. His Lordship, in passing the ante-chamber, had been attracted by the deep sobs of his mother-in-law. He had entered the bed-room, and, concealed by the curtain, he had witnessed the whole scene between the daughter and the mother. His feelings were moved to the extent of offering the poor old creature refreshment and the ride home; they were moved to this extent, and no further.

Two pounds thirteen shillings and four pence half-penny was the sum precisely which the poor old widow had in her pocket, as she tottered down the steps from the portico of her daughter's mansion at Whitehall. She hurried to the — inn, at White-chapel, and that night took her outside place in the mail to —. It was a wet and bitterly cold night, preceding, by eight-and-forty hours, that night on which all hearts are made glad, all stomachs are filled to the verge of extravagance and wantonness; it was the night of the twenty-third of December, when the decrepit old widow seated herself outside the — mail, immediately behind the coachman. The wind drove the sharp sleet so fiercely that no ingenuity of the loom could withstand its searchings, and but for the cold at the heart, the old widow might have been sensible that her daughter was not wrong in describing her dress as old, threadbare, and shabby—shabby—in such a night. The little curved hunchback was drenched to the skin, and looked like a whisk of frozen straw—a bunch of white bristles. The coachman, moved to pity, procured her an ostler's coat where he changed horses, and without the hope of the perquisite. Arrived at the village of —, the widow was lifted into her cottage. The bright warming pan was put in requisition, and less than twelve hours had witnessed the transition of the old creature from sobbing on the quilt of Lady Ankettell, in her splendid room, to gasping under the brown and red rug in her stone paved chamber. In four hours she was a corpse.

THE TOWNSMAN.—BY LEIGH HUNT.

More Boots; and no more Smith!

Boots being a subject of inexhaustible interest to the contemplative mind (whether the mind be of such an order as deeply observes the boots of other men, or of such as sits in the shape of a well-dressed body, more deeply considering its own; or lastly whether it be of that class, which uniting experience with reflection, comes to the question with an impartiality humanized by self-love,) we have willingly acceded to a request made to us for the utterance of some further thoughts on a matter so obviously connected with the 'march of intellect.'

Nor is it to be objected, that we are travelling out of the path of our Townsman, in devoting a whole paper to this very urbane subject; for besides its right to the application of that epithet in its ordinary sense, as implying a polished elegance, it is well known to all the lovers of shoe-leather, that there is no boot like your 'town-made boot;' and therefore no town-made article connected with the subject, whether boot or essay, can be anything but what is extremely proper and metropolitan.

Much could we say on the lustre of boots from all antiquity, especially during the heroic ages of Greece, when to say that a man was 'well-booted,' was to say that he was well-armed at all points, and irresistible. Homer's fondness for this epithet is so remarkable, that boots perhaps may be considered as the things he admired most, next to good cheer.—'Boot and saddle' of *mutton* may be conjectured to have been his military cry—his interpretation of the sound of the trumpet. But we cannot enter at any length into the epical or historical parts of our subject. We must be content with catching a few of the most illustrious lights of it, as they strike upon un the legs of ages; such as the Seven-league

boots of Giganticide, the boots of Napoleon, and on Frederick the Second, those of the cat that waited on the Lord Marquis of Carrabba whose descendant has become so famous in the songs of Béranger,) and the boots of my lord the Bishop, who was made to dance in them by that merry Radical, Robin Hood; a dance still performed in private, they say, by some of his lordship's successors, in a delirium of anticipation.

We know but a single ill thing of boots in the whole circle of their history, and that is, the ingratitude with which one of them suffered Sir John Suckling to die of him, after having been the most brilliant and accomplished friend they had had in the annals of high life. Sir John, as every one knows, was one of the tip-top wits of the Court of Charles the First; and no man had ever done greater justice to the exterior manifestation of what a wit has in him, by the grace and spirit of his attire, from top to toe. His feather must have been among the airiest, and his boots among the most solid yet animated, that ever announced the quality of the wearer. We say nothing of his failure in a campaign—doubtless the work of envious fortune. A servant, envying the fortune that he still had in the shape of money, robbed him and ran away: Sir John, in his indignation, though the most generous of men, called for his boots in order to pursue the scoundrel, when on thrusting his foot down, his heel encountered a nail, or knife, or some such horror, (we forget what,) which the rascal is supposed to have stuck into the boot on purpose, and the result to the gallant poet was mortal. "Where were ye, nymphs, (who preside ever boot-making,) when ye could allow such a catastrophe to take place? Nay, where were ye, who preside over dancing, and riding, and all 'poetries of motion,' that ye did not put a voice into the boot, and make it cry out against the approach of the ill-fated leg?" The tragedy was long ago, but the sweet wit is alive in his writings, and we cannot but feel for his wound to this day. That couplet alone in his *Ballad on the Wedding*—

Her feet beneath her petticoat,
Like little mice, stole in and out.

ought to have brought down Venus to save him. But Venus can sooner get people into scrapes than out of them. Perchance the boot, being, of course, exquisite of its kind and too small, was even less easily got off than on; so that the plunge being once taken—But we shall be distressing too much the legs of the reader's sympathy.

We had our admiration very pleasantly excited the other day by the candour of a friend of ours—a wit and a patriot withal, and one that would part with his leg and boot together to do the State service—that he never had anything new sent home from the makers of his habiliments, but it made him rise that morning with the greater alacrity. It should be added, that he is both young and handsome enough to render an attention to these things natural and graceful. Yet what signifies hand-someness? If we are not handsome, we may have a handsome taste—an air—an address; and it is not a man's fault if nature has not given him a good leg. His nurses and progenitors must look to that. His soul may have a good leg—calf may be in his brain; why should he not help out his limbs accordingly, and, with the boot-maker's assistance, make his leg appear worthy of him? We remember the time ourselves, when a knock at our chamber-door, with "the tailor has brought the things, Sir," or the opening of our eyes upon a new pair of boots standing in the corner, and demanding (as the poets say) our legs inside of them, gave a new color to the morning. A youth buds forth into new clothes, as a tree with its blossoms. Nip not his bibe too coldly, nor breathe dulness upon the polish of his Warren's jet. He will outgrow his blossom, and produce fruit by-and-by. Charles Fox, one of the most natural of men, was at one time a buck about town, with red heels to his shoes. Petrarch reminds a friend, in one of his letters, of the time when they used to pace the streets of Avignon, conscious of their cloaks and stockings, and afraid of a spot of mud. But we grant that "the same is not the same." A youth may be a dandy, and nothing else, and remain one all his life. That is not desirable certainly; though seeing what he is, and that his thoughts cannot soar above his hat, perhaps we ought to be thankful that they can rise even so high, and that a regard for his very boots saves him from sheer grovelling in the mud. Mud is assuredly not what he likes. The countryman in the farce will not wear his boots in bad weather, for fear of spoiling them; and we have seen men in town, such as would have thought themselves preposterously treated by comparison with him, who nevertheless appeared quite as anxious to save the boots they had on from their ostensible uses,

and occasionally turned round to survey them, as nicely as if they stepped in again.

It must be owned, that boots, like other honors, are not to be worn without their drawbacks. The pulling on of a new pair, even when nothing dandified is intended, is often no joking matter; unless, indeed, a man has arrived at that time of life, or philosophy, or adversity, or *spindle-shankism*, when he has no more respect for his leg than for his walking-stick; or rather so much tenderness or pity for it, that he will consult its ease above all things. We confess this to be the ease with ourselves, to whichever of those four causes the reader may choose to attribute it; therefore, as we have not been without our experience the other way, we may own, that, like Mr. Pepys when he chuckled at seeing people go to be married, it is not without something of a peculiar feeling of entertainment that we think of any one's undergoing the "torture of the boots," when the maker has just brought them home, and his helping them to put them on. There they go at it, the patient straining and tugging with the boot-hooks, the maker humming and *puling* the fit, or non-fit, vowing that nothing can be better, and that a *lelle* more thrust at the instep will do the business. Occasionally they stop to take breath, or the bootmaker takes the hooks into his own hands, and then they go at it again; or they take the foot out and *recommence*! Horrible, yet refreshing moment! Big with the thoughts of the next tug! Then comes that detestable evidence of a struggle, the shoeing-horn; and the bootmaker, though he hails it as the terminator of all difficulties, knows very well that the instep will stick again, and that the gentleman will walk for the next ten days in a Valley of the Shadow of Gout, not because the boots have been made as directed, but because he has not the heart to send them home again.

And yet this shall be nothing, perhaps, the achievement of taking the boots off again at night! Wear them all day he must, for he has got them; and get them off at night he must, or how is he to go to bed? Meantime his feet have swollen; their prison seems, for the last three hours, to have been growing closer and closer; and get them off he cannot! Boot-jacks are tried; servants are tried; the boy, suddenly letting go, is kicked almost through the wall. What is to be done? Sometimes there is no help for it, short of cutting the boots off; and blissful must be the release even then, to any one but a miser, spite of the convulsive twitches and resentment of the ill-treated muscles. We know a philosopher, now lost to all sense of his boots, except when he has to buy new ones, who, one night, when a young man, in the joviality of his despair at not being able to get off a pair, laughed at the impossibility of sleeping in them, and fairly took them to bed with him. Horrible was his waking about four o'clock in the morning, with a sense in his legs as if they had been turned into mile stones.

We had something to say on boots mudded, and boots too large, and boots suddenly burning one's legs at the fire-side, &c. &c.; but adieu, boots. We must suddenly break off and leave you, else we shall have no room to bid another adieu, little expected by us when we wrote our last, and in fact, denounced as impossible. Let no man say what will happen next Sunday; for we are positively about to give up our use of the name of Smith? 'Tis true!—and all, after all, to please Smith himself;—nay, to please John Smith!—John Smith whom we should still designate the Smithest of all Smiths, and therefore the voidest of all right to a particular consideration, had he not convinced us we were in the wrong by one of the most agreeable and charitable of letters. This was the correspondent whom we alluded to in our last, and whom in consequence of our not having referred to his first letter to mend our recollections, we had mistaken for Tomkins. Tomkins (as we are now reminded) he spoke of in that letter, but it was out of an inclusiveness of sympathy, and because while feeling for the sensitiveness of the Smiths, he thought himself bound not to overlook minor claims; or as he overwhelmingly puts it because "your creed teaches me to consider others first." Now who can resist such a Smith as this? Has he not brought together and concentrated the whole common-place universality of the Smiths into one particular and shining light, and forced us to acknowledge in his person the thoughtfulness due to others, even in a jest? and let us add (without giving the good-natured suggestion an air of solemnity beyond what he intended), that it is a good symptom of the times, when sympathy is so widely and so extending, that the "vested interest," even of a jest is good humoredly questioned in its behalf. Well, we have owned our weakness in this matter (for we are not strong minded and anti-conventional enough to own, except in this whisper of

a parenthesis, that we consider it a strength), and shall frankly, and at once, give up all similar future use of the name of Smith. We do not care who taxes us for it. Being above poverty of spirit, we are above taxation. We shall "go on, Sir" (as the man said), "superior to a vicious sarcasm," "By excess of pride," saith Bacon, "the angels fell;" and by the excess of the desire of knowledge man fell; but in charity there is no excess, neither can Smith—we beg pardon, "*man* nor angel come in danger by it." This last slip of the tongue must be excused. Bad habits, like boots, are difficult to conquer.

Next week, we intend to make immense reparation to the name of Smith, and utterly to baffle the hopes of its scoffers, by touching upon the various memories, male and female, that have rendered it eminent.

GENEROSITY OF A ROBBER.—After the defeat at Hedgely Moor, the Lancastrians concentrated their forces on the plain of Hexham Levels and there waited the advance of the Yorkists, resolving to place on the issue of the expected contest their final overthrow or triumph. The result of this battle is well known: the army of Henry was completely routed, and even the high cap of state, with its two rich crowns, fell into the hands of the Duke of York, who shortly after ascended the throne of England by the title of Edward the Fourth. Henry fled from the field; and Margaret, his queen, with the young prince Edward, escaped into an adjoining forest. They had scarcely entered within its intricacies, when they were seized by a band of ruffians who had there located themselves. Regardless of her rank, sex, or situation, they stripped the queen of her jewels, and were proceeding to greater indignities, when a quarrel arose between them as to the distribution of the spoil.—Seizing this favorable opportunity for escape, the prince and his mother fled into the interior recesses of the forest. As the royal fugitives were pursuing their toilsome journey through this wilderness, a rustling of the trees forewarned them of approaching danger; but before they could reach concealment, a robber confronted them in their path. "Ruffian," exclaimed the queen, assuming the dignity and haughtiness of carriage familiar to her, "thou hast tarried over long; thy comrades have been before thee, and despoiled us of our treasures." "Truly," answered the robber, "their chief will find but worthless prey in what they left you. You may pass: 'twere better that you take the right hand path, its windings lead to an opening of the forest." "Stay man," said Margaret, "though a desperate outlaw, there yet may be some spark of pity in thee, some reverence for a kingly name." "Pity and reverence are terms alike unknown to me," replied the man, "and kingly power is but an idle sound to him who knows no sway—respects no laws;" "Yet will I trust thee," answered the Queen, "for fortune leaves us little choice of friends. Behold this boy—the son of Henry of Lancaster, your king." Whether surprise overpowered him, or a latent nobleness of mind forbade him to insult fallen majesty, the robber chief uncovered his head, and proffered his assistance to the wanderers. "What service said he, 'can I render to you and the prince your son?' "Provide us with a place of concealment," eagerly rejoined the queen, "and effect our escape beyond the reach of York." "Concealment," said the robber, "is not difficult; and what more I can do I will do: for the present follow me to a cave hard by, where you may repose in safety, and wait a favorable opportunity of rejoining your friends." He led the way through an unfrequented path, and brought them to "a wretched but secure asylum" in the forest, which, in memory of the unfortunate queen, still retains the name of the "Queen's Cave."—[Fisher's Picturesque Illustrations.]

Extract from Bulwer's "Pilgrims of the Rhine."

"I know not what the love of others may be," said Gertrude, "but ours seems different from all which I have read. Books tell us of jealousies and misconstructions, and the necessity of an absence, the sweetness of a quarrel; but we, dearest Albert, have had no experience of these passages in love. We have never misunderstood each other, we have no reconciliation to look back to. When was there ever occasion for me to ask forgiveness from you? Our love is made up of only one memory—unceasing kindness!—a harsh thought, a warring thought, never broke in upon the happiness we have felt and feel."

"Dearest Gertrude," said Trevelyan, "that character of our love is caught from you; you, the soft, the gentle, have been its pervading genius; and the well has been smooth and pure, for you were the spirit that lived within its depths."

List of Subscribers to the Railroad Journal who have paid in advance to Jan. 1, 1835, —continued from March 22, 1834.

NOW READY,

AN INTERESTING AND USEFUL MAP.

Upon which is delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It may be had either in sheets, price \$1 25, or put up in morocco for pocket maps, price \$1 50, or on rollers at \$2 25, in any quantity, by applying to the subscriber.
 D. K. MINOR, 35 Wall street.
 New-York, April 2, 1835.

TO CIVIL ENGINEERS.

The Western Railroad Company, incorporated by an act of the General Assembly of the State of Tennessee, for the purpose of constructing a Railroad from the town of Jackson, in the county of Madison, by the most practicable route to the Mississippi river, wish to employ one or more persons as engineers to survey the route and superintend the location and construction of said road. Gentlemen who wish employment in the above capacity, will forward to the undersigned on or before the 3d day of June next, the terms upon which they are willing to engage, also the most unquestionable testimonials of good character and scientific and practical skill in works of the above description. An election of an engineer will not take place before the 3d of June.
 By order of the Pres't & Directors.
 JOS. H. TALBOT, Cash'r & Sec.
 Jackson, March 18, 1834.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 24, 1833.

For further information on this subject see No. 40, page 776 of this Journal.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
 No. 264 Elizabeth street, near Bleeker street,
 New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
 J 25 15

RAILROAD CAR WHEELS, BOXES AND AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTZ, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Hertz.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such facts should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.
 JAMES F. STABLER,
 Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

To Messrs Ewing and Hertz.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,
 Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.
 m26

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon dale, Luzerne county, Pennsylvania.
 Hudson, Columbia county, New-York,
 January 29, 1833.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833.

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,		Flat Bars in lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.	
200	do. 1 1/2 do.	do.	
40	do. 1 1/2 do.	do.	
800	do. 2 do.	do.	
500	do. 2 1/2 do.	do.	
soon expected.			

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 4 1/2, and 5 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.
 A. & G. RALSTON,
 9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.
 d71meowr

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
 E. & G. W. BLUNT, 154 Water street,
 J31 6r corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes; and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.
 WM. J. YOUNG,
 Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.
 Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
 JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.
 Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.
 E. M. GILL, Civil Engineer.

Germantown, February, 1833.
 For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
 Germantown, and Norristown Railroad

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, APRIL 26, 1834.

MR. BURDEN'S BOAT.—In answer to various inquiries respecting this boat, we may say, after taking pains to ascertain the fact, that she will take her place in the North River line on or before 1st June.

The banks of the upper level of the Chesapeake and Delaware Canal gave way last Saturday morning, and the water of the canal nearly all escaped. This accident will compel the trading vessels between Philadelphia and the ports on the waters emptying in, to the Chesapeake bay, to go round by sea as heretofore.

A good beginning.—Letters from Boston of the 17th instant, mention that the receipts on the 16th instant of the Boston and Worcester railroad, from passengers, were *one hundred and fifty dollars*.—The Locomotives now travel over the first ten miles of the road. It is expected that in a few days the whole of the first section will be completed and the travel extended to Needham.

Survey of the New-York and Erie Railroad Route. By J. S. To the Editor of the American Railroad Journal, and Advocate of Internal Improvements.

SIR,—I find in your Railroad Journal of Saturday last, the first object of notice contained therein is to the following effect:

"**SURVEY OF THE NEW-YORK AND ERIE RAILROAD ROUTE.**—A bill providing for this survey through the southern tier of counties, at the expense of the State, under a principal engineer to be appointed by the Governor, is now before the Legislature."

A railroad located as above described has long been a favorite object of my attention, and, as I apprehend, has, more than once, been a subject of observation in conversation with

you. I do conceive, if properly constructed, it bids fair to be ultimately the greatest thoroughfare in the United States, if not in the world. A slight knowledge of the country through which it must necessarily pass, the connection it will form between the waters of the ocean and the immense range of interior lakes, will give to it such a flood of business as must surpass any conception we at present can form an idea of.

I cannot, at the present moment, go into a minute description of the peculiarities of the formation of the ways now contemplated, but promise you to have it ready for insertion in your next number. It will possess the merit of entire singularity, if no other. But what will more particularly recommend it for adoption on this extensive route, is, that it is capable of being carried into complete effect at one quarter the expense of railroads on the construction of those now in use. Your obt. servt.

J. S.

Hoboken, April 23d, 1834.

The Liverpool and Manchester Railway. [From the London Mechanics' Magazine.]

We have been favored with a copy of the report made by the Directors of this Company, and find in it so much matter of fact that is of universal interest, on the subject of railways and locomotive power, that we need offer no apology for transferring it (with but little abridgment) to our pages. Mr. Grahame, and the other partisans of canal navigation, who still persist, with so much honesty and candor, in representing that the profits of this railway arise mainly from the conveyance of passengers, and that it cannot possibly compete with canals in the conveyance of goods, will observe in this report some rather stubborn facts on both these heads. The common-road steam-carriage charlatans too, who tell us that the expense of working a steam-carriage on a granite highway will be not more than *sixpence per mile*, and the tear and wear *next to nothing* (for "1,700 miles" at least), may learn from the circumstantial details here given of the actual expense of working such carriages on a railway, where the friction is many times less than on the best granite road than can be constructed, how much occasion they have to blush for the delusive representations they have sent forth to the public. We do not of course include in this class of public deceivers any of those honest and intelligent individuals—the Heatons, Hancocks, and Saxulas, of the day—who frankly subscribing to the undeniable fact, that there is more friction to be overcome on a common road than on a railway, have proposed to themselves to determine by experiment whether it would not be cheaper to work steam

carriages against that greater friction, than to be at the expense of laying down railways to avoid it—in some cases at least, if not in all. These last are adventurers of a very different stamp; they speculate on a particular result, which, though as yet unascertained, is neither impossible nor improbable; and as long as they pursue the reasonable object they have in view by honorable means, they shall command as they deserve our best encouragement and support.

LIVERPOOL AND MANCHESTER RAILWAY—FOURTH HALF-YEARLY MEETING.

LIVERPOOL, January 23, 1833.

Report.—The Directors, in submitting to the Proprietors a statement of their accounts and proceedings for the half-year ending 31st December, 1833, have to report a considerable increase in the general business of the concern, as compared with the corresponding six months of the previous year.

The total quantity of merchandise conveyed in the six months between Liverpool and Manchester was.....	69,806 tons.
To and from different parts of the line, including Warrington and Wigan.....	9,733
Between Liverpool and Manchester and Bolton.....	18,708
Total quantity conveyed.....	98,247
Quantity of coal from various parts to Liverpool.....	32,304
Do to Manchester.....	7,830
Total to Liverpool and Manchester....	40,134
The number of passengers booked at the Company's offices.....	215,071
The number of trips of 30 miles performed by the locomotive engines with passengers was.....	3,253
With merchandise.....	2,587
Total.....	5,840

Compared with the corresponding six months of the last year, the increase in merchandise conveyed has been..... 11,405 tons. In passengers 32,248.

The present winter has been in an extraordinary degree stormy and wet, which has no doubt diminished the amount of travelling.

The wetness of the season also has prevented the railway from being maintained in that complete order which is desirable; while the boisterous weather, with the dirty state of the rails, has impeded the passage of the trains, not unfrequently rendering assistant engines necessary to ensure their progress, even on the level parts of the way. These circumstances have unavoidably increased the charge for locomotive power. On the other hand, the navigation of the river, owing to the long continuance of tempestuous weather, being frequently dangerous, and sometimes impracticable, the utility and importance of the railway convey-

ance have become more manifest and striking, and the natural consequence has been an accession of traffic to the Company proportioned to the required accommodation afforded to the public.

The following is a statement of the receipts and expenditures for the half-year; and the subjoined table exhibits a detailed classification of the disbursements.

Half-year ending 31st December, 1833.

During the past six months the excavation of the new tunnel from the vicinity of Waverstreet lane to Lime-street has proceeded regularly and satisfactorily, and is now more than half completed.

In order to extend the advantages of a railway conveyance to the northern docks, and those parts of the town which are at a considerable distance from the railway station, the Directors transmitted a memorial to the Common Council, the Dock Committee, and the Commissioners of Sewers, proposing to construct, at the expense of the Company, a line of railway from Wapping to the Clarence Dock, by means of which merchandise deposited at the north end of the port might possess the same facilities of conveyance by railway into the interior of the country as goods in the southern portion of the town, besides relieving the streets from the noise and interruption of numerous waterside carts. This memorial, as might be expected, from the evident utility of the scheme, has been favorably received, especially by the Dock Committee, and the Commissioners of Sewers; the principal objection to the plan being that it was not sufficiently

general and extensive to afford to the public at large that measure of accommodation which appeared so easily practicable. The Directors, however, confidently look forward to the establishment on a comprehensive plan, probably to be undertaken by the Dock Trustees, of a line of railway with the requisite branches, along the dock quays from the northern to the southern extremities of the port; which measure seems alone wanting to give to the mercantile public those advantages of economy and despatch which a railway conveyance is so peculiarly calculated to afford.

The proprietors are aware that the subject of locomotive engines has always been one of great interest and importance. The charge under this head continues very heavy, arising in a great measure from the necessity of renewing and strengthening the frame work of the machinery; and from the purchase of copper and brass plates for the renewal of fire boxes and tubes.

The charge for coke has been a heavy item in the locomotive expenditure, amounting to nearly £6,000 per annum. The directors have lately been induced to try gas coke to a very considerable extent. The cost per ton is less than one-half the cost of Worsley coke; and although a greater weight is required to do the same service, and an extra consumption of fire bars and some other difficulties attend the use of it, the Directors have considered the experiment well worth making, in the hope of diminishing the expenditure in that department.

Several new schemes for an improved locomotive power have lately been brought under the consideration of the Directors. Past experience forbids any very sanguine anticipations of success in respect of untried speculations; at the same time, the Directors will not fail impartially to investigate the pretensions of any scheme from a respectable source, which professes to introduce improvement into so important a branch of the Company's establishment.

The charge for the maintenance of the way is another heavy item of the current expenditure. In particular parts of the road, especially on the descending lines of the inclined planes, the rails prove too weak for the heavy engines,

and the great speed at which they are moved; and from the breakages which have taken place, the Directors have thought it expedient to order a supply of stronger and heavier rails, to put down in those districts where the present rails have been found insufficient. This proceeding will in the first instance subject the Company to some increased expenditure. The Directors, however, have contracted (for the ensuing year) for that portion of the maintenance of way which consists of labor and small materials on terms of comparative advantage to the Company, which they expect will balance the increased outlay required for the purchase of stronger rails.

Observations on Flame—Mr. Rutter's Late Discovery. [From the London Mechanics' Magazine.]

SIR,—There is something very pleasing in applying chemical knowledge to the explanation of the various phenomena that are daily before our eyes. I now propose, with your permission, to make a few observations on the flame of a candle that is now burning on my table. I shall observe, at first, that the heat of the flame melts the tallow, which then ascends the wick by capillary attraction, and is in consequence subjected to intense heat; the tallow is next decomposed, and the principal part of the resulting gas is carburetted hydrogen, which is again decomposed in the following manner: When this gas is first formed, it expands in every direction, and thus getting into the hottest part of the flame, its carbon is deposited in an abundance of fine particles; the hydrogen now increases in volume three and a half times the bulk it possessed when in perfect chemical union with the carbon. This expansion, which is probably again more than doubled by the intense heat of the flame, causes the hydrogen to appear at the outer surface of the flame, where it unites with the oxygen of the atmosphere, and envelopes the white and luminous flame, or that part containing the particles of carbon, with a thin sheet of blue flame.

I now come to a very difficult part of this subject, which, I think, will, when satisfactorily explained, have a great tendency to illustrate Mr. Rutter's discovery of the advantage of burning water with coal-tar, which is by far the greater part carbon; *the difficulty is, to account for the appearance of oxygen in the interior of the flame.* Lord Bacon proved that flame would burn within the interior of flame; and Dr. Ure, in his *Dictionary of Chemistry*, relates a similar experiment, and gives the following definition of flame, founded on the researches of Sir H. Davy: "The flame of combustible bodies may, in all cases, be considered as the combustion of an *explosive mixture* of inflammable gas, or vapor, with air." It may seem very presumptuous in me to differ with such authorities as Davy and Ure, but my defence is, that I regard truth more than all the authorities in the world. I question the truth of the above definition of flame on this ground, that the flames of "*explosive mixtures*" give no light, but afford merely a feeble blue flame. This is the case with explosive mixtures of coal-gas, oil-gas, and indeed all gases containing carburetted hydrogen or olefiant gas; surely, then, the flame of a candle, or of olefiant gas from a small aperture, exhibits phenomena very different from the combustion of an explosive mixture. After giving the aforementioned definition, Dr. Ure says, alluding to flame: "It cannot be regarded as mere combustion at the surface of contact of the inflammable matter. This fact is proved by holding a taper or a piece of burning phosphorus within a large flame made by the combustion of alcohol. The flame of the taper or phosphorus will appear in the centre of the other flame, proving that there is oxygen even in its interior part." This is, in my opinion, no proof whatever of oxygen being in the interior part. There may be carbonic acid, or

there may be vapor of water, &c.; and what confirms this conjecture, is the well known fact that carbon can decompose carbonic acid, or at least unite with one atom of its oxygen, thus forming carbonic oxide; for carbonic acid is composed of one atom of carbon and two atoms of oxygen. Carbonic oxide may therefore decompose the vapor of water formed by the union of the hydrogen with the oxygen of the atmosphere, or carbon itself may decompose the vapor of water; this latter is my opinion. But, it may be asked, how does the vapor of water find its way into the interior of flame? In the case of the candle-flame, I apprehend, it is by the union of the hydrogen with the oxygen of the atmosphere at the surface of the flame; and I have before explained that the expansion of the hydrogen, when the carbon is deposited, is the cause of its being projected with considerable velocity to the outer surface of the flame. When the hydrogen thus unites with the oxygen, water is formed, which being immediately subjected to extreme heat, expands with great velocity into vapor, which is projected, not only into the interior of the flame, but from the sides where it is formed. The carbon decomposes this vapor, and, by uniting with its oxygen, hydrogen is again formed, which may be repelled by the sudden expansion, which it must have when the carbon seizes the oxygen, to the exterior of the flame, where, uniting with oxygen, it may again return to the interior—and thus play backward and forward many hundred times in a second. This play of affinities would, however, soon cease, were not the supply of hydrogen kept up by the continual and *first* decomposition of the carburetted hydrogen. That vapor is projected from flame is proved when I hold the point of a pair of cold steel snuffers within, say three-eighths of an inch of the flame, by moisture being deposited; but the particles are so fine, and in so small quantity, that a dull appearance only of the steel results, which quickly vanishes on their removal. Should the snuffers be held very near the flame, small drops of water will appear on their removal. As this deposition of moisture takes place when the snuffers are held under the flame, and at a distance of perhaps one-fourth of an inch, I conclude it to be projected with considerable velocity, in the manner before pointed out, from every part of the flame; and I further consider that this atmosphere of vapor may, in some measure, account for the luminous halo which appears to surround the flame of a candle.

There are many other considerations which induce me to believe the above conjectures to be nearly right. One is, that if carburetted hydrogen be mixed with a very small portion of common air, its power of giving light is impaired, for part of the carbon is then burnt in its gaseous combination. Another circumstance that induces me to question the presence of oxygen in the interior of the flame of carburetted hydrogen, is the fact, that a small portion of carbon, when deposited on a small fibre of the wick of a candle, will remain in the white part of the flame without undergoing decomposition. Now, if oxygen were present in an uncombined state, and at such an elevated temperature, who can doubt that an immediate decomposition of the carbon would take place? But, it may be asked, why does not this portion of carbon decompose the vapor of water which you consider to be present in all flames containing hydrogen? One cause may be that the particles of which it is composed attract each other with part of their force, and cannot therefore exert their full force to decompose the vapor. That coal-tar cannot be burned like oil, is because it is nearly all carbon, and has not sufficient hydrogen to form the requisite quantity of vapor—what it does possess being only sufficient to supply part of its carbon with oxygen; the other part of the carbon deposited rises from the flame in dense black smoke. It may be further inquired,

why does not the black smoke, or the carbonaceous particles arising from a hot flame, unite with the oxygen of the atmosphere, and so form carbonic acid, which is invisible? I apprehend it is because of their low capacity for heat, and the instantaneous radiation of heat from their surfaces; the particles being thus deprived of their heat cannot unite with oxygen, which is also cold—for the union of carbon with oxygen will not take place under a dull red heat. Is it possible, then, to burn coal-tar without producing smoke? Nothing is more easy to a person possessing a slight knowledge of chemistry; let a long tunnel of fire-brick be constructed, leading to a chimney, and let a coal fire be lighted till the sides of this tunnel become of a white heat; if a small stream of coal-tar be now introduced, it will inflame, and as the particles of carbon deposited cannot lose their heat, and will be floating in a strata of air heated to redness, their union with oxygen must take place, provided sufficient air be admitted with the stream of coal-tar.

I shall now conclude with a few words on Mr. Rutter's project of introducing a small quantity of water with the tar. The water will first be formed into vapor, which will require some portion of heat; now this vapor may be decomposed by the carbon, when the hydrogen will again unite with the oxygen of the atmosphere, and vapor will again be formed, till the decomposition of all the carbon is complete. Perhaps two gallons of water is more than one gallon of coal tar could be made to decompose, and it would be very gratifying to me to see the actual fact proved by experiments so conclusive as to satisfy the doubts of the most sceptical. Your Salisbury correspondent states, that "15 lbs. of coal-tar," which I suppose is about equal to an imperial gallon, "and an equal bulk of water," say 10 lbs., "and 25 lbs. of Newcastle coke, will be found equal to 120 lbs. of Newcastle coal." But this is on the supposition that the whole of the water will be decomposed, which I consider a practical impossibility, for a large portion of the carbon must unite with the oxygen admitted to inflame the hydrogen.

Should Mr. Rutter, however, have formed too high an estimate of the heat gained by his process, there are other advantages attending it which must not be overlooked; for two intense chemical actions are supported with the same volume of air that either of them would require separately, which is of great importance in its application to steam boilers. Your Salisbury correspondent has certainly blundered in endeavoring to explain this. (See his paragraph, page 452, beginning with "Another condition," and ending with "gases.") He is also wrong in saying, (page 453,) "The sides of the furnace in that vessel formed a part of the boiler, consequently their temperature never exceeds that of the contained water." How then is the heat communicated, if both sides are of the same temperature? According to my experience, the sides of boilers are often many hundred degrees hotter than the contained water, and sometimes red hot just at the outer surface.

I have no other object in making these remarks than to elicit truth, and prevent scientific men from trusting too much to "hope's delusive mine." I remain, sir, your obedient servant,
WILLIAM WITTY, Jun.

ANALYSIS OF OYSTER SHELLS.—One hundred grains of oyster shell will give Carbonate of Lime, 95.18; Phosphate of Lime, 1.88; Silica, 0.40; Water, 1.62; Insoluble animal matter, 0.45; Loss, &c. 0.46. From this view of the composition of recent oyster shell, it is obvious that no appreciable advantage can be expected in applying it as a manure from the minute proportion of animal matter which it has been shown to contain. It is as a carbonate of lime, and that nearly in a state of purity, that it should claim the attention of the agriculturist.—[Farmers' Register.]

On Railroad Wheels, &c. By WM. M. CUSHMAN. To the Editor of the Mechanics' Magazine and Register of Inventions and Improvements.

SIR,—There are few applications of science which make such continual and importunate calls upon its resources as the subject of railroads—its principles having place as well in the minute, as the more prominent parts; and to such an extent does this obtain, that, although casuists might dispute the endowment of sensibility, we may with some propriety credit the "sympathy" which subsists among its various constituent parts.

To those of your readers who know the important part the appendage, which forms the subject of this paper, acts in the successful operation of a railroad, no apology for its appearance would be proper or necessary. Impressed, however, with the belief that, in matters of science, nostrums and secrets are the peculiar property of empiricism, I am persuaded that liberality, to a certain extent, among engineers, in a mutual interchange of ideas through public journals devoted to such objects, will be attended with the most beneficial results to the profession and its members generally—it is the hope of contributing a trifle to such result, which induces me to send for publication, the subsequent compilation from my common-place book.

The problem assigning to the parts of the wheel the proportions requisite to sustain a given stress, has been investigated;* but as I have never seen any discussion touching the particular distribution of metal to obtain the requisite strength with the least quantity of metal, and at the same time to offer the least resistance to motion, after briefly reciting the mode of proceeding in order to attain the single condition of strength, I propose to examine that necessary to the attainment of the latter conditions.

To determine the dimensions of the rim, arms, &c., consider them rectangular prisms, calculate the stress these prisms will bear; and lastly, dispose them in the best form for strength and motion on the various parts of the line.

Each arm must be of sufficient strength to bear the greatest stress that can ever fall upon it, which is half the weight of the car and its load; then this formula holds,

$$\frac{S}{2200} = a; (1.)$$

in which S is put for half the weight, and a for the surface in inches of the section of the arm.

In the rim this formula holds,

$$t = \sqrt{\frac{c \times S}{850b}}; (2.)$$

in which c = the length of the arc between the arms, in feet, at the mean diameter of the rim; S, as before; b = the breadth of the rim, in inches; and t = the thickness of the prism, in inches—to be disposed in the best form for strength and for the rim. The formula (2) is general, but the other is affected by the number of arms; it is designed for a 3 feet wheel, having 10 arms, or a 5 feet wheel, having 12.

But since, in rolling bodies, each particle of matter resists motion in proportion to the square of its distance from the axis of motion, it is evidently an object of the first importance to dispose of the weight of metal as near the axis of motion as is consistent with strength, safety, and the perfection of the wheel in other respects.

To illustrate the effects of this principle, let

*Vide Tredgold on Railroads. Science is deeply indebted to this author: his work on railroads, however, published in their stunted infancy, although in many particulars sound, is in others behind the age; it has the merit of having been a pioneer—of having demarcated by a rigorous application of scientific principles, the absurdities which at that period entangled the subject. It is in our own country that many of its most important principles have been developed, with a rapidity corresponding with the fertile genius of our countrymen, and the impetus and zeal every object to which they direct their attention receives.

the weight of a car and its load be 3 tons, and suppose further, that a wheel of 3 feet diameter is the height most suitable for the road it is to run upon. Now, if it be desired to sustain a given constant weight by a prism of a given breadth, supported at each extreme, it is manifest that, as the distance between the supports is increased, the depth of such prism must likewise be increased in a certain ratio; and vice versa. This condition is expressed in formula (2.) in its true ratio—hence, in increasing the number of arms, we diminish the weight of the rim, and effect a transfer of metal towards the centre of motion; and this may be done without injury to the wheel in any respect.

I shall in the first place assume formula (1) to be general, to illustrate the effect resulting solely from the change of place of the metal from the exterior towards the interior.

Excluding the part of the radius occupied by the nave and rim, the quantity of metal for an arm will be 19.92 cubic inches, and on the hypothesis of 10 arms, the surface of a section through the rim will be 4.090 inches; but on the hypothesis of 9 arms, the sectional surface is 4.315 inches: hence the volume of the rim for 10 arms is less than that for 9, by 25.5 cubic inches.

These preliminaries made, in order to effect a comparison of the efficiency of the two wheels:

Let the prism representing the volume of any arm be divided into an indefinite number of equal parts, by planes cutting it orthogonally, and m = one of these parts; let also r, r', r'', r''', &c., ad infinitum, be the respective distances of these quantities from the axis of motion, and x = the sum of the rectangles of the subdivisions into the squares of their respective distances from the axis: then, by the law, we get

$$mr^2 + mr'^2 + mr''^2 \text{ \&c. ad inf.} = x;$$

which expression, since each term is affected by the same quantity m, becomes

$$m(r^2 + r'^2 + r''^2 \text{ \&c. ad inf.}) = x; (3.)$$

In assigning a value comparatively small to m, we shall have for all practical purposes the value of x: thus, let m = $\frac{1}{30}$ of the mass of the arm, which (taking the diameter of the nave 5 inches, and considering the last half inch of the arm merged in the rim,) is represented by 19.92: then, r, r', r'', &c. become 1, 2, 3, 36; and,

$$\frac{19.92}{30} (6^2 + 7^2 + 8^2 \text{ . . . } 35^2) = 9864. = x. (5.)$$

Again, since the matter in the rim lies in a circle described about the axis, it is at every point equally distant from the axis; its mass, therefore, drawn into the square of its distance from the axis, will be its moment of inertia: hence,

$$36^2 \times 25.5 = 33048 = x'; (6.)$$

wherefore, the relative resistances to motion of the means used to attain the same end, in the two wheels, are as

$$x : x' :: 1 : 3.35.$$

2d. But the mass of each arm may, in general, be diminished in the ratio of the increase of value to that contemplated in formula (1.) in consequence of conditions entering therein.

The value of x (form. 5) is reduced by the addition of a single arm, $\frac{1}{3}$ for each arm; their sum being 9, gives x for the total diminution in resistance to motion offered by each, which in amount is just sufficient to make the new arm; whence the relative moments are as

$$x : x + x' :: 1 : 4.35;$$

if the number be increased to 11, the relative moments stand thus,

$$1 : 6.94;$$

if to 12, thus,

$$1 : 9.62;$$

and so on for a greater number.

Such are the results when the principle of momentum of inertia enters as a condition in the determination of the problem.

Extending this principle, we see that the wheel of greatest efficiency with the least quantity of metal would be one without spokes, i. e. having a sheet of metal extending from the nave to the rim: but the limit to the number of arms will be attained when the rim has such a thickness that, when further reduced, there would be danger of fracture from other causes than the stress it is to bear.

I shall not extend my remarks further. By those acquainted with subjects of this nature, the consequences which flow from them will readily be appreciated. My aim has been not to define with precision the exact form necessary in practice, but to illustrate the importance of introducing the principle of momentum of inertia; and to indicate, in a general manner, the changes which ought to be made in the ordinary form, from its introduction.

WM. M. CUSHMAN, C. E.

Albany, April 14, 1834.

AMERICAN PATENT—Specification of a Patent for Improvements in the Wheels of Railroad Carriages. Granted to JOHN ELGAR, Civil Engineer, City of Philadelphia, November 19, 1833.

To all whom it may concern, be it known, that I, John Elgar, Civil Engineer of the city of Philadelphia, have invented certain improvements in the wheels of railroad carriages, by one of which improvements they are made to adapt themselves more readily to curved roads than such as have been heretofore used for that purpose; and by the other a construction is given to them which will render them more firm and durable than those now in general use; and I do declare that the following is a full and exact description of my said improvements.

The self-adjusting conical wheel for running upon curved roads is well known to engineers, it having been made the subject of a patent by Mr. James Wright, and a modified form of it being now used on the Baltimore and Ohio railroad. The plan which I have devised is a new modification of this principle, by which some of the inconveniences which have hitherto attended its employment are in a great degree, if not altogether, obviated.

Instead of making the wheel conical on its whole tread, like Wright's, or of forming the conical part against the flanch, and leaving the other part cylindrical, as in those used on the Baltimore road, I form the cone on the outer part of the tread of the wheel, opposite to the flanch, leaving that part of the tread which extends from the flanch towards the opposite side cylindrical, or nearly so, for one half of its width, more or less, and then tapering outwards in such degree as may be most convenient, according to the curvature of that part of the road which has the smallest radius.

The curved part of the road is adapted to these wheels, by widening the track in proportion to the radius of curvature, so as to admit the conical part to roll on the interior rail, whilst the cylindrical part bears upon the exterior rail. This construction obviates the objection arising from the wrong tendency of the cone when running on the exterior rail, and adapts the whole more perfectly to those parts of the road which are straight, and produces other advantages, which will readily occur to experienced engineers.

In order to render railroad wheels more firm and durable than those now in use, I form that part of the wheel usually occupied by the spokes of two plates of iron, preferring for this purpose thick sheet iron of three eighths of an inch, more or less, in thickness. These sheets of iron are raised so as to be concave, or dishing, forming the segments of a large sphere, or, if preferred, they may be made conical. These plates have a hole in their centres to receive the hub, or nave, and have a flanch turned up, over which the hoop of the hub may pass; or, if preferred, the hub may be secured in other ways. If the rim or tire

is of wrought iron, the plates may have a flanch turned at their peripheries, through which they may be rivetted on the interior of the rim. When the rim is of cast iron, the plates may be secured without a flanch, one being cast within the rim, on either side, against which the plates may fit, rivets or bolts passing through them and through the flanch, to secure them in their places. Other modes of fixing the plates in their places may be devised, and I do not mean to confine myself to any specific plan of effecting this object, the manner of doing so not in any way affecting the principle upon which my improvement is founded. This mode of construction is particularly adapted to wheels for locomotive engines, that run either on common roads or on railways.

What I claim as my invention in my first described improvement, is the making the wheel of a railway carriage conical on its outer edge, and cylindrical between said conical part and the flanch, for the purpose of adapting it to run upon curved roads, and applying it thereto upon the principle, and in the manner herein before set forth.

What I claim as my invention in my second described improvement, is the substituting of metallic plates (generally of wrought iron,) for the spokes usually employed; and the giving to such plates a form which shall be convex, either curved or conical, from the rim to the hub of the wheel.

JOHN ELGAR.

IMPORTANT DISCOVERY.—We are informed by two gentlemen who lately passed through Syracuse, N. Y., that Mr. Avery, the proprietor of an extensive iron foundry in that place, has made a very important discovery in relation to casting of iron. The best kind of earth used in foundries is brought we believe from Canada. Mr. Avery analyzed this earth, and found it to contain a certain portion of blue clay. Following this up by a series of experiments, he discovered that if *common fine sand* was mixed with *common blue clay*, in the proportion of one tenth part of clay to nine tenths of sand, it would constitute the best possible composition for casting that he had ever used. Even the most delicate castings came out perfectly free of sand, and required no sort of cleaning by vitriol. He dismissed ten of his cleaners on the spot. Mr. Avery has taken out a patent for his discovery, and estimates that his composition will make an immense saving in the expense of iron foundries—in the diminution of labor, the cheapness of the sand, and in the disuse of vitriol in the process of cleansing. We hope that our neighbors of the furnace will immediately test it by experiment.—[Brattleboro' Independent Inq.]

THE BANKS OF NEWFOUNDLAND.—These banks extend over a space of forty thousand miles, and are from thirty to forty-five fathoms below the surface of the ocean. The shoals are inhabited by innumerable tribes of muscles and clams, to which it is a favorite residence, as they can easily bury their shells in the soft sand. They have enemies to contend with. The cod fish resort to this coast to prey on them. They keep a constant watch, and swim about a foot above the sub-marine sands; when a muscle opens its shell, it is immediately seized and devoured. At other times the fish do not wait; they are provided with a horny protuberance round their mouths; with these they burrow in the sand, and capture the muscle in its shell. The fishermen of various nations, French, English, and Americans, who resort to these banks, take annually from eight to ten millions of fish; on opening them they find the remains of twenty or fifty muscles in each; sometimes the muscle shells are found either wholly or partially dissolved. The first care of the fishermen, after taking their sta-

tions, is to ascertain the depth of water; the lines must be regulated so as to lie on the bottom, where the fish are always engaged in this species of sub-marine war

FEMALE SUPREMACY.—By all external symptoms, says an amusing writer in this month's Metropolitan, we may apprehend that the reign of women is fast approaching: look at the present aspect of Europe; a Queen of Spain, a Queen of Portugal, a prospective Queen of England. So that we are, at last, to be duly brought under "petticoat government." There is, too, Mrs. Norton conducting a magazine, and Mrs. Cornwall Wilson a weekly publication. Have not women invaded literature and art in all its branches—nay, the most awful arcana of science? There is Mrs. Somerville teaching us the mechanism of the heavens; while Miss Harriet Martineau gives us lessons on political economy.—[London paper.]

SALT.—The people of Onondaga County, N. Y., believe that they have under them an inexhaustible mass of rock salt, and that in raising this, instead of brine, they shall save half the expense of manufacturing, and be able to supply the Atlantic towns with salt cheaper than they can import it. There is one difficulty which now threatens, and that is the expense of fuel. The wood now used at the different salt springs now in operation amounts to 400 cords a day, and as the works are in use 200 days in a year, the annual consumption is 80,000 cords.

PRODUCTS AND PROFITS OF A FARM.—Full debit and credit accounts of farming operations afford one of the best sources of practical information. The following is from the Farmer's Register:

Sir—At the solicitation of a friend I am induced to give a statement of the products of my farm for the year 1833, and of its general arrangement. In doing this, as my grain is not yet all thrashed and taken to market, I cannot now arrive at perfect accuracy; but from what is, thrashed and sold, I can make a correct estimate of the quantity, and I have ascertained the price for such as has not been actually sold. My farm is situated on an extensive plain, that was once covered pretty generally with small pine timber. The soil is sand, occasionally gravel, and more or less mixed with loam. It consists of two hundred acres, of which thirty acres are in wood, twenty in meadow, and ten acres of waste, leaving for cultivation about one hundred and forty acres of arable, or land used for the plough, which is divided into seven lots, of twenty acres each. One of these lots is planted in corn, on clover seed. The corn is the large twelve rowed early yellow, and my usual produce is about fifty bushels per acre. My mode of cultivation is, that after the lot has lain one year in clover, to plough it the last of April or first of May, about six inches deep; then furrow both ways with a light corn plough; the first time across the furrows about two feet nine inches apart, the next about three feet. I plant immediately after furrowing. As soon as the corn is up the length of the finger, I harrow it with a large heavy harrow lengthwise with the furrow, as the ground was originally ploughed, and take two rows at a time. Two men or boys follow the harrow with aprons, out of which they plaster the corn, and also raise any plants which may have been thrown down by the harrow passing over them. In a week after I plough once between the rows as they are planted the narrowest way; the men follow with the hoe, and they will finish twenty acres in ten days. In about a fortnight more, I plough it the widest way of planting, twice between the rows, and throw the ground towards the plant. I cut the stalk above the ear as soon as the kernel in the ear is hard, and secure the stalks in shocks. We husk the corn on the hill, and two men will gather

one hundred bushels of ears in a day. The lot which was in corn, I put down the succeeding year to oats, and it commonly produces about forty bushels per acre. This lot I seed down with western clover seed, eight quarts per acre. Two lots are in wheat which were likewise the year previous in clover seed. The one is ploughed the first of August, and again just previous to sowing in September; the other but once the last of August or first of September, about a fortnight previous to sowing. These lots have the benefit of my barn manure, which is scattered on such portions as I think require it most.

I commonly sow about one bushel twelve quarts per acre, and my common yield is twenty bushels of wheat per acre. Thus four lots are employed, one in corn, one in oats, two in wheat; the remaining three are in pasture. Two of these are again to be ploughed up in the fall for wheat, and the remaining one is for corn the succeeding season. The experience of twenty years has confirmed me in the belief that this is the most successful mode of cultivation in our soil, and I have at all events been satisfied with the amount of produce my farm has yielded me. I annex a statement showing the amount of produce and the proceeds therefrom of my farm, for the year 1833, and the expenses of its management.

Cr.

20 acres meadow, 2 tons hay per acre, sold a \$7½ per ton,	\$300 00
20 acres producing 1,000 bushels corn, for which I am offered 62½ cts. per bushel,	625 00
40 acres producing 800 bushels wheat, sold a \$1½,	850 00
20 acres producing 800 bushels oats, sold a 37½,	300 00
500 bushels potatoes a 2½	125 00
3000 weight of pork, a \$5 50,	165 00
Sold one beef,	25 00
500 lbs. butter, a 16 cts.,	80 00
225 lbs. wool, a 4½	112 00
55 lambs, increase of my flock,	80 00
	\$2,662 00

The item of pasturage not put down.

Dr.

To hiring one man per year,	\$100 00
To do. do. seven months,	70 00
To hiring 15 days in haying and harvest,	13 12
3½ tons plaster a \$7 50,	26 25
3½ bushels clover seed a \$7 50,	26 25
Taxes,	15 00
Mechanics' bills,	50 00
	320 63

Income,	\$2,341 38
The farm sold a \$60, for 200 acres,	\$12,000
Stock and implements valued at	1,000
	\$13,000
Interest on this sum at 7 per ct.,	910 00
Gain,	\$1,431 83

Making the entire interest upon \$13,000, after deducting expenses, about 18 per cent. There are other profits from the farm not enumerated in the within statements, such as house-rent, garden, orcharding, raising of poultry, &c. I will put them against any little incidental expenses not enumerated, but which they will be amply sufficient to defray. The labor upon my farm is performed by two men as above stated, but under my own direction, and all our operations tend to lessen the amount of labor as much as practicable; and I find that nothing conduces more to this result than to keep ahead of my work through the season. For myself, I labor but moderately, but keep up a constant supervision. I will only farther add, that since I have adopted the principle of total abstinence from ardent spirits, at all seasons of the year, I think I have not only gained vastly in the amount of work done by my men, but my farming business has gone on more cheerfully.

Yours, respectfully,

TEUNIS HARDER.

Kinderhook, Columbia Co. Jan. 14, 1834.

In consequence of the resignation of the Postmaster at Kittery, Maine, and no candidate being recommended to succeed him, the Postmaster General has discontinued that office.—[Eastern Argus.]

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

(Continued from page 215.)

There is another curious circumstance in the form of the thigh bone, showing how it is calculated for strength as well as freedom of motion. To understand it we must first look to the *dishing* of a wheel. The dishing is the oblique position of the spokes from the nave to the felly, giving the wheel a slightly conical form. When a cart is in the middle of a road, the load bears equally upon both wheels, and both wheels stand with their spokes oblique to the line of gravitation.

If the cart is moving on the side of a barrel shaped road, or if one wheel falls into a

Fig. 17.

rut, the whole weight comes upon one wheel; but the spokes of that wheel, which were oblique to the load, when it supported only one-half of the weight, are now perpendicular under the pressure, and are capable of sustaining the whole. If roads were made perfectly level, and had no holes in them, the wheels of carts might be made without dishing; but if a cart is calculated for a country road, let the wheelwright consider what equivalent he has to give for that very pretty result proceeding from the obliquity of the spokes, or *dishing* of the wheel.

When we return to consider the human thigh bone, we see that the same principle holds; that is to say, that whilst a man stands on both his legs, the necks of the thigh bones are oblique to the line of gravitation of the body; but when one foot is raised, the whole body then being balanced on one foot, a change takes place in the position of the thigh bone, and the obliquity of that bone is diminished; or, in other words, now that it has the whole weight to sustain, it is perpendicular under it, and has therefore acquired greater strength.

[Fig. 18.]

CHAPTER V.

OF THE TENDONS COMPARED WITH CORDAGE.—Where nature has provided a perfect system of columns, and levers, and pullics, we may anticipate that the cords by which the force of the muscles is concentrated on the moveable bones, must be constructed with as curious a provision for their offices. In this surmise we shall not be disappointed. To understand what is necessary to the strength of a rope or cable, we must learn what has been the object of the improvements and patents in this manufacture. The first process in rope making is hatcholling the hemp; that is, combing out the short fibres, and placing the long ones parallel to one another. The second is spinning the hemp into yarns. And here the principle must be attended to, which goes through the whole process in forming a cable; which is that the fibres of the hemp shall bear an equal strain; and the difficulty may be easily conceived, since the twisting must derange the parallel position of the fibres. Each fibre, as it is twisted, ties the other fibres together, so as to form a continued line, and it bears at the same time a certain portion of the strain, and so each fibre alternately. The third step of the process is making the yarns. Warping the yarns is stretching them to a certain length; and, for the same reason that so much attention has been paid to the arrangement of the fibres for the yarns, the same care is taken in the management of the yarns for the strands. The fourth step of the process is to form the strands into ropes. The difficulty of the art has been to make them bear alike, especially in great cables, and this has been the object of patent machinery. The *hardening* by twisting is also an essential part of the process of rope-making; for without this it would be little better than extended parallel fibres of hemp. In this twisting, first of the yarns and then of the strands, those which are on the outer surface must be more stretched than those near the centre; consequently, when there is a strain upon the rope the outer fibres will break first, and the others in succession. It is to avoid this that each yarn and each strand, as it is twisted or hardened, shall be itself revolving, so that when drawn into the cable the whole component parts may, as nearly as possible, resist the strain in an equal degree; but the process is not perfect, and this we must conclude from observing how different the construction of a tendon is from that of a rope. A tendon consists of a strong cord apparently fibrous, but which, by the art of the anatomist, may be separated into lesser cords, and these by maceration, can be shown to consist of cellular membrane, the common tissue that gives firmness to all the textures of the animal body. The peculiarity here results merely from its remarkable condensation. But the cords of which the larger tendon consists do not lie parallel to each other, nor are they simply twisted like the strands of a rope; they are, on the contrary, plaited or interwoven together.

If the strong tendon of the heel, or Achilles tendon, be taken as an example, on first inspection it appears to consist of parallel fibres, but by maceration these fibres are found to be a web of twisted cellular texture. If you take your handkerchief, and, slightly twisting it, draw it out like a rope, it will seem to consist of parallel cords; such is, in fact, so far the structure of a ten-

don. But, as we have stated, there is something more admirable than this, for the tendon consists of subdivisions, which are like the strands of a rope; but instead of being twisted simply as by the process of hardening, they are plaited or interwoven in a way that could not be imitated in cordage by the turning of a wheel. Here then is the difference: by the twisting of a rope the strands cannot resist the strain equally, whilst we see that this is provided for in the tendon by the regular interweaving of the yarn, if we may so express it, so that every fibre deviates from the parallel line in the same degree, and consequently receives the same strain when the tendon is pulled. If we seek for examples illustrative of this structure of the tendons, we must turn to the subject of ship rigging, and see there how the seaman contrives, by undoing the strands and yarns of a rope, and twisting them anew, to make his splicing stronger than the original cordage. A sailor opens the ends of two ropes thus:*

Fig. 19.

and places the strands of one opposite and between the strand of another, and so interlaces them. And this explains why a hawser-rope, a sort of small cable, is spun of three strands; for as they are necessary for many operations in the rigging of a ship, they must be formed in a way that admits of being cut and spliced; for the separation of three strands, at least, is necessary for knotting, splicing, whipping, mauling, &c. which are a few of the many curious contrivances for joining the ends of ropes, and for strengthening them by filling up the interstices to preserve them from being cut or frayed. As these methods of splicing and plaiting in the subdivisions of the rope make an intertexture stronger than the original rope, it is an additional demonstration, if any were wanted, to show the perfection of the cordage of an animal machine, since the tendons are so interwoven; and until the yarns of one strand be separated and interwoven with the yarns of another strand, and this done with regular exchange, the most approved patent ropes must be inferior to the corresponding part of the animal machinery.

A piece of cord of a new patent has been shown to us, which is said to be many times stronger than any other cord of the same diameter. It is so far upon the principle here stated, that the strands are plaited instead of being twisted; but the tendon has still its superiority, for the lesser yarns of each strand in it are interwoven with those of other strands. It however gratifies us to see, that the principle we draw from the animal body is here confirmed. It may be

* A strands and yarns opened. B, ends opened and laid for splicing, in a manner exactly like the interlacing of the tendon.

asked, do not the tendons of the human body sometimes break? They do; but in circumstances which only add to the interest of the subject. By the exercise of the tendons, (and their exercise is the act of being pulled upon by the muscles, or having a strain made on them,) they become firmer and stronger; but in the failure of muscular activity, they become less capable of resisting the tug made upon them, and if, after a long confinement, a man has some powerful excitement to muscular exertion, then the tendon breaks. An old gentleman, whose habits have been long staid and sedentary, and who is very guarded in his walk, is upon an annual festival tempted to join the young people in a dance; then he breaks his tendo Achillis. Or a sick person, long confined to bed, is, on rising, subject to a rupture or hernia, because the tendinous expansions guarding against protrusion of the internal parts, have become weak from disease.

Such circumstances remind us that we are speaking of a living body, and that, in estimating the properties of the machinery, we ought not to forget the influence of life, and that the natural exercise of the parts, whether they be active or passive, is the stimulus to the circulation through them, and to their growth and perfection.

CHAPTER VI.

OF THE MUSCLES—OF MUSCULARITY AND ELASTICITY.—There are two powers of contraction in the animal frame—elasticity, which is common to living and dead matter, and the muscular power, which is a property of the living fibre.

The muscles are the only organs which properly have the power of contraction, for elasticity is never exerted but in consequence of some other power bending or stretching the elastic body. In the muscles, on the contrary, motion originates; there being no connection, on mechanical principles, betwixt the exciting cause and the power brought into action.

The real power is in the muscles, while the safeguard against the excess of that power is in the elasticity of the parts. This is obvious in the limbs and general texture of the frame; but it is most perfectly exhibited in the organs of circulation. If the action of the heart impelled the blood against parts of solid texture, they would quickly yield. When by accident this does take place, even the solid bone is very soon destroyed, but the coats of the artery which receive the rush of blood from the heart, although thin, are limber and elastic; and by this elasticity or yielding, they take off or subdue the shock of the heart's action, while no force is lost: for as the elastic artery has yielded to the sudden impulse of the heart, it contracts by elasticity in the interval of the heart's pulsation, and the blood continues to be propelled onward in the course of the circulation, without interval, though regularly accelerated by the pulse of the heart.

If a steam engine were used to force water along the water-pipes, without the intervention of some elastic body, the water would not flow continuously, but in jerks, and therefore a reservoir is constructed containing air, into which the water is forced against the elasticity of the air. Thus, each stroke of the piston is not perceptibly communicated to the conduit pipe, because the intervals are supplied by the push of the compressed air. The office of the reservoir

containing air is performed in the animal body by the elasticity of the coats of the arteries, by which means the blood which flows interruptedly into the arteries has a continuous and uninterrupted flow in the veins beyond them.

A muscle is fibrous, that is, it consists of minute threads bundled together, the extremities of which are connected with the tendons which have been described. Innumerable fibres are thus joined together to form one muscle, and every muscle is a distinct organ. Of these distinct muscles for the motions of the body there are not less than four hundred and thirty-six in the human frame, independent of those which perform the internal vital motions. The contractile power which is in the living muscular fibre, presents appearances which, though familiar, are really the most surprising of all the properties of life. Many attempts have been made to explain this property, sometimes by chemical experiment, sometimes on mechanical principles, but always in a manner repugnant to common sense. We must be satisfied with saying that it is an endowment, the cause of which it would be as vain to investigate as to resume the search into the cause of gravitation.

The ignorance of the cause of muscular contraction does not prevent us from studying the laws which regulate it, and under this head are included subjects of the highest interest, which, however, we must leave, to pursue the mechanical arrangement of the muscles.

Since we have seen that there are four hundred and thirty-six distinct muscles in the body, it is due to our readers to explain how they are associated to effect that combination which is necessary to the motion of the limbs, and to our perfect enjoyment. In the first place, the million of fibres which constitute a single muscle are connected by a tissue of nerves, which produce a unison or sympathy amongst them, so that one impulse causes a simultaneous effort of all the fibres attached to the same tendon. When we have understood that the muscles are distinct organs of motion, we perceive that they must be classed and associated, in order that many shall combine in one act; and that others, their opponents, shall be put in a state to relax and offer no opposition to those which are active. These relations can only be established through nerves, which are the organs of communication with the brain, or sensorium. The nerves convey the will to the muscles, and at the same time they class and arrange them to as to make them consent to the motions of the body and limbs.

On first looking to the manner in which the muscles are fixed into the bones, and the course of their tendons, we observe everywhere the appearance of a sacrifice of mechanical power, the tendon being inserted into the bone in such a manner as to lose the advantage of the lever. This appears to be an imperfection, until we learn that there is an accumulation of vital power in the muscle in order to attain velocity of movement in the member.

Fig. 20.

The muscle, D, which bends the fore-arm, is inserted into the radius, E, so near the fulcrum, or centre of motion, in the elbow joint, and so oblique, that it must raise the hand and fore-arm with disadvantage. But, correctly speaking, the power of the muscle is not sacrificed, since it gains more than an equivalent in the rapid and lively motions of the hand and fingers, and since these rapid motions are necessary to us in a thousand familiar actions; and to attain this the Creator has given sufficient vital power to the muscles to admit of the sacrifice of the mechanical or lever power, and so to provide for every degree and variety of motion which may answer to the capacities of the mind.

If we represent the bones and muscles of the fore-arm by this diagram, we shall see

Fig. 21.

tendon to the lever into which it is inserted. It represents the lever of the third kind, where the moving power operates on a point nearer the fulcrum than the weight to be moved.

Here A represents the muscle, B the lever, and C the fulcrum. The power of the muscle is not represented by the distance of its insertion, *a*, from the fulcrum C. The line which truly represents the lever must pass from the centre of motion perpendicularly to the line of the tendon, namely C *b*. Here again, by the direction of the tendon, as well as by its actual attachment to the bone, power is lost and velocity gained.

We may compare the muscular power to the weight which impels a machine. In studying machinery it is manifest that weight and velocity are equivalent. The handle of the winch in a crane is a lever, and the space through which it moves, in comparison with the slow motion of the weight, is the measure of its power. If the weight raised by the crank be permitted to go down, the wheels revolve, and the handle moves with the velocity of a cannon ball, and will be as destructive if it hit the workman. The weight here is the power, but it operates

that power is lost by the inclination of the

with so much disadvantage that the hand upon the handle of the winch can stop it: but give it way, let the accelerated motion take place, and the hand would be shattered which touched it. Just so the fly wheel, moving at first slowly, and an impediment to the working of a machine, at length acquires momentum so as to concentrate the power of the machine, and enable it to cut bars of iron with a stroke.

The principle holds in the animal machinery. The elbow is bent with a certain loss of mechanical power; but by that very means, when the loss is supplied by the living muscular powers, the hand descends through a greater space, moves quicker, with a velocity which enables us to strike or to cut. Without this acquired velocity, we could not drive a nail; the mere muscular power would be insufficient for many actions quite necessary to our existence.

Let us take some examples to show what objects are attained through the oblique direction of the fibres of the muscles, and we shall see that here, as well as by the mode of attachment of the entire muscle, velocity is attained by the sacrifice of power. Suppose that these two pieces of wood, to be

Fig. 22.

drawn together by means of a cord, but that the hand which pulls, although possessing abundant strength, wants room to recede more than what is equal to one-third of the space betwixt the pieces of wood, it is quite clear that if the hand were to draw direct on the cord, A B, the point A would be brought towards B, through one-third only of the intervening space, and the end would not be accomplished. But if the cord were put over the ends of the upper piece, C, D, E, and consequently directed obliquely to their attachment at A, on drawing the hand back a very little, but with more force, the lower piece of wood would be suddenly drawn up to the higher piece, and the object attained. Or we may put it in this form: If a muscle be in the direction of its tendon, the motion of the extremity of the tendon will be the same with that of the muscle itself: but if the attachment of the muscle to the tendon be oblique, it will draw the tendon through a greater space; and if the direction of the muscle deviate so far from the line of the tendon as to be perpendicular to it, it will then be in a condition to draw the tendon through the greatest space with the least contraction of its own length.

Fig. 23.

Thus, if A B be a tendon, and C D a muscle, by the contraction of C to D the extremities of the tendon A B will be brought

together through a space double the contraction of the muscle. It is the adjustment on the same principle which gives the arrow so quick an impulse from the spring of the bow, the extremities of the bow drawing obliquely on the string.

To free breathing, it is necessary that the ribs shall approach each other, and this is performed by certain *intercostal* muscles, (or muscles playing between the ribs,) and now we can answer the question, why are the fibres of these muscles oblique?

Fig. 24.

Let us suppose this figure to represent two ribs with thin intervening muscles. If the fibres of the muscle were in the direction A, across, and perpendicular to the ribs; and if they were to contract one third of their length, they would not close the intervening space; they would not accomplish the purpose. But being oblique, as at B, although they contract no more than one third of their length, they will bring the ribs C D together. By this obliquity of the intercostal muscles they are enabled to expand the chest, in inspiration, in a manner which could not be otherwise accomplished.

In the greater number of muscles the same principle directs the arrangement of the fibres; they exchange power for velocity of movement, by their obliquity. They do not go direct from origin to insertion, but obliquely, thus, from tendon to tendon:

Fig. 25.

Supposing the point A to be the fixed point, these fibres draw the point B with less force, but through a larger space, or more quickly than if they took their course in direct lines; and by this arrangement of the fibres the freedom and extent of motion in our limbs are secured.

But the muscles must be strengthened by additional courses of fibres, because they are oblique; since by their obliquity they lose something of their force, and therefore it is, we must presume that we find them in a double row, making what is termed the *penniform* muscle, thus—

Fig. 26.

and sometimes the texture of the muscle is still further compounded by the intermixture of tendons, which permit additional series of fibres; and all this for the obvious purpose of accumulating power, which may be exchanged for velocity of movement.

BLINDNESS OF PASSION, OR MISTAKES OF A KAMTSCHATKAN BEAR.—Fish, which forms their chief nourishment, and which the bears procure for themselves in the rivers, was last year excessively scarce in Kamtschatka. A

great famine consequently existed among them, and, instead of retiring to their dens, they wandered about the whole winter through, even in the streets of the town of St. Peter and St. Paul. One of them finding the outer gate of a house open, entered, and the gate accidentally closed after him. The woman of the house had just placed a large tea-machine, full of boiling water, in the court: the bear smelt to it and burned his nose; provoked at the pain, he vented all his fury upon the kettle, folded his fore-paws round it, pressed it with his whole strength against his breast to crush it, and burned himself, of course, still more and more. The horrible growl which rage and pain forced from him brought all the inhabitants of the house and neighborhood to the spot, and poor bruin was soon dispatched by shots from the window. He has, however, immortalized his memory, and become a proverb amongst the town's-people, for, when any one injures himself by his own violence, they call him "the bear with the tea-kettle."—[Capt. Kotzebue's *New Voyages round the World in the Years 1823-1826.*]

AGRICULTURE, &c.

WATER FOR GREEN-HOUSE PLANTS.—Soft pond water, such as is supplied from the watering or floating of meadows, holds in solution, and in its most limpid state, all the food which most plants require; and it is only such food as they are capable of taking up by their spongioles, or digesting by their system. Such water is not attainable by every person; but I think that a good substitute might be artificially procured by placing some turfs from a common or sheep-walk, into a large wicker-basket; and, after nearly filling the basket with them, to place *two turfs manured with a thin layer between them of poultry or sheep dung*, at the top of the basket. The best and softest water that can be had should then be poured over the turfs till it filtrates, in a clear state, into a recipient vessel placed underneath. A bushel-basket would last, for this purpose, many weeks, and suffice for the saturation of some hundreds of gallons of water with nutritious matter, and also for the detention of other particles which could not be assimilated by the organs of the plants.—[Mr. Mearns, gardener to the Duke of Portland.]

ENCLOSURES.—Most of the modern nations of Europe still enclose their lands in the ancient method. Property is so much subdivided in France by the extinction of the law of primogeniture, that no *field* enclosures are to be observed in that country,—a few march-stones, a row of trees, or particular single trees here and there, marking the boundaries of estates. Throughout Germany, Bohemia, Switzerland, Spain, and Italy, enclosures are only found near farm-houses and villages, the bulk of the corn being raised on extensive unenclosed grounds. On the other hand, the land in Holland and Belgium is in general very much enclosed, so much so, that the fields appeared half choked with hedge-row trees and hedges. The same remark very nearly applies to the south of England, where much valuable ground is occupied with, certainly beautifully luxuriant, but sadly neglected hedges. The land in Ireland is also too much subdivided, and mostly with turf walls, which are generally very unfit to detain live stock. It is in the north of England, and the best cultivated districts in Scotland, that enclosures, suited to the improved state of the husbandry of the kingdom, are to be found. There, not only whole farms are enclosed, but the size of the enclosures conforms to

that system of husbandry which is suited to the nature of the soil. There, the growing crops of all kinds receive shelter from the vicissitudes of the weather, and protection from the depredations of live stock; and the live stock themselves enjoy, as a recompense for their confinement within the enclosures, peace and plenty unmolested.

A fence occupying elevated ground bestows more shelter to fields than in other situations; and on this account, if any other circumstances will permit it, the elevated summits of rising ground ought always to be chosen as the sites of fences. Such sites place a thorn-hedge beyond the crushing power of a heavy fall of snow. But it generally happens that the lower ends of fields cannot be enclosed in a straight line,—a rivulet or hollow between two rising grounds frequently terminating their lower ends. In that case, the fence ought to follow the course of the water or hollow ground, in order to provide an egress for the surface-water coming from both sides of the rising ground. A serpentine fence in a hollow, contrary to one on a rising ground, affords more shelter than a straight one, in the direction of the wind, which almost always takes the direction of the valley. A public road or canal passing through a property, or an old plantation growing in the middle of the land, affects the shaping out of enclosures. Whether any of them exists before or after the land is enclosed, the irregular sides of the enclosures, which alone should contain wedge-shaped ridges, should be placed next the obstacle.

The advantages of enclosing land may thus be summed up. Enclosures shelter corn against the inclemency of the weather, and they prevent the trespasses of men and animals. They not only afford the most excellent shelter to live stock, but they insure them peace and protection while feeding, or when at rest. They enhance the value of land in every situation; and they greatly beautify the appearance of a country. They confer ease of mind to the farmer by securing his crops, and flocks, and herds, from danger; and they impart confidence to the country gentleman, that the enclosing of his estate of land and wood will continually improve his means, so long as he continues to protect it by maintaining the fences in an efficacious manner.

ON THE CULTURE OF THE GARDEN BEAN.—I have been very successful for half a dozen years in obtaining two crops of beans from the plants. In the summer of 1826, my first crop of magazin and early long pod beans was by a very strong and violent wind blown down; this was done when the beans were in full blossom. The crop from the blossoms which the plants then possessed was very fine and abundant, and gathered during July. In three weeks after, the beans were prostrated, each stem pushed forth from near the root one or more, in some instances four to six, fresh stems; these bloomed freely, and produced an abundant crop, which were gathered during September. Since that grew, I have uniformly bent down, so as to break the stalk near the root, my first and second crops of beans; I have by this means obtained four crops of beans from two sowings, and which supplied me from July 1st to 31st October. By this method only half the seed was required which I had been accustomed to use, and the greatest advantage to me was, that only half the ground was required, so that my

advantages by this method are four-fold. I always pinch out the tops when the plants are in full bloom; this throws the vigor into the production of fruit instead of a continued increase of stem and foliage.—[Cobbett.]

RECEIPT FOR DRESSING SALLAD.

BY THE REV. SIDNEY SMITH.

Two large potatoes, pressed through kitchen sieve, Smoothness and softness to the sallad give, Of mordent mustard add a single spoon, (Distrust the condiment that bites too soon;) But deem it not, thou man of herbs, a fault, To add a double quantity of salt, Four times the spoon with oil of Lucca crown, And twice with vinegar procured from town; True flavor needs it, and your poet begs, The pounded yellow of two well boiled eggs; Let onions' atoms lurk within the bowl, And, scarce suspected, animate the whole And lastly, in the flavored compound toss A magic spoonful of anchovy sauce. O! great and glorious,—O! herbaceous treat,— 'Twould tempt the dying anchorite to eat; Back to the world he'd turn his weary soul, And plunge his fingers in the sallad bowl.

BEST TIMES FOR REMOVING LAURELS, &c.—

Evergreens, if taken up carefully, may be planted with success at all seasons. About eight years ago, I superintended the planting of some very large ones, consisting of Portugal, and Common Laurels, Cedars, &c., in the month of July, when the weather was very dry, at Sulby Hall, Northamptonshire, the seat of Geo. Payne, Esq., which did remarkably well. If, however, the situation be dry, and the soil light and sandy, they will in general, with the exception of hollies, do best, if planted in November or December, providing the weather be mild. On the other hand, if the soil be low and retentive of moisture, they thrive best if planted in May. In both cases, it is indispensably necessary that all large plants be taken up with large balls, the roots being as little damaged as possible. S. H.—[Hort. Register.]

SUBSTITUTE FOR HOPS.—I was highly delighted in finding so much in the Register calculated to interest ladies. My wife remarked the other day, that she had got fully the worth of the subscription already. I trust you will, in every number, have an eye to that; and as I have lately become acquainted with a fact which may be convenient to them at some period, I will briefly mention it on this occasion, and if it be indeed new to you, (as it is to me,) you can use it for the interest and instruction of the ladies, if you see cause. It is the substituting the Life Everlasting (the botanical name I do not know,) for hops, in making yeast.

The yeast is made of the dried leaves and flowers just as yeast is made of the hop, and used in the same way. I am informed by those who have used it for some time, that bread is not as apt to become sour, and the flavor is finer than the hop bread. I have no doubt its qualities would be greatly improved if it were cultivated, and the leaves and flowers gathered as soon as they were ripe, and dried in the shade.—[Farmers' Register.]

FORSIL MANURE IN NORTH CAROLINA.—It is enough to make the heart of the patriot bleed, when he reflects what North Carolina is, and what she is capable of being. With every thing in the way of resources, physical and moral, to make her a great, commanding and prosperous state—she is at best but stationary, and which you know is comparative declension. Her population and wealth are deserting her in one continued and augmenting stream, for other climes. And why? Simply because she will not improve the means which the God of Nature has placed at her disposal. Internal improvement is at present a more urgent want with us, than the improvement of our soils. Millions of our resources are lying dormant, for the want of facilities for transportation. Let me offer a single illustration, applicable exclusively to the eastern section of the state. The pine-trees, (long leaf,) of North Carolina, for lumber and naval stores, are unquestionably of greater value

than her slaves, if they could be made available. I have been informed upon the best authority, that 20 per cent. can be cleared on the capital embarked in making turpentine, when convenient to market. But for the want of this convenience, this immense resource can only be called into action on small portions of our navigable streams. I travelled a few days ago from Waynesborough to Fayetteville, a distance of sixty-five miles, through a country heavily timbered with the finest long leaf pines, and saw no evidence during the route of their being used for any thing but plantation purposes. I should except one tar kiln and half a dozen trees designed for tar timber, partly hewn and left to decay—but not one stroke of the axe for turpentine. Hundreds and thousands of acres are in the state that nature formed them. This is but "*e pluribus unum*," to show how profoundly the giant sleeps. But I am trespassing to much of your patience, and will force myself to a conclusion. Yours, &c. ISAAC CROOM.—[Farmers' Register.]

STAINS BY FRUITS are readily removed from clothes by wetting them, and placing them near lighted brimstone; a few matches will answer the purpose.

ARABIAN HORSE.—Perhaps the most remarkable point about the Arabian horse is the extraordinary smallness of the head and mouth,—so small, indeed, is the latter that you would think they might use a common tumbler for a water bucket.

INCREASE OF MANURE BY ROTTING.—It is, we believe, a very general impression that even dry vegetable substances undergo a great loss in rotting, and hence one of the strong and oft repeated arguments of the advocates of long unfermented manures, that 50 per cent. in weight is lost by fermentation, and 50 per cent. in the quality of the remainder. We recommend to their consideration the following extract from an article on the Rotation of Crops, by J. H. Couper, Esq. of South Carolina.

A sufficient amount of manure is yielded to keep the soil in the most productive state, if a stock of animals be kept on the plantation and the dry vegetable matter of the fields be carefully carted to the pens. The expressed cane, tops and leaves, from an acre of cane, yield about 10,000 lbs. of dry vegetable matter. An acre of corn, including blades, stalks, shucks and cobs, about 2500 lbs., when the yield of corn has been 20 bushels;* and the after crop of peas 1000 lbs., together 4500 lbs. An acre of solid peas 2000 lbs. The potatoe vines, pumpkins and turnips, being eat green, contribute only to the production of fluid manure. The total quantity of dry vegetable matter to be applied to the manuring of 16 acres in crop, will therefore be,

4 acres in corn, at 4500 lbs. per acre,	18,000 lbs.
1 " peas and turnips,	2,000
3 " cane, at 10,000 lbs.	30,000
	50,000

which, if merely rotted by rain, will yield 100,000 lbs. of manure; and if rotted by the urine and dung of stock, from 150,000 lbs. to 200,000 lbs.,† or at least 25,000 lbs. of manure to each of the 4 acres proposed to be manured. To this supply of manure must be added from 50 to 70 bushels of cotton-seed from seven acres of cotton to be applied to the four acres of corn; and the peas that are ploughed in, preparatory to the potato crop of vines.

* Mr. Madison estimates the corn-stalk, with its appurtenant offal, at not less than three times the weight of the grain belonging to it.—[Address, Amer. Far. Vol. i. p. 171. See Idem. Vol. iv. p. 404, for Dr. Bellenger's estimate.]

† Three hundred stone of dry wheat straw increased by absorption to 719 stone in seven months. Straw, if simply rotted by moisture from the heavens, will double its original weight; but when rotted by the urine and turnip-fed stock, every ton will yield four tons of manure.—[Sinclair's Code of Agr. ch. iii. sec. 4. 5.]

Plan of an Apiary or Bee-house, by means of which the honey and wax can be taken without destroying the Bees. By G. [From the Quarterly Journal of Agriculture, &c.]

First,—Erect a building of wood, of dimensions according to the extent you may wish to avail yourself of the labor of bees. A frame building of 7 feet square, and 7 feet high to the eaves, will contain 90 hives of the dimensions after mentioned. The front should face the south or south-east. The sides of the house within should be shelved with stout plank, well supported by uprights and cross pieces, to hold the hives. The lower shelf may be about a foot from the floor, and the others about 14 inches apart. A tier of shelves is to be placed in the middle of the house, at the same distances from each other; this arrangement will leave two feet gangway between the shelves for the convenience of passing between the hives. There must of course be a door to each gangway, if the shelves are continued from the front to the rear of the house.

Secondly,—The hives must be made as near as may be of 12 inches square, and 12 inches high outside; it being found that a hive of these dimensions, well filled, is sufficient to support an ordinary swarm of bees through the winter. The hives should have a bottom board to fit close, but it need not be nailed fast; each hive must have two openings at bottom, exactly opposite each other, 3 inches wide, and $\frac{1}{2}$ inch high; these openings are furnished with shutters of tin or thin wood, moveable in a groove, in order to close them when the hives are to be removed. On the opposite side of each hive should be inserted a pane of glass, covered with a shutter, to enable you to see, on raising the shutter, that the hives are full. For the greater convenience of opening and shutting the apertures into the hives, they should be made of a slit of tin long enough to reach from the aperture, when closed, to the outside of the hive. In the front of the house there must be openings to correspond with the front hives within, and on the outside there should be placed a small shelf to each aperture for the bees to alight on.

You may begin to stock your house in the winter with old hives, placing a new hive of the above dimensions in front of the old one, and in the spring the bees, after filling up the old comb, will fall to work in the new hive. As soon as you perceive this, you may drive the bees from the old hive by striking on it, or by injecting the smoke of tobacco, and take it away; or take it away and set it down in front of the house, invert it and take off the bottom board—before night, the bees will have all left it and gone into the new hive. When the new hive is filled, close the apertures, draw it back and place another in front; open the communication, and they will in like manner fill this hive. You thus continue to supply hives till your shelves are full. In the fall you may take up as many as you find there are no bees in, leaving however sufficient honey to support the stock through the winter.

In order to derive the greatest possible advantage from their bees, some people take away in the spring all the old comb and honey that the bees have left unconsumed. But this should not be done until you are well assured that the bees can get their living from the early spring flowers. This can only be done, however, but by those persons

the bees will not sting, or by protecting the hands and face from their attacks.

G.

HORSES AND OXEN.—The following comparison between the expense of a yoke of oxen and a horse at a marketable age is given in the Report of the Trustees of the Kennebec (Maine) Agricultural Society, which we find in the Maine Farmer:

Raising a Horse.		A Yoke of Oxen.	
Use of Stud	\$4.00	Use of Bull	\$2.00
Use of Mare	20.00	Raising Calves	10.00
Keeping first winter	7.00	1st Wintering	12.00
Insurance	1.00	Insurance	50
At 1 year old \$32.00		At 1 year old \$24.50	
2d year—Summering	3.00	2d year—interest	1.49
Wintering	7.00	Summering	4.00
Interest	1.92	Wintering	12.00
Insurance	1.00	Tax	33
Tax	50	Insurance	50
At 2 years old \$45.00		At 2 years old \$42.82	
3d year—Summering	5.00	3d year—Summering	7.00
Wintering	11.00	Wintering	12.00
Interest	2.71	Interest	2.56
Tax	75	Insurance	75
Insurance	1.50	At 3 years old \$65.13	
At 3 years old \$66.38		Price of Oxen	50.00
4th year—Summering	5.00	Price of Horse	60.00
Wintering	15.00	Difference	\$30.00
Interest	13.98	Loss on the Horse	34.36
Tax	1.00	Gain in the Oxen	14.87
Insurance	1.50	Difference to raise	\$49.23
Shoeing	1.50		
At 4 years old \$94.35			
Labor equal to breaking.			

Bots.—Much difference of opinion prevails among farmers, as to the cause of Bots, the manner in which they destroy horses, and the best method of protecting them against their attacks.

The Bots which cause the death of so many horses are hatched from the eggs of a Bee or Insect, which belongs to the Class Insecta, order diptera, genus cestrus. It is affirmed by entomologists that there are two species of the genus cestrus, which deposit their eggs upon horses, but which of the species it is that produces bots, or whether both of them do or not, they are not agreed.

The eggs which produce bots are deposited during the months of August and September, but how they are conveyed to the stomach is also unsettled.

This insect, like others of the same class, passes through different stages. Commencing with the egg, which hatches into a larvæ, which remains in the stomach through the winter, where it continues to increase in size, until the warm weather in the spring, when it passes off with the feces, and changes from its larvæ state to that of the perfect fly, or bee.

It is during the winter or fore part of the spring that these larvæ do the greatest injury to the internal coats of the horse's stomach.

From examination made on the stomachs of horses which have been destroyed by bots, it appears that the larvæ attach themselves to the stomach when small, by their antennæ, or horns, where they continue to increase in size as the season progresses, drawing their nourishment from the juices of the stomach. As the season approaches for their transmutation or transformation from the larvæ to the fly, they become stupid, and let go their hold upon the stomach and pass off with the remains of the animal's food, and from thence into the ground, from whence they emerge perfect insects.

When the number of these larvæ is not great, and the food and exercise of the horse are steady, they do not often affect him; but where the number is great, and the horse is fed irregularly during the last of winter they often prove fatal.

The season when horses are destroyed by bots, in this latitude, is from the middle of February to the middle of May. The remaining nine months in each year there is little danger to be apprehended from them.

Numerous experiments have been made, by immersing them in different substances, after

they have been taken from the stomachs of horses, in order to find something which would destroy them, by being given as a medicine, very few of which have ever given any encouragement of success.

During the time that this insect is in its larvæ state, it is covered with a thick, tough skin, which seems to protect it against the effect of any substance which can be introduced into the horse's stomach with safety.

As it is next to impossible to destroy bots in horses, the greatest safety is in making use of such preventives as are found beneficial.

The first step toward preventing bots undoubtedly is, to keep the horse's legs and sides as clear as possible from the nits or eggs of the insect, by scraping them daily with a sharp knife. By doing this the quantity is supposed to be materially diminished.

The next precaution is to keep horses moderately loose in their bodies, and not to make sudden alterations in their food, nor to treat them in any manner that would have a tendency to render them inclined to fever.

The articles most recommended to be mixed with their food are lime and ashes, either of which, if given in small quantities, during the three months when they are troublesome, are said to be efficacious. Salt is highly recommended by some, who suppose that, if a horse is salted once or twice each week, it will prevent his being troubled.

The manner in which bots operate, is by destroying so much of the inner coat of the stomach as to produce inflammation, or by collecting either at the upper or lower end of the stomach, and obstructing the common passage of the bowels; cathartics are to be recommended.

A late English writer on the diseases of horses says, "when bots fix themselves on the sensible portion of the stomach they may do no harm; but no medicine that we know of will destroy them." Another English writer on this subject says, that bots are generally attached to the insensible part of the stomach, and that while remaining there they produce health rather than injure it. Blaine, as well as most American writers, recommends common salt as one of the best preventives against inflammation from bots, and says it should be given daily.

Treating the disease by bots as an inflammatory complaint, undoubtedly is the course most beneficial, and will come under the same management as other inflammations of the bowels. The same causes that produce ordinary inflammations of the bowels are also liable to produce inflammation from bots, and these are—over-exertion, after which the horse is allowed to stand exposed to cold; poisonous substances mixed with food; but the most fruitful cause is the change of food. Perhaps there are more cases of inflammation produced by this last cause than all others.

Whatever is used as cathartics in cases of inflammation caused by this larvæ in horses, they should always be accompanied with gruel, boiled starch, flax-seed tea, or some thing of the kind, to prevent irritation; and the animal treated in every respect as for an inflammation of the bowels, without any regard to its being caused by bots, and no medicine should be given in the one case which would not be proper in the other. The whole course to be pursued may be summed up in a few words: first bleed, give physic, follow it with mucilaginous drinks, keep the animal warm, and if he recovers, feed moderately for several days.—[Goodsell's Farmer.]

CURE FOR THE BOTS OR GRUBS IN HORSES.—If you will excuse the subject, (for although graceless, it is valuable not only to agriculturists but to all classes, using that valuable animal the Horse,) I send you a remedy I used while our coals were brought to market in road waggons, which obliged us to use a great number of horses; and I never knew it fail of giving relief, in from one to five minutes, viz.: Pour out half a gill of spirit of turpentine

into the hand, and rub it on the breast of the horse while suffering; let it be applied to the hollow or pit of the stomach, just at the point where the neck joins the breast, on a space six to eight inches in diameter. The relief is certain, if the grubs have not already cut through the coats of the stomach.—[Farmers' Register.]

CURE FOR A FILM IN THE EYE OF A HORSE OR OX.—Edward S. Jarvis, Esq. of Surry, Me. in a letter to Mr. Joseph R. Newell, proprietor of the Boston Agricultural Warehouse, states as follows:

Have you ever heard of a cure for a film on the eye of a horse or an ox? I was told of one eighteen or twenty years ago, and have been in the practice of it ever since with perfect success. It was brought to my mind by just having had a proof of its successful application in a calf that had its eye hurt by a blow from another creature. A film formed over it, and it was thought its eye was lost. But by turning into the opposite ear a great spoonful of melted hog's fat, it was cured in 24 hours. I do not pretend to account for this, but I have seen it tried with success so often, that I think it ought to be made public, if it has not been before. I learned it of an Indian.

INOCULATING.—Mr. A. Robinson, in the Northern Farmer, gives an account of his method. He says—

"I have found that instead of striking a horizontal, it is best to cut quite a sloping stroke, splitting down from this slope, perpendicularly, so low as to admit the bud, taken off in an oval shape, in the same careful manner as above described; having as much care to preserve a little wood at the eye of the bud as I had in taking it away in the former process. The bud then is to be thrust under the raised bark, down so low as to admit the bark of the stock to come in its former place, above the bud, for half an inch, where it immediately receives its usual nourishment; being bound up with coarse woollen yarn, which I prefer to any thing else. In winding on the yarn I am careful to draw it gently over the wound, omitting to cover the bud till the last, over which I then draw the yarn very softly. In this process, every part works so natural, and so smooth, if unbound the next day it would be difficult to distinguish the bud from a natural one; and, indeed, the bud as well as the bark of the stock seems not in the least affected. In this mode of inoculating, there is no such thing as not taking. On the other hand, the bark being cut square across, and the bud not being sufficiently thrust down, the bark of the stock coming to bear on the outer bark of the bud, at top of the slit, there is nothing to support it; but it dries and shrinks from its primitive place, admits air, and if the wood is taken out of the bud, it all falls together, especially if the eye of the bud is a little rubbed; at any rate, live or die, a dangerous wound is inflicted.

LIVE STOCK IN ROSS COUNTY, OHIO.—The amount of pork put up in this county during the year is about 20,000 barrels, worth about \$10 per barrel, besides a considerable amount which was driven to the eastern markets on foot. About 3000 head of fat cattle were sold to purchasers for the eastern markets, worth about \$4.50 per hundred. There was manufactured in Ross county about 40,000 barrels of flour, worth \$3.50 per barrel. This statement refers mostly to the amount exported, and sold by our farmers and dealers in the articles above specified.

THE BLACK OR COMMON ELDER.—The virtues of the elder are but little known among us. In continental Europe it is used with success in many diseases. From Hippocrates down to the present time, we are told by the French Society of Naturalists, the elder has been employed in medicine. Every one knows,

say they, its virtues and properties; they are not equivocal, for time and experience have confirmed them.

Its flowers are resolute, anodyne and emollient. Infused and drank like tea, they provoke and establish perspiration in certain fevers, colds and catarrhs. Fried with eggs, they operate as a purge; applied as a fomentation in the erysipelas, they reduce the heat and irritation, and are excellent in all inflammations of the skin; warmed and applied to the forehead and temples, they cure the megrims. They are used in the vapor bath for swollen legs, particularly in the dropsy, in which disease the berries, inner bark and roots of this plant are used with effect as diuretics and purgatives. From the berries a rob or thick syrup is made, which is given with success in bowel complaints, particularly in the dysentery.

Its flowers give a fine perfume to vinegar, and to wine the flavor of muscat. Apples, when laid on a bed of the flowers of elder when dried, and then confined from the air, acquire an exquisite taste. A decoction of its berries dyes linen, after passing it through alum water, of a greenish brown color, and from them good brandy can be distilled.

An English farmer, in the county of Devonshire, at a season when the whole of vegetation was destroyed by caterpillars, glasshoppers and other insects, observed that the elder remained untouched, in full health and vigor. This induced him to make an experiment which was attended with perfect success. With boughs of the elder he went over his fields whipping and rubbing gently his turnips, cabbage plants, wheat, &c., which drove off all those noxious insects, and they never returned to their destructive work. The strong stinking scent of the plant destroyed the eggs of these insects. Since that time the process has been used with success on fruit trees, and all other plants when attacked by insects. Some boil the branches, leaves, &c. of the elder in water, and then sprinkle it over those plants and trees attacked by insects, which has the desired effect.

This shrub flowers in June; after picking the flowers and berries they should be dried in the sun, and then laid up in a clean place free from moisture, for medicinal purposes.

There are varieties of the common elder. Some plants have deeply indented leaves. The leaves of some are streaked with yellow, others with white, and some with yellow and white. Some bear white and others green berries. The elder is multiplied by seeds, layers, and slips. They take root rapidly when planted in slips, as do most plants having much pith.

Hedges of elder are common in some parts of Europe. They are impenetrable, of long duration, and not subject to the depredations of cattle, from their odor being very offensive to them. Sheep will sometimes eat them.

The wood of roots of the elder is used in Germany and France in making toys, sword canes, snuff boxes, fishing rods, combs, and other articles, and by cabinet-makers and turners. WM. LEE.—[N. E. Farmer.]

CORN-SHUCK MATTRESSES.—As the laudable object of the Farmers' Register is to diffuse as widely as possible the mass of knowledge which relates to domestic economy, thereby procuring for the many the comforts which are at present possessed by the few; I take peculiar pleasure in aiding the benevolent design, so far as the narrow limits of my own information extend: and so, methinks, should every matron whose experience has surmounted the perplexities of household cares. For this purpose, I have deemed it of some importance to call the attention of its readers to the use of shucks in making mattresses. I have often been surprised to find shucks so rare in families, where every convenience was at hand to make (with the most inconsiderable expense) this article of comfort and utility.

Nothing but a little management is required for every farmer's family in the state to possess

them. Independent of the comfort of mattresses in summer, I have often heard experienced physicians plead hard for their general use in this bilious climate; though common sense, I should suppose, is sufficient to discover the relaxing and debilitating effects or being nightly smothered on a feather bed, through the heat of summer; and the increased suffering produced by their use, during the prevalence of fevers, incident to our climate.

For my own part, I have often suffered painful regret, as I have looked on the sick beds of the poor, where the possession of a hair mattress would be a luxury next to an impossibility for them to obtain; but I am happy to say, that the discovery of the use of backed shucks obviates all pecuniary difficulties, in the farmer's case at least.

There are few families in Virginia, where there are not some slaves, incapacitated by age or decrepitude for active labor; and since the bright era, which introduced the cotton gin, to supersede the use of fingers in picking cotton, they are thrown out of employment altogether; or have little else to do than to sit and stupify in the chimney corner. Now, for the benefit of all parties, I would recommend that a plenty of shucks, a flax hackle or common fork, and a barrel, should be conveniently arranged for the occasional exercise of the subject's faculties, until a sufficient quantity is shredded and packed up. When you have prepared your tick, and the weather is suitable, immerse and soak the shucks well in clean water, and then spread them thin in the hot sun to dry. This will cause them to curl and acquire the elasticity of hair. Be careful after hackling every bunch, to cut off the hard ends.

These shucks stuffed in a common tick, and tacked in squares through and through, will be quite comfortable on a feather bed, where cotton cannot be afforded—but if a case is made after the mattress style, and batts of carded cotton laid at the top and bottom, of several thicknesses, and neatly tacked in squares, they may be made to equal, if not surpass any hair mattress, for you can have them as thick as you choose; and in neatness and purity of material, they will surpass, the hair, though they may not in durability. I should think it a useless or presumptuous display of my own knowledge on the subject, to describe farther the process of making mattresses, but that I was told by an intelligent young housewife, that she had no idea how they could be conveniently completed. As I shall, in such dilemmas, ever feel it a delightful task to assist the young idea, I will merely suggest, that the piece which divides the top and bottom of the mattress case should be sewed all round the bottom, and bound with tape made for the purpose. The top part should be sewed to one side of this piece only, like a lid to turn back, until the batts of corded cotton are laid on the bottom of several thicknesses, and the shucks carefully and regularly packed in.—Place the layers of cotton again over the shucks, and turn the lid over all, and bind it round like the bottom. It must be then laid on a frame, for the purpose of tacking it through and through. This will require a very long needle, which can be made at any blacksmith's shop.—A FRIEND TO COMFORT. February 20th, 1834.—[Farmers' Register.]

SHALLOW PLOUGHING.—I haul out my coarse manure and scatter it on the land, where it is most stiff and close and then use a one or two-horse turning plough to plough the manure in, but am careful not to break the land more than three or four inches deep. I then haul out my fine manure on another part of my cotton land, and let it remain in ox load heaps, till I can finish ploughing the land with the same turning plough, or a trowel hoe plough, as I may find most convenient, and then scatter the fine manure, and harrow it in with a five-tooth harrow.—[Farmers' Register.]

NEW-YORK AMERICAN.

APRIL 19—20, 1834.

LITERARY NOTICES.

THE REVIEW OF THE WEEK—which we had prepared at some length—is of stern necessity, excluded to-day—and we fear, such is the aspect of public affairs; until next Saturday.

SUMMARY.

[From the Salem Gazette.]

Mr. Benjamin Gile, of Danvers, whose name will be found in our list of deaths, was a man of a vigorous and independent mind, and of extensive information. Books were the chief source of his happiness through life. In his youth he served several campaigns in the Army of the Revolution; during the siege of Rhode Island in 1778 he served in a company commanded by his father, Capt. Ezekiel Gile, of Plaistow, in Col. Peabody's New Hampshire Regiment.

His Pension Certificate was received from the War Department on the day of his death—but for a part of his services. He served six months as a substitute for a man named Davis; for this service the Pension agent refused to allow the pension, because Davis's name was kept on the Rolls, instead of Gile's, though Davis himself, and several others, swore that Davis *did not*, and that Gile *did* serve during all that period,—thus affording an example how Truth and Justice are often baffled and defeated by artificial and technical jargon! In a battle during that campaign the two Lieutenants of the Company were killed by his side, Lieut. Dearborn by a cannon shot, and Lieut. Cobb by a musket ball through his heart,—yet the official rules of evidence have made it out that Mr. G. was not exposed to danger during that campaign.

FOREIGN EXTRACTS.—The press and importance of domestic affairs have absorbed all attention and all interest so much recently, that we have found little room for any items from foreign countries. We present today, however, two or three extracts from London papers somewhat curious.

The first is from the Times of 26th February, and is an exposition that really would seem hardly credible, but for the undoubted facts on which it is founded, of the open and extensive corruption of an English election—that of Liverpool.

[From the Times.]

The published evidence, taken before successive committees of the House of Commons in 1831, in 1832, in 1833, and more lately that obtained by the Commissioners of Municipal Inquiry, sufficiently establish these facts, and must dissipate all doubts on the subject, either now or hereafter. It is proved in these documents that the elections both of the magistrates and members of Parliament for the borough have, on several occasions of late, been influenced by the grossest pecuniary corruption and the most prodigal use of treating; that at the contest for the mayoralty in 1827, one of the candidates expended between £7,000 and £8,000, and the other about £12,000; that votes which were sold at 6s. each at the commencement, rose in market price to £12 and even £20, before the conclusion of the struggle; that after the second day, every working freeman who voted on the other side received a bribe; and that they attended the pay-room in crowds to receive their money, as the operatives of a factory to receive their week's wages. It is established likewise on the most irresistible evidence, that in the grander political contest of November, 1830, between Mr. Denison and Mr. Ewart, for the seat in Parliament, vacant by the death of Mr. Huskisson, each of the candidates expended upwards of £40,000!! It is stated by one of the witnesses who audited Mr. Denison's accounts, that the expenditure on the part of that gentleman amounted to £44,000, after deducting £3,000 from publicans' bills, which the Committee disallowed; and a witness from Mr. Ewart's committee admitted that though £34,000 passed through his hands, that sum did not include the whole of Mr. Ewart's expenses.

On this occasion likewise votes rose in price as the contest advanced, and towards its conclusion a single vote was sold for £80!! Nearly every freeman who came to the poll was bribed. The tickets given for enabling parties to claim payment from Mr. Denison's committee amounted to about 2,000; and one of the witnesses having obtained these tickets, copied from them into a poll-book against the name of each voter the sum which had been paid him. The fol-

lowing is the analysis of the list of the other candidate, Mr. Ewart's voters, with their respective prices, as drawn up by his own law agent:

600 freemen received	£10 and under
462	between 10 and 20
209	20 and 30
24	30 and 40
7	40 and 50
1	60

1,303

One circumstance which disgracefully distinguished the bribery practised on these two occasions from almost every other, was the open, fearless, and shameless manner in which it was conducted. The respective parties advertised for supporters, and announced the price which they were ready to give for votes on the walls of their committee rooms. Tickets or tally-papers were openly distributed, which were as regularly paid. The ingenious conductors of the election had thus the merit of systematizing corruption—of making the sale of consciences a counting-house affair, and of erecting regular banks of bribery, with the proper assortment of promissory-notes or poll-tickets, and bags of gold, with cashiers, examiners, and controllers of accounts!!

Another most striking and most melancholy characteristic of the contest was, not only the universality of the corruption among the poorer freemen, but the height to which the tide rose among persons in better circumstances, whom, but for the levelling nature of the system, and the gradual decay of the moral sense which it produces, the infamy ought not to have reached. It was mentioned by the Treasurer of Mr. Ewart's committee, that several "respectable" persons received large sums of money. A retired brewer demanded £50; a captain in the militia received 35l.; three brothers, "respectable men," were paid 30l. a piece; a druggist and his father, "both respectable men," received each 20l.; and a "respectable man," worth 10,000l., as he came early in the contest, was satisfied to pocket the paltry sum of 12l.!

A third revolting feature in these disgraceful transactions was, that some of the freemen, after promising their votes to one side, and taking its bribe, broke their infamous compact by incurring the additional infamy of accepting the money and supporting the cause of the other. The system of corruption and profligacy which distinguished these contests was so disgusting, that the Grand Jury of the borough presented it as a nuisance to the Town Council, whom they invited to abate it.

Now, such are the freemen or burgesses whom it is proposed to disfranchise—such is the system which it is proposed to destroy. It is in evidence that 2,661 of these burgesses received bribes in 1830; that nearly 2000 of the same persons still remain on the register entitled to vote; and it is well known, that though all householders, paying a rent of 10l. or upwards, are entitled to share with such corrupt men in electing their Parliamentary representatives, yet that the latter enjoy exclusively the power of electing the chief magistrate and bailiffs of the borough. The whole number of these old burgesses now resident does not probably much exceed the roll of those against whom corruption was proved, if we deduct from the former such respectable voters as never received a bribe, and who would compose a part of the new constituency in whatever manner it were modified. That the number of voters in Liverpool would not become inadequately low for every purpose of independent action, even though the comparatively small body of freemen who cannot rent a house at 10l. value were struck off the list, will readily be admitted when it is considered that nearly 8,000 householders are already registered under the Reform Act, and that the number is constantly increasing.

The next, item is from a debate on the army estimates in the House of Commons. It is curious mainly from the speech of Cobbett.

Army Estimates.

Mr. Ellice thought it unnecessary, after the discussion which took place on Friday evening last, on the subject of these estimates, and after the house had voted the numbers of the effective service, to do more than put the first vote into the hands of the chairman. At the same time he should be very ready to answer any question which might be put to him respecting the various items, in order that they might be fully and clearly understood. The right hon. gentleman then moved the first vote,—“That a sum not exceeding 3,056,873l. 18s. 11d. be granted to defray the charges of His Majesty's land forces, for

service at home and abroad (except the regiments employed in the territorial possessions of the East India Company).

Mr. Cobbett offered no objection to the numbers of the army, because he was quite certain that 50,000,000l. of taxes could not be collected in gold without a standing army of 90,000 or 100,000 men. He felt it however, his duty to offer some objection to the pay of the army. The lowest private soldier received 7s. 7d. a week, exclusive of meat, bread, coal, and candles, and a sum of 68,000l. was expended to supply him with small beer, or something in lieu thereof. But the sum received by the soldier was not so objectionable in itself as it appeared on comparison with the amount of wages received by laborers in the country. An hon. baronet, who accused him of exciting the people to acts of incendiarism, had in a letter to the poor law commissioners stated that the farmers had, in consequence of the fires, raised the laborers' wages from 3s. 9d. to 5s. a week. The hon. baronet had also stated that the farmers grumbled greatly at the rise which had taken place in wages, leaving it to be fairly inferred that he considered 5s. a week too much money to be given to a laborer for his week's work. Would that hon. baronet consent to vote 7s. 7d. a week to the soldier, and at the same time tell the laborer that he was paid too highly if he received 6s. 7d. But in estimating the soldier's pay at 7s. 7d. per week, he was confident that he underrated the amount. He believed it it would be found, one thing with another, to be equal to 1s. 6d. a day. “But,” said the right hon. secretary, “the pay which the soldier received was not too much, considering the hardships and fatigues he was obliged to endure; he was continually changing his quarters—at one time broiling under a burning sun, and at another frost-bitten by cold.” The right hon. secretary was a very wise, sincere, able, and honest man, no doubt (general cries of “Hear, hear,”) but the right hon. secretary knew nothing about what he was talking of, (laughter—not so much as the youngest of his children, who was now probably in the cradle. (More laughter.) He (Mr. Cobbett) did know something of this matter from experience. He had not been under a broiling sun, it was true, but he had been at least as cold a region as any to which British troops were sent, and had remained there 7 years together. “I happen to know,” continued the hon. member, what so rt of life we led there; and if ever there was a pleasant life, ours was one.

Our summers were passed in fishing, shooting wild pigeons, rambling about the woods, and visiting the dwellings of the Yankee girls. (Laughter.) In winter our time was spent in skating on the river, walking about in snow shoes, or sitting before an excellent fire, singing, laughing, and drinking rum at 7d. per quart. (Laughter.) We had 7lb. of flour per week, 4lb. of the best meat, 6oz. of butter, a quart of peas, and a quart of rice—a greater allowance than falls to the lot of any two laborers in England.” He thought, after this statement, that the House would not be of opinion that the condition of British troops abroad was very arduous. However, as a bargain had been made with the soldiers for the present year, he would not propose that it should be broken, though he would oppose its renewal. “But,” asked the right hon. Secretary, “how can the soldiers be got rid of?” What, then, were they Janissaries? Could not his present majesty get rid of them as easily as the late King got rid of Sir Robert Wilson? What he objected to was the amount of pay given to the soldiers; while the laboring people of this country were so poorly remunerated for their work. He was afraid that the laborers, badly off as they were, had no chance of seeing their condition bettered, for he found it proposed by the poor law commissioners that they should be shut up in a sort of Bastille. But what else was to be expected from a report, the joint work of bishops, lawyers, and newspaper reporters? The hon. member concluded by saying that he should propose no amendment, as he understood a contract had been made for the present year, which must in fairness towards the soldiers be fulfilled.

Sir H. Hardinge had heard the hon. member for Oldham's speech with great astonishment. He did not think that the hon. member, who had once the honor of belonging to the army, would introduce topics calculated to lower the credit and character of the soldier. (Hear, hear.) He (Sir H. Hardinge) would show to the house that the British soldier received, at the present moment, smaller allowances than any other class but one of his Majesty's subjects. The report of the poor law commissioners distinctly stated that the soldier was ill-paid, as compared with other classes of his Majesty's subjects; and it further appeared from the same

document that the soldiers' was only brown bread, and that the convicts, who were supplied with white bread, held it up before the eyes of the soldiers' asking them, in derision, how they liked their "Brown Tommy." He (Sir H. Hardinge) was ready to admit that, under existing circumstances, the soldier was sufficiently paid, but he was sure the house would not think that he was overpaid. (Hear, hear.) A pauper's family was better maintained by the country than a soldier's. In very few poor-houses indeed was any distinction made between the diet of females and males, of children and adults; while in the army, the women were allowed only half the rations given to the men, and the children half of that given to the females. It appeared also from a scale of the comparative comfort enjoyed by different classes of his Majesty's subjects, given in the report of the commissioners, that the soldier was the worst off almost of all. The lowest in the scale was the independent agricultural laborer; just above him was the soldier; then came the able-bodied pauper; next the suspected thief; then the convicted thief; and the highest in the scale—he who enjoyed the greatest degree of comfort—was the transported felon. He was ready to admit that the state of despondency into which a convict was likely to fall rendered it necessary, perhaps, to give him a greater quantity of food than was supplied to the other persons in the scale; but the point he was contending to establish was, that, in reality, the soldier was worse off than a person guilty of crime, and sentenced to transportation. (Hear, hear.) He therefore trusted that no reduction would be tolerated in the soldier's pay.

The next, is the report of a case of forgery; the delinquent in which, it appears, had taken refuge in this country, was tracked, followed, taken back and convicted.

SATURDAY, MARCH 8.

Forgery.—*The King v. Edmund Campbell Brewer.* The prisoner was indicted for the forgery of a bill of exchange for 13l. 5s. with intent to defraud the Stourbridge Canal Company. There were other counts stating different intents.

Mr. Whately, Mr. Godson, and Mr. Scott conducted the prosecution, and Mr. Carrington and Mr. Lee defended him.

John Perry, examined by Mr. Godson.—I am an ironmonger at Stourbridge. The Stourbridge Canal Company owed me 11l. 14s. 10 1/2d. The prisoner was their agent. I applied to him at the end of last July for my account. He came to my house, and brought a bill drawn for 13l. 5s. to pay that account, and to pay the balance on his own private account.—There was an endorsement "Richard Smith—per proc. of Stourbridge Canal Company. E. C. Brewer." I paid away the bill. It came back dishonored on the 22d of October, and I sent it to the Canal Company's agent, Morris. (The bill was read. It was a bill dated the 25th of August, for two months, payable to Richard Smith or bearer, drawn by William Jones upon Messrs. Hanburs & Co., bankers, London.)

Cross-examined by Mr. Lee.—I had not received bills from the company that year.

Thomas Morris examined by Mr. Scott.—I have audited the account of the company. Prisoner came into their service in August, 1831. I occasionally audited his accounts. It was his duty to settle the accounts of the company. In September last I was about to audit his accounts, and prisoner sent me a note, stating that he had had permission to go out of town for a day or two, and should return on Tuesday, and would take all blame at the committee at his (witness's) not being ready. It was dated Sunday evening. He never returned into the service of the company, but absconded. I know the prisoner's hand writing. I believe the whole bill to be in his hand writing, and the endorsements also.

Cross-examined.—The endorsement is different from the face of the bill, but I believe it to be his hand writing.

Henry Eberhart, clerk to Messrs. Roberts, attorneys at Stourbridge, pursued the prisoner to Liverpool, and then embarked for America. Arrived at New York, and from inquiries found him at Utica, 300 miles up the country. There he was apprehended and carried before a magistrate, whence he was brought back to England, and delivered to the constable. After he was brought back to England, and was at Stourbridge, I asked the prisoner who was Richard Smith, the endorser. He hesitated for some time, and then said, "He is a friend of mine, and gave me the money to take it up." I asked him where he lived, and told him that if he had paid the money, Smith could not be hurt. He said "Yes, he

may." I asked him who was Jones, and said the whole bill was in his handwriting. He said "yes." After a little pause, he said "I knew I should be prosecuted on this bill, but having found myself involved, I uttered it, and stopped." He said he had paid it to Mr. Perry.

Cross-examined.—I had no power with me to bring him back from America. He came back voluntarily with me. He was at liberty afterwards, and during the voyage.

Craig, the constable, on the 27th of November last, received prisoner into his custody, and the prisoner told him the same story as to the last witness. He said it was drawn by Smith, but the names were fictitious, and asked if the crime was the same as if the names were known. The witness said he did not know. Prisoner said the last word he said when he left England was, he wished them to take up the bill. On the 29th, he wrote a note to Mr. Payne, requesting him to inquire as to that same question of Mr. Grazebrook, or some other attorney. This note was kept by Craig the constable.

It was proved that no person of the name of W. Jones, near Birmingham, banked at Hambury's, and that the person of the name of Smith was not known there.

The prisoner, a respectable young man, declined saying anything.

Mr. Whately, for the prosecution, stated that the prisoner had borne an excellent character, and had filled a place of great credit for many years.

Mr. Justice Parke summed up the case to the jury, who found the prisoner GUILTY. Sentenced to be transported for life.

The following is the plan of the Federal Constitution of Switzerland, which was to be presented to the Assembly of the Zofing, on the 26th February.—It is divided into two parts—general principles and special provisions. Among the general principles, the most important is that which declares the sovereignty of the nation. Paragraph 8 declares the Swiss territory to be one and indivisible, and stipulates a complete equality of rights for all the inhabitants. The liberty of the Press and the freedom of discussion, are acknowledged without any restrictions. The first part of the compact, which comprises the general principle in 12 paragraphs, can never be altered. Among the special provisions, we observe by paragraph 13 the nation is divided into tribes, and the country into cantons. Paragraph 14 is in the following terms:

"The Executive of the Federal Constitution is entrusted to a Diet, the members of which are to be elected by the tribes in the proportion of the amount of their population.—Paragraph 17. The tribes of Switzerland are to contribute in proportion to their resources to the support and the expenses of the State.—Paragraph 18. The Confederation will establish at its own charges such patriotic institutions as the tribes of themselves are enabled to establish.—Paragraph 19. The tribes will have the right of giving themselves special Constitutions, but on the express condition that they are not at variance with the general Federal Constitution."—[National Gazette.]

"*Scenes from the Life of Edward Lascelles, Gent.*—Whatever investigations the captain had instituted with regard to the individual with whom the fire had originated, the result was totally unknown, except to the parties concerned. That due inquiry had been made, we all felt quite assured; for the crime was one of a very serious nature, and not likely to be overlooked by so strict a disciplinarian as Captain Morley. Nay, when the systematic arrangement of every thing on board, and the correct information the captain usually had of what passed in the ship, was considered, it seemed extremely probable that the guilty person had been detected. It was not, therefore, matter of astonishment to myself, or any one else, when at six bells in the forenoon, all hands were turned up for punishment. In the fore-part of the quarter-deck stood Captain Morley, dressed in full uniform, holding a folded paper in his hand, apparently the articles of war. Near him were the different officers, in cocked-hats and side-arms; and a little farther removed, the men.—All was now anxiety as to the culprit; and there was a general murmur of regret and surprise when Richard Elkins, the boatswain's yeoman, was called forward and committed to the custody of the master-at-arms. If there was one man on board the *Hesperus* a greater and more general favorite than another, it was Elkins. Civil and obliging to his superiors, kind and friendly to his equals, an excellent seaman, and always ready at the call of duty, he was respected and beloved both by officers and men.—

During the war he had been engaged in the hottest of the fray, and bore many honorable wounds in testimony of his gallantry. Repeatedly had he led the van of his comrades in boarding the enemy; twice had he, by his prowess, and at great personal risk, saved the life of an officer; and on one occasion he swam to the Admiral with despatches when the iron shower of balls and grape fell so thick that no boat could be trusted on the water.

The captain, having read before an uncovered audience the clause in the articles of war which related to the crime, folded up the paper, and with a tone of deep emotion addressed the unhappy man nearly in these words:

"Richard Elkins! through your carelessness yesterday the ship was nearly destroyed by fire; and your shipmates have only been saved from the most dreadful of deaths, by the merciful intercession of that Being before whose awful throne you had nearly hurried them. You have broken the articles of war, having, in direct opposition to orders, removed a lighted candle from the lantern in which it was placed for safety, and fastening it to a beam, left it burning in that situation when you went to supper, (four o'clock, p. m.) In consequence of this act of disobedience and neglect on your part, the fire broke out in the boatswain's store-room. Is this the case, sir, or is it not?"

"It is, sir!"

"I therefore consider it my duty to punish you, as an example to the rest of the crew; and much do I regret that one who is in every respect so deserving a man should have incurred so severe a penalty.—Strip, sir!"

Without a syllable in his own defence, or a single plea for mercy, he took off his coat and shirt, and his brawny wrists were tied to the gratings. One only appeal he made, but not in words; it was merely an expressive glance of his eye, by which he seemed to request the intercession of his officers and comrades. The benevolent commander marked that glance, and it was reflected back from his own countenance, as if he wished to second the appeal. But in vain; no one spoke, for all knew that the offence was too heinous to be forgiven.

The boatswain had taken off his coat, preparatory to giving the first dozen—the cat was ready in his hand—the stiff figure of the master-at-arms stood by, prepared to record the stripes, and the captain paced to and fro upon the deck, chucking into the air a small bunch of keys—his common practice when he was agitated. After making several turns of the quarter-deck, he at length stopped, and every one expected that he was about to give the signal to commence.—For a moment he stood gazing on the culprit: it was an interval of the most anxious suspense, and all eyes were eagerly fixed on him. At last, turning towards the boatswain, he raised his hand gently upwards, and gave the unexpected order—"Cast him off!" (unbind him.) In an instant the bonds fell from the poor fellow's arms, and he stood, unshackled and undisgraced, among his comrades.

"Elkins!" said the captain, "I cannot flog you; it is not twenty-four hours since God forgave us all; it is meet that I should now forgive you. Pipe down, Mr. Parsons!"

Three rounds of such hearty cheers, as made the timbers of the *Old Hesperus* ring again, succeeded this short, but truly eloquent address; and I believe I was not the only one on board who envied our noble-minded commander the grateful applause of the seer within his own breast—an applause which, certainly, he must have that day experienced.

The *Instituteur*, a journal of primary instruction presents the following general results of elementary instruction in the departments:—The number of children of both sexes who learn to read is nearly 2,000,000. But almost half the communes of France refuse to tax themselves voluntarily to assist the Government in spreading the blessings of popular instruction:—

Number of Schools.	
Elementary Primary	35,007
Superior Primary	373
Private	9,092

Total 44,472

Number of Pupils who frequent the Schools.

Boys	1,175,248
Girls	731,773

Total 1,907,021

Total expense of primary instruction, 10,172,706*fr.* 19*c.*; portion of this expense paid by the communes, 7,693,793*fr.* 50*c.*; ditto by the departments, 2,054,051*fr.* 41*c.* Number of communes taxed *ex officio* 19,032. Amount of the taxes, 1,994,319*fr.* 60*c.*

The unparalleled enterprise of the Yankees is manifested in every quarter of the world. The Governor General of India, Lord William Bentinck, has presented Mr. Rogers, supercargo of the ship *Tuscan*, with a handsome Silver Vase, bearing the following inscription:

"Presented by Lord William Bentinck, Governor General and Commander in Chief of India, to Mr. Rogers, of Boston, in acknowledgment of the spirit and enterprise, which projected and successfully executed the first attempt to import a cargo of American Ice into Calcutta."

The Vase is of a chaste and classic form, ornamented with flowers and fruit, intersected with foliage, and richly embossed.

Banks of Alexandria.—The Directors of the two banks which remain in Alexandria, viz: the Bank of Potomac and the Farmers' Bank, have announced that they will hold themselves personally responsible for the debts of those institutions respectively. The run upon them had ceased and the panic in a great measure subsided.

[From the Norfolk Beacon.]

THE PROSPECTS OF THE CROPS—GLOOMY INDEED!—We continue to receive the most depressing accounts of the prospects of the coming crops, produced by the flooding of the low grounds by the late unexampled heavy rains. We learn from Farmers in the vicinity, that those who have planted corn in their low grounds, had it entirely drowned, and that where they have not planted, the ground continues so soaked as to prevent its being prepared for that operation. A respectable gentleman who has recently passed through several of the proximate Counties of N. Carolina, states that there also the prospects for the corn crops are quite disheartening.

The New Orleans Courier of 2d April, notifies, under some of the most respectable signatures of the city, a public meeting to convene for the adoption of measures, to give to the tragedian, Cooper, a benefit on the plan of that given to him in this city.

THE POLES.—At a meeting held, in pursuance of a public notice; at the Merchants' Exchange, on Saturday, the 19th of April, Abraham Ogden, was appointed Chairman, and Wm. B. Townsend, was appointed Secretary.

Resolved, That Albert Gallatin, Wm. B. Townsend, Theodore Dwight, James G. King, William W. Woolsey, S. V. S. Wilder, Pela. Perit, Moses H. Grinnell, be appointed a Committee for the purpose of collecting subscriptions here and elsewhere, and of distributing the same, for the relief of such exiles from Poland, as have been, or may be, landed in this city, and to devise such other means as may be needful for the purpose of carrying into effect, the benevolent views of the subscribers to the Polish Fund.

On motion, Resolved, That William W. Woolsey be appointed Treasurer of the Polish Fund, to whom all donations may be paid. A. M. OGDEN, Chairman.

Wm. B. Townsend, Secretary. The papers in this and other cities are requested to publish the above proceedings.

The ship *St. Andrew* was safely and beautifully launched this morning, about 9 o'clock. She will take her place in June, as a Liverpool packet, under the command of Captain Taubman.

Shipwreck.—The schooner *Diluvian*, (late) Green, master, from Baltimore bound to Charleston, when 15 or 20 days out, encountered a heavy gale in the Gulf Stream, during which Capt. Green was washed overboard and lost—both pumps choked, and the vessel having filled with water, the crew, with the assistance of Mr. Harrison, a passenger, by great exertions kept her before the wind and made for the land, which they fortunately reached about 15 miles to the southward of Cape Henry, on Friday night last, where they put the vessel on shore. The cargo consisted of corn, whiskey, coffee and flour, which has been mostly saved, though in a damaged state, and has been turned over to the Commissioners of wrecks. The vessel, we learn, may possibly be got off.—[Norfolk Herald, 16th April.]

WILKESBARR, (Pa.) 16th APRIL.—*Reward of Chivalry.*—A young hero by the name of Horace Williams was sentenced during our present session of Court to one year's imprisonment in the penitentiary and to pay a fine of \$500 for challenging to a duel. We believe this is the first conviction of the kind in

this county, and trust it will operate as a warning to others. A few such examples in different parts of the United States would effectually exterminate this despicable practice.

NORFOLK, April 16th, 1834.—*Arrival of the U. S. schr. Enterprise.*—The U. S. schr *Enterprise*, Lt. Com. DOWNING, 37 days from Rio Janeiro, arrived at the Naval anchorage this morning. Officers and crew all well.

The U. S. ship *Peacock*, Capt. GEISINGER, and schr *Boxer*, Lt. Com. FARRAULT, were at Rio 8th March, all well—the former waiting the arrival of the *Natchez*—the latter repairing.

The U. S. ship *Ontario*, Capt. SALTER, had sailed for the River La Plata.

The U. S. ship *Natchez*, Capt. ZANTZINGER, bearing the broad pendant of Com. WOOLSEY, was daily looked for at Rio from Montevideo.

The U. S. ship *Lexington*, Capt. McKEEVER, sailed for Portsmouth, N. H. 8 days previous to the sailing of the *Enterprise*.

Lieut. Com. WILLIAM F. SHIELDS, late Commander of the *Boxer*, and Midshipman WILLIAM H. BROWN, late acting sailing master of the *Peacock*, (for his examination) came passengers in the *Enterprise*. The E. left at Rio, several American vessels, among which were Ships *Extio*, Walker, for New York, in 10 days, and Brig *Sabra*, Winslow, for Richmond, in 7 do. The Brig *Barbary*, Brown, after being 10 days out, bound to Antwerp, had put back leaky. No news at Rio—Markets looking up.

List of Officers of the Enterprise.

SAMUEL W. DOWNING, Lieut. Commanding.
Timothy B. Benham, 1st Lieut.
James M. Watson, 2d do.
George Blacknal, Asst. Surgeon.
William P. Zantzinger, Purser.
Alexander C. Maury, Act'g Master.
Richard Forrest, Mid'n
Thomas T. Hunter, do.
Levin Handy, do.
Alex'r M. Pennoek, do.
John D'Camp, do.
John Mooney, do.
William P. Milnor, do.
Charles Fales, Gunner.
Edward Harrison, Act'g Boatswain.
Charles B. Wright, Purser's Steward.

COMMERCIAL RECORD.

REVIEW OF THE NEW-YORK MARKET, APRIL 19.
ASHES.—The transactions have been limited until the close of business yesterday, when about 80 bbls. fresh inspected Pots were sold at \$4.25.

CLOVERSEED.—Small sales of good quality were made yesterday at 64 cents.

COAL.—A cargo of 190 tons Liverpool Orrel was sold at \$3.75, on time. A good deal of Anthracite lies over.

COCOA.—250 bags Para sold at 5 cts., 4 mos.

COFFEE.—There has been quite an active demand since our last report, and the sales amount to about 6000 bags—embracing about 1060 St. Domingo at 104 cents, to 11 cents on time; 140 bags old crop Brazil, 104 a 104 1/2 cents; 250 new crop, 11 1/2 a 12; 5 a 600 Laguna, 11 1/2 a 11 3/4; 100 good Porto Rico, 12; some Cuba, 10 a 10 1/2; Manilla, 12 1/2; Java, 10; a large parcel of Sumatra at a price not transpired; and, by auction, 545 bags old crop Brazil, 104 cents, 4 mos., and 68 bags Cuba, good, 11 1/2 a 11 3/4 cents, 3 and 4 mos. The transactions have been both for home use and export, and the stock is very much reduced.

COPPER.—Sales of Sheathing have been made at 2 3/4 cents.

COTTON.—Prices are fully maintained, and in consequence of the limited supply, an advance has in some instances been realized. The sales of the week amount to 1900. Stock on hand only 13,664 bales of all sorts.

Imports here—from
New Orleans.....30
Florida.....103
Alabama.....763
South Carolina.....327
North Carolina.....184

Total.....1407 bales.
Total Import, since 1st inst.....6206 bales.
Export, from 1st to 17th inst.....6979 bales.

DOMESTIC GOODS.—There is a fair business doing.

FISH.—Now, 1 and 2 Mackerel have advanced 25 cents per barrel.

FLAXSEED.—We have no sales to report.

FLOUR AND MEAL.—A fair but not very extensive business has been done in Flour, and without any further advance in prices.

FURS.—A large quantity of articles under this head have been offered at auction by the American Fur Co. and others. Only a small proportion of which were sold, and others not being satisfactory.

GRAIN.—We have no arrivals of Wheat, of which the market is quite bare. Rye and Corn continue in demand at improving prices. No Southern in market. Oats remain as before.

HIDES.—The demand is more active.

HOPS.—We have heard of no sales. The article is extremely dull.

LEAD.—Several sales of New-Orleans Pig have been made this week at 5 1/2 cts. 6 mos., which is a reduction of 1/4 of a cent.

LEATHER.—Some considerable sales have been effected of Sole this week, by auction, at an improvement of 1/4 a 1/2 a cent on the previous transactions.

MOLASSES.—The supplies of late have been hardly equal to the demand.

OILS.—There has been an active demand of Whale Oil, for export, and pretty extensive sales have been made at 26 cents, which is an improvement.

RICE.—There have been no sales of any importance since our last report.

SKINS.—The American Fur Co. sold, by auction, 466 Shaved Deerskins at 40 cents per lb.; 122 Red and Blue, 35 cts.; and 256 Gray, 25 cents, 5 mos.; 208 Bear Skins, 75 cents, and 169 Cubs, 50 cents each.

SUGARS.—There is a very active demand, and the stock of all descriptions is reduced quite low.

TEAS.—The cargo of the brig *Nabob*, consisting of about 4000 packages, was sold on the 17th, and went off with some degree of firmness, at rates about equal to the previous sales.

WHALEBONE.—A large sale was made at 17 cents, which establishes an advance.

WOOL.—12 bales Saxony Lambs were sold, by auction, yesterday, at 10 1/2 a 100 cents per lb., 4 and 6 mos.

FREIGHTS.—To Liverpool continue dull. To Havre, the packets are readily filled at our rates.

PHILADELPHIA MARKET—Week ending April 19.

COTTON.—The stock is still very light, and only small parcels selling; the present supply does not exceed 150 bales.

DRUGS AND DYES.—A large parcel was sold by auction his week, at very low prices; some articles were forced off to close accounts.

DRY GOODS.—Continue to decline in value.

FEATHERS.—Western at 37 1/2 a 38c.

FISH.—No extensive sales of any description; our quotations designate value. No. 3 Mackerel are scarce.

FLOUR AND MEAL.—We have to advise a still further advance in almost all descriptions.

HOPS.—Different sorts, selling at 15 a 18c.

OILS.—A further advance in Lined Oil.

PROVISIONS.—150 bbls New York prime Beef, \$6 50; 300 kegs Western Lard, 8 a 8 1/2c; 4 mos; 113 do, 7 1/2c, cash; 70 do, Jersey, 9 1/2c; 600 western Hams, 9c; 10 hbls do, 8 1/2c; 60 bbls cargo Pork, \$2 1/2; 30 do Mow, 134; 25 kegs butter, 8c.

RICE.—45 casks \$3 1/2 a 3c.

SEEDS.—Flax seed is worth \$1 25 a 1 30, and Clover, \$3 50—little doing in either.

WOOL.—Considerable demand in Pulled and Fleeced, at quotations, 5 bales washed western, a 33c, on Thursday.

BALTIMORE MARKET—April 22.

A little more animation in the Coffee market; 14 1/2c was offered for 400 bags St. Domingo, which offer was declined; it freely brings 11 cts. There is no alteration in prices of Tea; the groceries are well supplied; a cargo daily expected from Canton Virginia Cotton is scarce, and would readily command 12 a 12 1/2c. Rice continues very dull.

The Banks improve in their discounts. Large quantities of Specie that was drawn out during the great excitement have been returned, and we hope soon to see confidence restored, particularly towards country banks.

FLOUR.—There is very little change since our last.

GRAIN.—No arrivals of wheat since our last report.

CHARLESTON MARKET, April 15.

COTTON.—The sales in Uplands were to a fair extent on Monday and Tuesday, at the full prices of last week. Yesterday later advices having been received from Liverpool via Savannah, of a further decline, purchasers held back until holders succeeded to a small reduction, when they again came freely into market.

RICE.—During the first two days of this week, the market exhibited its usual dullness. Yesterday fair sales were made of all descriptions, some lots of very prime and choice were disposed of at \$2 75 and \$2 87 1/2.

SUGARS.—A lot of hbls. New Orleans was offered at auction yesterday on landing.

SAVANNAH, April 12.—**COTTON.**—During the early part of the week, the demand for Upland was moderate. The sales of the week amount to about 3,500 bales. We quote 10 a 12 1/2 and 12 1/2 a 13 for choice. In Sea Island there has been considerable done, particularly in the common qualities at an advance of from 1 to 2 cents on last week's prices. We quote 24 a 30, and upwards for choice.

FLOUR.—Is selling at our quotations, \$5 a \$6.

CORN.—Is retailing at 75 a 80 cents.

FREIGHTS.—To Liverpool, 1d. To Havre, no vessel. To New York, \$1 per bale. To Providence, \$1 1/2 per bale.

MACON, April 10.—**COTTON.**—Extreme prices 8 to 10 cents; principal sales 9 1/2 to 10 cents. Freight to Savannah, \$2 per bale.

MOBILE MARKET, APRIL 5.

COTTON.—The receipts since our last review are 5300 bales,—the exports 5650.

The demand for cotton during the week has been moderate. Good and fine qualities are scarce.

Wholesale Prices.

CORR.—Sales to a fair extent have been made during the week at 13 1/2 a 13 3/4 for prime; inferior, dull at 11 1/2 a 12.

SUGAR.—The small quantity in market sells freely at 8c for prime.

FLOUR.—Import 75 bbls. No transactions have come under our observations.

CORN.—By the barrel \$1.50; in sacks \$1.50 a \$1.62 1/2.

OATS.—Per barrel \$1.00; in sacks \$1.50 a \$1.53 1/2.

RICE.—A small quantity has been received this week, which is held at higher rates.

MOBILE, April 4.—**COTTON.**—Sales of this article have not been so brisk, and the demand not as active for the last two days as at the close of last week. The receipts this week amount to 6506 bales quote—choice, 12 a 12 1/2; good, 11 1/2 a 11 3/4; good fair, 10 1/2 a 11; fair, 10 a 10 1/2; middling, 9 1/2 a 9 3/4; ordinary, 9 a 9 1/2.—[Mercantile Advertiser.]

FROM BENJAMIN LEVY'S NEW ORLEANS PRICE CURRENT OF April 5.

COTTON.—The market was steady in the commencement of the week, but the sales of Thursday were at a decline of half a cent. This decline is attributable, in part, to late news from Liverpool, which has been of rather an unfavorable character. We have consulted with those well acquainted with the market, and have concluded to make no alterations this week; but they all agree in saying they are extreme prices, and could not, at this moment be obtained, unless for parcels of the very best description.

Liverpool Classification.

Ordinary.....	9 1/2 a 9 3/4	} good demand.
Middling.....	10 a 10 1/2	
Fair.....	11 1/2 a 12	
Good fair.....	12 1/2 a 13	
Good and fine.....	13 1/2 a 14	

Stock on hand.....Bales 105451
SUGAR.—The demand is not as good as formerly.
MOLASSES.—Former rates remain without change, and the demand continues fair at 30 a 21 cents per gallon.
TOBACCO.—The former good demand still continues, and we quote as heretofore 3, 4, and 5 cents per lb.
Stock on hand.....Hhds. 3167
FLOUR.—Like almost every other article of produce, has still further declined in price—the market is overstocked.
CORN.—In the ear, is selling on the Levee at 75 a 87½ cents per bu. The supply is shelled, in sacks, is small.
COFFEE.—Fine Havana green is scarce and in good demand. Quotation 1 cent. St. Domingo of good quality, is scarce and in fair demand. We now quote fine Havana green at 12½ a 13½, Rio 114 a 12½, St. Domingo 10 a 11 cents per lb.
LEAD.—There is a reduction in the price of this article.
FREIGHTS.—We make no alteration in the rates of Freight this week, but merely remark they are dull.

NOW READY,

AN INTERESTING AND USEFUL MAP.

Upon which is delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It may be had either in sheets, price \$1 25, or put up in morocco for pocket maps, price \$1 50, or on rollers at \$2 25, in any quantity, by applying to the subscriber.
D. K. MINOR, 35 Wall street.
New-York, April 2, 1835.

TO CIVIL ENGINEERS.

The Western Railroad Company, incorporated by an act of the General Assembly of the State of Tennessee, for the purpose of constructing a Railroad from the town of Jackson, in the county of Madison, by the most practicable route to the Mississippi river, wish to employ one or more persons as engineers to survey the route and superintend the location and construction of said road. Gentlemen who wish employment in the above capacity, will forward to the undersigned on or before the 3d day of June next, the terms upon which they are willing to engage, also the most unquestionable testimonials of good character and scientific and practical skill in works of the above description. An election of an engineer will not take place before the 3d of June.

By order of the Pres't & Directors.

JOS. H. TALBOT, Cash'r & Sec.
Jackson, March 18, 1834.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 23 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, blue wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 40, page 772 of this Journal.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine.

MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them; by calling at 347 North Market street, Albany.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bloeker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J 25 1f

RAILROAD CAR WHEELS, BOXES AND
AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to.
Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.
m18

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTY, at the sign of the Quadrant, No. 58 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Hartey.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable.

They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyor's Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustment.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing and Hartey.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by my self, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The effects you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.
m28

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splices) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York, {
January 29, 1833.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely fitted to redness, that its capacity for being cleached is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833.
A20 1f RM&F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1 inch,	lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.
200 do. 1 1/2 do. 1 inch,	do.
40 do. 1 1/2 do. 1 inch,	do.
800 do. 2 do. 1 inch,	do.
500 do. 2 1/2 do. 1 inch,	do.
soon expected.	

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, and 4 1/2 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.
A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.
d71mewr

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street, corner of Maiden Lane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes; and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.
WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested:—
Baltimore, 1832.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Departments.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails;—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.
E. M. GILL, Civil Engineer.

Germanstown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
Geomet. and Norist. Railroad

m1 y

THE ARMY.
HEAD QUARTERS OF THE ARMY,
Adjutant General's Office,
WASHINGTON, APRIL 19, 1834.

Order No. 31.

I. The Field Officers of Artillery are assigned as follows:

* 1st Reg't of Artillery,	Colonel,	Fort Washington.
	Lt. Col.	Fort Severn.
	Major,	Fort Moultrie.
+ 2d Reg't of Artillery,	Colonel,	Augusta Arsenal, Geo.
	Lt. Colonel,	Fort Marion.
	Major, (act'g)	Fort Monroe.
+ 3d Reg't of Artillery,	Colonel,	Fort Monroe.
	Lt. Colonel,	Fort Wolcott.
	Major,	Fort Independence.
+ 4th Reg't of Artillery,	Colonel,	Fort McHenry.
	Lt. Colonel,	Fort Columbus.
	Major,	Fort Monroe.

II. Company B, 1st Artillery, now stationed at Fort McHenry, will relieve Company I, of the 4th Artillery, at Fort Severn; and on being so relieved, Bvt Major Erving, with his Company, will repair to Fort McHenry. Capt. F. Whiting's Company, (I,) 1st Artillery, will repair to Fort Washington, and relieve Company F, when Bvt Major Mason, with his company, will proceed to join the garrison at Fort Monroe.

III. Fort Niagara will be evacuated, and the garrison, consisting of Companies D and H, of the 2d Infantry, will proceed to Fort Gratiot, and there relieve Companies E and H, of the 4th Artillery, when Bvt Major Payne, with his command, will proceed to New York, and thence, with his Company, take post at Fort Trumbull; Company H will join the garrison of Fort Hamilton.

IV. The Head Quarters of the 2d and 4th Regiments of Infantry are transferred, the former from Fort Niagara to Madison Barracks, the latter from Mobile to Baton Rouge.

V. The Field Officers of Artillery and Infantry, will proceed to their respective stations, as above designated, on the 31st of May, or as soon as circumstances will permit; and the movement of troops, under the direction of the respective commanding officers, will take place without unnecessary delay.

VI. Assistant Surgeon Minie is assigned to duty at Castle Pinckney, to which post he will repair without delay. Assistant Surgeon Stinnache will continue on duty at Fort Gratiot.

VII. The garrison of Fort Monroe will no longer be regarded as the exclusive School of Practice;—as, at all military posts, the commanding officer will be responsible for the discipline and proper instruction of the troops, in all their duties. The usual reports and returns from the post, will be made direct to the General of Department, who will exercise the same authority at Fort Monroe as at other military posts within his command: accordingly, the monthly, and other returns and reports, heretofore received from Fort Monroe, as of "The Military School of Practice," will be discontinued.

By order of Major General MACOMB,
R. JONES, Adjutant General.

[From the New Orleans Bee of 5th inst.]

Capture of an English armed Schooner.—We understand from a person whom we deem worthy of credence that he learned on board the schooner *Tita*, which arrived here day before yesterday from Mantanzas, that the Spanish revenue cutter, *Retilla*, had boarded and taken, on the coast of Cuba, an English schooner of war. The circumstances were briefly these:—The English vessel taking the Spanish cutter for a slave-trader, as was afterwards ascertained, fired upon her, whereupon she hoisted her colors, which having not been deemed a satisfactory evidence of her real character, a broadside succeeded, upon which an engagement took place, which resulted in the capture of the schooner, whose loss amounted to 14 men.

Sudden Death.—A man named James Brack, a clerk employed at the office of the Old Countryman, in passing down Frankfort street, about one o'clock yesterday afternoon, suddenly fell upon the sidewalk opposite the Pewter Mug, in a state of insensibility. He was immediately taken into an adjacent house, and efforts were made to revive him, but without success.—[Standard.]

The river St. Lawrence was open on the 14th of April, from Montreal to Quebec.

Capt. Lewis, of the schooner Northampton, arrived yesterday from the Island of St. Vincent, re-

ports that on the day he sailed, three successive shocks of an earthquake were felt there, one of which was extremely violent, and it was supposed did great damage. The Sea and the harbor was so high that it was with great difficulty that the vessels at anchor were prevented going ashore. A number of negro houses were destroyed, but the Captain had an opportunity of ascertaining whether any lives were lost.—[Jour. Com.]

Destruction of a Pirate and Death of an Officer and several men on board an English Man of War.—The New Bedford Mercury, says that Capt. Bennet of the ship London Packet, arrived there on Saturday, gives information that on the 3d March, off Ascension Island, he was spoken by his Britannic Majesty's man of war Carlow, and was informed that on the coast of West Africa, the Carlow fell in with a suspicious looking vessel armed with five guns and a carronade on a pivot amidships. The Carlow sent her boats to board, when the boats got along-side they found the vessel deserted, and in a few minutes after she blew up, killing one officer and several men belonging to the C. It was supposed that the explosion was caused by a match being led to the magazine and fired before the piratical crew left her. The English commander immediately sent his boats on shore and succeeded in capturing nineteen pirates, who were then in irons on board his ship.

It was ascertained from articles on board that this was the vessel that had robbed the brig Mexican of Salem of goods and \$25,000 in specie. The pirates were Spaniards and Portuguese. The commander of the Carlow sent letters by Capt. Bennet to the owners of the Mexican.

MONMOUTH N. J.—One or two vessels laden with oranges, came ashore near Squan, sometime last week, in consequence of which, we have had oranges here by wagon loads.

The Susquehanna Democrat (Pa.) of 16th April, has this significant editorial article:

There are several rumors in circulation too ridiculous to mention.

An Act relating to the Court of Common Pleas for the City and County of New York. Passed April 11, 1834.

The People of the State of New York, represented in Senate and Assembly, do enact as follows:

§ 1. An Associate Judge shall be appointed for the Court of Common Pleas for the City and County of New York, in the same manner as Judges of the several Courts of Common Pleas of this State now are appointed, who shall be a Counsellor of the Supreme Court, and shall have the same power to hold said Court of Common Pleas as the first Judge thereof, and may equally with him as presiding Judge, authenticate the records of said Court.

§ 2. Such Associate Judge shall receive a like trial fee, for every cause noticed for trial in said Court as is allowed in the Superior Court of the said city, to be received in the same manner and with the same restriction.

§ 3. Each term of said Court may continue until the end of the fourth week after the commencement thereof, and a new panel of Jurors may, by order of said Court, be summoned for the two last weeks of said term, and any writ or process may be tested on any day in term, and be made returnable on any other day in the same term or the next term; provided, however, that said Court may be adjourned on any day previous to the expiration of term, and also from any one day in the term over to any other day in the same term.

§ 4. The said first Judge and Associate Judge shall, except when sick or absent from said city, have sole and exclusive authority at chambers touching any suit, security, judgment or proceeding in said Court.

§ 5. All the powers now vested in the said first Judge by virtue of the Statutes of this State relative to any legal proceedings, are hereby given also to the said Associate Judge; and any proceeding commenced by one of said Judges, may, in his absence, be continued, decided, and perfected by the other of said Judges.

§ 6. The said Associate Judge shall have the same power as the said first Judge to hold, and in the same manner preside, in the Courts of General Sessions of the peace in and for the City and County of New York.

§ 7. This act shall continue in force for the term of five years from its passage.

§ 8. This act shall take effect immediately after the passage thereof.

State of New York, Secretary's Office.

FIELD FLOWERS.—By Thomas Campbell.

Ye field flowers! the gardens eclipse you, 'tis true?
Yet, wildings of nature, I doat upon you,
For ye wait me to summers of old,
When the earth teemed around me with fairy delight,
And when daisies and buttercups gladdened my sight,
Like treasures of silver and gold.
I love you for lulling me back into dreams
Of the blue highland mountains and echoing streams,
And of broken glades breathing their balm,
While the deer was seen glancing in sunshine remote,
And the deep mellow crush of the wood-pigeon's note,
Made music that sweetened the calm.
Not a pastoral song has a pleasanter tune
Than ye speak to my heart, little wildings of June:
Of old ruinous castles ye tell,
Where I thought it delighted your beauties to find
When the magic of Nature first breathed on my mind,
And your blossoms were part of her spell.
Ev'n now what affections the violet awakes:
What loved little islands, twice seen in their lakes,
Can the wild water-lily restore;
What landscapes I read in the primrose's looks,
And what pictures of pebbled and minnowy brooks,
In the vetches that tangled their shore.
Earth's cultureless buds, to my heart you were dear,
Ere the fervour of passion, or ague of fear,
Had scathed my existence's bloom:
Once I welcome you more, in love's passionless stage,
With the visions of youth to revisit my age,
And I wish you to grow on my tomb.

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in semi-monthly form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wallstreet, N. Y. D. K. MINOR, Proprietor.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail Price, \$5 per annum, in advance.

N. B. A small edition only will be published. Also, the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

All Letters and Communications for the above publications, may be addressed, free of postage, to D. K. MINOR.

RAILROAD TURNOUTS, REVOLVING PLATFORMS AND SIDELINGS.

The subscriber having been for some years engaged in constructing turnouts, and inserting the necessary switches and fixtures appertaining to the same, on the Baltimore and Ohio Railroad,—and as those works on that road will be shortly completed, he is desirous of being employed by any Railroad Company requiring work of the above description.

He will either contract at a fixed price to execute the work, he providing all the necessary materials and fixtures, or otherwise,—or he will engage himself at a stated salary.

In relation to his abilities and general character he begs to refer any Company, disposed to engage him, to the Baltimore and Ohio Railroad Company.

Letters can be addressed to him at the Office of Construction Baltimore and Ohio Railroad, Baltimore.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MAY 3, 1834.

TO CORRESPONDENTS.—P. G. V. will please accept our thanks for his monthly statement of the weather. In reply to his query in his communication of the 6th April, containing the table for March, we would observe that we have received a report for every month, except December, 1833. With regard to the *irregularity* of the receipt of the Journal, and other New-York papers, referred to in the annexed extract, we can only say that the *fault* and “neglect” are not with us. Our papers are carefully and regularly mailed.

“I received yesterday, by mail, papers from New-York (say only) dated from 24th January, 1834, to March 15, 1834, inclusive, all in original envelopes, and in good order. Intermediate numbers I have received in part before, but not all yet. How is it possible that such neglects should or ought to occur.

“Avoylle Ferry, La., April 6th, 1834.”

We also acknowledge our indebtedness to V. D. G. for his frequent and valuable communications upon the subject of railroads; F., upon internal improvements; S. D., upon road-making, and other subjects. This communications are always acceptable, although sometimes delayed by other matter on hand.

We have received, and shall, at our earliest convenience, examine the first annual report of the Philipsburgh and Juniata Railroad Company. The President, H. Phillip, Esq., to whom we are indebted for it, will please accept our thanks.

SLOOP CANAL FROM THE HUDSON TO THE LAKES.—In the Assembly of New-York, on the 14th of April, Mr. O. Robinson, from a select committee to whom was referred the petitions

of numerous inhabitants of Oneida, Oswego, and other counties, for the exploration, survey and estimate of a sloop canal from the city of Utica to the village of Oswego, on Lake Ontario, made an interesting report, and concluded by introducing a bill to provide for the survey of a ship or steamboat canal from Albany to Oswego, and also to improve the outlets of the Onondaga, Cayuga and Seneca Lakes.

The bill provides for the survey of the route commencing at Albany, thence up the valley of the Mohawk to the Oneida Lake, and thence down the outlet of said Lake, and the Oswego river, to Oswego, on Lake Ontario, of sufficient capacity to admit vessels of 200 tons burthen, also, so to improve the outlets of the Onondaga, Cayuga and Seneca Lakes, as to admit vessels of like dimensions.

On motion of Mr. Humphrey, four times the usual number of this report were ordered to be printed.

PENNSYLVANIA CANALS AND RAILROADS.—The following paragraph from the Harrisburgh Reporter of Friday last, presents a gratifying picture:

The several lines of the Pennsylvania canal, are in excellent navigable order, and in full operation. The slight breach on the Juniata, which interrupted the navigation of that division for a few days, has been repaired. The Portage railroad is also in full operation, and immense quantities of produce and merchandise daily pass over it. The receipt of tolls on our public improvements since the commencement of the present financial year, have more than trebled the amount received during the same period of the last financial year! The receipts of the treasury up to this time, the tolls in the hands of the collectors not paid in, and the probable receipts for the balance of this month, will amount to upwards of one hundred and ten thousand dollars! During the corresponding period of the last financial years, the receipts were thirty-four thousand two hundred and thirty-eight dollars, showing an increase thus far, of upwards of seventy-five thousand dollars!!!

To the Editor of the Railroad Journal, &c.

SIR,—As I am a farmer, I have been so much occupied by my attention to planting trees, that I have really not had time to attend to my other business. The time for executing such business, in the spring especially, is so short, that it requires close attention to perform the work in season. I have now, however, got nearly through, so that you may rely on my communication being in readiness for your next number.

Your obedient servant, J. S.
Hoboken, April 23, 1834.

On the Construction of Diving Bells. By S. D. To the Editor of the Railroad Journal and Advocate of Internal Improvements.

SIR,—In the construction of the common diving-bell, an instrument now very extensively and importantly used, a complication of pulleys, barrels, and ropes, always liable to accident and interruption, is necessary to insure a supply of pure air to the person in the bell, and to remove the impure air constantly generating. It has struck me sometimes—although from its not having been already adopted, there probably exists some insuperable objection to the proposal, which I do not perceive—that a condensing syringe might be used with great advantage. This syringe might work into a small reservoir above water, from which the communication (a well-constructed hose would serve every purpose) would proceed to the bell; this hose, it is evident, might be of any length, coiled even while in use on the deck of the lighter, which always accompanies the bell, and connecting by means of an opening in the top of the bell, to which might be attached a stop-cock, by which the person inside would always be enabled to govern the supply. For the removal of the impure air, a second set of hose should connect with a second stop-cock; the upper mouth of this set would be in immediate communication with the atmosphere, while the condensing syringe above was supplying the bell with additional air, and thereby expelling from it additional water, the person inside would occasionally, at his discretion, open this second stop-cock, and allow a portion of the impure air to escape, which would be immediately replaced by pure air from the first set of hose, and thus a current of air might be created apparently more perfect, and attended with much less trouble than by the methods in present use. A sketch would more readily explain the simplicity of the mode; but a sketch requires a wood cut, and while doubting whether the idea is not open to some peculiar objection, I have not troubled you with one.

Very respectfully, Sir, S. D.
Boston, April 21, 1834.

On the Location of Railroad Curvatures. By VAN DE GRAAFF. [For the American Railroad Journal, and Advocate of Internal Improvements.—Continued from p. 162.]

Although a system of rectangular lines, traced from given co-ordinate axes, will, in general, furnish the best *data* for computation, yet cases sometimes occur when those calculations have to be made either from computed curves, or curves actually laid upon the ground. In a first location this case will sometimes happen, when, from difficulties which are found in advance of a line, it becomes necessary to

change a part of that which was either already computed, or actually laid. Such a case will sometimes occur, even when the operations in the field have been skilfully conducted; and in laying curves upon a surface already graded, it will be frequently necessary to compute from curves actually traced. The principles contained in the four last articles have been given chiefly with this object in view. But with regard to the two last articles, (7 and 8,) it may be observed, that, *when the curves are long*, it becomes very important to have some method of obtaining the position of the line *w* from the extremity of either curve; for a knowledge of only the length of that line will, in such a case, be of very little use in the field, unless the direction is also known, in order that the termination of any proposed curve may be immediately pointed out by an instrument placed at the termination of a given curve. There is no difficulty in obtaining very convenient formulas for the object thus proposed; but for want of room in this journal, I must proceed to other things.

10. Take a system of rectangular co-ordinate axes, having their origin at a given station in a tangent line, from which a certain required curve is to be laid, passing through a point designated by the co-ordinates x y ; the given tangent line coinciding with the axis of x : and let a system of rectangular lines be traced from the origin to the designated point, agreeably to the method proposed in article 4. It is then required to determine a method by means of which the instrument may be immediately directed into the true tangent at the designated point.

Let the successive rectangular lines, as traced from the origin, be represented by a b c d , &c. It may then be observed that the safest method of recording the lines a b c d , &c., in the field, will be to take a blank form,

$$\begin{Bmatrix} x = \\ y = \end{Bmatrix}, \text{ and then record each line in its proper equation, and with its proper sign, immediately as their values are determined by measurement.}$$

A matter of considerable importance in the field, after the rectangular lines a b c , &c. have been traced to any proposed point, is to be able to examine, by the direction of the instrument, what the direction of the curve would be passing from the origin through that given point. Indeed, in difficult situations, a curve cannot be selected without such a datum; and if the rectangular lines a b c , &c. were not sufficient to furnish that datum with facility, a curve would have to be actually laid upon the ground, in order to judge of its fitness, even if a point were known through which it would pass. It would evidently be not difficult to direct the instrument, when placed at the given point, into the true tangent there, if the inclination of that tangent to the primitive tangent at the origin were known. For the last rectangular line traced will, of course, be either parallel to the primitive tangent, or perpendicular to it; and, in either case, it furnishes the means of directing the instrument into a line parallel to the primitive tangent at the origin. It is then only necessary to deflect an angle equal to the inclination of those two tangents, when that inclination is known, and the direction of the curve at the given point may then be perceived at once, from the position of the instrument, without that delay which would be occasioned by actually tracing a curve upon the ground, which must ultimately be relaid. The result, therefore, is, that a formula must be investigated, expressing the inclination of the two tangents in terms of the given co-ordinates x y . Take D to denote the inclination required;

then $D = 2 \pi T$, and consequently, by art. 2,

$$x = \frac{\sin D}{2 \sin T}, \text{ and } y = \frac{1 - \cos D}{2 \sin T}.$$

Eliminating D from those two equations, the result is,

$$\cot. \frac{1}{2} D = \frac{x}{y}.$$

Such is the formula required, and its applications are very extensive in the field: for it will thus be seen at once, whether or not the given point can be maintained; and this fact should be always ascertained, and the most judicious line definitely selected, before any curve is actually traced.

11. It is frequently necessary that several points should be designated, through which a curve is required to pass by means of a change of curvature at each of those points. To show the method of operation which ought to be pursued under such circumstances, take a system of rectangular co-ordinate axes, coinciding with the primitive origin and tangent line. Trace, parallel to those axes, a system of rectangular lines, given by the equations

$$\begin{Bmatrix} x = a + b + c + \&c. \\ y = d + e + f + \&c. \end{Bmatrix}$$

and terminating at the first designated point. Let the instrument be then placed at that point, and directed into tangent agreeably to the method explained in the last article. Take this second tangent as the axis of x , for a new system of rectangular co-ordinate axes; and parallel to these new axes, trace a second system of rectangular lines, given by the equations

$$\begin{Bmatrix} x = a' + b' + c' + \&c. \\ y = d' + e' + f' + \&c. \end{Bmatrix}$$

and terminating at the second designated point. Let the instrument be now placed at this second point, and again directed into the proper tangent by the same means as before. Take this third tangent as the axis of x , for a third system of rectangular co-ordinate axes; and parallel to this second new system of axes, trace a third system of rectangular lines, given by the equations,

$$\begin{Bmatrix} x = a'' + b'' + c'' + \&c. \\ y = d'' + e'' + f'' + \&c. \end{Bmatrix}$$

and terminating at the third designated point. Continue this obvious order of proceeding, until equations

$$\begin{Bmatrix} x = \\ y = \end{Bmatrix}$$

have been obtained for all the designated points; and then by means of those equations, and article 4, compute all the moduli of curvatures. Returning now with the instrument to the primitive origin, let each curve be traced from its proper modulus of curvature, and the line will be found to pass through all the designated points. If proper care be observed in chaining the different systems of rectangular lines, by means of which the equations

$$\begin{Bmatrix} x = \\ y = \end{Bmatrix}$$

have been obtained, there can be no disappointment in the result; and, consequently, if the designated points have been judiciously selected, there will very seldom be a necessity of tracing the same part of a line the second time; and thus the method of co-ordinate axes, when skilfully conducted, will constitute one of the most important systems of operations connected with the location of railroad lines.

In tracing the various systems of rectangular lines through the different points which may be designated for a curve, there is a principle of practical convenience which must be mentioned. I mean the principle of designating such points for a change of curvature, as will cause each section of the whole curve, between the designated points, to be composed of an integer number of chains, when those curves come to be ultimately traced, after their respective moduli of curvatures have been as-

certain by the methods explained above. It is indeed necessary in every case, except where the road-way is perfectly horizontal, to know the length of each of those separate curves, in order to select the designated point correctly with respect to grade; and this datum must therefore always accompany the levels. When a system of those rectangular lines have been traced to any given point, and the resulting equations

$$\begin{Bmatrix} x = \\ y = \end{Bmatrix}$$

have been thus obtained, the distance from the origin to that given point, in a right line, will obviously be truly expressed by $\sqrt{x^2 + y^2}$; which is a formula rendered very convenient for use, by means of a table of the squares and square roots of numbers. And this quantity may be frequently taken as the length of the intervening curve, by which to compute what the grade would be at that given point, and will always furnish an easy method of obtaining the approximate distance necessary in making a selection for the position of a line, as far as the levels have an influence. The next object, then, must be finally to designate such a point as near the point fixed by the levels as a desirable curvature will permit, and which will produce a curve, from the origin, containing an integer number of chains. The preceding principles will furnish very simple means of obtaining the desired point; but I cannot here enter farther into such details.

12. Let two curves be under consideration, having different origins, and tangent lines; and let one of those curves be given, from a system of rectangular lines or otherwise, and a point designated therein through which the other curve is required to pass. It is proposed to explain a method by means of which the modulus of curvature of the required curve may be computed.

Take a system of rectangular co-ordinate axes, corresponding with the given origin and tangent line of each curve respectively, and let the co-ordinates of that point in the given curve which is designated for the required curve to meet, as taken with reference to the co-ordinate axes of the given curve, be x y ; the values of these co-ordinates being computed by article 2, if the given curve be already laid in the field, but determined by means of a system of rectangular lines, when that curve has not been actually laid. Let the co-ordinates of the new origin, taken with reference to the axes of x y , and determined either by computation, or by means of a system of rectangular lines, be denoted by α , β ; α being supposed to coincide with the axis of x . Take z to denote the given inclination of the tangents at the origins of the two curves.

It is sufficiently obvious that the required modulus of curvature will be immediately derived from article 4, when the co-ordinates x' y' , of the designated point, as taken with reference to the new origin and axes, becomes known. The formulas for those new co-ordinates are,

$$x' = y + \beta. \sin. z + x + \alpha. \cos. z$$

$$y' = y + \beta. \cos. z - x + \alpha. \sin. z$$

These are the well known expressions given by most authors for the transformation of rectangular co-ordinates, and they only here stand transposed in such a manner as will best suit the engineer's purpose in the present inquiry. By means of article 4, the above equations immediately produce the following formula, for the value of the new modulus of curvature T' :

$$\sin. T' = \frac{y + \beta. \cos. z - x + \alpha. \sin. z}{y + \beta^2 + x + \alpha^2}$$

The theorem thus obtained has a very good form for computation, and when skilfully applied, it will frequently save much labor in the field, which would be otherwise required, when certain alterations are proposed in a line, once computed, or actually traced. In the prac-

tical use of this theorem, particular attention must be paid to the algebraic sign of all the quantities; but this does not here require an explanation.

VAN DE GRAAFF.

Lexington, Ky., April, 1834.

Experiments made on the Forth and Clyde Canal, to ascertain the best form of Canal Boats. By J. ROBINSON, Esq., Secretary of the Royal Society of Edinburgh. [From the Transactions of the Society of Arts, Second Part for 1833.*]

In the way in which experiments to ascertain the forms of least resistance of floating bodies have generally been made, so costly an apparatus, and so much precision and skill in observation, have been required in order to give any value to the results, that comparatively few persons have been enabled to undertake such investigations, notwithstanding the obvious advantage to be derived by those interested in canal navigation, from an accurate knowledge of the forms most suitable for vessels, according to the circumstances under which they are to be employed.

The great increase of speed which has lately been effected in railway carriage having made it expedient that corresponding improvements should be introduced into the transport of goods on canals, it became the interest of canal proprietors to use active endeavors for this purpose. The directors of the Forth and Clyde canal have shown themselves particularly well disposed to encourage such investigations, and have applied a considerable portion of their revenue to the construction of experimental steam-vessels, and to the improvement of the facings of the canal, so as to admit of the transit of large vessels at rates of speed which, until lately, have been supposed impracticable in confined water.

In order to obtain a maximum of effect from the power employed in such steam-vessels, it was necessary to ascertain as nearly as possible the form which should be given to their bottoms: and as much diversity of opinion existed on this point, I ventured to suggest to the directors that experiments should be made on the canal with models of a sufficient size to admit of safe conclusions being drawn from the results of the trials.

In consequence of this suggestion, four models were prepared, of the following dimensions:

- No. 1 was 8 feet 3 inches long, 2 feet wide, and 1 foot deep.
- No. 2 was 8 feet 3 inches long, 2 feet wide, and 1 foot 6 inches deep.
- No. 3 was 8 feet 3 inches long, 2 feet wide, and 1 foot 6 inches deep.
- No. 4 was 9 feet 1 inch each part, 1 foot wide, and 1 foot deep.

And the weight of each 187½ lbs.

No. 1 was quite flat on the floor, rounded at the bilges, and perpendicular in the sides at the midship section, but with a fine entrance and run.

No. 2 was made in the proportions of an ordinary coasting trader.

No. 3 in the proportions of a sharp-built schooner.

No. 4 was a twin boat, similar in its sections to No. 1, only that the breadth of each portion was half of the other breadth, while the depth was the same.

The weight of all the models being alike, their displacement of water was equal, although their draft, or depth of immersion, was necessarily different.

The usual way of trying the resistance of floating bodies is by drawing them across a dock or basin, by a cord running over delicately hung pulleys on a high mast, and with certain weights attached: the time is accurately noted which each form requires to move through a certain space, and the comparative resistances are calculated from these elements.

*Mr. Robinson was presented by the Society with their large silver medal for this very valuable communication.

This method presents many difficulties and disadvantages; and I therefore resolved on adopting a different one, which should admit of each experiment being carried on through a much greater space than can be accomplished by means of cords and pulleys. My first intention was to tow each model by a long slender line from the after part of a light steamboat, which was capable of running about seven miles per hour in the canal. This line was to have been attached to an hydrostatic dynamometer, and by this means the strain exerted on the towing line at every different rate of speed by each of the models in succession might have been approximated. I was enabled, however, by a suggestion from an ingenious friend (Mr. Oldham, of the Bank of Ireland), to adopt a much more summary and satisfactory way of determining the comparative resistance of the different models; and as it was the comparative resistance alone which required investigation, there could be no inducement to go through the more tedious process of trying the resistances separately, and of incurring the risk of error from mistakes in reading off the indications of the dynamometer.

I prepared accordingly a spar or yoke, of 16 feet 8 inches long, which was divided into 100 parts of 2 inches each; a small eye-bolt was fixed at each extremity, and a shifting hasp fitted to the middle part. With this yoke all the experiments were made by the two following processes. 1st, a model was attached by a slender towing-line to each eye-bolt, and the hasp was fixed exactly in the middle of the yoke, and linked to an outrigger on the steam-vessel, which was then set in motion at the required speed. If it was found that one of the models preceded the other, in consequence of

its offering less resistance, the hasp was shifted along the spar towards the sluggish one, until the resistances were balanced, and the two models ran abreast of one another. The relative lengths of the arms of the yoke then gave an inverse measure of the comparative resistances of the models, at that rate of speed; this being noted down, the hasp was brought again to the middle of the yoke, and the model which showed least resistance was by degrees loaded with weights until it again exactly balanced the other, and swam abreast of it; the amount of the added weights being likewise noted, afforded a second measure of the difference of the resistance of the two models.

Each of these forms of the experiment was gone through with different pairs of the models, and was frequently repeated through long spaces of the canal, as it was found that various circumstances interfered to render the resistances inconstant, such as approaching nearer to the one or the other side of the canal, passing a loaded vessel, or making a turn round a projecting part of the bank.

It was at first attempted to conduct the experiments by towing the models astern; but it was immediately found that the ripple of the wake of the steamer disturbed the uniformity of the resistance of the models. Various modifications were then tried with more satisfactory results, and finally the arrangement was made as follows: A spar, like a bolt-sprit, of about twenty feet in length, was run out a little above the level of the water from the bow of the steamer, the hasp of the yoke being attached by a link to the point of this spar, the models were in this way kept ahead of the steamer in smooth water, and were altogether undisturbed by any ripple or wave.

The draught of water noted in the column of immersions was that observed when the models were at rest previous to the commencement of each experiment; the actual immersion during the experiment was considerably less, especially in the flatter vessels; but there were no means of ascertaining it precisely.

The accompanying tables contain the results of these trials, from which the important inference may be drawn, that there is no form which will present a minimum resistance in all circumstances; and that the form which is easiest drawn through a canal at a low velocity does not possess the same advantages at a higher rate of speed.

By looking into the table A, experiment 1st, we see that, although the resistance of No. 1 be to that of No. 2 as 13 to 12, when the velocity is 3 miles per hour, yet when the speed is increased to 6 miles, the advantage which No. 2 had over the flatter vessel entirely disappears.

Again, in table B, we see that in one experiment No. 2 carries two-ninths more weight than No. 1, with equal resistance, when the velocity is 3 miles per hour; but that when the rate is raised to 6 miles, the loads require to be made the same in both, in order to equalise the resistance.

It appears, from numerous experiments made at intermediate speeds, that this change in the relative resistance is progressive; there is reason, therefore, to conclude, that if circumstances had admitted of carrying on the experiments at a higher velocity than 6 miles per hour, the flatter formed vessel would have attained a superiority over the sharper ones: this conclusion is corroborated by the fact, that the swiftest going steam-vessels which have been built in this country are those which are nearly quite flat in the floor for a great proportion of their whole length.

The first practical inference which may be drawn from these experiments is, that all vessels which are intended to be tracked, or impelled by machinery, through canals at low velocities, should be built as sharp in their bottoms as circumstances will admit of, although this must necessarily increase their draught of water; the second inference is, that whenever vessels are intended to move in canals with a higher rate of speed than 6 miles per hour, the general form of the bottom should be nearly quite flat.

ITHACA AND OWEGO RAILROAD.—The following account of the Ithaca and Owego Railroad has been furnished us by a friend, who will please accept our thanks for his politeness. We are indeed gratified to learn that this road is in operation, as it will, beyond all question, dispel unfounded prejudices, and produce a proper spirit and feeling among those whose interests will be most promoted by their general introduction:

COMPLETION OF THE RAILROAD.—In pursuance of arrangements to that effect, as announced in our last, the first grand experiment on the Ithaca and Owego Railroad, was made on Monday of this week. At 9 o'clock in the morning, between fifty and sixty cars, each drawn by two horses, and loaded with salt, plaster, and passengers, left the head of the plane for Owego. The train was led by three pleasure cars, filled with passengers,—among whom were the president and a part of the directors of the railroad company, the engineer-in-chief, the assistant engineers, the superintendents of carpentry and masonry, a part of

the directors of the Bank of Ithaca, and several other gentlemen of high standing and respectability from Tompkins county. Thus arranged, and accompanied by a first-rate band of music, they proceeded to within about three miles of Owego, where they were met by four cars, filled with citizens from that and some of the neighboring towns, among whom were the members of the board of directors from that village, the officers of the corporation, the clergy, &c., as also the Owego band. As the cars approached each other, three hearty cheers went forth from the party from Owego, which in the same flow of good feeling was almost immediately responded to. After a few moments delay, the united train was again put in motion, and as it came in view from the bridge, one mile from the village, a field piece that had been placed there for the purpose, was discharged as a signal of its approach, which was immediately re-echoed by another from the village. On passing the park, in front of the academy, and whilst rounding the curve to come into Front street, one of the grandest spectacles presented, we do not hesitate to say, that has ever been witnessed in this section of the state, and we had almost said in our country. The streets, on either side of the park, presented one dense mass of admiring spectators, who had congregated from the neighboring towns and counties, whilst the doors and windows of the academy, the court-house, and the private dwellings, on the right hand and on the left, gave fair evidence of the "hearty welcome" that responded from every bosom. It was under these peculiarly gratifying circumstances that the cars, in regular succession, and at short intervals, rolled through our streets until they arrived in front of the hotel,—whilst the roaring of cannon, the ringing of bells, the waving of flags, the exhilarating music from two excellent bands, and the loud and oft-repeated huzzas of the multitude, produced an animation that brightened every countenance, and gladdened every heart. The scene was novel and interesting beyond description, and the reader must draw largely upon his imagination in order to have any thing like correct conclusions as to the high and universal gratification which prevailed.

About 3 o'clock, the company sat down to an excellent dinner, prepared by Mr. Manning, at the hotel. L. A. Burrows, Esq., presided at the table, assisted by T. Farrington, and S. B. Leonard, as vice-presidents. After the cloth was removed, several appropriate sentiments were given, some of which we give below. Judge Bloodgood, President of the Railroad Company, being called upon, rose and delivered a very appropriate address, and closed by offering a sentiment; but the committee had not been able to obtain a copy for publication when our paper went to press.

TOASTS.

1. The Ithaca and Owego Railroad. We hail its completion as a matrimonial alliance between the waters of the Cayuga Lake and the Susquehanna River; may its progeny be prosperity to the surrounding country, and a rich return to the enterprising individuals who have projected and accomplished the work.

2. Individual enterprise. It has erected a monument in this part of Western New-

York, which justly excites the pride of our citizens.

3. The Erie Canal, and New-York and Erie Railroad. The same liberality and foresight which hastened the completion of the one, will overcome the obstacles and prejudices which retard the construction of the other.

4. The Southern Tier of Counties. They have borne their share in the burthens of internal improvements. It is just that they should share in its benefits, by an extension of the system.

5. The State of New-York. Indebted to Nature for its advantages, and to its Citizens for the improvement of them.

6. Our Neighbor, and Rival in Internal Improvements—the Commonwealth of Pennsylvania. A timely exercise of sound policy on the part of New-York, will prevent a large slice of the Empire State from passing into the hands of Simon Snyder.

7. The Cayuga Lake has long courted the Susquehanna River. To-day we celebrate their wedding.

8. The President and Directors of the Ithaca and Owego Railroad Company. Their persevering and successful efforts entitle them to our gratitude.

9. Ithaca and Owego. Prosperity to the one is prosperity to the other.

10. The Stockholders of the Ithaca and Owego Railroad. May the revenues of the road enable them to sing to the tune of money in both pockets.

11. The memory of De Witt Clinton. He was the efficient friend and the able and eloquent advocate of internal improvements.

12. The constituted authorities of the State of New-York, and of the United States.

13. The New-York and Erie Railroad. Its construction no otherwise inexpedient or impracticable, than was the construction of the Erie Canal. The objections to both have the same foundation,—error. But a wise man has said, "error may be tolerated, when reason is left free to combat it."

Volunteers.—By N. Randall. John Randel, Jr., Engineer-in-Chief of the Ithaca and Owego Railroad. To his profound skill, and untiring perseverance, are the people of Owego indebted for their present celebration.

By John Randel, Esq. The Citizens of Owego. May all their future intercourse with the citizens of their sister village of Ithaca, be as happy and joyful as the intercourse of to-day.

By Wm. R. Collins. Richard V. De Witt, Treasurer of the Ithaca and Owego Railroad—the main spring of the work.

By J. S. Beebe. The Ithaca and Owego Railway. The true way to unite the interests, and promote the prosperity of the villages of Ithaca and Owego.

By D. C. Woodcock. John Randel, Esq., Chief Engineer of the Railroad. His character as a man of science, is well attested by the beauty and excellence of the work which he has just completed, and has heretofore been abundantly established by a verdict of \$226,000.

By Henry Ackley. The Ithaca and Owego Railroad Company, and Susquehanna and Cayuga Banks. May the former remove the deposits of the latter to the tune of ten per cent. profit.

By T. Farrington, Esq. The Engineer-in-Chief, the Assistant Engineers, Superintendents and workmen on the Ithaca and Owego Railroad.

By Samuel Crittendon. The matrimonial connection between the Cayuga Lake and Susquehanna River. May it multiply and increase abundantly.

* Referring to a verdict recently obtained by Mr. R. against the Chesapeake and Delaware Canal Company.

On the Currents of the Ocean. By G. K. O. To the Editor of the Mechanics' Magazine, and Register of Inventions and Improvements.

SIR,—I have lately read the dissertation on

G. B. Palmer's Gold Washing Machine. By J. STICKNEY. To the Editor of the *Mechanics' Magazine*.

DEAR SIR,—Accompanying this rude sketch of a Gold-Washing Machine I also send you a few remarks, which, from various circumstances, will of necessity be still more crude and hasty.

REFERENCES.—*a a*, parts of a horizontal frame, 5 feet long, 3 wide; *b b*, rockers supporting the trunk of the machine; *c c c*, posts inclosing the trunk; *d*, trunk in which the rippler is secured, 7 feet long; *e e*, sloping sides of the box; *f*, cast iron plates, 5 feet long, 15 inches wide; *g*, the rippler, partly drawn out; *h*, outside rippler, stationary; *i*, box, conveying the water to the outside rippler; *k*, the head, or feeding place; *l*, water conductor. The rockers are shod, and stand on plates of iron; a bolt fixed in the sill passes into a hole in the centre of each, to keep them from slipping. The sill of the centre frame, (to which is fastened the handle,) continues beyond the post, and, when the machine is in operation, beats upon two irons on the lower frame, to give motion to its contents. When washing, the rippler is locked up in the body of the trunk, and not seen; the true form of its partitions is seen

at *g 2*. The machine is "fed" at *k*, and the stones, &c. discharged at the sloping end; the gold and sand having passed through the plate, *f*, into the rippler which contains mercury, if any gold escapes the first ripple it is supposed to be caught in the one outside.

The gold mines of this country may be divided into those of *vein*, *surface*, and *deposit*. The first have a great diversity of appearance; in some of them the gold is imbedded in pure white quartz rock, and often visible to the naked eye. Of this kind is at least one vein at Carroll county, Georgia. Others in white and red sand stone, (the King's Mountain mine possesses masses of pure white stone, which is so friable as to crumble to fine sand between the fingers;) some in sulphuret of iron, in different stages of decomposition, (of this kind is an extensive vein at Narcocochly Valley, in Georgia;) others in the oxides of iron, or ochres. Sometimes it appears in dark spongy masses, the gold tipping the edges, and points of the structure in such manner as to resemble the small flowers of lichens. In some mines a dark, porous, and vitrious substance is exhibited, impressing the idea that the mass had been suddenly cooled when in extreme fusion. In one specimen from South Carolina the gold is disseminated in small particles through a rock, resembling fine variegated marble; as it does not contain lime, I presume it a species of slate. Another, which I obtained at the celebrated Duncan vein, (No. 1052 of the Georgia Lottery,) has particles of rich gold embedded in strata of slate, or rather of slaty structure, unctuous, of pearly lustre, and somewhat resembling stratite.

These veins are of various widths, from a few inches to that of several feet, but I believe little is known as yet respecting their length or depth. They are usually inclined upon one side, or are said to dip, the angle of which varies from that of nearly a vertical position, to more than 45°.

In places where the soil has been washed from the sides of hills, these veins of quartz, of various sizes, are seen traversing the micaceous slate, or gneiss, and, as it may be presumed that some of these small as well as large ones contain gold, it may not be unreasonable to account for the *surface* and *deposit* mines, by supposing it to be disintegrated from its natural bed by the effects of frosts, atmosphere, water, &c. Veins thus broken down, and the gold disengaged, will constitute what is called a *surface mine*; one of this kind before the door of a neighboring dwelling is now being operated upon, worth from two to three dollars per hand, per day, which has been trodden under foot for thirty years. From these *surface mines* the gold (being assisted by every shower that forms a rill) finds its way to the beds of the streams, and is deposited as soon as the gravity of each particle overcomes the force by which it is impelled forward; being heavier than other substances, and by the constant changing of the beds of the streams, and other causes, it finds the lowest situation in the deposit, that is, next to the slate, which arrests its downward progress. Next in specific gravity is the quartz and iron rocks, which are also found resting on the slate, and are covered by various strata of other soils, from the depth of from one to thirty feet; and as the constant deposition of gold may be supposed to be going on by fresh accumulations from the surface, and particles disengaged from fragments of rocks by attrition, in their way downward, and as the progress of these *particles* is in some degree impeded by the firmness of this quartz strata, we are enabled to account for their being diffused through this mass generally.

I should not thus gravely attempt to account for "*gold in deposit*," was it not that we have philosophers who assert that it *grows*—that new creations of the precious metal are afforded "day by day;" and oth-

ers, that those streams *were its natal beds*, and it has remained here since the creation; while others say that an eruption of the mountains at some distant period had ejected forth a golden shower, of which we are now reaping the harvest.

The first object of the operator on a *deposit* mine is to ascertain its value, for which purpose he usually proceeds in the following manner: He finds the depth of the "grit," or quartz deposit, by forcing down a slender iron rod. If not too deep, he excavates the soil in pits or ditches. When reaching the grit he washes a small quantity, and proceeding through that strata to the slate, tries it again by washing, and if from these results in several places he forms a favorable opinion, he sets about preparing the mine by cutting ditches for the streams, and others for draining the mine, which sometimes are necessary to be twelve or fourteen feet deep, and of great length. His supply of water for washing must be brought in in small canals six or eight feet above the surface of the mine, and often times the fountain must be sought a mile or two from the place of operation. The next thing is to place his machine, or rockers, where they will be most convenient for the plan of his future operations; he then clears a pit ten feet wide, and from ten to one hundred and fifty yards in length. As soon, however, as a portion of the grit is laid bare, a number of the hands are employed in raising, and others in wheeling it in barrows to the machine, where one is employed to fill it, one to move it, one to cast away the cocks when washed, and perhaps another to keep the outside rippler clear from sand. The grit being placed in the machine, (which in some respects resembles a family cradle,) and agitated from side to side under the streams of falling water, washes the gold and sand through the cast iron plates into the inside rippler containing mercury, where, by

the strong affinity or attraction which exists between the mercury and the gold, the latter is secured, while the sand is washed away. When the day's work is finished the rippler is drawn out, the gold in amalgam washed and secured, and the mercury expelled by heat. It is then sent to the refiners, where all foreign substances (silver excepted) are destroyed by the different agents employed in this fluxes, and (if correctly refined) valued accordingly, the quantity of silver in different mines is supposed to vary from two to forty per cent.

Machines of various constructions have been used in collecting the gold, but the one here represented has mostly taken the place of all others among regular miners. It was invented and patented about three years since by Mr. G. B. Palmer, of Spartanburgh, South Carolina, whose experience in mining enabled him to embrace in this simple form every requisite principle for effectually collecting the fine as well as coarse particles of gold. His price for rights amounts to a mere compensation for his expense and labor in perfecting his improvement.

We fear that the richest mines in this vicinity are mostly wrought out, and that we shall soon begin to feel the effects of the "removal of the deposits."

Most respectfully, yours, &c.

J. STICKNEY.

AGRICULTURE, &c.

CULTIVATION OF BARLEY.—Although this grain is of very considerable importance, yet we are inclined to think that the apple, the grape, and other fruit, from which liquids are obtained, will prevent a great increase of barley culture. For most of the following information we are indebted to Goodsell's Genesee Farmer.

More than two-thirds of the barley raised in the United States is the produce of this state, and this is almost wholly grown in the northern and western parts. The quantity marketed at Albany and its neighborhood, in 1893, is stated at 450,000 bushels. This, estimated at seventy-five cents a bushel, makes an aggregate of \$37,500 dollars.

Barley, as a field crop, has been cultivated from time immemorial. It is not known of what country it is a native, nor at what time it was first cultivated. At this time it is much more extensively cultivated in England than it is in this country. Few crops require more care in the cultivation, or are more apt to disappoint the cultivator in all the good wheat growing districts in the United States, than barley.

There are six species of barley at present cultivated in England, viz.:

Spring or Summer Barley.—There are two varieties of this species, but the one commonly cultivated (*H. vulgare*) may be distinguished from the Siberian barley by the heads being much larger, and, as well as beards, arranged in double rows, whereas the other is single, which the heads appear flat. This is considered the best kind of barley for malting, as the husk is light.

Winter Barley.—There are three kinds of winter barley which are at present cultivated for profit, besides two or three species and varieties that are cultivated as matters of curiosity.

The common or long eared Barley (*H. distichon*) is perhaps cultivated more than both the other species. Both heads, and awns, or beards, of this kind, are much longer than those of other kinds of winter barley. The heads of this kind are flat.

Square Winter Barley.—The heads of this kind, though not as long as the foregoing, are much thicker and have the appearance of being square, the grains being arranged in four distinct rows. This is accounted a harder species than the long eared, and not as subject to be injured by the winter.

Big or Barley big.—This species has large square heads, with grains arranged in six rows, and is cultivated on account of its being earlier than the common or square barley. It is not valued so high for malting as either the other two varieties mentioned.

If the different kinds are mixed they will not command as good prices from the brewer, on account of requiring different lengths of time in malting. The loss in this way last year is stated at ten per cent. upon the whole product, or equal to 45,000 bushels.

Soil and Climate.—Barley succeeds best in a cool damp climate, and there upon a fine warm sandy loam; but where the climate is warm, and dry, as in most of New-York, a loose soil, rather moist than dry, produces the best-crops.

The best crops of barley grown in the state of New-York are upon a high range of table land on the north side of the Mohawk river, near Fairfield. From the elevation of this range of land, it is too cool to produce either corn or wheat, unless when the seasons are usually favorable, but it produces barley in great perfection. It does better upon corn than wheat soils. It may be sown upon a clover ley, or after a hoed crop, which has been well manured; but recent manure should by no means be applied to the barley, as it induces a rank growth, and causes the grain to lodge. When the plants are three or four inches out of ground, the roller may be passed over the field with great advantage. By often burying the crown it causes the grain to tiller, or multiply its seed stalks, and causes a beneficial compactness to the soil. It should be sown upon the fresh ploughed soil, and well harrowed in. Grass seeds may be sown with this crop to advantage.

In preparing lands for winter barley, the course taken is the same as in preparing for wheat, and the sowing done in the same manner, but there should be twice as much seed sown upon an acre as of wheat.

The seed for light should come from strong land, otherwise it degenerates in bulk and fullness. A change of seed is more important in this than in most other grain. The best seed for sowing is that which is free from blackness at the tail, and is of a pale yellow color, intermixed with a bright whitish cast; and if the rind be a little shrivelled, it is so much the better, as it shows that it has sweated in the mow, and is a sure indication that its coat is thin.

Fresh stable manure should never be used upon land to be sown with barley, as it will generally be found to do more hurt than good. Lands for barley should always, where the soil will allow of it, be ploughed deep, and after seeding, the process should be finished with the roller. There is not a crop raised where the use of this implement is more important. By examining the plant, it will be seen at once that it is not well calculated to stand the drought, as the roots are small and do not penetrate deep, and it has a great proportion of broad, thin foliage.

Summer barley should be sown about the same time as oats, and lands capable of producing good crops of the one will be found suitable for the other.

From the great quantity of foliage produced by winter barley, when sown early in the fall, in countries where the snows lie deep and long, it is found advantageous to feed it with calves or sheep previous to the setting in of winter, to prevent it from moulding.

Harvest Management.—There is more care required in the management of this than any other crop raised upon a farm. If cut too soon, it will be found very difficult to separate the

awns, or beards, unless thrashed in a machine; if allowed to stand too long, the ears are apt to break off at the bend of the straw near the head. If cut green, and suffered to remain upon the ground, to render the awns brittle, through rain storms, many of the grains will vegetate, which renders them of little worth for malting. Where farmers are provided with thrashing machines, the better way is to allow barley to stand until fully ripe, then cut it with a scythe, and let it remain upon the ground a day or two, if the weather is favorable, then take it directly to the machine, and thrash and clean it.

The quantity of barley produced per acre is quite variable. We have sowed good lands, that did not produce more than twelve bushels; and we have seen upon lands that were no better in quality, nor better prepared, crops that would average fifty bushels, much depending upon climate for its perfection. In England the average produce is allowed to be about twenty-eight bushels per acre.

From the uncertainty of the crop, barley is cultivated but little for any other purpose but malting for beer, so that the market price will depend upon the distance at which the crop is raised from a brewing establishment.

In some parts of Europe barley is extensively used for making bread; but in this country, where, in most parts, a bushel of wheat may be raised as cheap as a bushel of barley, it is not likely to come into use as an article of food.

STRAW WEAVING.—We had the pleasure, a few days since, of witnessing the operation of weaving straw for the manufacture of bonnets, at the establishment in this town, under the direction of Mr. J. P. Golding. There are now employed in this establishment upwards of 100 females, all engaged in weaving the straw into plaits or webs of about two inches in width. The variety of patterns is large, many of them very beautiful. In some the common rye straw of this country is interwoven with the Tuscan straw. The web or warp into which the straw is woven is composed of silk doubled and twisted from the cocoons very fine, but yet sufficiently strong for the purpose. This silk is prepared, as we are informed by Mr. G., by a son of his, who is located in Mansfield, Conn. where for several years past a considerable quantity of silk has been produced. Mr. Golding was formerly a silk weaver in Manchester, England, and his family understood the culture of the worm, the manufacture and weaving of silk, and are said to be in the exclusive possession of this information in this country. Mr. Golding has already invented machinery and woven several patterns of silk vesting and webbing in this country, but at present this part of the business cannot be profitably carried on here. He intends, however, to prosecute the business, and has set out trees for that purpose at Dedham.

We have no doubt that the production and manufacture of silk will become a very important branch of American industry, as many millions of dollars are annually paid for the imported article. We have yet much to learn, but a few years will put the country in full possession of all the necessary information for carrying on successfully every branch of silk manufacture.

We notice by the papers that some silk handkerchiefs have been manufactured in Dayton, Ohio, under the superintendence of Daniel Roe, Esq. the produce of the native mulberry. Their color is the natural color of the silk, and they appear to be a very durable article.—[Bunker Hill Aurora.]

To preserve Cheese.—If you have a greater quantity of cheeses in the house than is likely to be soon used, cover them carefully with paper, fastened on with flour paste, so as to exclude the air. In this way they may be kept from insects for years. They should be kept in a dry, cool place.

COLUMBIAN STRAW CUTTER.—Noah Davis, of York, Livingston county, has exhibited a machine in this village denominated the Columbian Straw Cutter, patented to Amos Russell and himself on the 19th of November last.

Several hundred people examined the principles of the machine, and saw it operate in cutting straw, hay, &c., and almost without a dissenting voice pronounced it the best machine for cutting fodder that they had ever seen.

That the public may have some idea of this machine, a partial description of it is given:

Three knives (more or less,) say twenty inches in length, are placed upon a cylinder diagonally, by means of screws—the cylinder is about 20 inches in length by 28 in diameter, which is placed on a frame in the manner usual for hanging a grindstone—on a bar of wood, across the rear of the frame, is placed a thin plate of steel, upon which hay, straw, stalks, or oats in the sheaf, are cut by the passing knives, which come in so perfect, though tight contact with the steel, as not to admit of the thinnest leaf of straw, though alone, to escape uncut. The straw, &c., is carried to the cutting point in the manner that wool is fed into a machine for carding.

The cut may be altered to any length required in three seconds of time, from one-fifth of an inch to an inch or more. A hopper is also placed upright over the summit where straw, &c. is cut, similar to that already described, but is not considered any better, except for cutting ears of corn to short pieces, say half an inch or an inch, which it will do square across the cob at the rate of about a bushel of ears in a minute.

And as people generally suppose this must be hard hand labor, it may be observed that as the cylinder is large, and covered with three inch heavy staves, it not only supercedes the necessity of a fly-wheel, but gives power at the point required, and the knives being placed spirally on the cylinder, and under quick motion, the corn may be cut as above stated by the power of two fingers. All fodder cut is carried into a box beneath.

The knives, by means of the screws which attach them to the cylinder, are set more or less close to the bed shire or steel, almost as easy as the length of the cut is regulated.

To shift from hand to any other power, nothing is necessary but to attach a band or belt to a pulley placed on the end of the shaft instead of a crank.

Any person wishing to take an interest in this improvement, may have a shop, town, county, or state right, on reasonable terms, by applying to Noah Davis, of York, or may have town or county rights by applying to Thomas Williams, of Waterloo, or Philander Denslow, or George W. Huntoon, of Syracuse, Onondago co., his agents.

The machines will be manufactured by Joseph Hall, in Rochester, of whom they may be had on short notice.

Printers who are in favor of agricultural improvements are invited to insert the above. [Genesee Farmer.]

SALSIFY OR VEGETABLE OYSTERS, *Tragopogon porifolius*.—This plant, which is known by the several names of salsify, vegetable oyster, and goat's beard, is often confounded with that of the *scorzonera hispanica*, garden scorzonera or viper's grass.

The salsify is a deciduous, herbaceous, bien-

nial plant, with a long, tapering, white root; sarsnip shaped, with a white milky juice, and mild sweetish flavor. It has long been cultivated in gardens, for the sake of the roots, which, when cooked, have much the flavor of oysters.

The leaves of the plant somewhat resemble those of the leek, being smooth, green, and pointed. The second year the seed stalk rises three or four feet high, producing flowers of a dull purple color, which are followed by seeds, surmounted by a crown of downy substance, somewhat resembling the common thistle.

Were the valuable properties of this plant more known, it would be more extensively cultivated in gardens, particularly in the inland parts of this country.

It is thought impossible, by many, that a plant should be cultivated which should bear any resemblance, in flavor, to oysters; but all who have tasted salsify, when properly cooked, must not only acknowledge that there is a resemblance, but that this root is a good substitute for the marine production.

The manner of cultivation is precisely the same as that of parsnips; and roots which are not wanted for fall and winter use, may be allowed to stand in the ground in the same manner for spring use.

They are cooked in all the different ways as oysters. When they are intended to be fried in butter, they should be first parboiled, the skin taken off and sliced; the same for stewing, or they may be mashed. They impart a fine flavor to the stuffing for fowls.

There is an annual plant, which belongs to the same class with the salsify, and which very much resembles it, both in leaf and seed, the seeds of which are, sometimes, through design or mistake, sold for salsify seed. It is the *Geropogon glaber*, or old man's beard. It is not worth cultivating.

Scorzonera, or *Viper's Grass*, also belongs to the same class with salsify, but is a perennial plant, with a deciduous, herbaceous top, which grows to about the same height as salsify, but has yellow flowers, which are followed by seeds not unlike those of salsify. The root bears a resemblance also, but is not counted as profitable. The leaf of *Scorzonera* somewhat resembles that of the plantain.

TRANSPLANTING RUTA BAGA.—Mead Atwater, of Brighton, has called at the office, and communicated to us, verbally, his success in cultivating the Ruta-baga the past season.

Mr. Atwater informs us that he sowed the seed about the middle of June, on seed beds, and when the plants were a suitable size, transplanted them out at suitable distances. The plants were afterwards hoed, and kept clear from weeds. At the proper season for harvesting he went over the ground with a sharp garden hoe, and struck off the tops which he afterwards gathered up with a rake. He then with a dull hoe pulled the turnips out of the ground. The produce he thought was at least one thousand bushels per acre, and the quality as fine or finer than those which had been allowed to stand where they were sowed.

Mr. Atwater expressed himself in favor of transplanting, instead of sowing the seed where they were to grow, for the following reasons: that it saved once hoeing, which he thought more labor than to transplant them. That the ground might be ploughed at the time of setting, and would continue in better condition for maturing the crop than when ploughed earlier in the season.—[Goodsell's Farmer.]

NEW MODE OF SELECTING SEED CORN.—Mr. Solomon Thayer, of New Braintree, Mass., has left in the office of the N. E. Farmer, several ears of Indian corn, which are remarkable for a property in which common corn is often deficient. The small ends of the ear are filled completely out, quite to the extremity, with sound kernels of good size, instead of an inch or two, more or less, of small imperfect kernels, or barren cob, as is often the case, in the product of

our corn fields. This was effected by Mr. Thayer, by selecting for seed for several years in succession, kernels which grew at the tip of the ear; and as like not only produces its like but improves its likeness, these top-end kernels being planted, produced two or three more ears to a stalk, which were filled, and the ends rounded off with sound corn of larger size than top-end kernels usually are.

We doubt, however, whether these ears are as large as if the largest kernels had been planted. Some cultivators think they have derived advantage by selecting their seed corn exclusively from the largest end of the ear. They tell us that "the nearer the seed is taken from the butt-end the larger will be the ears." Perhaps Mr. Thayer might improve on his praiseworthy experiment by selecting seed corn for two or three years from the large end of his improved ears; and then plant a while from the middle. Dr. Deane, directed in shelling seed corn, to select about an inch from each end of the corn, planting the middle only. But experiments are of more weight than authority in the scale of improvement.—[N. E. Farmer.]

PLANTING CORN.—Although the following experiments are on a small scale, yet they are deserving the attention of the farmer. The article is from the Long-Island Star.

Having made some little experiment in planting corn, I have concluded to relate my doings, and give the result. Six years ago, I planted eight and a half square rods of corn, two feet in width one way, and one foot the other, and one grain in a hill. The result was, I had eleven bushels of ears, making at the rate of 207 bushels to the acre, which I conclude is nearly double that which it would have brought by being planted in the ordinary way. The land was not first rate, tolerably good, and a sprinkling of coarse dung ploughed in.

I last spring planted three-quarters of an acre, three feet three inches in width one way, and about two feet four inches the other way, and put three grains in a hill: there were on the ground about fifty young apple trees, which had been planted three years, and two large pear trees, and I planted four rows of potatoes and a patch of vines, and I conclude that fifteen square rods will not overrate the deduction which ought to be made—that leaves 163 square rods. The result was, I had 82 bushels of ears of corn, which is at the rate of about 125 bushels to the acre; if it had been planted in the common way. I think it would have fell short of producing 100 bushels to the acre.

And I planted half a square rod one and a half feet apart each way, one grain in a hill, seventy-two grains. After it was up, I sprinkled between three and four quarts of unleached ashes on it, having heard say that it was of great advantage to the crop to break off the suckers or scions, which I did to one-half of it twice or thrice. I thought that which I suckered did not look quite so healthy as the other; however, there was little difference. When I gathered, the result was this: I had from the part that was suckered forty-eight ears, weighing sixteen and three-quarters lbs., filling a half bushel, rounding it over; from the other part I had forty-four ears, weighing eighteen and three-quarters lbs. measure, about the same as above. Some days after, I shelled the whole together, and had exactly half a bushel—this is producing at the rate of 160 bushels of corn to the acre, or 320 bushels of ears; the last is as large an increase as ever I recollect hearing of. From these small experiments, I have ascertained to my satisfaction, that a piece of ground will produce the most corn by planting one grain in a hill; as to the width, I have not got exactly, but I venture to say it should not be more than two feet, nor less than one and a half feet apart. I should take one foot nine inches.

Of ploughing and harrowing corn, I am about to say a word in favor of the harrow, although I know that in these days it amounts

almost to heresy. In the first place, I allow that where people do but little work in the corn, they had better do it with the plough; but to put it in good order, I think it can be done better with both, than with either plough or harrow separately, for you may harrow corn before it will answer to plough; then every time after ploughing, let it lay a few days, and go through it once in a row with the harrow; it will then keep clean longer, and be in better order to plough again. In my opinion, people in general ought to plough as much as they do, and make use of the harrow some too, and their corn ground would be in better order than it commonly is.

STEAM-DIGGING MACHINE.—M. Wronski, a celebrated mathematician at Paris, has, according to the Paris papers, discovered a new system of applying steam to carriages, digging machines, hoes, picks, ploughs, &c. so superior to any thing hitherto known, that a French company has bought his patent for four millions of francs.—[Le Temps.]

PEAS.—Farmers of Great Britain have ascertained, by many years' experience, that no other fallow crops leave the ground in a situation so favorable for a crop of wheat, as leguminous vegetables. At the head of this class may be ranked the pea. "To fallow, and at the same time, to have a shading and ameliorating mild crop growing on the fallow," is the system pursued by the best farmers of that country.

Lime in the soil is considered indispensable to produce this pulse in perfection, and where it does not exist in sufficient quantity, the application of gypsum will be found very beneficial. Nearly all our western lands contain a portion of calcareous matter, which is evidenced by the abundant crops of wheat. As far as my experience goes, no other crop so effectually subdues and pulverizes a heavy clay soil, as peas. On such soil, fall ploughing is necessary. Early in the spring roll and harrow, then sow two and a half to three bushels of peas per acre, and cover with the cultivator. When the crop comes off, the ground will be found remarkably mellow, and once ploughing will put it in fine condition to receive wheat.

By this management, I have raised twenty bushels of peas per acre, and my wheat on the pea ground was the heaviest on my farm. In England it is not uncommon for a large farmer to have 50 acres of peas, and they find them the most valuable crop for several kinds of stock. Some farmers may say they cannot raise Indian corn in England, and are compelled to fatten their swine with peas. To such I would remark, that a bushel of peas is worth more than one of corn, to bring hogs forward early in the season, and is raised with half the labor. I begin to feed my hogs with peas as soon as they are too old for the table, and find that all is greedily devoured but the straw. I never had hogs to thrive so rapidly on any other kind of food. Corn is indispensable in the latter part of the season to give solidity to pork, but if we were to plant less corn, and sow more peas, we should be gainers by the change.

A celebrated writer on agriculture says, "A crop of peas is so far from exhausting the land, that it may be considered as an excellent and ameliorating manure." Another writer says, "Various crops pulverize the soil, and to a great extent prepare it for different crops. Peas, for instance, are peculiarly calculated for preparing the ground for wheat."

The bug (*Bruchus pisi*) punctures the pod when very young, and deposits an egg. Very few crops escape them, except such as are sowed after the 10th of 6th month (June.) It will therefore be best for every farmer to sow a part after that time for seed, or to keep a sufficient quantity over one year. The last method I have found effectual. If, however, the farmer cannot procure seed clear of bugs, let him heat water in a large kettle, and dip the

basket containing the seed into the water when in a boiling state; keep them in *not more than one minute*, then throw them on a floor and strew on plaster.

I have sowed the small yellow pea, and the marrowfat, but if I could obtain them in sufficient quantity, I should much prefer *Bishop's new early dwarf prolific pea*, which I have found in my garden to be the most prolific variety. It seldom attains a height of more than twelve to fourteen inches, and is of fine flavor. When in blossom they present a beautiful appearance.—[Genesee Farmer.]

IMPROVING SEEDS.—I heard him tell Col. Williams that day that he was born on a farm, and lived on one all his life, and that he was then, I think he said, near 80 years of age. I knew him about twenty years before his death, and knew him to be a skilful farmer, and a very industrious man. In his long life he tried a great many experiments in farming and gardening with success. He advanced some new ideas respecting seeds, &c. [See Dr. Darwin's *Phytologia*, Dublin edition, printed in the year 1800, page 410.]

"He believed that no kind of incest would degenerate the breeds of vegetables," &c. And further, "Mr. Cooper was led to his present practice, which he begun more than forty years ago, by observing that vegetables of all kinds were very subject to change with respect to the time of their coming to maturity, and other properties, but that the best seeds *never failed* to produce the best plants. Among a great number of experiments he particularly mentions the following:

"About the year 1746, his father procured seeds of the long watery squash, and though they have been used on the farm ever since that time without any change, they are at this time better than they were at first."

"His early peas he procured from London in the year 1756, and though they have been planted on the same place every season, they have been so far from degenerating, that they are preferable to what they were then. The seeds of asparagus he had from New-York, in 1752, and though they have been planted in the same manner, the plants are greatly improved."

P. S.—Joseph Cooper: As some persons may be sceptical, with respect to his seeds not only continuing their good qualities, but increasing in goodness, I will here relate what I saw him practice. He generally sowed every spring from about five to six acres of early peas, and in gathering his peas for sale, he always reserved a number of rows for seed, and he would not permit any one to touch these rows, and he made it a point to gather those first ripe on those rows for his seed pens. The consequence was, that he generally had the earliest peas in the market of Philadelphia, and mostly got for the first gathered a dollar and a half for a peck, and by the time they came down to two dollars a bushel, his were always disposed of. He never sowed more than one kind.—[Genesee Farmer.]

THE LOCUSTS.—It appears that the seventeen-year Locusts (*Vicidae septemdecim*) are to pay their periodical visit this year. It has been ascertained that the insect appears, periodically, once in seventeen years, and in the spring of the year. They were observed in this country at the stated intervals from 1749 to 1817. Apprehensions are expressed that they will commit great ravages, and it is asserted that more than once, when they

visited some parts of New England, they not only ate up all the grass in the fields, but actually attacked *clothing* and *fences* to appease their insatiable hunger. But the *Encyclopædia Americana* informs us that they are in no way injurious to vegetation, except from the damage done by the female in depositing her eggs—while the insect is itself the favorite food of various animals, and in this way may be turned to good account. Hogs devour them eagerly, and some of the larger birds are fond of them. The Indians consider them a delicate food when fried. In New-Jersey they have been converted into soap.

In various parts of the world, from time immemorial, these insects have been used as food for human beings. For this purpose, in some countries, they are caught in nets, and when a sufficient number is procured, they are roasted over a slow fire, in an earthen vessel, till the wings and legs drop from them; when thus prepared they are said to taste like craw-fish. The locust constituted a common food among the Jews, and Moses (Levit. xi. v. 22) has specified the different kinds which they were permitted to eat.

It has been disputed, however, whether the food of John the Baptist, in the wilderness, was the insect locust, or a fruit of the same name.

TOBACCO FOR TICKS.—We should suppose the tobacco wash, in the following recommendation from the N. E. Farmer, should also be applied at the time of shearing:

Boil a small quantity of tobacco, perhaps what grows on one good thrifty stalk would be enough for half a dozen sheep, in so much water, as when it is sufficiently boiled, there shall be two or three gallons of the liquor; let it become sufficiently cool, then open the wool along the centre of the neck and back of the sheep, and with a bunch of tow or some other spongy substance put on the decoction until the skin becomes thoroughly moistened therewith, and in a short time the ticks will all be destroyed, and the sheep instead of pulling out and wasting their wool by fruitless exertions of self-defence, will become easy and contented, and suffer their fleece to remain to be taken off by the shears.

For many years I have taken this method with my sheep, just before the time of their lambing, and have always found it to have the desired effect. I very much dislike the foolish practices of smoking, chewing, and snuffing this poisonous weed, at least when no better reason can be given for so doing than fashion or the force of habit; yet I annually raise a few plants for the benefit of my sheep, and would recommend to every one who keeps these useful animals to do the same.

DALE'S HYBRID TURNIP.—Mr. Allnatt, sen., has a moderate breadth of that new and valuable field turnip, Dale's hybrid, the bulb of which is said to be as solid and nourishing as a Swedish turnip, and as tender as an early Dutch. It is also said to be not in the least degree injured by the frost, and it is thought that it will prove to be invaluable for field produce in wet soils. The seed of this variety is also for Mr. Ronalds; and, if a fourth part of what we heard of this turnip be true, it must be a prize of immense value to the farmer.—[Loudon's Magazine.]

[The seeds of the above can be had of the seedsmen in New-York.]

TAR ON SHEEP.—If you are apprehensive lest foxes should take unwarrantable liberties with your lambs and geese, you will rub a little tar on their necks, and it is said neither foxes nor wolves will attack them, as those marauders cannot endure the odor of tar.]

NEW-YORK AMERICAN.

APRIL 26—MAY 2, 1834.

LITERARY NOTICES.
No. XXI.*Galena, Upper Mississippi, Feb. 1.*

A furious squall of snow, which would have rendered it impossible to keep a given road in crossing the prairie, subsided before night fall, on the day that I left Boyd's Grove, bound for the Upper Mississippi; and as the calm clear sky of evening succeeded, our sleigh glided over the open plain at a rate which soon made the houses behind us disappear in the distance; while four fleet horses, with a good driver, and but one passenger, swiftly accomplished the short stage of 12 miles, and brought us to the room where we were to pass the night. The intervening prairie, for the first six miles, was high and level, with not a stick of timber—one broad snow covered plain, where you could see the dark figure of a wolf for miles off, as it stood in relief against the white unbroken surface. A prospect more bleak and lonely, when night is closing in, and you press toward some distant grove, whose tree tops cannot yet be discovered above the monotonous plains, is inconceivable. Presently, however, you come to a break in the prairie; a slight descent next shelters you somewhat from the wind, and now you can discover a wood, which hitherto had appeared many miles off—or, perhaps, was not perceptible at all—that has pushed a scattered clump of trees here and there, like an advanced guard under cover of the ravine. You come to the brink of another platform, and you are on the edge of a grove, while for 20 miles ahead the eye ranges over what looks like a shallow basin of immense extent, broken occasionally by dusky masses, which seem rather to repose upon than to spring out of its surface: such was the view in advance, from a point about six miles from Boyd's Grove. The elevation, from which we descended, was not more than 20 feet, and it commanded a prospect of as many miles. It was like looking from the edge of a snow covered desert upon a frozen lake, with its isles, headlands and scattered rocks, and its waters riveted as fast as they. The rosy rays of the setting sun still lingered over the scene, as on one they longed to set free from the icy chains which bound it, while the calm pale moon grew momentarily more bright, as if her cold beams borrowed lustre from the extent of pure white surface over which they shone.

A single room, miserably built of logs, the interstices of which were so unskillfully filled up with mud, that I could hear the night wind whistling through them as we drove up to the door—was to be our lodging for the night. A couple of rifles with a powder horn, and a pair of Indian blankets lay without, and two painted Potawatomies were crouched on the hearth, as I entered the cabin. One of them, a small but elegantly formed youth of twenty, sprang at once to his feet, while the other, a dark ill-looking negro-faced fellow, retained his squatting posture. They were dressed in complete suits of leather, both having their ears bored in several places, with long drops of silver pendant in thick bunches therefrom, while broad plates suspended over their chests, with armlets of the same metal, made quite a rich display. Their dress was, however, the only point in which they resembled each other; and the aquiline nose, keen eyes, and beautifully arched brows of the one, contrasted as strongly with the heavy inexpressive look and thick lips of the other, as did the closely fitting hunting frock of the first, which a black belt, sown thick with studs of brass, secured to his erect form, with the loose shirt that crumpled around the crouching person of the other. A thin featured gentleman, with long sandy hair, flowing from under a cap of wolf-skin, and dressed in a bright green capote with an orange colored sash—sat smoking a pipe on the other side of the fire place, while one foot dangled from the bed on which he had placed himself, and another, rested on a Spanish saddle, whose holsters were bro't so near to the fire as it lay thus carelessly thrown in a corner, that the brazen butts of a pair of heavy pistols were continually exposed to view by the flickering light. A pale, sickly-looking woman, with an infant in her arms, and two small children clinging

around her lap, sat in the centre, and completed the group. Her husband, and another hanger-on of the establishment, had stepped out to look after our horses, as we drove up to the door. The apartment, which was not more than twenty-five feet square, was cumbered up with four beds, and when I thought how many there were to occupy them, and observed a thin cotton curtain flapping against a wide unglazed opening, which formed the only window of this forlorn chamber, I thought that the prospect of comfortable accommodation for the night was anything but promising. Presently, however, the landlord entered with an armful of bur-oak and split hickory, which crackled and sputtered at a rate that made the Indians withdraw from the ashes. The good woman placed her child in a sort of cradle, and bestirred herself with activity and good-humor in getting supper; while the frontiers-man, knocking the ashes from his tomahawk pipe, passed me a flask of Ohio whiskey, which, after my cold ride, had all the virtue of Monongahela. Some coarse fried pork with a bowl of stewed hominy, hot rolls, and wild honey, did not then come amiss, especially when backed by a cup of capital coffee from the lower country: though the right good-will with which we all bent to this important business of eating did not prevent me from noticing the Frenchman-like particularity with which the Indians eat from but one dish at a time, though tasting every thing upon the table.

The best looking of the two, though daubed with paint to a degree that made him look perfectly savage, was almost the only Indian I had found yet who could talk English at all; and he seemed both amused and interested while I read over to him a slight vocabulary of words in his own language, as I had taken down the terms occasionally in my pocket-book, and was evidently gratified when I added to their number from his lips. He spoke the language, indeed, with a clearness and distinctness of enunciation such as I have only heard before from a female tongue; and the words thus pronounced had a delicacy and music in their sound entirely wanting in the usual slovenly utterance of Indians. You would have been struck, too, in the midst of our philological task, to see the grim-looking savage bend over and rock the cradle, as the shivering infant would commence crying behind us. In this way the evening passed rapidly enough; and then the good dame, with her husband and children, taking one bed, the green rider and I took each another, while the stage driver and remaining white man shared the fourth together. The Indians brought in their guns and blankets from without, and making a mattress of my buffalo skin, they placed their feet to the fire, and after a chirping conversation of a few minutes beneath their woollen toggery, sunk to slumber.

The moon was still shining brightly above, as I sallied out an hour before dawn to wash in the snow, and finish in the open air the toilet commenced in the crowded shantee. Our sleigh, a low clumsy pine box on a pair of ox runners, was soon after at the door, and covering up my extremities as well as I could in the wild-hay which filled the bottom, (for the morning was intensely cold,) I wound my fur robe around my head to keep my face from freezing, and soon found myself gliding at a prodigious rate over the smooth prairie. The sun was several hours high when we struck a fine grove of timber, through which the small but rapid river Huron takes its way, and thrashing through the wintry stream, we merely paused long enough at a shantee on the opposite side to adjust some of our harness which was broken while fording the torrent, and reached a comfortable log cabin, in which we breakfasted at noon. There was an Indian encampment within gun-shot of the house, and seeing a melancholy looking squaw with an infant in her arms, hanging about the farm house, I left my landlady turning some venison cutlets and grilled grouse, to see how the aborigines fared in this cold weather. A pretty Indian girl of fourteen, driving a couple of half starved ponies, indicated the camp of her friends. They proved to be a very inferior band, having but two hunters, and those inefficient looking fellows to a score of women and children. Sheer necessity had compelled them to encamp near the settlement; and a more squalid, miserable looking set of creatures I never beheld. The chief of the party, contrary to the usual Indian custom, had let his beard grow till it stood out in small tufts from every part of his sinister-looking smoke-dried face; and the thong of leather which sustained his scalping knife, seemed to answer the double purpose of binding the fragments of his greasy and tattered capote to his body, and of keeping the loosely

hung component parts of the body itself together.—A bluff faced English-looking white youth of 18, with a shock head of black curly hair, and wearing a hunting frock of some coarse material striped like a bed-ticking, secured to his body with a red belt, from which a hatchet was suspended, was assisting him spangling a refractory poney. The young gentleman, as I afterwards learnt, belonged to the tribe—some runaway apprentice, perhaps, who thought he was playing Rolla. The rest of the mongrel concern dodged like beavers beneath the mats of their smoky wigwags as I approached their common fire, to warm myself.

Returning to the farm-house, I found a little girl playing on the floor with several strings of beads, which the squaw first mentioned had just parted with to purchase food for her starving infant. The family, however, though they suffered the child to retain the ornaments, supplied the poor woman with food and comforts to ten times their value. The Indian mother, I was told, though nearly fainting from exhaustion, asked for nothing except for her child, and seemed deeply affected when after, by signs, apprising the whites of her situation, she obtained the required sustenance.

Upon emerging from this grove and getting out once more on the prairie, I could distinguish a solitary horseman followed by his dog, coming towards us, at least a mile off; and remarking that as they approached us the distance between the man and his canine companion increased at a very unusual rate, I was induced to scan the appearance of the latter as he passed within rifle shot of our sleigh after his master was out of hail. It proved to be an enormous wolf; and we actually tracked the fellow for eighteen miles, to a thick brake on the banks of a frozen stream, from which he had first leaped into the traveller's tracks, and steadily followed on in his horse's steps to the point where he passed us. The cowardly rascal being hard pushed with hunger, though he could have no idea of attacking the traveller by himself, had probably just trudged along mile after mile in the hope of raising a *posse comitatus* of his long haired brethren along the road, or of availing himself after nightfall of some accident that might overtake the horseman, who was so unconscious of his volunteer escort. Had the man but turned his horse and run the wolf a hundred yards, he would have rid himself of a companion that circumstances might possibly have rendered inconvenient.

It was late in the afternoon when we reached the banks of Rock river, whose broad and limpid current was of course congealed by the rigors of winter. The enterprising and intelligent settler from the city of New York, who, though repeatedly driven off by the Indians, has been for fifteen years established at "Dixon's ferry," detained me some time at dinner in expatiating upon the healthfulness of the adjacent country, and the abundance of fish and game of all kinds which frequent the waters of the fine stream upon which he resides. The river, which is navigable for boats of fifty tons nearly a hundred miles above the Mississippi, flows through a gentle valley with the prairie sloping to its edge upon either side, except when a group of bold rocks forming a cove, whose entrance has a perfect gothic arch of some twenty feet high, rear their sudden pinnacles above the farther bank. The smoothness of the adjacent ground is broken here and there by an open grove, while an occasional thicket, with one or two rankly overgrown alluvial islands in the river, must constitute a beautiful landscape in summer. This spot was Gen. Atkinson's head quarters during the Black Hawk war, and may be considered about the centre of operations during the recent Indian difficulties. A sharp ride of twelve miles over the open prairie brought us after dark to Buffalo Grove, the scene of some of the most melancholy incidents that attended those commotions. A party of four or five mounted travellers, bound from Galena for the lower country, were obliged to pass the Grove on their route just after the difficulties with the Indians commenced. They had reached the edge of the Grove, when one of the number conceiving that it might harbor an ambush, suggested the expediency of deviating from the usual path, and taking a somewhat circuitous course. He was opposed, however, by his companions; and one of their number taunting him with an unnecessary regard to prudence, spurred his horse and advanced first into the fatal wood. His horse could have made but a few bounds—I have seen his grave just within the edge of the grove—when an Indian bullet brought him to the ground, and his companions wheeling on their track, for the present escaped further mischief. On arriving at Dixon's Ferry, it was proposed the next day to return and bury the poor fellow, who had thus

fallen a victim to his own rashness. Eight persons, among whom was Mr. Savary, the Indian agent for the hostile tribes, volunteered upon the kind office, which was performed without molestation, and the agent, with the greater part of those present, then kept on his way to the upper country; the rest, among whom was my informant, returning to their home on Rock river. A confused account is given of what followed, as four of Mr. Savary's party, including himself, were slain in another ambush, and those who escaped by the speed of their horses, had but little opportunity, after the first surprise, to observe how their companions met their fate. It is agreed, however, that the unfortunate agent, turning in his saddle after the first fire, was shot in the act of appealing to the Indians as their friend and "father"—the reply being a disclaimer of his official character, and the words "we have no longer any white father," accompanying the discharge of the piece whose bullet pierced his brain. The head of the ill-fated gentleman carried off by the Indians, is said to have been afterwards recognized and recovered from the savage band. The Indians fired the house of the settler (an old New Yorker) at Buffalo Grove, and the charred timbers and lonely door-ways contrasted strangely, as I viewed them in passing, by the mering sun, with the neat new log dwelling a few paces off, in which I had most comfortably spent the night before. But these traces of savage war soon, by their frequency, became familiar. The aspect of the country changes considerably soon after passing Rock River. The prairie is frequently broken by sudden ravines. The number of groves increases. The streams run more rapidly over their pebbly beds, and huge masses of crumbling rock rise like the ruined walls of old castles along the mimic vales through which they take their way. In those secluded dells a number of settlers had ventured to fix themselves along the Galena route; and though many have now returned to their precarious homes, the humble dwellings and various little improvements of others remain as they left them when fleeing with their families before the dreaded savage. With the appearance of one of these cottages I was struck particularly. The roots of a large tree, whose branches brushed a wall of rock opposite to it, had caused a sparkling brook to describe the form of a horse, shoes in winding through a small alluvial bottom, while a row of wild plum-trees across the little peninsula thus formed, divided it from the rest of the valley, and just left room enough for the cabin of the settler with a few acres for a garden around his door. A few acres more along the margin of the brook supplies another enclosure; and the fences and fixtures exhibited a degree of care and arrangement by no means common in this region. But the exiled owner had never returned to his tasteful though humble home. The open door swung loose upon a single hinge. The snow lay far within the threshold, and a solitary raven perched upon the roof, seemed to consider the abode of desolation so much his own that, heedless of a flock of his brothers which rose from some canyon near, as we approached the place, he only moved sideways along the rafter and gave a solitary croak as we drove by.

Approaching Galena, the country becomes still more broken and rocky, until at last a few short hills, here called "knobs," indicated our approach to Fever River; while the river itself at once became visible when we had wound round the last of these, and got among the broken ravines that seam the declivity, sloping down for nearly a mile to its margin. Short sudden hills, the bluffs of the prairie beyond, partly wooded and partly faced with rock, formed the opposite shore, while the town of Galena lay scattered along their broken outline, as if some giant had chucked a handful of houses against the hill side, and the slimy mud (for which the streets of Galena are celebrated) had caused them to stick there. We crossed on the ice, and I am now once more in a frame house.

POEMS, BY CYNTHIA TAGGART, Providence, R. I.—CRANSTON & HAMMOND.—This is a remarkable volume. Many of our readers will, doubtless, remember an *Ode to the Peppy*, published some months ago in this paper, in introducing which, the fact was stated, that the writer was, and had for years, been the helpless tenant of a sick bed. We here have a collection of poems from the same pen, and written under the same circumstances of suffering and discouragement. Yet, the mind—the immortal mind—triumphs over the sorrows of poverty, the bitterness

of affliction, and the tortures of disease, and soars on Empyrean wings into the high regions of poetry. There is genius, grace, pathos, and, above and over all, a resigned and quiet spirit, and unwavering Christian hope, pervading this little and well printed volume, that must commend it alike to the acceptance of virtue, and the approbation of taste. A more melancholy story than that connected with the history of this young person, can hardly be imagined. The father, a revolutionary officer, feeble, broken in constitution, and poor, wore out the latter end of his days in anxious efforts to obtain the pension due to the services of his youth. Just as success crowned these efforts, he died. His wife—(we take all these particulars from an affecting letter of the Reverend B. C. Cutler, prefixed to the poems)—was a confirmed invalid, and could only, with difficulty, discharge the ordinary domestic duties. There were three daughters, of whom one was bereft of reason, and the other two were martyrs to disease, the one having been two years, the other seven years confined to her bed.

We will give Mr. Cutler's own words, in telling the rest:—

The father, the mother, and one of the daughters appeared cheerful and resigned; but the other daughter seemed greatly depressed. She had been now seven years on a bed of exquisite pain. Her hair had turned gray by the unmitigated anguish of her head. Sleep had long deserted her, and she seemed to have been in the act of martyrdom for years.—Confined for so long a time to her bed, incapable of occupation, or amusement, at times, even of devotion, she struggled hard to say "Thy will be done." She however appeared to confide in God, but was destitute of spiritual consolation.

In this state, and in this place, she composed, from time to time, the Poems which are about to be published. They are like the lamentations of Jeremiah, or, more truly, like the complainings of Job; and may serve to make both the prosperous and the afflicted more grateful, and submissive to the allotments of Divine Providence.

The Poems were composed and committed to memory, chiefly in the night; and were committed to writing by the father and others, at their leisure.

A little garden before her window, the sun which rose and set, the winds of heaven which shook her cottage, and the ocean, whose "billowy anthem" was ever chanting at the foot of the hill, afforded the only variety to her thoughts. From these and from her bodily sufferings she draws subjects and illustrations for her Muse. She remains to this day sunk on a bed of anguish, calm and patient.

It is hoped by the publication of these poems to add something to the narrow means of this afflicted, but unrepining household, and to pay at the same time a merited tribute to genius.

We annex some lines, which will bear out, we think, all we have said:—

THE VOICE OF THE WIND.—1839.

But list! O list! the mighty Harp,
Devoid of frame or strings,
Touched by a hand omnipotent,
With tones celestial rings;
With awful notes now swelling high,
Bearing mysterious power,
Then sinking soft with gentle voice,
Breathing of mercy's dower.
O list again! the soothing sound
Of Sympathy is near;
Enchanting tones aerial
Burst on the captive ear.
Ah! yes, and now the pitying tears
Fast falling bathe the ground;
Weeping the woe, the grief, the fears
That wretchedness surround.
Then cease my soul, no more repine;
The healing mercy flows;
Blest sympathy, with voice benign,
Her cordial gifts bestows.

OBSERVATIONS ON THE EDUCATION OF THE DEAF AND DUMB: Re-printed from the North American Review. Boston, 1834. pp. 80.

A correspondent, who takes great interest in the subject treated in this pamphlet, asks a place, which we willingly give, for the following notice of it:

"It is a re-print of the article on Deaf and Dumb Instruction, in the April number of the North American Review, with the addition of about thirty pages,

which the limit assigned to matter in that periodical made it necessary for the author to suppress."

It is understood to be from the pen of Professor Barnard, of the New York Institution for the Deaf and Dumb. Those who read it will have a better recommendation in the article itself, than any which we should be able to give them: and if we abstain from expressing our high sense of its merit, to those who will not peruse it, it is only because we have not the space to prove our assertions. We may remark, however, that it is altogether superior to any thing on the subject which has hitherto appeared in the United States.

The thirty pages which now make their first appearance in this pamphlet, are of a character more particularly to interest the general reader. From them we make a few quotations. The first is respecting personal signs:

"Signs denoting persons are usually derived from trifling peculiarities of physical conformation, of manner or of dress, which arrest the attention of the deaf and dumb at first sight. These peculiarities may be barely transient, but the sign is retained after the circumstance in which it originated has passed away. The deaf and dumb are particularly expert in detecting distinctive circumstances which would escape ordinary observation. When President Monroe visited the Asylum at Hartford, he wore a cocked hat, of the old school; and it was by reference to this article of dress, that he was ever after designated among the pupils. The same sign has since become generalised; and it is now applied indiscriminately to all Presidents, whether their functions be political or otherwise. Dr. Spurzheim, on the occasion of a similar visit, in taking a survey of the pupils assembled for prayers, placed his hand for a moment over his eyes to screen them from the light. The imitation of this action afterwards constituted his distinctive sign."

The following facts with respect to the deaf, dumb, and blind girl, at the American Asylum, who attracted so much attention a few years since, may, perhaps, interest some of our readers:

"Julia Brace, at present in the Asylum at Hartford, was deprived at once of hearing and of sight, at the early age of four years. She bore her calamity, at first, with little resignation; but her disposition, at length, became remarkably serene. The accomplished pen of our American Hemans, Mrs. Sigourney, an early benefactress of this unfortunate female, has already given her story to the public; to the correctness of which we take pleasure in here according our testimony. We do this the rather, that since the publication of that article, many persons, induced by its statements to visit Julia, have found in her a less interesting object than they had anticipated. This poor girl is not now, in fact, what she was. It is painful to observe, that, as her monotonous years roll away, the same docility, the same uniform placidity of temper, the same willingness to meet the advances of strangers, and the same readiness to exhibit proofs of her manual dexterity, and of her wonderful sagacity in distinguishing individuals, and the articles belonging to them are not always apparent. But in Julia Brace, notwithstanding her absolute exclusion from society, the existence of the moral sense, is strikingly manifested. With her right of property is sacred.—An article committed to her for examination or for keeping, she will deliver to no individual but the owner, to whom she will deliver it without hesitation, and with an appearance of satisfaction. Should the owner neglect to receive it, she will even force it upon him, and having satisfied herself that it is once in his hand, will immediately relinquish her hold. She selects her own articles of clothing from among those of all the female pupils, and never, in any instance, has been known to appropriate the property of another."

Although we are compelled with these two extracts to finish our notice of this article, we must not omit to mention that its general character is that of a labored disquisition, and that the anecdotes which we have quoted, and others similar to them, are introduced only by way of illustration. The author appears to understand his subject, and is intent on penetrating fundamental principles, instead of merely skimming the surface. The whole paper seems calculated to do much towards rescuing the subject of deaf and dumb instruction from the comparatively

low estimate formed of it by the public, and towards giving it a consideration equal to that with which the subject is viewed in France.

HARPER'S FAMILY LIBRARY—Vols. LXVI., LXVII., LXVIII., LXIX.—New-York, HARPER & BROTHERS.—It is a source of real gratification to us, as we are sure it must be to the friends of knowledge and good letters throughout our country, that amidst the interruptions and disasters which have more or less paralyzed all other trades, these enterprising publishers are enabled to continue their career of useful activity.

Of the four volumes before us, the first two are a continuation, or second series, by ALLAN CUNNINGHAM, of the Lives of Eminent Painters; and those who read the first series with pleasure—as from the taste with which the general subject is handled, and the agreeable style of the writer must have been the universal result—will find the continuation not less attractive. From the life of Copley, our American artist, we make the following extract, both for the sake of the description given of the picture—one that the present relation of our Supreme Executive with the Senate of the United States renders, perhaps, somewhat admonitory—and for the very calculating and business like letter of Earl Ferrers:

The mind of Copley teemed with large pictures: he had hardly failed in his Irish subject before he resolved to try an English one, viz. the Arrest of the Five Members of the Commons by Charles the First. Malone, an indefatigable friend, supplied the historical information, and gave a list of the chief men whose faces ought to be introduced. It was the good fortune of the eminent men of those days, both Cavaliers and Roundheads, that their portraits had chiefly been taken by the inimitable Vandyke: all that had to be done, therefore, was to collect these heads, and paint his picture from them. They were, it is true, scattered east, west, north, and south; but no sooner was Copley's undertaking publicly announced, than pictures came from all quarters; and it is a proof of his name and fame that such treasures were placed in his hands with the most unlimited confidence. The labor which this picture required must have been immense; besides the grouping, the proper distribution of parts, and the passion and varied feelings of the scene, he had some fifty-eight likenesses to make of a size corresponding with his design. The point of time chosen is when the King having demanded if Hampden, Pym, Hollis, Hazlrig, and Strode were present, Lenthall, the Speaker, replies,—“I have, Sir, neither eyes to see, nor tongue to speak, in this place, but as the House is pleased to direct me.” The scene is one of deep interest, and the artist has handled it with considerable skill and knowledge. The head I like best is the dark and enthusiastic Sir Harry Vane: the Cromwell is comparatively a failure. Many have left their seats dismayed; while fear, and anger, and indignation have thrown the whole into natural groupings: the picture was much talked of when it appeared, and deserves to be remembered still.

There has always been a difficulty in disposing of historical pictures in this country; and no one was doomed to experience it more than Copley: no customer made his appearance for Charles and the impeached Members. I know not whether the following remarkable letter, from a wealthy peer, arose from his own inquiries, or from an offer made by the artist; the letter, however, is genuine, and proves that they err, who imagine that the spirit of bargaining is confined to mercantile men:—

“Lord Ferrers's compliments to Mr. Copley; he cannot form any judgment of the picture; but, as money is scarce, and any one may make eight per cent. of their money in the funds, and particularly in navy bills, and there is so much gaming, he hopes he'll excuse his valuing his picture in conformity to the times, and not think he depreciates in the least from Mr. Copley's just merit; but if he reckons fifty-seven figures, there are not above one-third that are capital, but are only heads or a little more; and therefore he thinks, according to the present times, if he gets nine hundred pounds for the picture with the frame, after the three other figures are put in, and it is completely finished, and he has the power of taking a copy, it is pretty near the value: that is what very few people can afford to give for a picture. However, if Mr. Copley would undertake to do a family piece for him with about six figures, about the size of the picture he has of Mr. Wright's, with frame and all, he would

agree to give him a thousand guineas for the two pictures. But he imagines the emperor or some of the royal family may give him more, perhaps a great deal more, which he wishes they may, and thinks he well deserves; but if he can't make a better bargain, Lord Ferrers will stand to what he says, and give him six months to consider of it, and will not take it amiss if he sells it for ever so little more than he has mentioned, as he has stretched to the utmost of his purse, though he does not think he has come near up to Mr. Copley's merit.

“Upper Seymour Street, 5th June, 1791.”

The two other volumes present us with a *History of Arabia*, by ANDREW CRICHTON.

Considering how much of real and substantial knowledge, and how much of delightful romance we owe to Arabian learning and Arabian fancy, and how great the influence which was exercised even in western Europe by the warlike race that for a while held dominion from the Pillars of Hercules to the Wall of China, we are less conversant with the history of their country, than with the history of any other. Mr. Crichton in these two volumes, has condensed a vast mass of information, rectifying by consulting the records of modern travellers and investigators—especially among the latter the exact and indefatigable Niebuhr—many, erroneous crudities and prejudices.

We annex as a fair specimen of the work, a notice of the taste for, and rapid growth of, literature, science and the arts, under the Abbassides:

It was at a period when ignorance and barbarism overspread every part of the Western World, that literature and philosophy found an asylum in the schools of the Saracens. Unlike the Goths and Huns, they became the instructors and enlighteners of the countries they had conquered. Their stern fanaticism yielded to the mild influence of letters; and, by a singular anomaly in the history of nations, Europe became indebted to the implacable enemies of her religion and her liberties for her most valuable lessons in science and the arts. In the preceding chapters of this work we have beheld the disciples of Mohammed in the character of warriors and conquerors. Their success in arms had been enough to satiate even the most unmeasured ambition. But, great and splendid as were the events we have just detailed, we shall turn with pleasure from fields of blood, from scenes of misery and vice, to contemplate the more gentle and useful progress of the Arabs in the cultivation of learning. The first Mussulmans knew, or at least esteemed, no other book than the Koran. But this aversion to intellectual pursuits gradually relaxed, in proportion as their faith and their empire extended. The possession of those happy countries, so long the seats of ancient taste and splendor, naturally introduced among them a spirit of refinement; and here their career was as rapid and surprising as it had been in the field. The literature of Greece, such as it was in the days of Pericles, required the slow growth of nearly eight centuries of progressive cultivation. The same period elapsed between the foundation of Rome and the age of Augustus. In France, the reign of Louis XIV., the brilliant era of wit and genius, was 1200 years subsequent to that of Clovis. But among the Saracens, such was their enthusiasm for learning, that little more than a single century elapsed from the period of their deepest barbarism to the universal diffusion of science over the vast extent of their dominions. It was in the year 641 that Omar committed the Alexandrian library to the flames, and in 750 the house of Abbas, the munificent patrons of letters, mounted the throne.

Under the first of the Omniadian caliphs, the genius of Greece had begun to obtain an influence over the Arabs. But it was not till the great and final division of the empire—till Bagdad arose, a fair and splendid city—that the golden age of Arabian literature commenced in the East, and the Muses were courted from their hallowed retreats beyond the Bosphorus, to expiate the guilt of conquest, and illustrate the fame of the Abbassides. Al-mansur, successful in his domestic wars, turned his thoughts to the acquisition of science. Accident brought him acquainted with a Greek physician, named George, who was invited to court to prescribe for the removal of a temporary indigestion. To him the Saracens were indebted for the introduction of medicine. The famous Haroun al Raschid has acquired a splendid name as the encourager

of letters. He was fond of poetry and music, and himself considerably skilled in these divine arts. Volumes have been written on the learning of the Moslem empire during this caliph's reign. Whenever he undertook a journey, or a pilgrimage, he carried with him a retinue of a hundred learned men. The Arabs were deeply indebted to him for their rapid progress in education, for he issued a law that a school should be attached to every mosque erected within his dominions. With a toleration superior to the fanaticism of his creed, he did not despise the knowledge which the believers of another faith possessed. The head of his schools, and the chief director of academical studies in his empire, was a Nestorian Christian of Damascus, of the name of Jehn ibn Messue. His generous example was imitated by his successors; and in a short time the sciences that were cultivated in the capital were diffused to the distant extremities of the caliphate.

But the Augustus of Arabian literature was Al-mamoun, whose attention from his youth had been chiefly engrossed with books and study. Even in his father's lifetime, and during his journey to Khorasan, of which he was appointed governor, he had selected for his companions the most eminent scholars among the Greeks, Persians, and Chaldeans. His accession to the throne did not abate his ardor for knowledge. Bagdad became the resort of poets, philosophers and mathematicians, from every country and of every creed. His ambassadors and agents in Armenia, Syria and Egypt were ordered to collect the most important books that could be discovered. The literary relics of the conquered provinces, which his governors amassed with infinite care, were brought to the foot of the throne as the most precious tribute he could demand. Hundreds of camels might be seen entering Bagdad loaded with volumes of Greek, Hebrew and Persian literature: and such of them as were thought to be adapted to the purposes of instruction, were at the royal command translated by the most skilful interpreters into the Arabic language, that all classes might read and understand them.—Masters, instructors, translators, and commentators formed the court of Bagdad, which appeared rather to be a learned academy than the capital of a luxurious and warlike government. Aware of the vast treasures that were deposited in the libraries of Constantinople, Al-mamoun, in concluding a treaty of peace with the Grecian Emperor, Michael III., stipulated, as one of the conditions, that a collection of rare and valuable authors should be delivered up to him.—These were immediately subjected to the process of translation; but it must be recorded with regret, that, through an ill-judged partiality for his native tongue, he gave orders that after the Arabic versions were finished, the original manuscripts should be burned.

The Caliph Vathek not only admired and countenanced literature and the sciences, but was himself a proficient in some of them, especially poetry and music. He was particularly addicted to astrology; and having conferred with some of his learned fraternity in his last illness, they assured him, on consulting his horoscope, that his reign was yet to endure fifty years. His death in ten days falsified this prediction, and ruined the credit of Hassan ibn Sohal. Abu Masher, an eminent astrologer, flourished in the reign of Mostein; but his talents received sorry encouragement, for that prince ordered him to be severely whipped, because an event which he had foretold actually came to pass.

Long after the power of the Abbassides had dwindled into a mere pageant of state, they affected to patronize and cultivate learning. Many distinguished men in almost every science illustrated this period of Saracen history; but the capital of the muses in the East had seen innumerable rivals spring up in other parts of the empire. The last prince that shed a ray of departing glory on his race was the Caliph Mostanser, who adorned Bagdad by the celebrated college that bore his name. According to oriental historians, this edifice had no equal in the Moslem world, whether we consider the beauty and elegance of the building, the number of students it contained, or the splendid revenues assigned it by its founder. Each of the four chief sects of the Sonnees had its appointed professor, with a monthly salary and a maintenance from the royal exchequer. Every student had daily a very handsome allowance of provisions of all kinds. There were baths set apart for their use, and a physician employed to attend them at the caliph's expense.

STORIES OF POLAND; by ROBIN CARYER. Boston: CLAPP & BROADERS.—This is a well-timed and instructive little book, intended to interest children in the fate and history of unhappy Poland. The stories

are well told, and there are a great many pictures, moreover.

CELEBRATED SPEECHES OF CHATHAM, BURKE AND ERSKINE; to which is added the argument of Mr. Macintosh in the case of Peltier; selected by a member of the Philadelphia Bar: 1 vol. 8vo; *Philadelphia, Kay & Biddle*.—We are glad to see such models presented in so good a form to the youth of our country. We lack taste as orators: we are too redundant—too verbose; apt to overcharge, and above all, to spin out interminably our harangues. Where there is boundless wealth both of knowledge and fancy, as with Mr. Burke, one may endure,—for even then it is a penance,—a book under the name of a speech; but only think of Mr. Benton, of Missouri, inflicting such a punishment on the nation. The volume is well printed; and is, we are glad to learn, to be followed by another, giving speeches of Fox, Pitt, Sheridan, Canning, and Brougham.

NATIONAL CALENDAR AND ANNALS OF THE UNITED STATES, for 1834, by PETER FORCE: *Washington, FISHEY THOMSON*.—To this book we have been indebted for much valuable information, for which erroneously we have given credit from time to time to the *Blue Book*, so often referred to in Congress, and which we confounded with this. Their contents are very similar; and to any one who would know the interior and whole detail of our Government—the number and duty of officers—amount of compensation—and everything that relates to the actual and active machinery of the system, this a most valuable manual—and we recommend it accordingly.

HELEN, A TALE, by MARIA EDGEWORTH; 2 vols.: *Philadelphia, CAREY LEA & BLANCHARD*.—After a long interval we have here a new work from the admirable pen of Miss Edgeworth. Time does not seem to have abated aught of its former spirit.—Helen will be read with avidity—and by those who meditate the moral, as well as enjoy the incidents of such a tale—with certain benefit. It is an illustration throughout of the value and indispensableness of truth, and of the dangers of any concealment of it. The three characters—of Miss Clarendon, who sometimes made truth repulsive—of Lady Cecilia, who could not understand that it was necessary always to adhere to it—and of Helen, who, wherever her own self or own interests were concerned, always told it—though in the affairs of her friend Cecilia, assenting to—not deceit—but concealment—are admirably wrought out—and combined as they are—with a good general story of high life, and much—perhaps too much elaborately clever dialogue—constitutes altogether a charming work.

THE **HARPERS**, we should add, have also just issued this latest work of Miss Edgeworth—in one volume, constituting Vol. X.—of their handsome, uniform, and well executed stereotype edition of the *Tales and Novels of Miss Edgeworth*.

SUMMARY.

THE FINE ARTS.—In the hope that the sun of May will soon shine upon us, and tempt abroad the lovers of the beautiful in art, we commend to the notice of our readers the exhibition at the Academy of Arts in Barclay street, of *Cole's* picture of the *Angel appearing to the Shepherds*, and *Ball Hughes's* group of *Uncle Toby and Widow Wadman*.

The picture is a very striking one, and the subject, difficult as it is, is treated with great skill. In the midst of a fine landscape, constituting of itself an attractive painting, the shepherds are suddenly startled by the appearance of the heavenly messenger and the shining forth of the bright star indicating the spot to which they were directed. Prostrate on the earth, they listen to the glad tidings of a Saviour born unto them and all mankind, and their reverential awe is well contrasted by the unconscious and undisturbed serenity of the dumb flocks around. The star, by

a most happy license, is represented as darting forth its refulgent light in rays that form a cross, and the effect is greatly heightened by its reflection in a transparent sheet of water beneath. Among the minor accessories is that of a snow white lamb in the foreground typifying the spotless birth announced to the Shepherds. The coloring, design, and general effect of the picture strike us as admirable; and the only objection we have to make is one common to all others where spiritual and incorporeal beings are introduced and presented in the substantial form and lineaments of mortals. It shocks the natural sense to see such figures self-supported in air, and robed in drapery of earthly texture.

The group by *Ball Hughes*, which is in an adjoining apartment, presents Uncle Toby in the sentry box, invaded by the Widow Wadman, complaining of something in her eye, which she is showing to the simple minded and unsuspecting soldier, who looks into it with all his credulous soul—without, indeed, finding there ought that troubled her, but not without the risk of being thereby considerably troubled himself. The whole appearance of the Widow might, in truth, trouble a stoic. We could hardly imagine that so much expression could be thrown into so cold a material. The folds in the robe are almost incredibly natural; and the little foot that is carelessly dropped into view from beneath it, could not be improved. The figure of Uncle Toby strikes us as comparatively too large, and the limbs particularly as too robust for the body.

We wish our Broadway fashionables, of both sexes, would make the Academy a lounge. The position is central; the rooms are well ordered; and the attraction of these two Exhibitions sufficient to invite repeated visits—besides the chance of meeting there "all one's acquaintances."

LAKE ONTARIO.—The Steamboat United States, Capt. Van De Water, touched at the mouth of the Genesee River, on Wednesday last, with 1000 passengers!

GENESEE RIVER.—The Steamboat Genesee, Capt. Weed, has commenced her trips between Rochester and Genesee. She went from Genesee to Rochester in six hours.

The Sag Harbor Coroner states, that a boat which left that place on Saturday for Three Mile Harbor, having on board John Perry, Collins Miller, Jonathan Miller—Stillman, all of Easthampton, has since been found at sea a wreck, and it is supposed those on board were drowned.

The Cherokee Phoenix of 29th March, is in mourning for the death of the honorable WILLIAM WIRT, whom it denominates "not only the legal and able counsellor of the Cherokees, but likewise their most sincere and faithful friend."

APPOINTMENTS.—The Globe contains a long list of officers confirmed by the Senate. Most of them are reappointments connected with the Custom House, and the land offices. Among them we remark Aaron Ogden, as Assistant Collector at Jersey City, and in this State Thomas Loomis, Collector at Sackett's Harbor, Jacob Gould at Rochester, Seymour Sewell at Lewistown, Baron S. Doty at Ogdensburg, Jere Carrier at Cape Vincent, John P. Osborne at Sag Harbor, David B. McNeil at Pittsburg, George H. McWhorter at Oswego, and Sam Swartwout at New York.

The United States Frigate Brandywine sailed yesterday for Norfolk.

OFFICERS.—David Deacon, Captain.—Lieutenants, William Inman, Henry Bruce, J. G. Van Brunt, Edward S. Johnson, John H. Smith, H. H. Hobbs.—A. A. Adey, Surgeon.—Samuel F. Hazard Sailing Master.—J. R. Lambert, Chaplain.—A. G. Gambrill, Assistant Surgeon.—Passed Midshipmen, John Weems, William C. Spencer, E. M. Yard, Charles Green, Luther Stoddard, William B. Ludlow, J. S. Patterson, C. H. Piper, C. Valentine, L. W. Wilkins, Daniel McKay, C. R. P. Rodgers, Francis Winslow, J. S. Biddle, M. D. E. Watson, R. R. Nicholls, Jas. W. Reed, S. Pierce, Francois Loury, Joseph Norville.—Boys acting as Midshipmen, R. B. Biel, John Dennis, Howard Tillotson.—John Peira, Jr. Schoolmaster.—Charles Boardman Carpenter.—J. R. Childs, Sailmaker.—Daniel James Gunner.—D. McComb, Purser's Steward.—James C. Low, Master's Mate.—Thomas C. Ryall, Captain's Clerk. Ship Brandywine, Jos. H. TERRY, Purser.

The Opera at Philadelphia seems more attractive to the ladies than to the gentlemen: the latter of whom, according to the Philadelphia papers, not even music and beauty combined can draw to the theatre.

NEW BANKS.—Seven bills have passed both houses of the Legislature for the incorporation of Banks, and one increasing the capital stock of an existing bank, as follows:

	CAPITAL.
Commercial Bank, Buffalo	\$400,000
Sackett's Harbor Bank, Sackett's Harbor	200,000
Commercial Bank, New York	500,000
Orleans County Bank, Albion	200,000
Albany City Bank, Albany	500,000
Farmers' & Manufacturers' Bank, Po'keepsie	300,000
Highland Bank, Newburgh	200,000
Phoenix Bank, New York [increased]	1,000,000

—[Alb. Argus.] \$3,300,000

General E. Hawkins, of Union District, S. C., died very suddenly on the 16th inst.

[From the Journal of Commerce.]

PHENIX BUILDINGS BURNED.—About 9 o'clock last evening, an alarm of fire was sounded, which was found to proceed from the large five story brick building S. E. corner of Wall and Water streets, known as the Phoenix Buildings. It is about 60 feet on Wall street, by say 50 on Water street. When we reached the spot, the 5th story was completely on fire, and the great height of the building rendered it impossible to reach it, except by the hydrant. The firemen, however, by going inside of the building, and upon the neighboring roofs, succeeded in saving the three lower stories, except that the third was somewhat injured. The 4th and 5th, with the roof, were totally destroyed except the walls. Great credit is due to the firemen for arresting the flames where they did.

The 5th story was occupied by Messrs. Bowne & Co. as a book bindery. Here the fire originated.

In the fourth story was the printing office of the Mercantile Advertiser, the materials of which, including a Napier press, were almost wholly destroyed. We are happy to state, however, that the proprietors (Butler & Co.) were insured, and that they have lost none of their books. A part of this story was occupied by Oakley & Co. for the storage of wool.

The third story was also occupied by Oakley & Co., who, we understand, were insured.

The 2nd story, which was not injured except by water, was occupied by George Barrell, Produce Broker; W. Cahoon & Co, cotton brokers; and two offices were unoccupied.

The first story was occupied by Bowne & Co, (the same who owned the bindery) as a stationer's shop, Wm. N. Norris, copper smith; and J. Mathews, hide dealer. Bowne & Co's goods were principally removed and thus escaped being drenched with water. They were insured.

This building was owned by Mr. Weyman, senior.

The receipts of the Cooper Benefit at New Orleans amounted to about two thousand five hundred dollars

Awful Calamity.—We copy from the Kittanning (Armstrong county) Gazette and Columbian, the following account of a most distressing occurrence:

On the night of Friday, the 18th instant, the house and barn of Captain John C. Kissinger, of Toby township, in this county, were consumed by fire, and what is most shocking to relate, nine of his children perished in the flames! The parents were absent on a visit to Mrs. Kissinger's father's, a distance of about eight miles. Out of eleven children, two only are left—one an infant which the parents had with them, and the other a daughter eight years of age, who was away from home. The way the fire originated is not known, and it was not discovered till about 9 o'clock the following morning. One horse and a large quantity of grain were consumed; in short, nothing was left in or about the house or barn unconsumed.

A gentleman who had been present at the scene of the calamity, subsequently called upon us, from whom we learned a few additional particulars. The sufferers were from nineteen years of age downwards. So far as could be observed, the bones were in the same relative position in which they slept, which leads to the belief that they were smothered in their beds by the smoke before the flames reached them. One only had gone to a different part of the house. Awful as was the agent of their death, it was probably attended with but little suffering. The unhappy parents were at first (and very prudently too) only informed of the destruction of their property. The father returned on Saturday, but the mother remained at her father's until the next morning, still ignorant of the extent of her loss. When she arrived, she surveyed for a moment the smoking ruins, and then asked for her children. Let the reader imagine, if he can, the effect of the shocking disclosure.

It is a remarkable circumstance, and one calculated to heighten, if possible, the distress of these parents, their oldest child was burnt to death some years since.

A horse and a yoke of oxen were burnt. A dog that lay in the barn, was burnt, and his bones were found in the place he was accustomed to lie. Two large hogs were consumed in the pen, although the door was open.

On Sunday, the bones of the children were collected, deposited in a coffin, and buried, in presence of a large concourse of sympathizing friends and neighbors. An impressive discourse was delivered at the grave, by the Rev. Mr. McGarragh.

The weather for the last two or three days has been as cold and boisterous as we usually experience in the early part of March. Ice was formed on Friday and Saturday nights, and we had snow squalls on these days and yesterday. It is feared that the early vegetation has sustained injury.

Yesterday morning a severe N. W. gale set in, and continued till evening. Some damage was done to the shipping in the North river. The ship *Empress*, lying at pier No. 4, broke her fasts and ran into the brig *Marcellus*, both of which were considerably damaged. Other vessels received slight injury. The tin roofs and gutters of the new stores, Nos. 56 and 57 Whitehall, were blown off.

A small wooden tenement, corner of Cherry and Oliver streets, was nearly destroyed by fire yesterday afternoon.—[Mercantile.]

UNITED STATES BANK.—The *National Intelligencer* of Saturday says,—

"Mr. Duncan, of Illinois, yesterday laid upon the table of the House of Representatives, in order that it might be printed, an amendment which he intends to move to the bill lately reported by the Committee of Ways and Means, for regulating the deposits of the public money in the State Banks, when that bill shall come up. That amendment proposes that the Charter of the present Bank of the United States shall be continued for ten years from the 4th day of March, 1836, provided that the United States shall surrender the whole of its stock, and the present stockholders shall surrender half of the stock in the Bank held by them respectively; the several States to have the right to subscribe, at par value, in proportion to their respective representation in the House of Representatives of the United States, for the twenty-one millions of dollars of stock so to be surrendered, or the citizens thereof, in the event of any State's declining to subscribe and pay in the amount of the quota on or before the 1st day of January, 1836. The amendment embraces several other new features; such as limiting the dividend on stock to seven per cent. per annum; the surplus, after the accumulation of a contingent fund of three millions, to be paid over into the Treasury of the United States; prohibiting the issue of any notes of a denomination less than ten dollars; requiring a bonus of \$200,000 per annum, to be appropriated to internal improvements, &c. &c. This being the first practical proposition in the House of Representatives contemplating, in any form, the extension of the charter of the present Bank of the United States, we have thought this brief note of it might be acceptable to our readers."

The occurrence of a fire in New-Orleans, on the 10th instant, has led to a disclosure of circumstances of a horri-fying character. The *Courier* of that day has the annexed particulars:

"A fire broke out this morning in the kitchen of Madame Lalaurie, corner of Royal and Bayou streets, which was soon wrapt in flames. It was known to some of the neighbors, that the upper part of this building was used as a prison, and that it was then tenanted by several unfortunate slaves loaded with chains. Information of this fact was communicated to Judge Canonge, who instantly waited on Mr. Lalaurie, and asked permission of that gentleman, in a polite manner, to have the slaves removed to a place of safety; when the latter, with much rudeness replied, that 'there were those who would be better employed if they would attend to their own affairs instead of officiously intermeddling with the concerns of other people.' The flames gaining rapidly on the building, orders were given to break open the doors, which being promptly obeyed, a most appalling sight was presented, in the shape of several wretched negroes emerging from the fire, their bodies covered with scars and loaded with chains! Amongst them was a female slave, upwards of 60 years of age, who could not move. Some young men carried her to the city guard house, where the others, six in number, were also conducted, to be protected from the cruelty of their owner. We saw one of these miserable beings. The sight was so horrible that we could scarce look upon it. The most savage heart could not have witnessed the spectacle unmoved. He had a large hole in his head, his body from head to foot

was covered with scars and filled with worms!!! The sight inspired us with so much horror, that even at the moment of writing this article, we shudder from its effects. Those who have seen the others represent them to be in a similar condition.

We forbear a further description of this revolting spectacle, as it can hardly be agreeable to the feelings of our readers. We hope the Grand Jury will take cognizance of this unparalleled outrage, and bring the perpetrators of it to the punishment they so richly deserve."

The Bee, of the 11th instant, says—"The populace have repaired to the house of this woman, and have demolished and destroyed everything upon which they could lay their hands. At the time of inditing this, the fury of the mob remained still unabated, and threatens the demolition of the entire edifice."

The New Orleans papers of a date subsequent to those which relate the revolting incidents in the above extract, inform us, that a day or two after the fire, and when all the property of the woman fiend whose unheard of cruelties are the subject of this extract, was replaced in her house, a large collection of persons assembled, and gutted it from top to bottom, demolishing every article of furniture, tearing up the floors even, and leaving nothing but the walls standing. Plate, jewelry, glass, piano's, &c., were tossed into the street and trampled under foot. One paper estimates the damage altogether, at \$40,000. Mob law is always bad law—yet in this case, human nature could not but revolt against the atrocities so providentially revealed.

John H. Eaton has been appointed by the President of the United States, with the advice and consent of the Senate, to be Governor of the Territory of Florida, to succeed Governor Duval, whose term of service has expired. The nomination, made to the Senate some days ago, was confirmed yesterday.—[*National Intelligencer* of Friday.]

UP A TREE.—The following letter from the Post Master of Columbia, S. C. accounts for the failure of two mails.

LOSS OF THE MAIL.

Post Office, Columbia, S. C. 14th April, 1834.

One of the Mails going North, got lost in the river between this and Camden, yesterday morning, and the other is now on a tree in the river and unapproachable. It is not known which Mail got lost; the drivers think it is the Great Mail which lodged on the tree: if they judge from its size, it is probable they are mistaken; for our Mail on Sunday was sent off in a very large Portmanteau. One of the negroes attending at the Ferry got drowned.

The Wateree river is very full, and we have had no Northern Mail since Friday night.

Respectfully,

B. F. RAWLS, Ass't P. M.

P. M. Augusta, Geo.

NEW ORLEANS, APRIL 15.—We understand that on Friday night last, a young man by the name of Kelly, in a fit of passion, cut the throat of his wife with a razor. Immediately after, believing her dead, he cut his own with the same instrument. The wife was not dead on Saturday morning last, and hopes were then entertained of her recovery. We have been unable to obtain any further particulars.

Shipwreck.—British bark Robert Russell, from N. Orleans for Liverpool, was lost on Sand Key, first March. Cargo will be saved—part of it had arrived at Nassau, N. P. on the 15th.

The Girard Bank.—The President of the Girard Bank has made an arrangement with the Secretary of the Treasury, by which that institution terminates its connexion with the Treasury. The deposits will be given up by the first of July.—[*Philadelphia Intelligencer*.]

The Arkansas Gazette of the 15th instant, furnishes information of the death of Lieut. Wm. Bradford, of the United States Dragoons, by the accidental discharge of one of his pistols whilst placing them in the holsters, preparatory to mounting his horse.—His remains were carried to and interred at Fort Gibson.

The Norfolk Beacon says—"The schooner *Minerva*, of Thomastown, Gray, while lying between the forts, was struck by lightning, on Saturday morning last, at about 5 o'clock. Both masts were struck at the same time, injuring them so much as to render them unfit for use—the lightning descended to the

deck, a part of which was ripped up—the crew escaped uninjured.

Mr. Isaac Edwards, of Penntownship, in the western section of Chester county, informs us that he disposed of 211 lbs. of Butter from four cows, in the space of eleven weeks, in the early part of last season; besides furnishing the ordinary supplies of a family of from four to seven persons.—[*Westchester Village Record*.]

RECIPE FOR SCARLET FEVER.—A very simple remedy, says a correspondent, for this dreadful disorder, is now using in this city with good effect. It is merely a mixture of Cayenne pepper, salt, and vinegar, used as a gargle.—[*Commercial Advertiser*.]

NEW YORK MARKET, APRIL 26.

LIQUORS.—From a cargo of Heuglins Gin there were sold on the wharf 60 pipes in lots, at 105 cents; from store it is sold at 106 cents. Borden Brand, Crown brand, at 115 cents. St. Croix Rum on the wharf at 93 cents. Whisky in bis, at 24 cents, and in druggs casks at 22 cents.

PROVISIONS.—Beef and pork continued to go off freely, and at full prices. Orleans prime pork, reinspected, at \$9 25. In butter more is doing; dairy we quote at 12 1/2 a 15 cents, which is rather a low price. The stock of cheese is low.

WOOL.—Prices tend downward with but few sales. **CORN EXCHANGE.**—Flour was heavy throughout. Common brands of Western closed at \$5 37, and fancy at \$5 50; some Utica city was sold at \$5 31; Tryon and Albany sold at \$5 on some short account. 1700 bushels good Genesee wheat in store was sold at 106 3/4 cents a bushel; a cargo arrived from Virginia, but was not sold. Rye sold freely at 60 cents for northern. Northern corn at 60 a 62 cents.

BALTIMORE MARKET—April 25.

COFFEE.—There has been a fair demand on the part of the trade for Rio Coffee.

Flour—Howard street Flour.—The demand for this description has been quite limited, and transactions from stores are consequently but few.

City Mills Flour.—We have no sales to report. **Sauquoit Flour.**—The quality of this description is generally much approved this season, and the article has been in fair demand for export.

GRAIN—Wheat.—The sales of Wheat since our last weekly report, have been at an advance of several cents per bushel. Most of the City Mills are yet idle for the want of wheat.

Corn.—There was a full supply at the opening of the market on Monday, and prices receded a little. Sales of yellow were made at 55 cents, and of white at 55 1/2 cents.

Rye.—We have to note a decline in prices.

Oats.—Sales as in quality at 30 a 33 cents per bushel. **Scots and Shipstuffs.**—have advanced. We quote the former at 18 cts, and the latter at 32 a 33 cts per bushel.

Flour.—Yesterday, the wagon price of Flour was \$4 37 1/2. We were not advised of any sales from stores; several lots of stored Flour were priced at \$4 37 1/2-12. The market is quiet.

Review of the New Orleans Market, abridged from Leoy's Price Current of April 12.

Credit and confidence are much impaired; those who have heretofore been in the habit of making liberal advances, or giving extensive credits, have, from necessity, greatly curtailed them; their sales, and consequently their profits, falling far short of what, under other circumstances, they might reasonably have anticipated. Reflecting men hesitate about entering into contracts, when even the possibility of a doubt exists as to their having the ability to meet their engagements. Of the causes which produced this state of affairs, we have not pace, neither is it our province, to speak; we merely notice the effects.

COTTON.—Arrived since the 4th instant: of Louisiana and Mississippi 8170 bales; Tennessee and North Alabama, 9526; Florida, 256—altogether, 17052 bales. The sales of the week amount to about 17,000 bales, of which we have been able to learn the particulars of the following, viz:—776 at 11 1/2, 975 at 10 1/2, 103 at 10 1/2, 243 at 11, 500 at 11 1/2, 108 at 11 1/2, 300 at 11 1/2, 50 at 9 1/2, 94 at 11 1/2, 140 at 11, 190 at 11 1/2, 800 at 11 1/2, 200 at 12 1/2, 600 at 10 1/2, 13, 70 at 10 1/2, 420 at 11 1/2, 233 at 10 1/2, 48 at 11 1/2, 70 at 11 1/2, 89 at 11 1/2—all Louisiana and Mississippi, 512 at 10 1/2, 2000 at 10, 103 at 10 1/2, 600 at 10, 1000 at 10 1/2, 100 at 11 1/2, 53 at 10 1/2, 400 at 10 1/2, 2150 at 11 1/2—of Tennessee and North Alabama, 50 bales Arkansas, at 10 1/2, and 300 Lake at 10 1/2 cents per lb. There has been a good feeling manifested in the market throughout the week, and nearly all descriptions have met with a brisk demand, at an advance of fully 1 cent, and, in some instances, a shade higher, on the Liverpool classification. Mississippi Cotton, it is said, is becoming extremely scarce, and very little for sale now in market.

LIVERPOOL CLASSIFICATION.

Ordinary	9 1/2	a	9 1/2
Middling	10	a	10 1/2
Fair	11 1/2	a	12
Good fair	12 1/2	a	13
Good and fine	13 1/2	a	14

SUGAR.—We notice no change in the price of Sugar since our last report. Molasses continues to arrive, but in small quantities, and must soon become scarce; the season, as we before remarked, being nearly at a close, a portion of that now coming in is of inferior quality.

TOBACCO.—There still continues to be a brisk demand for Tobacco.

FLOUR.—Notwithstanding the depressed state of the market for this article, it still continues to arrive freely.

CORN.—The supply of Corn in market in the Ear is abundant, and of 8½-lb in sacks fully equal to the demand. Arrived this week, 4015 bbls, 9834 sacks.

LEAD.—The price of Lead remains without change; at present there is nothing doing.

MAKERS.—Our quotations remain the same as last week.

FURS AND FURTRIMS.—There has been a number of heavy arrivals lately, which knocked down the market, and last week they were extremely dull.

FRUITERS.—The only alterations we have to notice are in the rates to Havre, three vessels having taken up at 138 for Cotton, per lb; and for Tobacco, per bbl to Cows, 60 shillings is now taken. We have to remark they are dull.

NOW READY.

AN INTERESTING AND USEFUL MAP.

Upon which is delineated nearly all the Railroads now chartered in the U. States. It is designed to show the present contemplated connexion of the different lines, as well as where others may hereafter be constructed to connect with them. It may be had either in sheets, price \$1 25, or put up in morocco for pocket maps, price \$1 50, or on rollers at \$2 25, in any quantity, by applying to the subscriber.
D. K. MINOR, 35 Wall street.
New-York, April 2, 1835.

RAILROAD TURNOUTS, REVOLVING PLATFORMS AND SIDELINGS.

The subscriber having been for some years engaged in constructing turnouts, and inserting the necessary switches and fixtures appertaining to the same, on the Baltimore and Ohio Railroad, and as those works on that road will be shortly completed, he is desirous of being employed by any Railroad Company requiring work of the above description.

He will either contract at a fixed price to execute the work, he providing all the necessary materials and fixtures, or otherwise, or he will engage himself at a stated salary.

In relation to his abilities and general character he begs to refer to any Company, disposed to engage him, to the Baltimore and Ohio Railroad Company.

Letters can be addressed to him at the Office of Construction Baltimore and Ohio Railroad, Baltimore.

a96 &c

REUBEN ALER.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 23 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company.

WILLIAM NORRIS, Secretary.

December 24, 1833.
For further information on this subject see No. 40, page 774 of this Journal.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by expert seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORNBURN.

347 N. Market st. (opposite Post Office).

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better practice can be done in the execution.

Mr. Thornburn is also Agent for the following publications, to wit:—

New York Farmer and American Gardener's Magazine.

Mechanics' Magazine and Register of Inventions & Improvements.

American Railroad Journal and Advocate of Internal Improvements; and the

New-York American, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them by calling at 347 North Market street, Albany.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York, {
January 29, 1835.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for shire. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A29 if RM&F

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,	Flat Bars in length 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.
300 do. 1 1/2 do. 1/2 do.	
40 do. 1 1/2 do. 1/2 do.	
300 do. 2 do. 1/2 do.	
300 do. 2 1/2 do. 1/2 do.	
soon expected.	

350 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, and 4 1/2 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.
A. & G. RALSTON.
9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.
d7lineowr

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 184 Water street, corner of Maiden lane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.
WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.
Baltimore, 1833.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.
Philadelphia, February, 1835.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.
E. M. GILL, Civil Engineer.

Germantown, February, 1835.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY K. CAMPBELL, Eng. Philad.,
General and Novelist. Railroad

STEPHENSON.

Builder of a superior style of Passenger Cars for Railroads
No. 364 Elizabeth street, near Bloecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 63 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.
JAMES F. STABLER,
Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.
WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1835.

To Messrs Ewing & Heartt.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unequalled approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.

An act authorizing a loan for the benefit of the people of this State. Passed April 19, 1834.

The people of the state of New-York, represented in Senate and Assembly, do enact as follows:

§ 1. The commissioners hereinafter named are hereby authorized, if, in their opinion, the public interest shall require it, by an order in writing signed by a majority of them and filed in the office of the comptroller, from time to time, whenever they shall deem it expedient, to direct the comptroller to issue special certificates of stock, in such manner, for such amounts, and under such restrictions as are hereinafter provided, for an amount not exceeding in the whole six millions of dollars; for the redemption of which, and the punctual payment of the interest thereon, as herein provided, to the owners of such stock, the faith and credit of the people of this state are hereby pledged.

§ 2. Upon the filing of every such order, the comptroller shall issue certificates of stock to the amount required thereby, in such sums and to such persons or bodies corporate as the said commissioners, or a majority of them, may direct, for the purpose of being loaned as hereinafter directed.

§ 3. The said commissioners are hereby authorized to loan so much of the said stock when so issued as aforesaid, or of the monies arising from the sale thereof, as in their opinion the public interest may require, to such of the incorporated banking institutions in the city of New York, as they shall deem proper, not exceeding in the whole four millions of dollars, and in such sums to each as they shall deem proper, not exceeding in amount to any one institution one half the capital stock of such institution, at a rate of interest not less than five per cent, payable quarterly yearly, upon its par value; and they said commissioners before they shall make any such loan, shall examine particularly into the affairs of such bank. And the said commissioners may also at their discretion, take such security for the punctual payment of said interest, and the ultimate payment of said principal, as they shall deem proper and necessary to insure such payments at such times as may be agreed upon, not extending beyond the time when the principal of said stock shall be reimbursable; but no part of the loan made to any banking institution, shall be repaid to the State, before the expiration of the period at which the stock shall be redeemable, unless such repayment shall be made in the stock created under this act.

§ 4. The said commissioners shall prescribe the form in which the said certificates of stock shall be issued; and the said stock shall be transferable at the pleasure of the owner, in such manner as the said commissioners shall direct.

§ 5. The said stock shall bear an interest of five per centum per annum, payable quarterly yearly at the Manhattan Bank in the city of New York, and shall be reimbursable at such time or times within twelve years from the passage of this act, as the said commissioners shall designate.

§ 6. The said stock shall be converted into money, in such manner, and under such regulations, as the commissioners hereinafter mentioned shall direct; but the amount of any premium received on such stock upon converting the same as aforesaid, shall be paid into the treasury of this State for the benefit of the general fund.

§ 7. The said commissioners hereinafter named, are hereby authorized to convert into money, by disposing of the same by auction or otherwise, in their discretion, a further amount of stock authorized by the first and second sections of this act, not exceeding two millions of dollars, and to pay the said money into the treasury of this State, the premium thereon to belong to the general fund, and the capital to be loaned to the citizens of the different counties of this State, except the counties in the first senatorial district, in the manner and subject to the provisions hereinafter mentioned, to wit:

1. The amount to be loaned in each county shall be ascertained by an apportionment of the whole amount of two millions of dollars, among such counties according to the number of inhabitants in each, as ascertained by the census taken in the year one thousand eight hundred and thirty.

2. No loan shall be made to the citizens of any county until an application therefor shall have been made to said commissioners by the board of supervisors of such county.

3. The monies to be loaned in each county shall be loaned by the "commissioners for loaning money" in such county, under the act of April 11, 1808; and where there shall be no such commissioners in any county, they may be appointed in the same manner, and shall hold their offices for the same term, and upon the same tenure as if appointed under said

act, and pursuant to the provisions of the revised statutes.

4. The commissioners of each county, before entering upon the duties of their office, under this act, shall take the oath of office as prescribed by the constitution of this State, and file in the office of the Comptroller a like bond as is provided for by the fourth section of the act last aforesaid, in addition to the bond required by that section in cases where that may now be required.

5. The principal moneys to be loaned under this act shall be payable at such time or times, within twelve years from the passage of this act, as the said commissioners mentioned in the eleventh section of this act, shall designate, and the interest thereon at the rate of six per centum per annum, shall be payable on the first Tuesday of May in each year; and the said commissioners for loaning money may retain out of the said interest, one-half of one per cent. for their compensation.

6. The said commissioners for loaning money shall keep separate books and accounts relating to the loan authorized by this act, distinct from their other loan office books and accounts, and in addition to the evidences of title required by said last mentioned act, it shall be the duty of the said commissioners to require of the borrower certificates from the proper officers, showing that there is no incumbrance upon the property proposed to be mortgaged on record in their offices.

7. Whenever any principal moneys loaned by said commissioners shall be paid in to them, it shall not be re-loaned, but shall be paid into the treasury of this State.

§ 8. The moneys to be realized from the stock authorized to be issued under the preceding section of this act, shall belong to the general fund of this State, and the interest upon said stock shall be paid out of the said general fund.

§ 9. Except as herein otherwise provided, all the provisions of the act aforesaid, entitled "An act authorizing a loan of monies to the people of this State," passed April 11, 1808; and also of the act to amend the same, passed March 29, 1809; and also the act passed April 21, 1825, entitled "An act to provide for the conveyance of land sold by a commissioner of loans under the act entitled 'An act authorizing a loan of monies to the citizens of this State,'" passed April 11, 1808; and also of the act, entitled "An act relative to the loans of 1786, 1792, and 1808, passed April 13, 1832," shall apply to the loans to be made under the seventh section of this act, in the same manner as if the moneys loaned constituted a part of the said loan of one thousand eight hundred and eight.

§ 10. Whenever upon the foreclosure and sale of any premises mortgaged to secure any loan made under the seventh section of this act, the said mortgaged premises shall not bring the amount due and to become due upon said mortgage with the costs of foreclosure and sale, the deficiency shall be reported by the commissioners making such sale, to the board of supervisors of the county, who shall at their next annual meeting, cause such deficiency and the interest thereon, to be raised as part of the contingent charges of such county, and paid over to the county treasurer whose duty it shall be to pay the same over to the said commissioners for loaning money.

§ 11. The commissioners of the canal fund, and the bank commissioner appointed by the Governor and Senate, shall be commissioners to carry this act into effect; but it shall not be lawful for them to require any issue of stock, as herein before provided, after the first day of February next.

§ 12. If the supervisors of any county in this State shall refuse or neglect, for three months after the passage of this act, to take said loan on the terms herein mentioned, the said commissioners may, in their discretion, loan the money appropriated to said county to any incorporated bank or banks in said county; and if there is no incorporated bank in said county, then the said commissioners may loan the amount apportioned to said county to any incorporated bank or banks in this State. Said loans mentioned in this section to be made upon the like terms and security as the loans mentioned in the third section.

§ 13. The clerk of the board of supervisors of the several counties in this State is hereby authorized to call a special meeting of the board of supervisors in their respective counties, on the application in writing of any three of the supervisors, giving at least six days notice to each supervisor of the time and place of meeting; and the said supervisors or a majority of them, when so met, shall have power to adjourn from time to time for the purpose of carrying into effect this act.

§ 14. This act shall take effect immediately on the passage thereof.

State of New-York, Secretary's Office.—This bill having been approved and signed by the Governor of the State, on the 19th day of April, 1834, I do hereby certify that the same became a law on that day.
JOHN A. DIX, Secretary.

NEW ORLEANS MARKET—April 15.

COTTON.—The following were the sales we heard of yesterday, viz:—800 bales Mississippi at 11½; 300 bales Alabama and Mississippi at 10½; 1300 bales Mississippi and Louisiana at 13½; 40 bales Louisiana and Mississippi at 11½; 17 bales do at 12; and 17 do at 14 cts.
Flour, \$3 12½ a 3 35; Pork, mess, \$11; prime, \$9; bulk pork, 2½ a 3c; Bacon, 4½ and 5½; Lard, 5 58 a 6½; Whiskey, 23 a 24c; Molasses, 21 a 22; Sugar, 5 a 6½; Corn, 67½ per bushel.—[Bulletin.]

VOL. III. OF THE RAILROAD JOURNAL AND ADVOCATE OF INTERNAL IMPROVEMENTS is published once a week in quarto form, with 16 pages to each number, at \$3; or in semi-monthly form, of 32 pages, stitched in a cover of colored paper, at \$4 per annum, in advance. The first and second volumes of the Journal may be had in two parts to the year, either stitched in covers or bound in boards, at the subscription price, with price of binding, in one part, 50 cents, in two parts \$1 per volume. Those in covers may be sent by mail to any part of the country, the same as a magazine. Published at No. 35 Wall st., New-York, by D. K. MINOR, Editor and Proprietor.

THE MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS is now just commencing its second year. It will be continued in a manner altogether superior to that of the first year. It has drawn forth many valuable correspondents, in different parts of the country, with the assistance of whom, and those who may hereafter contribute to its columns, together with the ability of Mr. JOHN KNIGHT, formerly, and for several years, proprietor and publisher of the LONDON MECHANICS' MAGAZINE, who is engaged as Editor, the proprietor has no hesitation in saying that it will be found worthy of an extended circulation and a liberal support. The first year, or two first volumes, having been stereotyped, may now be had either in numbers, or bound in boards—either at wholesale or retail. Price \$1 50 per vol. in numbers, or \$1 75 in boards, or \$3 per annum. A liberal discount made to the trade. Published by the proprietor, D. K. MINOR, at No. 35 Wall st. N. Y.

THE NEW-YORK FARMER AND AMERICAN GARDENER'S MAGAZINE, has commenced the second volume of a new series. It is published once a month, in quarto form of 32 pages to each monthly number, at \$3 per annum in advance. The last volume may be had either stitched in a cover, so as to be sent by mail, or in boards. Price, stitched, \$3 25; in boards, \$3 50. Each subscriber who pays in advance, or previous to the first of April, free of postage or commission, will be entitled to eight additional pages to each monthly number, or 96 extra pages to the volume. Published at No. 35 Wall street, N. Y.; D. K. MINOR, Proprietor.
Jan. 22, 1834.

A QUARTERLY JOURNAL OF AGRICULTURE AND MECHANICS will hereafter be published at the same office. Each quarterly number will contain about 300 large octavo pages, embracing the most choice articles from the best agricultural and mechanical publications both in America and Europe. It will form 2 volumes to the year, of about 640 pages each, and will be put up like other quarterly publications, so as to be sent by mail. Price, \$5 per annum, in advance.

N. B. A small edition only will be published. Also, the PLOUGH-BOY, a cheap agricultural publication, of eight quarto pages, is issued once a week, at \$1 50 per annum, in advance. It contains much interesting reading upon agriculture, &c.

Also, the NEW-YORK AMERICAN, daily, tri-weekly, and semi-weekly.

§ All Letters and Communications for the above publications, may be addressed, free of postage, to

D. K. MINOR.

PATENT RAILROAD, SHIP AND BOAT SPIKES.

§ The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 16 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having counter-sunk heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

§ All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

§ Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. L. Brower, 323 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

§ S.—Railroad Companies would do well to forward their orders as early as practical, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

Jas. Lam

H. BURDEN.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MAY 10, 1834.

SURVEY OF THE NEW-YORK AND ERIE RAILROAD ROUTE.—We are gratified to announce that the Bill which we formerly noticed as being before the Legislature of this State, directing a complete survey at the public expense of the proposed Railway from this city to Lake Erie, through the southern tier of counties, has become a law.

This is a measure of great public importance, and of peculiar interest to this city and to the southern tier of counties: and we design to give it a more extended notice in a subsequent number.

SLOOP CANAL.—Our friends in Oswego are looking forward to a more ready communication between the Atlantic and our great inland seas. We publish to-day the report of a committee upon the project of a Sloop Canal from Lake Ontario to the Hudson.

A Railroad is in contemplation, and will, no doubt, soon be commenced, from Columbus to Augusta. This will so connect the latter place with Charleston, that the communication between Charleston and Columbus will be made in 26 hours—allowing 12 from Charleston to Augusta, and 14 from Augusta to Columbus. From Columbus to Pensacola, 20 hours is a liberal allowance of time. From Pensacola to some suitable point on Mobile Bay, the mail could be carried in 7 hours over land in stages, and thence to New-Orleans, a distance of 160

or 170 miles, in steamboats, it could be carried in 16 hours, making in all *two days and twenty-one hours* from Charleston to New-Orleans. To this add the time required by the steam-packets running between Charleston and New-York, (72 hours,) and the result shows that, with the aid of our Railroad, and that from Augusta to Columbus, to connect with the railroad already completed from Charleston to Augusta, the communication between New-York and New-Orleans would be made in *five days and twenty-one hours*.

To these facts, which ought to be impressed upon every mind, it is proper to add, that there is perhaps no country equal in extent in the Union, over which a railroad could be constructed at so small an expense as over the route from this place to Columbus. It is a level ridge throughout the whole distance, and the choicest timber for the construction of such a work is growing in the greatest abundance upon the very ground which the railroad would occupy.—[Pensacola Gazette.]

DELAWARE AND RARITAN CANAL.—On the 28th, two boats, loaded with coal, from Mauch Chunk, arrived at the Easter Basin in Trenton, via the Delaware Canal, Penn. They came up the river from Bristol, and entered our canal at Bordentown.

These are the first arrivals at Trenton from Mauch Chunk, by the canal. The feeder, we understand, is navigable to Lambertville for boats. The main Canal is also navigable for boats from Bordentown to Kingston; several with lumber have passed from Trenton to Princeton or Kingston this week, and a number have come down the feeder loaded with stone for the new Penitentiary.—[Trenton State Gazette.]

WISCONSIN PORTAGE CANAL.—By the following act of the Legislative Council of Michigan, it will be seen that a regular water communication is to be opened between Fox and Wisconsin rivers, or between Green Bay and the Mississippi at Prairie du Chien:

AN ACT TO INCORPORATE THE PORTAGE CANAL COMPANY.

SECTION I. *Be it enacted by the Legislative Council of the Territory of Michigan,* That such persons as may hereafter become stockholders therein, shall be, and they are hereby declared to be, a body corporate and politic, under the name and style of "the Portage Canal Company," and as such corporation they are hereby declared capable of suing and being sued, answering and being answered unto, impleading and being

impleaded, defending and being defended, in all courts and places whatsoever, and in all manner of actions, suits, complaints, matters, and causes whatsoever: And the said company shall have continued succession for the term of twenty-five years, and may have a common seal, and change the same at pleasure, and shall be in law capable of purchasing, holding, and conveying any estate, real or personal, for the use of said corporation.

SEC. II. The capital stock of said company shall be fifty thousand dollars, to consist of one thousand shares of fifty dollars each; and books to receive subscriptions towards constituting said stock may be opened by each of the following persons: Daniel Whitney, Charles R. Brush, Daniel Jackson, John P. Arndt, Henry G. Soulard, Nathan Godell, and John Larre, who are hereby appointed the first directors, and are authorized to elect their president from their own number, and to conduct every operation of said company until the first Monday in September next; and the subscriptions aforesaid shall continue open until the whole number of shares are subscribed; and if the subscriptions to the said capital stock shall on the first Monday in September next exceed the amount authorized by this section, it shall be the duty of the directors to meet and apportion the said stock among the subscribers thereto, in such manner that no person may have less than five shares if he subscribe for so many.

SEC. III. Five dollars on each share shall be paid at the time of subscribing to the said directors, and the balance in such instalments and at such times as the directors for the time being may require: Provided, that no instalment shall exceed ten dollars on each share; and previous notice shall be given whenever the payment of any instalment is required, by advertisement in a newspaper, printed three successive weeks, in the Territory or State in which the said canal is situated. The shares of the capital stock shall be deemed personal estate, and transferable in such manner as shall be prescribed in the by-laws of said company.

SEC. IV. The said directors may commence and continue the operations of said company, as soon as they may think the stock subscribed sufficient therefor.

LEGISLATURE OF NEW YORK.

In Assembly, April 14, 1834.

Report of the Select Committee on the Petition of Inhabitants of the County of Oswego.

Mr. O. Robinson, from the select committee to whom was referred the petition of sundry inhabitants of the county of Oswego, praying for the passage of an act directing the exploration and survey of an improved navigation from Lake Ontario to the Hudson river, adapted to the tonnage of vessels navigating those waters, and proportioned to the capacity of the supply of water from the lakes, rivers, and streams which may be made tributary thereto, and for a plan and estimate of the cost of the same; and for a survey, plan, and estimate of an improved navigation of the same capacity of the Seneca river, to its communication with the Seneca and Cayuga lakes, and for a report thereof to the next Legislature,

REPORTED:

That the subject referred to the committee, in whatever light it may be viewed, may justly be considered of the first importance, both to the enterprise and interest of the State of New-York. The citizens of this State have witnessed with high satisfaction the commencement, completion, and successful operation of the Erie canal, which has more than answered the expectations of its ardent and patriotic projectors. The value of property has been multiplied many fold; the arm of industry has converted the almost interminable regions of the forest in the western part of the State into fertile fields, enriching alike the hardy cultivator and the great commercial emporium of the State; cities and villages have arisen as if by enchantment, where, but for the Erie canal, would now have been a wilderness. Great and important have been the results of these works of internal improvement, not only to this State, but to a portion of the territory bordering upon the basin of the great western lakes. Let it not be supposed that the resources of western New-York are exhausted, or that she has arrived at that point in commercial and agricultural enterprise beyond which she cannot and will not pass. The spirited and enterprising citizens of that section of the State are now calling the attention of the Legislature to the construction of a canal from Rochester, up the valley of the Genesee, to Olean on the Allegany, the distance of 96 miles. Another project of equal importance is now in contemplation to unite the fertile regions of the north with the valley of the Mohawk, by means of a canal from Rome to the high falls of the Black river. Complete the Chenango canal and the improvements already commenced, double the locks upon the Erie canal east of Syracuse, construct those canals in contemplation, and your committee confidently predict, that in ten years the Erie canal will not be adequate to the business of our own State, and the products of the west will be forced to find an outlet to the Atlantic through some other channel.

Three great objects were primarily contemplated in constructing the Erie canal: First, to furnish the citizens of this State with an easy and cheap conveyance of their surplus produce to market; second, to secure and preserve the trade of the west; third, revenue.

The first of these objects has been attained, and the attention of your committee has been principally directed to a consideration of the second. That to secure and preserve the trade of the west is an object worthy the continued exertions and resources of the "empire State," cannot and will not be denied; that it is so secured may well be doubted. The importance of the western trade will be seen by a view of the vast extent of country bordering upon and surrounding the western lakes, a region of country more fertile and productive than the sun in his course through heaven does not shine upon. If we glance an eye over the immense regions connected by the western lakes

SEC. V. Whenever any stockholder shall fail to comply with any call or demand for the payment of any instalment, he or she shall forfeit his or her shares, and any previous payments made thereon; and it shall be lawful for the said company to make division of the surplus capital and net profits which shall accrue thereon from time to time, in such manner as the directors shall see fit, or to employ the same in the purchase of any stock of any company incorporated by the laws of the Territory, or in any other manner to dispose and use the same for the benefit of the stockholders therein: Provided, that nothing herein contained shall confer upon said company banking privileges.

SEC. VI. The said company shall within five years after the passage of this act construct and complete a canal to connect the waters of the Fox and Wisconsin rivers, at or near the place known as the "Wisconsin Portage," in the counties of Brown and Iowa, of sufficient depth and width to admit the passage of such craft as are usually employed in the carrying trade on the said rivers, and properly secured at the extremities by guard-locks, or such other means as may be requisite to prevent the flowing, by means of said canal, of either of said streams into the other: Provided, that nothing in this act contained shall be so construed as to give to said company any privilege which might tend to impair the facilities which at present exist for the passage of boats and property on the said portage, but the same shall remain in as simple a manner as if this act had not passed.

SEC. VII. The election of directors shall take place annually the first Monday in September, and public notice thereof shall be posted up in three public places, or published in a paper printed in the county of Brown, for three weeks previous to the time of holding any such election. At the time and place appointed in said notice, the stockholders present, either in person or by proxy, shall proceed to elect by ballot seven directors, who shall hold their offices for one year, and until others are elected in their places, and are qualified. The said directors shall immediately on their election, or within ten days thereafter, take an oath, or affirmation, for the faithful discharge of their duties, and shall, by a majority of vote, select one of their number to be president; and the said president and directors may meet from time to time, at such places as they may find expedient, and shall have power to conduct by a majority all the concerns of said company, to make such by-laws, rules, and regulations, not repugnant to the laws of the United States, or of this Territory, as they shall deem necessary for the well ordering of the affairs of the said corporation, and in case of vacancy by death, or resignation, or otherwise, in the office of director, the other directors in office may supply such vacancy by a majority of votes until the next annual election. The president and directors may appoint a president *pro tem.*, to preside at said meetings, and to do all other acts that the said president might or could do.

SEC. VIII. In case any election shall not be held at the time when the same ought to have been held, the directors in office shall appoint another day for holding the same, giving the like notice required of any annual election: Provided, the said directors in

office shall be incapable of transacting any other business except in regard to said election after the annual election day.

SEC. IX. Five directors shall be a quorum to transact the business of said company, and any acts of the majority so met shall be binding upon the company; and the said directors shall have power to appoint and remove at pleasure such sub-officers, agents, clerks, artists, and workmen, as shall be necessary for executing the business of said company.

SEC. X. The company shall have power to erect piers, wharves, warehouses, and other necessary buildings and improvements, in and about said canal for commercial purposes.

SEC. XI. Said company shall be compelled at all times to allow the passage of any boat or water craft through said canal, upon the demand of any person, on payment of such toll or duty as the directors of said company may prescribe: Provided, that the toll to be exacted for the passage thereof shall never exceed five cents per hundred for any property which may be transported thereon, or forty cents per ton burthen for any boat or other craft which shall be admitted through said canal: Provided further, that the tonnage of no boat or other craft, which shall be admitted through said canal, shall be estimated at less than three tons burthen; and said directors are hereby authorized so to estimate all boats or water craft of less than three tons burthen, and to charge toll accordingly; but if more than one boat of less than three tons burthen shall be ready to pass said lock at the same time, they shall be received until the lock is full, and no more toll than for three tons burthen shall be charged upon the whole, unless their tonnage shall actually exceed three tons.

SEC. XII. The privileges granted by this act shall be vested in said company for the term of twenty-five years: Provided, that the said canal shall be completed on or before the ninth day of March, which will be in the year eighteen hundred and thirty-nine.

SEC. XIII. Said company may purchase any land, or lands, of the owners thereof, through which said canal may pass, but no part of this act shall be so construed to give any right to said company to occupy the land of any individual or individuals without first obtaining their consent.

SEC. XIV. The property of every individual vested in the said corporate funds shall be liable to be taken in execution for the payment of his or her just debts, in such manner as is or may be prescribed by law: Provided, that all debts due to said company shall be first paid and discharged.

Approved March 7, 1834.

Territory of Michigan, ss.

This shall certify to all whom it may concern, that the foregoing is a true copy of the original act, entitled "An Act to incorporate the Portage Canal Company," now on file in the Office of the Secretary of Michigan Territory.

L. S.

In testimony whereof I have hereunto set my hand and affixed the Seal of the Territory, this 10th day of March, A. D. 1834.

STEVENS T. MASON,
Secretary of the Territory.

and their tributary streams, if we regard the fertility of soil, the multiplicity of product, which characterize those regions, and if we combine these advantages afforded by nature with the moral energy of the free and active people who are spreading their increasing millions over its surface, what a vista through the darkness of time opens upon us! We see arts, science, industry and social happiness already increasing in those countries, beyond what the most inflated fancy would have dared to hope, thirty or forty years ago.

As yet the commercial and agricultural resources of the west are not developed. These twin sisters of the wealth of nations are yet in their infancy. Owing to the rapid increase of population in Ohio, and the wild and uncultivated state of a portion of her territory, the surplus productions of her farmers have until recently been consumed within her own territory. Michigan and Illinois, comparatively speaking, have furnished nothing for transportation; but when their exhaustless soil shall be cultivated and improved by the hardy and industrious yeomanry of the north and east, who are emigrating thither to a degree unprecedented in the annals of our country, their rich productions will be put afloat and will find a market upon the shores of the Atlantic, through such channel as presents safety, cheapness and speed, and to the most advantageous market. The citizens of the west have witnessed the commencement, progress, completion and effect of the splendid system of internal improvements in this State, and are nobly imitating the example with an enterprise and zeal worthy their character. Already are the head waters of the Mississippi connected at different places with the great chain of western lakes, by means of canals and railroads. The channels of communication now opened, and which will hereafter be opened between the lakes and the interior, will be thronged with vehicles of transportation, conveying the rich fruits of the labors of millions of free and happy people to flourishing cities and villages upon the shores of the lakes, whose population, wealth, and enterprise, will be equalled only by those upon the shores of the Atlantic.

The surplus productions of this extensive region will find their way to the Atlantic. Natural communications possess facilities and advantages which artificial never will and never can. Lake and river navigation is being understood. Steam power has changed every thing. Twenty-three by-gone years have witnessed improvements in commercial facilities in our own State which have claimed the admiration and imitation of the world.

The lethargy under which the people of Canada have slumbered for the last century has been thrown off, and they are now fully awake to the importance of internal improvements. They are beginning to appreciate the natural water communications with which nature has so bountifully supplied them. They have entered the lists and are nobly contending for a participation in, if not a monopoly of, the rich dowry of the western trade. Their enterprise has caused a communication to be opened around the Falls of Niagara, a distance of forty-one miles, by which vessels carrying 1,000 barrels of flour can go through without being lightened, at an expense of one cent per barrel, exclusive of tolls. The amount of business done upon this canal will be seen by reference to the fact, that 5,000 barrels of salt passed through during the last season, and had the requisite repairs been made, so as to have opened the canal with the commencement of lake navigation, the revenue would have amounted to more than 50,000 dollars.

The evil which the Canal Commissioners feared in 1812 now really exists. The produce designed for transportation upon the Upper Lakes is now let down to Lake Ontario by means of this canal with facility, and for a trifling expense. The prediction of the Canal

Commissioners, "that articles for exportation, when once afloat on Lake Ontario, would, generally speaking, go to Montreal, unless our British neighbors were blind to their own interests," is now fully verified. By a reference to the parliamentary proceedings of the Canadas during the last winter, it will appear obvious that they are not thus blind; that, on the contrary, they duly appreciate the importance of this trade, and that the greatest industry, activity, and talent, are employed in the attainment of further improvements on the most magnificent scale. Appropriations have already been made for the improvement of the St. Lawrence, by which it is intended to connect the Atlantic with the lakes by ship and steamboat navigation. Let them make the Welland canal and the St. Lawrence navigable, as they purpose to do, and which they will do, for steamboats, and Cleveland will be within a sixty hours' ride of Montreal. When these improvements are completed, vessels of 300 tons can load at Chicago, at Cleveland, at Detroit, at Oswego, and other ports on the lakes, and deliver their cargoes at foreign ports. When direct exportation has once succeeded, direct importation will follow as a matter of course. When the Welland canal shall be completed, and the St. Lawrence improved, as designed, goods may be delivered at Cleveland from London for less than one-half what it now costs by the way of New-York and the Erie canal. Make the Erie canal a public highway, and the Canadian route will be preferable by one-quarter in point of expense. The vast superiority in the great point of economy in transportation, effected upon natural water communication, admitting of navigation by large vessels or steamboats, above transportation upon canals and railroads, has been satisfactorily proved by experience on the Hudson, the lakes, and the great rivers of the west. Even at the present reduced rates of toll upon the Erie canal, river transportation has the advantage by more than 300 per cent. The charge upon the transportation of wheat, per bushel, from Troy to New-York, is three cents, while the same transportation for a like distance upon the canal cannot be effected for less than ten cents.

The importance of the western trade has aroused a spirit of enterprise and competition in sister States. To participate in this trade, rival canals and railroads have been constructed in Pennsylvania, Maryland and Virginia, and it cannot be denied that these are already diverting a part of that trade from its natural current towards the lakes and the Erie canal, and will no doubt continue to produce such diversion in a ratio regularly augmented in their progress to completion. It cannot be questioned that a great portion of the produce and merchandize going to and coming from the fertile countries at some distance south of the great chain of the lakes, and east and north of the tributary streams of the Mississippi, must find their way into Virginia, Maryland and Pennsylvania. To prevent this diversion, the tolls upon the Erie and Ohio canals have been very judiciously reduced during the present winter.

The State of Pennsylvania has already declared, through one of her Senators in Congress, (Mr. Wilkins,) during its present session, her determination "still to go on in the advancement of her great system of internal improvements. She would not stop short in her great works. No combination would have the power to arrest her progress, until she should have accomplished her ultimate object, of depriving the empire State of New-York of all the carrying trade of the west. To this great point Pennsylvania was rapidly advancing, and under the wise administration of her State Government, she would not stop short of its accomplishment. She was engaged in an honorable rivalry with the empire State of New-York for the rich dowry of the western trade, and she would not stop until she should

have obtained the treasure." These works, then, which have cost Pennsylvania such enormous amounts, will be sustained, should they pay nothing but the annual repairs required to keep them in order. But Pennsylvania has obstacles to surmount of no ordinary character, before she will witness the consummation of the objects declared by the honorable Senator. Nature has interposed an insurmountable barrier to the construction of canals from the navigable waters leading to her commercial emporium and the Ohio. That Pennsylvania does possess advantages over New-York cannot be concealed or denied. Their canal and railroads were in successful operation for the present season before the 20th of March last, while our canals must remain closed by the frigid laws of nature, on an average of seasons, until the middle of April. Goods were delivered at Pittsburgh on the 26th of March, in eleven days from Philadelphia, and before our canals are opened, will be delivered at the Sault St. Marie or Chicago. It is said too, that the Pennsylvania route possesses a decided advantage, in point of time and expense; that merchandize can be delivered in fourteen days at Cincinnati from Philadelphia, while from New-York, by the Erie and Ohio canals, it will require from twenty to twenty-five days, and frequently much longer; and that the expense of transportation from Philadelphia to Cincinnati, during the present season, will be \$1.80 per hundred, while from New-York to Portsmouth on the Ohio \$2.06.

That the trade of the west is of vast importance, and is becoming yearly more and more important to the commercial interests of this State, cannot admit of doubt; and that there is danger of its being diverted, or a portion of it at least, through other channels than the Erie canal, to the Atlantic, your committee think is equally apparent.

In the spirit of enterprise and rivalry with which our southern and northern neighbors are actuated, your committee see no cause for serious apprehension, jealousy, or alarm, because they believe it is within the power of this State to secure the trade of the west beyond the reach of competition or rivalry.

The remedy and only remedy which can be applied to secure to ourselves and posterity this rich inheritance of national wealth, is by opening a communication between the Hudson and lakes Ontario, Seneca, Cayuga and Onondaga, of sufficient magnitude to admit the passage of the smaller class of steamboats, and of the ordinary vessels which navigate those waters. The advantage to be derived from such a communication must be apparent to all. It will combine safety, cheapness and expedition, the three great considerations in commercial enterprise, and save the loss and expense attendant upon numerous transshipments.

That such a communication is entirely practicable, your committee entertain no doubt. Whether the object can be better accomplished by improving the Mohawk river, Fish creek, and from thence into Onondaga lake and down the outlet to Three River point, and thence down the Oswego river to Lake Ontario; or by enlarging the Erie canal and the Onondaga lake side cut, and thence to Lake Ontario by the Onondaga lake and river, and the Oswego river, your committee are unable to form an opinion, not possessing the requisite information. Upon the practicability and necessity of carrying this project into execution, your committee have been referred to a communication from Benjamin Wright, Esq., late chief engineer of the New-York canals, addressed to Joseph Bloomfield, Esq., which is hereto attached, and to which they beg leave to refer, as a paper containing much valuable information.

As to the expense of opening such communication, your committee possess no correct information upon which to base an opinion.

Comparing, however, the estimates of Judge Wright in relation to the St. Lawrence canal, and estimates which have been made as to the expense of opening all the proposed channels of communication from Utica to Oneida lake, and from thence to Ontario, Onondaga, Cayuga and Seneca lakes, (which latter is estimated at less than \$900,000,) the cost will, when contrasted with the important results, be but trifling.

The amount of revenue to be derived from transportation is difficult to be imagined, and much more difficult to be ascertained. Judging, however, of the future from the past and the present, we may safely come to the conclusion, that ten years will not elapse, after the completion of the proposed project, before we witness the same busy scenes upon its waters that we do now upon the Erie canal. Calculation, like our advance in numbers, outruns fancy. "Things which twenty years ago a man would have been laughed at for believing, we now see. At that time, the most ardent mind, proceeding on established facts by the unerring rules of arithmetic, was obliged to drop the pen at results which imagination could not embrace."

The Erie canal is but a carrying place between the Hudson and the great lakes. It bears about the same proportion to the amount of business which is done between those waters now, as the Great Western turnpike did twenty years since. Proportionably to the wants of the country it affords about the same facilities.

Your committee here adopt with satisfaction, and in their opinion with particular propriety, the language of the Canal Commissioners, in their report before referred to. "The life of an individual is short. The time is not distant when those who make this report will have passed away. But no term is fixed to the existence of a State, and the first wish of a patriot's heart is, that his own may be immortal. But whatever limit may have been assigned to New-York by those eternal decrees which established the heavens and the earth, it is hardly to be expected that she will be blotted from the lists of political societies before the effects here stated shall have been sensibly felt. And even when, by the flow of that perpetual stream which bears all human institutions away, our constitution shall be dissolved and our laws be lost, still the descendants of our children's children shall remain. The same mountains will stand, the same rivers run, new moral combinations will be formed on the old physical foundations, and the extended line of remote posterity, after a lapse of two thousand years, and the ravage of repeated revolutions, when the record of history shall have been obliterated, and the tongue of tradition, the shadowy remembrance of ancient events into childish tales of miracle, this national work shall remain. It shall bear testimony to the genius, the learning, the industry and intelligence, of the present age."

It is unnecessary for your committee to dwell on the advantages which the commerce of the State must derive from opening a scene so vast to its incessant activity, and so the influence which must result from holding beyond the reach of rivalry and competition, a key to the commerce of our western world. They are known and will be duly appreciated by the intelligent people of this State.

Deeply impressed with the importance of the subject, your committee are of opinion that speedy measures ought to be adopted to carry into effect the prayer of the petitioners. In pursuance of these views and opinions, your committee have prepared a bill, which they now ask leave to introduce.

DOCUMENT.

Letter from Benjamin Wright, Esq.

New-York, April 1, 1834.

Dear Sir,—Your favor of 29th ult. is before me, and I will endeavor to give you all the in-

formation in my power touching the subject of your letter. The project which the Canadians have in hand to make a steamboat canal of 10 feet water, to pass all the rapids between Montreal and Ogdensburg, or Lake Ontario, is one which has a very important bearing, in its consequences, upon the people of the State of New-York, and the Erie canal tolls. It is certain to my mind, that with such a canal as I have projected along the St. Lawrence, and the Welland canal, in good order, that all the products of the soil, from all the Upper Lakes, can be carried to tide water *a great deal cheaper by this route than they can ever be done by the Erie canal*, or any other work.

The plan of the improvements as projected along the St. Lawrence, is to make short canals and locks around the rapids, leaving the steamboat to navigate the river and lakes in all the intermediate spaces. The whole length of all these canals, (although in seven or eight different pieces,) does not exceed 31 miles and about 175 feet of lockage. This can be executed for about three millions dollars, and completed in three years from the time it is commenced, if they choose to do so.

That the Welland canal can and will be put in good order, there is no doubt, as it appears by the measures adopted at the late session of their parliament, that they intend to make it a government work, and will no doubt do so next winter.

The question now arises, what shall be done by the state of New-York to retain the trade of the Upper Lakes to her great commercial port, under all these views of the matter? I see no better plan than your memorial, adopted by the people of Utica, suggests, viz.: by a large canal to the Oneida lake, or rather to a certain point on Fish creek, where 8 feet water can be at all times carried to the lake; thence through the lake, and down the outlet to Three Rivers, and then down the Oswego river. And I see by your letter, that your views extend to branching off up the Seneca river, to Cayuga lake: this would be a very good addition to the whole project.

You ask me to give my views of the expense of such a work from Utica to the Oneida lake, upon the plan you propose, of 60 feet canal width and 8 feet depth, with locks the size of the Welland canal, which is 110 feet by 22 in the chamber.

As I know the country well, from having surveyed it, I see no point of extra expense in the canal, except in passing the Rome summit, and the plan of getting over Oriskany creek, Sedaque; these latter, I do not think, would present any very formidable obstacles to good engineers; but I have not sufficiently digested a plan of the project that would enable me to even approximate the expense. I know that you must look for water either from Fish creek, to the Rome summit, or from Black river. The former would not be expensive, as I know, and have surveyed, a route where it may be brought easy and cheap.

This project would, if executed, enable vessels of 130 to 140* tons, to navigate on the large rivers and lakes with sails, and on the canals be towed by horses, or it would permit steamboats of certain construction, with wheel in stern, to pass through—such boats, from a model I have seen, would carry 100 tons of goods or produce.

The expense of such a project can only be known by a regular survey, and such survey ought to be made by an engineer who knows the formation of the whole country and can adapt his plan to a good and cheap work, and overcome the various difficulties best.

I have not said any thing about the competition which is to be looked for from Pennsylvania, if she goes on to form a connection between her canal at Pittsburgh with the Ohio canal at Akron. This latter place is about 40 miles

* Vessels of this tonnage measurement will carry 250 tons dead weight.—J. E. B.

from Cleveland, on Lake Erie, and we see already that Pennsylvania has been this year navigating her canals since about the 10th of March. The truth is, and we ought not to disguise it, that Pennsylvania can navigate three or four weeks earlier than we can, and even Canada can open her Welland canal nearly one month earlier than we can our Erie canal, and the St. Lawrence canal can be navigated earlier than our canals if they pay a little attention to management to clear the ice. That the project of making a canal of the size I have named from Utica to Oneida lake is *feasible at an expense not alarming, is certainly true*; indeed, with the exception of the difficulties at the summit and east of it, all the country is as favorable *as you can wish or desire*. That such canal will be able to transport much cheaper than the present canal, taking into consideration that such a large portion of distance between Oswego and Utica is natural waters, there can be no doubt; and that the time will soon arrive when we must expect competitors for that lake trade, is also certain; and in the race for this important object, it is of vital importance that we should have early and sound information on every point relating to this matter, so as to act promptly and definitively when we do act, cannot be doubted.

If such a project was well executed so far as from Oswego to Utica, there is no doubt its advantages would be such as to show the propriety of conveying it on to some proper point of the Hudson, and then we should see whether we cannot compete successfully with any of our neighbors, north or south of us. The prize contending for is a grand one, and well worthy of the exertions of the state of New-York.

Permit me to make one remark before I close as to the Oneida river, below Oneida lake. I have understood that some surveys have been made to estimate the expense of overcoming the three rapids in the 18 miles of this river between Oneida lake and Three River point. Let me say that great care is necessary, to prevent injury to the country, by dams, across this river, which I have heard is the plan proposed. There is a great extent of flat country along this river, and no dams ought to be made on any account. From a perfect knowledge of this river, and the country along it, I am decidedly of opinion that the improvements ought to be by short canals and locks. One at the outlet of the lake would be about one mile, one at Cockederoy $\frac{3}{4}$ mile, and one at Oak Orchard, say one mile, all the other parts of the river are, or may easily be made, 8 feet water, and this would do no injury to the country.

I have suggested the above from my wish to see every improvement of this kind, when attempted, done right, and I know too well the evils to a country to have a pernicious plan of such works adopted.

I am not perfectly satisfied with the size of the locks and canal as you proposed, I should prefer locks 24 and 26 feet wide and a canal not less than 75 to 80 feet on the surface. However, this is a future consideration, and when orders are given for the survey, the estimate can be made on as many different plans as shall be thought advisable.

With great respect and esteem, I am, dear sir, your obedient serv't,

BENJ. WRIGHT.

JOSEPH E. BLOOMFIELD, Esq.

THE RAILROAD.—We learn with pleasure that the Tusculumbia, Courtland and Decatur Railroad Company has agreed that their road may form a link in the grand chain of internal improvement, by which it is contemplated to unite the Atlantic Ocean with the Mississippi river, at some convenient point above New-Orleans.

The Paisley Canal Passage-Boats. By JAMES WHITELAW. [From the London Mechanics' Magazine.]

Sir,—As your correspondents have been requested to forward to you information respecting the light gig-shaped boats lately introduced upon canals, I send you the following account of the Paisley canal passage-boats, from which account I think it will be seen that the skiffing, or rising to the surface of the water principle, so much insisted on by Mr. Macneill, has little to do with their quick rate of sailing.

Description of one of the Boats.—The length is 70 feet, width 6 feet, and 1 foot 10 inches is the depth. With ninety passengers, which is as many as a boat can conveniently take, the draught of water is 19½ inches; when all the passengers are out the draught is only 5½ inches. The rudder is 2 feet long and 20 inches deep, and its bottom is in a line with the under side of the keel. The weight of the iron work is 17 cwt.; and the weight when the boat is finished is 33 cwt. The prefixed figure is a side view of one of the boats. The windows in front light the cabin, and those behind are for the steerage. The part at the bow marked 8 feet, is a deck for the passengers, and the part marked 6 feet, has seats round it. The 6 feet towards the stern is for the same purpose as the 6 feet feet in front, and the 7 feet is a deck on which the steersman stands; under each deck is a place for any light luggage. The keel is 35 feet long, the part in front (under the boat) marked 16 feet, and that behind, marked 19 feet, have no keel; this allows the boat to turn quicker. A line stretched from the highest point in the bow to the highest point in the stern, would rise about 6 inches above the lowest part of the gunnel. The depth of the keel is 5 inches; and this depth did not form part of

the measures given above, of the draught of water, and the depth of the boat. The plates are of 16th wire-gauge. The ribs are made of light gunnel-iron; and a rim of the same goes round the inside of the top edge of the boat, on which the wooden gunnel is fixed by means of square-headed screws. There are light ribs of wood laid inside of the boat, on which the flooring is nailed, and a broad stripe of wood runs between the seats and the windows, so high that the passengers may rest their backs upon it. The cotton oiled cloth, which covers the cabin and steerage, requires three very thin coats of boiled oil to make it water-tight, and it should be dried in the sun if possible: very light curved ribs, set about two feet apart, support the cloth overhead, and it is fixed to the frames of the windows, &c., at the sides of the boat. A boat of this kind can be finished in a most comfortable style for £130. The cost of the iron-work is £70, and £60 will pay the joiner and other work of the boat.

The hooks (there is one on each side), on which the towing-line is fixed, are fastened to the gunnel of the boat at about 15 feet from the bow; the rope is put on one of these, when the boat is not very much loaded; but when there are a great many passengers, the rope is fixed about 3 feet 6 inches nearer the bow; this helps the boat round the turns on the canal. The shape of the hook is as represented in the following sketch, to prevent the rope, any time it slacks, from falling off.

As the Paisley canal is a very winding one, the longest towing-line that can be used on it is as follows:

a, is the end connected to the boat; b, is fixed to the one horse, and c, to the other. If the rope were longer than this, it would draw the boat against the side, at a quick bend on the canal. The horse in front has blinders on it, and a boy rides on the one behind. The harness must be as light as possible. If the horses are run 12 miles a day, they keep in excellent order, but 16 miles per day is too much for them. The horses are changed every 4 miles. Half blood horses, or a breed between half blood and full blood, answer best.

The canal is 30 feet wide, except at the bridges, where it is only 11 feet, and there are two or three more contracted places on it, of considerable length. The average depth of the canal is 4 feet 6 inches. The sides of the canal are lined by a perpendicular wall, built of small stones, which goes 10 or 11 inches below the surface of the water, and as much above it. The distance from Glasgow to Paisley is 7½ miles by the canal, and the distance from Glasgow to Johnstone is more than 11 miles. The boats run the distance between Glasgow and Paisley in 50 minutes, and take in and put out a good many passengers at different places on the way; and the distance from Paisley to Johnstone is run over in a time proportionably short. The cabin fare is 9d., and the steerage fare is 6d., from Glasgow to Paisley. When passengers go from Glasgow to Johnstone, they

are charged 1s. in the cabin, and 9d. in the steerage.

The best speed for the Paisley canal boats is greater than 9 miles an hour; and this velocity occasions a very little and gradual swell, not more than 7 inches high on the canal; there is no wave whatever at or before the bow of the boat, and the water is lower than the surface of the canal just behind the bow; it then begins to rise, and the wave reaches its maximum elevation at about two-thirds of the length of the boat from its bow; at the stern the elevation of the wave is nothing, and any ripple that follows the boat is occasioned by the action of the rudder to turn the boat. At the best velocity the horses have not a heavy pull; but when the boat is drawn so slow as 6 or 7 miles an hour, the strain on the towing-line is very great, and waves rise in front of the boat more than 18 inches high, and wash over the banks of the canal. On account of the boat's being so light, it may be brought from its maximum speed to a state of rest without raising a wave in front; and for the same reason it may be brought from a state of rest to its greatest speed before a very high wave has time to rise. At the bridges the wave at the side of the boat is rather more than 9 inches high when the boat is going at its best velocity; and when two of the boats pass each other at a quick rate, the wave is not worse than this. When two boats

pass, the horses of one of them stop just before they come opposite the horses of the other boat, and a boatman takes the tow-line off its hook and holds it, in case it should come in contact with the bottom of the other boat, which is passing it at its full speed. As far as I know, no accident has happened since these boats have been put upon the canal, and the trade has increased very much.

When the speed of the boat is low, the waves rise and get a great way ahead of it; if the velocity is increased to a certain extent, the boat keeps up to the wave; and if it sail quicker still, the bow gets before the swell, which decreases in height as the velocity of the boat increases—in the highest velocities, at least, that I have seen the boat brought up to. From this it would appear that the wave has a determinate velocity, like the undulations that cause sound—at any rate, it has a maximum velocity: and if the whole cause of the formation of the wave continues when the boat goes quicker than its motion, the wave will fall behind. Now there is a vacuum formed towards the stern of every vessel when it is sailing; this, together with the height at which the wave stands above the level of the canal, and the motion of the wave in the direction of the boat, will cause it (the wave) to fall in towards the stern of the vessel, and act on its inclined sides, giving back a great part of the power spent in its formation, if the vessel is properly formed. The water sent towards the sides of the canal by the inclination of the bow, will be reflected from the perpendicular facing on the banks, and act in the same way. The lateral communication of motion among particles going in different directions, may have a tendency to keep down the swell. If this explanation is correct, the boats must have their dimensions and form corresponding to the width of the canal, and the velocity they are to sail at.

As the boat rises on the wave, its bow is up or down, according as the wave is fore or aft, I am, Sir, yours, &c.

JAMES WHITELAW.

CANAL TOLLS.—Since the opening of the canals, the amount of tolls paid to the collector at Albany has averaged about fifteen hundred dollars per day, up to and including the 24th instant, and the receipts have been gradually increasing from day to day. On the 25th, the amount received was \$2,300, and probably about the same on Saturday, the 26th. The receipts at this place, thus far, although less than last year, are fully equal to the tolls for the corresponding period in 1832—notwithstanding the diminution of the receipts by a reduction in the rates of toll, since 1832, of about 35 per cent.

During the first week of navigation, there has been received for tolls at Geneva, the sum of \$3,159 44—and at Salina, the sum of \$6,583 70. These are the most conclusive indications that the real elements of our prosperity are unimpaired.

PRODUCE FROM COXSACKIE.—We are fearful we shall not have the pleasure of reporting so favorably of the present season.

Coxsackie Landing is one of the most flourishing villages on the Hudson. In addition to the sloops employed by the enterprising merchants of that place during the past year, 25 in number, two lines of tow-boats, two boats to each line, have been established there, and will be in operation early in the present season. The principal exports from that place are brick, lime, stone, wood, hay, &c. Some idea of its local trade may be formed from the fact that 15,000,000 brick, 17,000 casks lime, 473,430 feet flagging and paving stone, 5,600 tons hay, and 3,750 cords wood, were shipped during the last year.

Stuyvesant is another large and flourishing village, a few miles above Coxsackie, on the opposite side of the Hudson. The Stuyvesant and Coxsackie steamboat United States, with its barges, commenced its regular trips on the 12th inst.

NEW INVENTED STOMACH PUMP—Description of a New Form of the Stomach Pump.
By P. B. GODDARD, M. D., of Philadelphia.
[From the Journal of the Franklin Institute.]

This pump consists of two parts, one of which I shall call the valve box, the other is an ordinary syringe, of good construction, to which the valve box is screwed when in use.

The valve box is a cylinder of metal, containing ovoidal or egg-shaped cavities, equally distant from the centre of the cylinder; at this point a pipe enters, which, when screwed on to the syringe, opens a communication between its cavity and these two cavities in the valve box. Near each end of the cylinder a short and slightly conical tube projects laterally, to which a flexible tube is to be fastened, and which causes a communication between the flexible tube and the cavity in the valve box. Each of these cavities contains a bullet accurately turned, so as to fit the orifices of the tubes, entering into it, and acting as a valve. It will be seen by reference to the accompanying cut (which is a section of the valve box) that if the valve box be held vertically, and the syringe screwed on it, the bullet in the upper cavity will fall upon the orifice of communication between it and the body of the syringe, whilst the bullet in the lower cavity will, in like manner, lie upon the orifice of the tube leading externally. If the lower tube be now immersed in water, and the piston of the syringe be drawn out, it will be evident that the body of the syringe will be filled with water from the lower tube. If now the piston be pressed home, the water will pass out of the upper tube; the bullet in the lower cavity preventing its escape there, just as the bullet in the upper one prevented the entrance of air before. It will then always pump water, or any other fluid, from the lower tube to the upper.

If the position of the valve box be now reversed, and the end which was above be placed below, the bullets will fall by their own gravity into the opposite ends of the cavities, and the instrument will act as it did before, viz. pumping from the lower orifice to the upper, although the relative position of the tubes has been reversed.

To use this instrument, the valve box must be held in nearly a vertical direction. A long flexible tube being passed into the stomach, is attached to one of the short conical tubes, say the upper, and a short tube leading to a basin is then fastened to the lower one. The basin being filled with warm water, and the syringe put in action, the water will pass into the stomach and dilute the poison. When enough has passed in, the syringe is to be turned in the hand, so as to bring the tube down which was before above, without taking off the flexible tubes, or changing them in any way, and the syringe again put into action. The water will be pumped out of the stomach, bringing the poison along with it.

The following are the chief advantages of this instrument. It is perfectly simple in its construction, and not liable to get out of order.

The directions for its use are easily understood, and as easily remembered.

After the flexible tubes are once adjusted, no alteration is required until the operation is finished.

When the instrument is once put in action,

gallons of water may in a few minutes be passed through the stomach, thus washing away every trace of poison and saving many a valuable life.

Ericsson's Caloric Engine. By G. K. O.
To the Editor of the Mechanics' Magazine.

SIR,—After reading several times the description of Ericsson's Caloric Engine, contained in your February number, I am yet at a loss in regard to some things. Assuming, as the description does, that the air in the part of the engine represented black is under greater pressure than that in the white, but being of nearly the same temperature, it must be of greater density; for example, let the density of one be represented by 50, and that of the other by 100, that is, the quantity of air contained in any given portion of the black is twice that contained in a corresponding portion of the white part: suppose the temperature in the large cylinder is 480 degrees higher than that in the small one. Now, if 10 cubic feet of air of the density of 100 be admitted into that of 50, it will expand till it becomes of the same density as that into which it is admitted, and occupy nearly 20 cubic feet; and when reduced 480 degrees in temperature, will yet occupy 10 feet. While the large cylinder admits 10 feet of the density of 100, the small one takes out 5 feet of the density of 50, which, though expanded by the heat, would only fill 10 feet of the density of 50; but being admitted into the black part, where the pressure and density is 100, it will become of the same density, and, of course, occupy but 5 feet. If the case be as I have stated, the corresponding portions of the two bodies of air in the black and white parts will soon be brought to the same density by a few strokes of the engine, and (according to the description) the difference of density constitutes the motive power. Will you, or some of your correspondents, please explain this difficulty. Yours, &c. G. K. O.

DR. MAJENDIE'S OBSERVATIONS RESPECTING THE PULSE.—Majendie has given a scale of the pulse, which shows that the difference in

frequency between that of the infant and the aged is more than double. The scale is, at birth, 130 to 140 a minute; at one year, 120 to 130; at two years, 102 to 110; three years, 90 to 100; seven years, 85 to 90; fourteen years, 80 to 85; adult age, 75 to 80; first old age, 65 to 75; confirmed old age, 60 to 65.

THE NUMBER FIVE.—The Chinese have a great regard for this number. According to them there are five elements—water, fire, metals, wood, earth; five perpetual virtues—goodness, justice, honesty, science, and truth; five tastes—sourness, sweetness, bitterness, acidity, and salt; five colors—azure, yellow, flesh-color, white, and black; they say there are five viscera—the liver, the heart, the lungs, the kidneys, and the stomach. They count five organs of the senses—ears, eyes, mouth, nose, and eyebrows. A Chinese author has written a curious dialogue between these senses. The mouth complains that the nose is not only too near, but above her; the nose in reply defends its position, by stating that but for it the mouth would eat stinking meats. The nose in turn complains of being below the eyes; they reply that but for them men would often break their noses.—[Le Lanterne Magique.]

CURIOUS ASTRONOMICAL THEORY.—We state the following on the authority of M. Arago, an eminent French astronomer: If we place in a horizontal line the series of figures of which the law is evident—

0 3 6 12 24 48 96 192

(each double the precedings,) and afterwards add 4 to each, we shall have a series denoting the relative distances of the Planets from the Sun, thus—

4 7 10 16 28 52 100 196

Mercury. Venus. Earth. Mars. * Jupiter Saturn. Uranus.

If 10 represents the distance of the Earth, 4 will be that of Mercury, 7 Venus, 16 Mars, and 52, 100, and 196, the respective distances of Jupiter, Saturn, and Uranus. This law was known as far as 100, before the discovery of Uranus: and the distance being found to correspond, affords a very remarkable confirmation of its truth. But it will be observed there is a deficiency of one term between Mars and Jupiter. This led philosophers to suspect the existence of a planet at the distance required to fill up the vacancy; and in 1801, Piazzi, of Palermo, actually discovered one, whose orbit was between those of Mars and Jupiter, and nearly at the proportional distance of 28 from the Sun. This planet was named Ceres; and since that period three others have been found—Pallas, Juno, and Vesta—all of which have their orbits so near each other as to lead astronomers to believe that these are the fragments of a larger planet, which had been shattered into pieces by some internal explosion, or the shock of a comet.—[London paper.]

FAMILY ALBUM.—We were not long since informed of a practice observed in the family of an excellent widowed lady of this city, which must be of great utility to her children, and which we venture to recommend to the readers of our paper. A folio, if we mistake not, is provided as a place of deposit, into which each member of the family is required to put once a week a piece of written composition, upon any subject that may suggest itself to the mind of the writer. Saturday evening the budget is opened and each piece read, criticised, and amended, in the presence of the family. It is impossible to calculate the advantage to be derived from such a practice, by establishing in early life habits of investigation, and mental improvement. The mother who thus educates her children, may sanguinely anticipate a maturity of usefulness and respectability. Dreading profligacy and low vice can have little to tempt a mind thus early shrouded by lessons of purity, domestic happiness, and pleasant fire side instruction. Give your children an early love for books, refine their taste by

works of art, set them an example of religious excellence, of correct manners, and endeavor to make the domestic hearth always attractive, and you bar up all the great avenues to immortality.—[Portland Courier.]

INGENUOUS CONTRIVANCE.—I wish, through the medium of the Centinel and Palladium, to notice a neat and economical improvement made by Mr. Currier, of this city, respecting bells for houses and hotels. Heretofore there have been separate bells for each apartment. These have been numbered to indicate the apartment where an attendant was wanted. In large establishments numerous bells are necessary, and these are costly, and sometimes not useful if the bell had ceased to sound before it was looked at. In the invention a single bell is sufficient for the largest hotel. The wire from each apartment, while it rings this common bell, communicates motion to a suspended ball over an appropriate number, and its long continued vibrations give, without fail, and without noise, the information that is desired. The expense is comparatively trifling.—[Boston Centinel.]

AGRICULTURE, &c.

SECURING A CROP OF FRUIT ON PEAR TREES.—Take a pair of scissors (such as are used in thinning grapes), and go over the corymbs of flowers, or rather of flower-buds, as soon as they are sufficiently elongated to allow the points of the scissors to pass between them (that is, some days before the blossoms are expanded), and thin them; leaving only five

or six blossoms in each, according to the size of the corymb; always preferring to leave the flowers which have the stoutest stalks, and those which are nearest the centre. This operation has the effect of diverting the sap to the flowers which remain, and gives them sufficient strength to set from one to three fruits in each umbel; which will prove a sufficient crop, and well repay the labor bestowed. Another mode, less tedious than the above, is also practised here, with success, on young trees. It consists in deferring that part of the pruning of them which is termed shortening the young wood, until the blossoms are in about the same state as is described in the above directions for thinning, and then shortening them back to the required length. This also checks the progress of the sap, and enables the tree to set fruit very freely. I am aware that my plan is a tedious one, and one that is almost impracticable on a large scale; but it is decidedly an excellent plan for dwarf trees in gardens, whether they are cultivated in the *quenouille* mode, against walls, or as espaliers; as these trees come within the reach of the hand, of a pair of steps, or of a ladder. In the hope that these remarks may, through your indulgence, avail my fellow-laborers in horticulture, at the coming season, I am, sir, yours, &c.

BERNARD SAUNDERS.

Nursery, Island of Jersey, Dec. 6, 1833.

We recommend the above article to the particular attention of young gardeners. The system of disbudding advised in the preceding paper by Mr. Callow, and that of thinning out blossoms suggested in the above paper by Mr. Saunders, are applicable to all fruit trees, and,

if generally adopted, would insure important results. We know an instance of a large apple orchard, the property of a commercial gardener in Kent, in which a knife has never been used: every thing is effected by disbudding, and pinching out young wood with the finger and thumb. The proprietor is not a scientific gardener; and he adopted the above practice from no particular theory, but simply from his own observation and experience, to save labor, and to insure good crops of large fruit. We hope to see his orchard next summer, and to report on it.—[Loudon's Mag.]

UVEDALE'S ST. GERMAIN PEAR.—A fine specimen of this pear has been sent us by Dr. Hamilton of Plymouth: its dimensions are, "13½ inches for the transverse, and 16½ inches for the longitudinal diameter; and its weight is 1 lb. 11½ oz. The tree from which these pears were gathered has, in former years, produced fruit of a considerably larger size, and in much greater abundance, than in the present season, and five years since a pear was gathered from it which weighed above 2½ lbs. —William Hamilton. 15 Oxford Place, Plymouth, Nov. 14, 1833."

CARROTS FOR LIVE STOCK.—The Altrincham carrot, grown in rows 18 inches apart, and the carrots at the same distance from each other in the rows, the roots attaining the thickness of a man's thigh, and the length of three feet, with a vigorously growing top, for feeding cows or other cattle.—[Loudon's Magazine.]

[The seeds of these carrots are for sale by H. Huxley & Co., 81 Barclay street.]

Description and Drawing of Beecher's Portable Horse Power. By the INVENTOR. [For the New-York Farmer and American Gardener's Magazine.]

This power is applicable to all purposes where speed is necessary, particularly to thrashing, grinding, turning, and sawing. Its superiority consists in the simplicity of the gear, only two wheels of 23 and 30 inches, with pinions of 9 and 6 inches, are necessary to get a speed of two to three hundred re-

volutions per minute. The power being obtained by a revolving lever on a smooth surface, it is not liable to break by sudden impetus, or stoppage. It requires no frame or building, but is simply fastened to the ground or floor. The lever may be increased in length without diminishing the speed. It may be removed and erected in three hours' time. It can be placed in a back yard or cellar, and it makes no jarring in the building. REFERENCES.—A, revolving lever; B,

driving wheel; C, nine-inch pinions; E, line shaft; and F, band wheel.

This horse power may be seen in the yard of the Railroad House, 98 Barclay street, New-York. The right to territory may be obtained of the inventor at the above place. Machines of one, two, three, or four horse power furnished to order at 60, 75, 90, and 100 dollars.

A portable cider mill and press to be seen as above.

[To the author of the following Report, the result of five years' practical experience, the thanks of the Society and the honorary Silver Medal were voted by the Directors.]

Report on the Value of Bone-Manure, in comparison with ordinary Farm-Yard Manure.

By the Honorable Captain W. OATLEY, Airlie Castle.

Mr. Watson, of Keilor, introduced the use of bone manure into Strathmore, having seen it used in England. I am not certain in what year he began to make experiments with it, or to employ it extensively, but I remember well that the great deficiency of farm-yard dung in 1827 (consequent on the almost total failure of the crop of the previous year) first induced me to try 4 acres of turnip without other manure, sown with 15 bushels of bone-dust per acre, which I obtained from Mr. Watson: it cost 3s. per bushel, or £2 5s. per acre. The crop of turnip on these four acres was at least equal to the rest raised with farm-yard manure; but as the whole of the turnips were pulled, and the land received some dung before the succeeding crop, much stress cannot be laid on the circumstance of the following white crop and grass being good.

Next year, 1828, encouraged by the former successful experiment, eight acres were sown with turnip, solely with bone-dust; the soil a light sandy loam; the subsoil gravel and sand, coming in some places nearly to the surface, which is very irregular, but in general has a south exposure. This field had been broken up with a crop of oats in 1827, after having been depastured six years, principally by sheep. The quantity of bone-dust given was 20 bushels per acre, and cost 2s. 6d. per bushel, or £2 10s. per acre. The turnip-crop was so heavy, that, notwithstanding the very light nature of the soil, it was judged advisable to pull one-third for the feeding cattle, two drills pulled, and four left to be eaten on the ground by sheep. The following year, 1829, these eight acres were sown with barley and grass-seeds, and the produce was 57 bolls 1 bushel, or 7 bolls 1 bushel nearly per acre, of grain, equal in quality to the best in the Dundee market, both in weight and color. Next year, a fair crop of hay for that description of land was cut, about 150 stones an acre; and though I am now convinced that the field should rather have been depastured the first year, yet the pasture was better than it had ever been known before for the two following seasons, 1831 and 1832. It is worthy of remark, as a proof of the efficacy of the bone-manure, that in a small angle of this field, in which I had permitted a cottager to plant potatoes, well dunged, and which, after their removal, was included in one of the flakings of the sheep, and had (one might have supposed) thereby had at least equal advantage with the adjacent bone-dust turnip-land, both the barley and grass crops were evidently inferior, and this continued to be observable until the field was again ploughed up. A very bulky crop of oats has been reaped this season, probably upwards of eight bolls per acre, but no part of it is yet thrashed.

Having detailed what may be considered a fair experiment during the whole rotation of the above eight acres, I may add, that turnip raised with bone manure, and fed off with sheep, has now become a regular part of the system on this farm; 15, 20, and, last year, 25 acres were fed off, and invariably with the same favorable results, with the prospect of being able to adopt a five-shift rotation, and to continue it without injury to the land. Every person in the least acquainted with the management of a farm, of which a considerable proportion consists of light, dry, sandy loam, at a distance from town-manure, must be aware of the importance of this, from knowing the expense at which such land was formerly kept in a fair state of cultivation; indeed, the prices of corn for some years past would not warrant the necessary outlay, and large tracts of land, capable of producing barley little inferior to that of Norfolk,

must speedily have been converted into sheep pasture, but for the introduction of bone-manure.

Note.—For the last four years, 25 bushels of bone-dust have been given to the acre; the price this year was 3s. per bushel, or £2 15s. per acre.

[The honorary Silver Medal having been offered as a premium for the best account of experiments made, to ascertain what advantage may be derived from plucking off the flowers of the Potato, it was adjudged to the author of the following Report.]

Report of an Experiment, made at Aberdona, to ascertain the Benefit resulting from the Removal of Potato-Blossoms. BY JAMES MURRAY.

The experiment was made according to the plan laid down by the Highland Society in their list of premiums for 1833.

The quality of the soil was not the best adapted for a very successful potato crop, but as I did not think of making the experiment until after the ground had been sown, I had no alternative left me. At the same time, I believe that an experiment of this nature, although made upon a crop raised in soil not peculiarly well adapted for its culture, will be quite as satisfactory in determining the advantages or disadvantages of it, as one made upon a more congenial soil. The soil consisted throughout the two acres upon which the potatoes had been sown, of a shallow loam, upon a bed of what is generally called till. The field had been well drained, but like every other field of the same nature of soil, (unless where Mr. Smith of Deanston's trenching plough may have been used,) continues in what may be called a cold, damp state, and therefore an enemy to the potato.

The variety of the potato sown was one which had been brought from Ireland some years ago by a gentleman of this neighborhood, and is called the red potato in this neighborhood.

I divided the whole field into parts of three drills each, and having explained what I wished to be done to a few children of from nine to twelve years old, previous to the appearance of any blossoms, they never allowed a day to elapse, without looking after their charge, and no sooner had a blossom begun to appear, (or in bud,) upon No. 1 of each part, than it was certain to be immediately plucked off. The other two drills of each part remained untouched until the blossoms upon No. 2 seemed to be fully expanded, when they were also plucked off, while No. 3 was allowed to ripen its fruit. By arranging the drills in this manner, I could depend on being more correct in having the soil of each of the drills of each part exactly similar than I could have been, had I divided the field in the manner proposed by the Society.

The preceding part of the experiment was (as it must appear to be) very simple indeed, and attended with no expense whatever, for there are always children in the neighborhood of a farm, who will do the work for a few pence a-day.

The most difficult part of the experiment to arrange was the taking up of the crop, so that there might be no interference between the different drills. To obtain this, I took three carts, one of which was appropriated entirely by No. 1 of each part, another by No. 2, and the remaining one by No. 3. In this manner I prevented the very slightest mingling of the potatoes.

The quantity of potatoes which each cart held, was exactly ascertained, and the management of this part of the experiment being given to one person, it was his business to mark down how many loads each cart took to the potato-pit.

After the whole crop had been taken off the field, and the overseer's note-book examined, the following was the result:

Drills, No. 1, being those from which the

blossoms were plucked in the bud, contained 30 bolls 2 bushels.

Drills, No. 2, being those from which the blossoms were plucked when in full flower, contained 27 bolls 3 bushels.

Drills, No. 3, being those upon which the fruit was allowed to ripen, contained 26 bolls.

The superiority, therefore, of No. 1 over No. 2, was 2 bolls 5 bushels; over No. 3, was 4 bolls 3 bushels; and of No. 2 over No. 3, was 1 boll 2 bushels.

From the above experiment it would appear, that the potato crop had been improved by having the blossoms plucked off, and that according to the period at which it had been done. At the same time, the difference is perhaps not much more than would be counter-balanced by the additional trouble given in taking up the crops; for, although regulated as well as possibly could be done, still it could not be taken up in nearly the time in which it would have been done, had the drills been resorted to indiscriminately.

The quality of the potato is remarkably good, it is of a mealy nature, and an uncommonly good keeper. We were using them last year here, in preference to early potatoes. Aberdona, Alloa, November, 1833.—[Transactions of the Highland Society of Scotland.]

TRANSPLANTING IMPLEMENTS.—Many farmers and gardeners prefer transplanting some field and garden crops, for various reasons, particularly on account of the greater certainty and yield of the crops. Turnips, which are so liable to be cut off by insects, and by turkeys, are, by transplanting, rendered as certain as most other field crops. In the New-England Farmer we find the subjoined notice of simple implements:

Several complicated transplanting instruments, consisting of several pieces, are described in the books, but I believe that one which I made and used last summer will be found to answer almost every purpose. It consists of a simple cylinder of tin plate, equal throughout, the top edge being turned over so as not to cut the hand. They may be made of any size, but the best for ordinary purposes are about 8 or 10 inches high, and 4 or 5 in diameter. It is placed over the young plant about to be removed, and pushed down a few inches into the soil, nearly or quite to the bottom of the roots; it is then taken up, bringing the earth and plant with it. Being then carried to the place where it is wished to set the plant, and the hole being previously made to receive it, it is set in the hole, and a few strokes from the digger on the outside loosens it, and leaves the plant erect in its place, with all the earth in a circular mass about it, when the transplanter is removed. The ease and neatness with which the operation is performed is very striking. A plant may be kept in the transplanter for several days uninjured, and carried to almost any distance. I have sent to Mr. Barrett three transplanters of different sizes, which will perhaps explain themselves better than my description. WILLIAM OAKES.

Ipswich, April 8, 1834.

Since the above notice we have been introduced to another implement for the same purpose, invented by a Mr. Smith, and which is for sale at the Boston Agricultural Warehouse. This machine is so fitted with a moveable slanting side, that the communication between the plant and the earth in which it grew, except a portion of soil attached to the roots, is cut off at the bottom as well as the sides, by which means, on withdrawing the implement, the extraction of the plant, and a quantity of attached soil in which it grew, is rendered certain.

Locusts.—According to the prevailing notion, these insects are to return this season, being the 17th year since their former appearance.

Manufacture of Silk—Gay and Bottum's Silk Apparatus. By the Editor.

Among the pleasing objects to be seen in the picture of our country, which is to be drawn some ten or fifteen years hence, will be the creeping and voracious silk worm,—pleasing, because the emblem of so much prosperity, and the source of so much earthly happiness. It will, in the language of the eye, say that the stony fields and the river bottoms of industrious New-England are inclosed by the bright-leaved mulberry—that the blooming fair in the land of steady habits are plucking the leafy food, feeding myriads of nature's humble and hungry offspring, and unwinding the glossy fibre that is to clothe and bring food to thousands and thousands of worthy families—that emulous New-York and Pennsylvania, and the youthful and vigorous West, are adding the important labors of the silk-worm to their already numerous and augmented resources,—and that the generous and high-minded South, seeing that industry and enterprise avail more than murmurings in averting the evils of the tariff, are introducing this and other abundant sources of wealth, for which their climate, soil, and internal resources afford many facilities.

From all we have seen and learned, we cannot resist the conclusion that this country will rapidly progress in the manufacture of silk until its own wants are supplied, and perhaps until it finds itself in a condition to compete with other countries to supply the markets of the world. In the northern, middle, western, and southern States, extensive preparations are being made, not only for the growth of the mulberry, but for manufacturing the silk, particularly in some of the New-England States. Of this progress our future pages will give an account.

Messrs. Gay & Bottum, of Lisbon, Ct., recently exhibited in this city their apparatus for the manufacture of this article. It was kept in active operation, and consisted of a reel for winding the silk from the cocoon, a winding frame for winding it from the hanks on to spools, or bobbins, a twisting or throwsting machine for doubling and twisting it on to other bobbins, and two looms for weaving. The whole apparatus would occupy a space of twenty feet square, and was made principally of iron, and in the most durable and finished manner. We took down a few notes, which we lay before our readers in the order they were taken.

The reel, which is on the principle of that of G. B. Smith, of Baltimore, consists of a wooden frame, and wheels of polished iron and brass. It is a very compact and simple machine, doing the work in the most perfect manner. The price of it is fifty dollars; and Mr. Gay thinks the part on which the silk is wound should be made of metal, to preserve the fibres or threads of the same tension until they become dry. This makes the thread smooth, and less liable to be fritted in the wear. If made of wood, he says the moisture of the silk will cause that part in contact with it to swell and shrink, and thus injure the thread. We should suppose, however, that glass, or thin pieces of metal fastened on the wood, would answer every purpose, and enable him to manufacture them at near one third the price.

On the supposition that the apparatus is moved with water or horse power, for which it is designed, one female will reel one pound

of raw silk for weaving, and one and a half or two pounds for sewing. For a hand reel, two females are required to do this quantity. One bushel of cocoons will make one and a quarter pounds of merchantable raw silk, and two ounces of floss silk.

The diameter of the winding part of Mr. Gay's reel is not sufficiently large. The larger it is the faster can the silk be reeled. One of these reels will reel for a whole neighborhood, and enable silk growers to produce raw silk that will command from \$4 to \$5.50 per pound.

The silk is taken from the reel and put on the winding frame, which winds, twists, and, if necessary, doubles the thread at the same operation. One female, on the above supposition that the apparatus is moved by other power, will wind and double two pounds from thirty bobbins in a day. This is for warp—a greater quantity for filling.

The spools are taken from the winding frame and put on the twisting or throwsting machine. One female will attend 30 to 50 spindles, producing about one and a half pounds of weaving silk, and two for sewing. After this operation the silk is cleaned by boiling in soap suds about two hours—20 lbs. of soap to 100 lbs. of silk. It is new colored, which is done in New-England principally with vegetable substances, almost entirely of the growth of this country. The silk is superior to that of foreign countries, in the durability of both color and wear. An elderly lady of Lisbon, Ct. has a piece of American silk of lead color, which has been lying about the house for more than twenty years; it is still unfaded and unchanged.

The next operation is weaving on a hand loom. A weaver, often a female, will produce per day five to six yards of thick vesting, or gros de Naples. Of thinner silks, six to ten yards can be woven. The specimens that we saw were very thick and strong, and were worth three dollars per yard.

Although silk has been manufactured in this country for more than fifty years, yet Mr. Bottum, who has given his attention to it for thirty years, informs us that there are not cocoons raised in the country sufficient to keep three hand looms in operation. If more cocoons were raised, there would be a better market, although they now command from three to three and a half dollars per bushel, of good quality. A farmer can raise one bushel for two dollars, if he hires all the labor. An orchard will let out for half or more of the cocoons produced. A gentleman in Hartford lets out his orchard for two thirds. One acre of the white mulberry will produce forty pounds of raw silk. Dr. Henry Holmes, of Hartford, says from fifty to a hundred pounds. Mr. Butler, of New-York, calculates the new Chinese mulberry, *Morus multicaulis*, will produce one hundred pounds. Mr. B. has 100,000 of these plants.

When the cocoons are first finished by the worms, they are put in shallow baskets, covered with paper, and dried in an oven moderately heated. When taken from the oven the baskets should remain covered until the cocoons become cool, and then they are spread to dry. If they are not immediately spun, they should be put in cotton bags, with a little tobacco sprinkled among them to keep out moths.

Cocoons before they are wound should be sorted into three qualities: poor, or first sort, for sewing silk, will command \$4 per

pound; next, of fair quality, worth \$4.50; best, worth \$5 to \$5.50, when wound.

American raw silk thus prepared is superior to that of foreign countries, and will command a better price. Mr. Bottum has for two years past bought all American raw silk he could obtain. But on account of the scarcity of the article, he has been obliged to depend principally on imported silk to keep his weaving in operation. He depends on the females of our own country for all the operations except that of weaving; and for this cotton weavers will supply every demand. Much loss and much discouragement have been met with, by depending on foreigners. Mr. B. has used raw silk from Bengal, Canton, and Italy, and he prefers American silk, at 10 per cent higher price. It is brighter, softer, and stronger, by 25 per cent. The Italian is next best for softness.

The whole apparatus exhibited by Messrs. Gay & Bottum is principally made of iron, finished in a superior style, and cost about \$1000. The greater part of it would last for a century. They will exhibit it in New-Haven, on the 15th of May, before the members of the Legislature of Connecticut. They intend also to exhibit it at the Fair of the American Institute in this city, in October next. As soon as it can conveniently be made, a reel will be exhibited at the Agricultural Warehouse, 81 Barclay street. The improvements in the machinery are the result of eighteen years of experiment and experience. Independent of the weaving part, or looms, two hands are required for the moving power. Horse or other power will be requisite in producing work in factories.

STRAWBERRIES IN FLORIDA.—Strawberries were in the market at Tallahassee, Florida, in the month of March. New potatoes had also made their appearance.

THE FRENCH TREATY.—Some grave questions seem likely to arise from the rejection by the French Chamber of Deputies, of the appropriation to carry into effect their treaty of indemnity with us. Under it, French wines have been admitted for more than two years, we believe, into our ports at a reduced duty. Some duties, overcharged, have been refunded, and the whole course of this country has been shaped on the presumption that the treaty was valid, and of mutual obligation. The perfect good faith, therefore, with which we have acted in the matter, may be advantageously contrasted with—to say the least of it—the carelessness and indifference of the French Government, as instanced by suffering, in the first place, the bill drawn by the Treasury of the United States for the first instalment, to be protested—then by omitting to submit the treaty to the Chambers till a period so late, in the session previous to this, that no action could be had on it—and finally by failing, on the present occasion, to support this measure of obvious justice, and now of admitted obligation, with the same strength, which a few days before in carrying an odious law—that for suppressing associations—the Ministers exhibited. That law, in a house of 460, was carried by a ministerial vote of 246 to 154—whereas the ministerial vote for the treaty was only 168, a defection of seventy-eight members! The rejecting, or anti-ministerial vote, was 176. The whole number composing the Chamber of Deputies is 460, and yet on a question involving the mutual harmony and good understanding of two nations, 344 members only attended. This is a matter, which, under the circumstances, it will be difficult for the French ministry to explain satisfactorily.

THE

NEW-YORK AMERICAN.

LITERARY NOTICES.

No. XXII.

Prairie du Chien, Upper Mississippi, Feb.

I had only been in Galena a few hours, when I learnt that a mail carrier was to start in the morning for Fort Crawford on the Upper Mississippi, and determined at once to accompany him, deferring an examination of the country around Galena till my return. It was about eleven o'clock of a fine, clear cold day, when my *compagnon de voyage*, a bluff-faced, curly-pated fellow in a green blanket coat, drove up to the door in a better sleigh than I had seen on any of the stage routes below, and wrapping myself up in a couple of buffalo robes and sundry blankets, I found myself, after ascending the rugged bluffs of Fever river, armed at all points to encounter the biting wind which swept the open plain beyond. And here I may remark, that although the cold winds in this prairie country have a power that I had no idea of till I experienced it, yet the people dress so much more rationally than they do at the North on the seaboard, that health and even comfort are but little invaded. I remember when first overtaken by the cold weather on the prairies, I was travelling with a simple furred wrapper as an overcoat and a pair of carpet socks over my boots; the last of which, from their clumsy and effeminate appearance, I long neglected to put on. But on arriving one night at a lonely shantee, I found an old Indian trader just disencumbering himself of his travelling gear, and the lesson has not been readily forgotten. His disrobing reminded me of the grave-digger in Hamlet with his sixteen jackets, (a stale joke by the by, which is now rarely practised upon the stage)—and a man at arms of the fifteenth century, with his armour of plate and triple coat of twisted mail, was not cased in better proof than was my Indian trader. Among the articles of dress that I recollect were a blanket coat over an ordinary surcoat, a plaid cloak upon that, and a buffalo robe trumping the whole; while three pair of woolen socks, buckskin moccasins, and long boots of buffalo skin with the fur inside, assisted his leggings of green baize in keeping his extremities warm; and a huge hood and visor of fur set Jack Frost at defiance, should he assail from above. I do not by any means mention all these defences as constituting the ordinary apparel of the country; for every one on the frontiers dresses just as he pleases, and whether he has his blankets and skins made up into coats and boots, or wears them loose about his person, no one comments upon it. The utmost freedom of dress prevails, and you may see the same person three days in succession with a leather hunting shirt, a surcoat of scarlet woolen, or a coat of superfine broadcloth, just from New York, all worn in any company, with the same air of independence; and, while several colors and textures frequently combine in the same dress, the result is of course an outrageous violation of taste in individual instances, but great picturesqueness of costume upon the whole. The very figure whose apparel is most obnoxious to the laws of good taste as last enacted by fashion, being often that, which, of all others, a painter would introduce into a landscape to relieve its colors, or copy for some romantic charm of its own.

The country through which we now rode, though only interspersed here and there with woodland, presented a very different appearance from the open prairie below. In the vicinity of Galena it was much broken by rocky ravines and deep gullies— which in the spring of the year must afford a ready passage for the water created by the melting of large bodies of snow—and far away toward the Mississippi the inequalities of the surface showed like a distant range of mountains, that on nearer approach resolved themselves into three or four distinct hills, which again on reaching their banks, proved to be only rocky mounds, of not more than 150 or 200 feet elevation—standing isolated on the vast plain like excrescences, thrown up by some eruption from its surface. Beyond these again, the country became beautifully undulating, and when the warm light of sun-set glanced along the tall yellow grass which raised its tapering spears above the snowy surface, and the purple light of evening deepened in the scattered groves that rested on its bosom—it required no exercise of fancy to conceive that these were sloping lands, and smooth meadows, and open parks, which the gathering shades of night were stealing from the eye. But at last, just where the landscape was becoming almost too broken to keep up these associations

of high cultivation, a distant light appeared glimmering at the bottom of a rocky valley, and slipping and floundering through the snow which partially smoothed the rugged descent, we entered a small hamlet of log huts, and drove up to the door of a frame building, which proved to be the public house of "Mineral Point."

A portly Tennessean of some six feet received us warmly at the door, and hurried me into a room where a large fire of bur oak, and a smoking supper of venison and hot corn cakes were alike welcomed. Half a dozen miners in leather shirts and belted coats of Kentucky jean were lounging about the establishment, while a tall backwoodsman in a fringed hunting frock, was stretched on several chairs, with a pipe in one hand, and the other resting on a Pelham savel, which, with a volume of Shakespeare, an old bible, and the "Western Songster," formed a pyramid beneath his brawny arm. "Whirling Thunder," the Winnebago Chief, had, as I was informed, just left the establishment, or our party would have been perfect. The old fellow, who, I presume, is superannuated, had been breathing revenge and slaughter against the Sacs and Foxes, who, he says, have killed a number of his tribe, and he avows a determination to come down upon the enemy with 700 warriors, though I believe it is well known that there are not at present 500 in his tribe, and they scattered far and wide on their hunting expeditions. As it was however, I found the company into which I was thrown, in more than one way agreeable. They were civil and intelligent; and when a segar was handed me by a well dressed gentleman engaged in the mines, who had set down to supper with us, I stretched my legs before the fire, and soon felt myself perfectly at home. The rumors of Indian wars, with the incidents in those already gone by being thoroughly discussed, feats of strength and activity were next introduced; whereat, a burly broad-shouldered fellow, with a head of hair like a boat's swab, jumped to his feet, and shaking the flaps of his rough kersey doublet like a pair of wings, he crowed and swore he could throw any man of his weight in the mines. "Why, Bill Armstrong," cried a little old man, who I was assured was 78 years of age, shaking the ashes from his pipe the while, "I could double up two such fellows as you in my time, and I think as it is (slowly rising and collarng the puissant Bill) I'll whip one of them now for a treat." They grappled at once, and Armstrong good naturedly allowing the old man to put him down, a laugh was raised at his expense. But Bill was too much a cock of the walk to mind it, and striding up to the bar, he called out, "Come here old fellow and take your treat—you're a steamboat—but who couldn't be beat by a fellow that had forty years the advantage of him."

The next day's sun found us, when a few hours high, in a country which, though not a house was to be seen for miles, I can only compare, with its intermingling of prairies and groves, rocky ravines and rapid brooks of sparkling water, to the appearance which the interior of the country along the Hudson would present, if the fences and farm houses were taken away. Its varied aspect was far more pleasing to my eye than the immense plains of table land below, where the sound of a waterfall is never to be heard, and a stone larger than a pebble is, (unless on the banks of the Illinois,) rarely met with. The soil, indeed, is not so rich, but the country is unquestionably more healthy; and though the climate is actually more severe in winter, yet the wind is so much broken by the numerous groves, and the general inequalities of the surface that one suffers much less from cold. A great error is committed by Government in keeping the land out of market, for the patches of woodland, though frequent, are not so dense as those below, and the number of smelting furnaces of lead ore, which are scattered over the whole country between Rock river and the Wisconsin, tends to diminish them so rapidly, that in a dozen years hence, wood enough will hardly be left for the ordinary purposes of the farmer. Whatever measures are adopted, however—and I believe there is a bill in relation to these lands, now pending in Congress—the pre-emption rights of the first settlers should be secured in the most liberal manner. Their sufferings from three Indian wars, and their endurance of every risk and privation, are almost incredible; and considering that it will take them some years now, to recover from the last affair of Black Hawk, I would have government give them several years credit; but the early sale of the lands, I believe to be indispensable to the future welfare of one of the finest regions in the world. The truth is, that no smelting should be done in the interior, but the mineral should be transported to points

where fuel is more abundant, and the timber now growing upon the spot left for the use of the farmers and the miners, to whom it is indispensable for the prosecution of their labors. Such will hardly be the case until a property in lands is established, and individuals be no longer permitted to sweep grove after grove from the soil, till the country begins to assimilate in some places to those leafless tracks in Illinois, which will probably remain unsettled prairie for a century to come.

I was particularly struck with the bold life which these miners have long led, the chief dangers of which, it is presumed, are now over—by observing a strong block house erected among a cluster of small shantees where two brothers lived with whom we stopped to take some refreshment at noon. They were miners and farmers together; and carrying on their business remote from any other house or settlement, they probably sent the mineral and vegetable productions of their favored soil to market at Galena in the same car. They had struck the vein of ore which they were working in badger hunting—the habits of that animal being of great assistance to the miner in exploring for mineral. I saw at the same place a fine dog terribly gored by a wild bear—the descendant of the domestic hog, which runs wild in this region, and sometimes makes a good hunt.

Our rout hither, which was by no means direct, carried us through a broken savage country, where a thousand clear streams seemed to have their birth among the rocks—singing away—though the earth was wrapped

"In safe-consuming winter's drizzled snow."

as if the leaves of June quivered over their chrysal currents. At one time these crisped fountains were the only objects that gave life to a burned forest through which we rode, where the tall branchless and charred trees stood motionless on the steep hill-side, or lay in wild disorder, as they had tumbled from the rocky heights, into a ravine below. Emerging from this desolate region, where the tracks of bears and other wild animals were to be seen on every side, we launched out on one of the loveliest prairies I ever beheld. It was about a mile wide, and not more than four or five in length, and smooth as a billiard table, with two small islets of wood in the centre. Our horses, which had seemed almost fagged out while slipping and stumbling among the rocks and fallen trees, in the timbered land—now pricked up their ears and snorted with animation, as they made our light sleigh skim over the smooth plain.

It was afternoon on the third day after leaving Galena, that on descending a steep bluff of about 150 feet, we came to a small tributary of the Wisconsin, winding through a narrow valley below. Following down the slender rill, whose banks exhibited no shrubbery, save a few dwarf willows, we crossed a wooded bottom, where the long grass among the trees shot above the snow to the height of our horses shoulders, and reached at last the Wisconsin, where the stream might be about a quarter of a mile wide. After trying the ice in several places with long poles, we ventured at last to cross; and scaling a bold bluff at the opposite side, paused a moment at a stone house, owned by a Frenchman, to let our horses blow. A band of Winnebagoes were standing at the door, and as they were all in mourning for some recently deceased relations, their broad blunt features, blackened as they were, made them look like Hottentots. A ride of six miles, through a high rolling prairie, interspersed with massive groves of oak, brought us at last in view of the bluffs of the upper Mississippi, rising in rocky masses to the height of 4 or 500 feet above the bed of that beautiful river, whose iron bound banks and gentle crystalline current, bear but little affinity to the marshy shores and turbid tide which are distinguished by the same name, after the Missouri gives a new character to its waters. Never shall I forget the first view of "The Father of Rivers," as a reach of several miles shut in, partly by its own bluffs, and partly by those of the Wisconsin, with its numerous islets, smiling in the light of the setting sun, looked like some comely lake of the West: girdled, apparently, by inaccessible cliffs on three sides, and keeping the edge of a broad meadow—which in its turn was bound and sheltered by lofty bluffs—on the fourth. That meadow lay now beneath me, and it was Prairie Du Chien. II.

SERMONS ON DUTIES BELONGING TO SOME OF THE CONDITIONS AND RELATIONS OF PRIVATE LIFE; by JOHN G. PALFREY, A. M., Professor of Biblical Literature in the University of Cambridge. 1 vol. 8vo. pp. 370. Boston: CHAS. BOWEN.—We like both the tone and the subjects of these sermons. They are

practical. They come home to the business and bosoms of all. They are catholic, too, in their sentiments, and embrace all: they are free from controversial points; and finally, they seek not to explain, what finite understandings can neither comprehend nor elucidate, but leave to faith what belongs exclusively to the domain of faith.

These Sermons treat of the duties and obligations of social life, and were delivered some years ago to the congregation in Brattle Square, of which the Rev. Professor was then the Pastor. They discuss the duties of the young and the old, of the rich and of the poor, of married life, and of the parental and filial relations. The style is clear, forcible, and polished, and the doctrines such as may be read without offence by all, and by many surely with profit. The book, too, is printed with the usual beauty and accuracy of the Boston press. We make an extract from Sermon X, on "the Duties of the Rich," as exhibiting fairly the manner of the writer:

It is well for us all, my friends to have cares.—There is no one indeed who has them not, if he is disposed to see them; but for any one who is not so disposed, it is happy if there are those which will force themselves upon his attention. For serious cares of any kind make the mind serious, which so far is a great good. Without them it becomes light and giddy. There are persons, who constitutionally seem almost incapable of being led, in the wantonness of their prosperity, to do or wish ill to any human being; whose feelings towards others appear all to be feelings of a superficial, indeed, but as far as it goes, a genuine kindness; but for whom we see, that the wish which a true friendship would dictate, would be that they should have some of those 'changes,' for want of which 'they fear not God.' They are the spoiled children of prosperity. There is nothing substantial in their character. There is nothing deep in any of their feelings. The business of their lives is a weak and capricious self-indulgence. The scriptures, which subject the human character to so rigid an analysis, are faithful in exposing this tendency. 'He gave them their request, and sent leanness into their souls.' What a just as well as strong picture this, of the condition, in which a luxuriance of outward blessings is contrasted with that dearth of all that is best in the mind and heart, with which we sometimes see it followed.—'The prosperity of fools shall destroy them.' How many the instances in which this sentence has been executed; in which minds not absolutely ill disposed, nor incapable under other circumstances of blessing and being blessed, have been intoxicated and made merely giddy and frivolous by too much good fortune, as we call it, and seduced away from every strenuous and honorable application of their powers.—'In my prosperity I said, I shall never be moved.' How natural a boast for a mind inflated by abundance, and by the deference which it brings, and by the habit of seeing its own will a law; yet a boast how presumptuous, an expectation how fallacious, a confidence how sadly ill-adapted to prepare for the changes which time may bring. The very waywardness and eccentric humors, which such a feeling generates, are the occasion of more wants than any prosperity can supply; and the affluent circumstances, which to others seem adequate to obviate every wish, are but experienced by the possessor to increase their number. The feeling is as much at war with the spirit of self discipline and improvement, as with that of content. 'Be not high-minded, but fear,' says the apostle, using the self same expression with that in our text, and conveying a lesson the most needful to be observed by all who are intent on growth in grace. But how little consistent with this humble and sanctifying spirit of self distrust is that vain elation of the mind which we are now considering. And what a stubborn and impracticable religious insensibility does it threaten to create. 'When thou shalt have eaten and be full, then beware lest thou forget the Lord.' This is an admonition, called for by well ascertained tendencies of human nature.—Jeshurun, when pampered, was restive and untractable; 'then he forsook God who made him, and highly esteemed the rock of his salvation.' 'They were filled and their heart was exalted, therefore have they forgotten me.' This is the history of many an envied, but unhappy man's experience; and if it would be going too far to infer that this kind of prosperity is therefore not to be desired, we needs must own that it is not every mind which has the strength to bear it.

THE LIFE OF THOMAS EDDY—comprising an extensive correspondence—by SAMUEL L. KNAFF—1 vol. 8mo—pp 400—N. Y.—CONNOR & COOKE.

In a life, however long, devoted to acts of benevolence and to the improvement of the institutions of charity, of education, of punishment and of reform—there can hardly be found, or indeed expected, any of those stirring incidents which impart a zest to the biographies of men more ostensible on the stage of human affairs. It was therefore not without surprise that, on opening this volume, we found ourselves gradually carried on from page to page, till our interest became thoroughly excited in the modest records of this good man's life. The correspondence with Colquhoun, the famous police magistrate of London, and with other foreigners, well known in the annals of philanthropy, as well as with many distinguished men in our own country, gives both variety and interest to the narrative—which, as a whole, does credit to the taste and feeling of the author.

AIDS TO MENTAL DEVELOPMENT, or hints to parents with an address to Mothers, by a Lady of Philadelphia. 1 vol. 12mo. pp. 340. Philadelphia: Key & Riddle.—This is a reprint, with some modifications, to adapt it to our use, of an English book. The design is good, and we think generally well executed, though liable to the objection of making the children, who are interlocutors in the dialogue, talk too cleverly. This is of bad practical tendency, as discouraging many from persevering in the plans here recommended and illustrated, by ascertaining that their children fall so far short in the nature of their answers, and in quickness of comprehension, of those in the book.

The address to mothers, by the Philadelphia lady, embodies some excellent views on education, and on the importance especially of that education of which home is the only school.

THE CLASSICAL FAMILY LIBRARY, Vols. XI and XII. New York: HARPER & BROTHERS.—These two volumes in continuation of the Classical Library, furnish us with Virgil's Poems, the Eclogues translated by Wrangham, the Georgics by Setheby, and the Æneid by Dryden. The dedication of Dryden's translation to Lord Normanby is also given, and it is, as is well known, an admirable critique on the Æneid.

Praise or extracts for such works as these would be misplaced.

AN ESSAY ON NEW TRIALS by DAVID GRAHAM Counsellor at law.—1 vol. 8mo—N. Y.—HALSTEAD & VOORHIES.

We can to-day only acknowledge the receipt of this well printed volume, treating a very important branch of law. We hope next Saturday to be able to speak of it, from careful examination.

CITY OF NEW YORK.—NEW YORK AND ITS VICINITY.—These are two very well executed little maps, colored, folded up and bound in morocco—so as to be conveniently put in the pocket and carried about.—The maps are executed by D. H. Burr, and are published by J. DIST RUN L.

THE NATIONAL PORTRAIT GALLERY, Part XI., by JAS. HERRING, of New York, and JAS. B. LONGACRE, of Philadelphia; N. York, MONSON BANCROFT.—This number presents us with engravings and biographies of Col. AARON OGDEN of New Jersey, of JAMES FENIMORE COOPER, also a Jerseyman, as we find, though we had always before supposed him a native of this State, and of the Rev. TIMOTHY DWIGHT, of Connecticut. It is an excellent number, both in the execution of the engravings and the biographical sketches—the latter of which, though prone, as is the nature of such notices, especially when applied to living men, to exaggerated estimates of merit, are quite interesting.

COMPANION TO THE NEWSPAPER; London and New York, at WM. JACKSON'S, 71 Maiden Lane.—This is

a capital publication. It is a sort of catalogue raisonné of the principal matters contained in a London weekly newspaper of great circulation and ability, the Spectator,—and furnishes in a quarto volume of some 220 pages, materials of information, convenient for consultation or history, of the greatest accessibility. Every public library at least, and private libraries of any extent, should take a copy of this publication, which is to be continued annually.

Among the items of great interest in this volume for 1833, are the history of, and discussions concerning, the East India charter, the Bank of England, reform in the law of real property, with a general retrospect of public events, &c.

AN ACCOUNT OF JANE C. RIDER, the Springfield Somnambulist, by L. W. BELDEN, M. D.—Springfield: G. & C. MERRIAM.—When we first heard the extraordinary stories concerning the subject of this memoir, we were certainly among the incredulous. We have now read with care and with interest, this account by Dr. Belden—the physician who saw her in her first paroxysm, and followed up the case till a cure was effected—and we can no longer refuse our faith to the truth of the facts related, nor our conviction that—however inexplicable and unexplained, as many of them still seem to us—there was neither imposture on the part of the girl, nor collusion on the part of those around her.

The great distinction in the case of this young person from other extraordinary cases of somnambulism on record, was an incredible power of vision; and, ingenious as we think Dr. Belden's attempt to explain this power, as the result of a diseased and thereby highly excited state of both the eye and brain, we are not satisfied with it. The idea that any conceivable increase of the sensibility of the retina, accompanied by any morbid change that can be imagined of the brain whereby its perceptive powers should be excited to the utmost, can explain the fact of this girl's reading in a darkened room through thick bandages wadded with cotton and placed over her eye lids—the names of strangers so faintly written in pencil, or in such small letters, as to be scarcely legible to persons with all their faculties awake—seems as contrary to the ordinary course of things—as the very fact, which it is meant to explain. We have nothing better, indeed, to offer in the way of solving the difficulty; and must, therefore, be content to believe—by reason of the unimpeachable evidence in the case—and to marvel.

LIFE OF M A-KA-TAI-WE-WA-KIA-KIAK, OR BLACK HAWK; with an Account of the Cause and General History of the late Indian War, dictated by himself. 1 vol. Boston: RUSSELL, ODORNE & METCALF.—This is the first specimen, we believe, known to our literature, of a savage's auto-biography. It was dictated by Black Hawk, after his tour in the United States, to Antoine Leclair, the United States Interpreter to the Sacs and Foxes, who vouches for the care and fidelity with which it is rendered into English. It is dedicated by Black Hawk in the Sac tongue, to General Atkinson, his conqueror. It refers the cause of the hostility of the Sacs against the Americans, to the fact of treaties surreptitiously made by them, with unauthorized agents of the Nation, which, when attempted to be carried into effect, were felt as grievous wrongs and outrages. We do not doubt if there were historians among the Indians, that such or similar would be the origin of most, if not of all, of what are called Indian wars, but which are, in fact, more predatory excursions to seize by force, the lands we covet and do not own.

The following notice of some of the most interesting points in this history we take from the New England Magazine, for this month:

Behold Black Hawk, then a general, in the British service, and a more respectable one than Sir Hudson Lowe. Fire-arms, ammunition, tomahawks, and clothing, were distributed, and General Black Hawk

started on the next morning, with five hundred braves, to join the allied army, below Detroit.—There was, soon after, a fight, in which, says the general "the Americans fought well, and drove us with considerable loss. I was surprised at this, as I had been told that they would not fight." The same success followed the attack of a fort, and Black Hawk became tired of his new service,— "the success being so bad, and having got no plunder." He remarks, that "the Americans shot better than the British, but are not so well provided for." In fact, our friend Bull always fights best with a bellyfull; but a Yankee is more pugnacious when hungry. Having left the service, Black Hawk "humiliated himself before the Great Spirit, and returned thanks for preservation through the war." He was never ferocious, and he has recorded, that he often spared the unwarned and helpless. When on an excursion against the whites, to avenge the death of his adopted son, he spared those he came to kill.— "We had not proceeded far, before we met the man whom we supposed we had killed, as he was scalped, staggering like a drunkard, all covered with blood. This was the most terrible sight I had ever seen. I told my comrade to kill him, to put him out of misery,—I could not look at him. I heard a rustling in the bushes, and distinctly saw two little boys concealing themselves. I thought of my own children, and passed on without noticing them."

Black Hawk was ever a good dreamer. The Great Spirit, in a dream, gave him particular directions where to find a large snake, viz: down the bluff, at a creek, in the top of a hollow tree that had been cut down. The snake was to point out with his head, the direction of an enemy. These were two American officers.

At a conference with American agents at St. Louis, Black Hawk and other chiefs, replied to the Commissioners, that "what they had said was a lie," and he seems to have been surprised that such a form of speech should excite resentment. "Here," said he, "for the first time I touched goose-quill to paper, not knowing, however, that by that act I consented to give away my village." Jack Cade was similarly taken in. "Some say," said he, "that it is the bee that stings; but I say it is the bee's wax; for I did but seal a bit of paper, and have not been my own man since."

The loss of two children brought much sorrow upon Black Hawk. He built a secluded hut and reduced himself to poverty. He blacked his face for two years; drank water in the middle of the day, and ate a little boiled corn at sunset. This he did hoping the Great Spirit would take pity on him; and, said he, "I never take a drink of water from a spring without being mindful of his goodness."

But the treaty was to be executed, and the Indians were called upon to leave their village. As the chiefs did not admit that they had knowingly sold it, there was a difficulty in getting them away. Besides, said Black Hawk, "my reason teaches me that land cannot be sold; nothing can be sold but such things as can be carried away." He was the "Village Hampden," and resisted all encroachments on his field. He resolved not to quit, and the Prophet assured him that he would not be removed. General Gaines, however, defeated the prediction, and Black Hawk "touched the goose-quill" to another treaty, and crossed the Mississippi.

But Black Hawk and the Prophet were making ready for war, and the "White Beaver" (General Atkinson) received a message, "If you wish to fight us, you may come on." The events of the war have been detailed in the newspapers. Pressed on all sides, vanquished but not humiliated, he gave himself up to his enemy like Weathersford, Themistocles, and Napoleon. He was carried to Washington, and visited other cities. He was astonished at the good trail which he found for his carriage—meaning the Cumberland road: he saw many wigwags and villages, but could see nothing in the country to induce the people to live in it. The Railroad was yet more astonishing, though Black Hawk preferred to travel on horseback.

The Great Father at Washington he supposes has seen as many winters as himself. "His wigwag is well furnished with every thing good and pretty."—At Washington, Black Hawk was well received by the people, and especially, as he says, by the squaws.

He was surprised at the size of Baltimore, and of the "big village where they make medals and money." A New York, to his utter astonishment, he saw a man ascend in a balloon till he was no longer visible: one of his young men asked if he was going to see the Great Spirit. "Every body," said he, "treated us with friendship. The squaws made us many handsome little presents. They were very kind, very good, and very pretty—for pale faces."

The publisher of the American edition of the "Foreign Quarterly" and "Westminster" Reviews, has given notice that the republication will be discontinued. The reasons assigned are the dissatisfaction produced throughout [the] Southern States [at the course of the Westminster Review during the last three quarters of 1833, on the subject of domestic slavery in this country, and the general pressure of the times, which have produced a great falling off in the circulation.

The intelligent correspondent of the New York American, who is now travelling in the far West, continues his interesting letters. We renew the hope, expressed some time ago, that these letters may be collected and preserved in a volume. They furnish more fresh and graphic sketches of Western scenery, and better illustrations of Western manners, than we remember ever to have seen any where else.

We may now say, we believe, with some confidence, that the desire repeated in the above paragraph from the Alexandria Phoenix, and which we may add has been manifested in various quarters, for the publication in a book, of the letters from the West of our correspondent H, will be complied with.

They will, it is expected, when completed, constitute a handsome volume, comprising much information in detail, statistics, prices of land, produce, &c., which was not deemed as well suited to the columns of a newspaper.

We have several letters now on hand, which lose nothing of their interest or freshness as they increase in number.

FOREIGN INTELLIGENCE.

LATE FROM EUROPE.—The ship *Victoria*, from Liverpool, brings us London papers to the 3d ult. inclusive, and Liverpool papers of the 4th. The accounts are not particularly interesting, and therefore, as we are much pressed for room, we do not make many extracts. Sir Thomas Denman has been made a Peer.

FRANCE.—The Ministers have succeeded in carrying their law on the subject of associations, nearly in the state in which they first proposed it,—all the amendments at all calculated either to modify its oppressive character or even to limit its duration having been rejected by large majorities. At the final debate, which took place on the 25th ult., M. Page spoke strongly against the measure, and in the course of his speech made the following solemn protest against it:

"If (said the Hon. Deputy) a Frenchman, an honorable man, wishes to form a union to propagate, strengthen, or preserve Christianity—I am his man, in spite of your Ministers and your law.

"If a Frenchman, an honorable man, wishes to form a union, to extend charity and assistance to the poor and laboring classes, to the sick, or to the workmen out of employ—I am his man in spite of your Ministers and your law.

"If any Frenchman, an honorable man, wishes more extensively to diffuse acquired truth, sound doctrines, and the knowledge which appears for the morality of the future and the happiness of mankind—I am the man, in spite of your Ministers and your law.

"If any Frenchman, an honorable man, wishes to secure to his country the safeguard of electoral independence, and oppose those disgraceful elections, which deliver political venality up to Ministerial corruption—I will be with him, in spite of your Ministers and your law.

"The slave of all just laws, the enemy of all unjust laws, between the prosecutors and their victims I will not hesitate. I know no human power which can make me apostatize from God, humanity and France. I will disobey your law, to obey my conscience."

On the division, the numbers were for the bill, 246,—against it 154,—majority 92. Several of the societies in the provinces have already protested against the law, and announced their determination to disobey it. Some of the most distinguished members of the *Société des droits de l'homme* have deemed it expedient to quit Paris. The veteran patriot, Lafayette, has delivered the following written protest against the measure:

"The new and progressive attack on our July re-

volution has been so completely manifested on both sides in the debates that my forced absence from the Chamber is a subject of regret for myself alone. I could, nevertheless, have certified to the heirs of 89 and 1830 that, even under the ancient regime, such an interdiction, subject to the good pleasure of the police of Sartines and Lenoir, would have excited astonishment and indignation, even in the Saloons of Versailles. I now confine myself to adding my personal protest to the numerous votes of my honorable colleagues against this anti-social consequence of a system, the origin and tendency of which I pointed out long ago. "Paris, 26th March, 1834.

(Signed)

"LAFAYETTE."

The *Tribune* has the following:—The *Union de Juillet* held a general meeting yesterday, under the presidency of General Lafayette, when they entered a protest against the Associations' Bill, and pledged themselves not to submit to it! Without making public things which concern the society alone, we say that more than one deputy was present at the meeting, and that M. Lafitte was not the least energetic in recommending resistance."

SPAIN.

BAYONNE, March 25.—Quesada has at last received instructions to commence operations, and this evening we learn that his division is already on its march, but the insurgents, as soon as they got intimation of it, immediately put themselves in motion, and are proceeding towards our frontiers. At Elisondo the municipal authorities were seized with panic, as well as the workmen who were making uniforms for the Carlists, who all took flight towards Balcarles, and spread alarm throughout the country. Numerous persons are emigrating from the country, and the place is full of persons who have fled thither, conceiving themselves in danger by the proclamation of Quesada.

The following is an extract of the *Boletín de Comercio*, respecting the convocation of the Cortes, and which it states, is obtained from quarters which are usually well informed—

There will be two Chambers, one styled 'Proceres del Reyno,' (Peers of the realm) and the other, 'Procuradores del Reyno' (Deputies of the kingdom).—The Chamber of Peers will be composed of the Archbishops and Grandees of Spain and Castile, Generals who have distinguished themselves, Magistrates, Landed Proprietors, Principals of Manufactories and Commercial Establishments, Directors of Public Instruction, and those who have rendered service to the country. The sittings will be public, and the dignity of the Peerage conferred for life. The Chamber of Deputies will be composed of persons freely elected, who have an income of 12,000 reals, and have attained the age of 30.

Government servants, lawyers, physicians, clerks of the supreme tribunal, and surgeons, may be elected Deputies, when possessing only half the above mentioned income.

Every elector must be possessed of an income of 6000 reals. The population of the places will be the basis on which the number of members to be returned will be decided, who will be elected for three years. The Cortes will vote the taxes. The King will have the power of convoking, provoking, and dissolving the Cortes; but he must convoke another for at least a year. At the death of the King the Cortes will assemble, that the heir to the throne may swear to protect the laws. The Cortes will also meet on any extraordinary occasion.

The Indicator of Bordeaux of the 27th inst. has the following of the 25th from Bayonne:—"The faction of Biscay is entirely dispersed, but the vexations of the inhuman Zabala are not at an end. It is said that Gen. Espartaco, in consequence of arrests made by Zabala at Legneitio, has taken several of the Carlist inhabitants of the same town as hostages. In consequence of the entry of the insurgents in to Vittoria, the Queen's troops made 52 prisoners, including 7 officers, who were shot, as well as a man who fired at a conscript from his window, by order of Gen. Ossa." It has the following from Madrid, dated the 19th inst:—"By a Royal decree, the Queen has named Patriarch of the Indies Don Manuel Frayle, Bishop of Sigüenza. By another decree Don Jose Maria Manesca has been named President of the Royal Court at Madrid. Don Pedro Velleli is named Corregidor of Madrid. Major-General Miguel Tacon has been appointed a Lt General, and Capt. General of the Isle of Cuba."

It is said the King of Holland has refused the pardon for which POLAKI prayed in his petition, or to grant any mitigation of the sentence pronounced on him for stealing the Princess of Orange's jewels.—[Times.]

By the packet ship *United States*, Capt. H. dredge, from Liverpool, we have Liverpool papers of the 8th, and London of the 7th April. It will be seen that a new French Ministry has been formed.

[From *Bell's Weekly Messenger*, April 6.]

The foreign intelligence of the week, so far as it relates to France, is not without interest. The American Indemnity Bill was rejected in the Chamber of Deputies on Wednesday by a majority of 176 to 168. Two of the Ministers, the Duke de Broglie and General Sebastiani, spoke at great length and with much vehemence in its support, and all the Ministers voted for it. But it was rejected by a majority of eight in a very full Chamber, much, very much, to their credit.

The Duke de Broglie and General Sebastiani immediately tendered their resignations. M. Guizot shortly after followed their example, and it was expected that M. Humann, the Minister of Finance, would also resign. The Cabinet is thus broken up. An attempt will be made to induce the Duke de Broglie to remain, but it is supposed that it will not be successful.

The consequences of the change of ministry in France at the present moment, says an able contemporary, may be of the utmost importance. It will be clearly impossible to carry the associations' law into effect by a divided and feeble administration, in the present temper of France, especially on the eve of a general election. Who are to be the successors of the resigned ministers is not yet fixed.

[From the *London Times*, of 7th April.]

We have waited with some anxiety, or at least with much interest, to learn the new cast of the French Ministry, the completion of which appears in the *Moniteur* of Saturday.

It was scarcely possible to conceive that the Duke de Broglie could resume his portfolio; after his resignation of office had been recorded in the *Moniteur*, and in the face of a vote of the Chamber of Deputies, which, though perhaps now repented of, could not be reversed. But it is not easy to imagine how he alone should have been expected to resign, since the treaty which he defended so ably in the Chamber was made in the time of his predecessor, and must have had the sanction of the whole of his colleagues, as well as his own. However that may be, his place is not yet adequately filled, and cannot perhaps be so worthily occupied by any French candidate for the Foreign office.

If, however, the French public has to regret the change in the Foreign Department, which has deprived them of the zeal and talents of de Broglie, some of the other appointments in the new Cabinet will appear still more objectionable. If there be one man in France more unpopular than the late Minister of Justice, Barthe, it is M. Persil, who is nominated his successor. The continued assaults of the latter upon the press, and the desire which he has shown to alter the constitution of juries, will make his appointment appear the result of a contempt for public opinion, rather than a compliance with the dictates of a moderate policy. The transference of M. Thiers from the Board of Trade to the Ministry of the Interior is an event of no consequence; but surely M. D'Argout must have thought himself the victim of an intrigue in being obliged to exchange the honors and emoluments of the Minister for the place of the President to a banking establishment.

We quote the abstract of the new appointments from the *Moniteur*, premising that the modifications of the Cabinet are said by the French journals of Saturday not to have been completed till Friday evening. The official journal promulgates Royal ordinances, by which M. Persil, Deputy, Procureur General of the Royal Court, is appointed Keeper of the Seals, and Minister of Justice and of Worship, in the room of M. Barthe, who is created a Peer of France, and made First President of the Court of Accounts, in the room of M. Barbe Marbois, who resigns, but who is invested with the dignity of Honorary First President of the Court of Accounts.

M. Thiers, Deputy, Minister of Commerce and Public Works, is appointed Minister of the Interior in the room of Count D'Argout, who is made Governor of the Bank of France in the place of the Duke de Gaete.

M. Duchatel, Deputy, is nominated Minister of Commerce in the room of M. Thiers.

The separation of the attributions of the Ministers of the Interior and of Commerce will be hereafter determined by a special ordinance.

Vice-Admiral Count de Rigny, Deputy, and Minister of the Marine and Colonies, is appointed Min-

ister of Foreign Affairs in the room of the Duke de Broglie.

Vice-Admiral Baron Roussin, Ambassador at Constantinople, is named Minister of the Marine in the room of Admiral de Rigny, who, however, will continue to exercise the functions of his late office till the arrival of Admiral Roussin.

M. Martin du Nord, Deputy, and Advocate General of the Court of Cassation, is appointed Procureur General of the Royal Court in the room of M. Persil.

It will be seen, therefore, that the Ministers who retain their previous offices are Marshal Soult, President of the Council and Minister of War; M. Humann, Minister of Finance; and M. Guizot, Minister of Public Instruction.

"The Sultan has," says the *London Spectator* of 29th March, "replied to Lord Ponsonby's interrogations respecting his famous treaty with Russia, in the most firm and haughty tone. He has made up his mind to keep his engagements with the Czar, in spite of the hatred which his subjects bear to the Russian alliance. The *Times* correspondent at the Porte says—

"The Russian fleet, with 25,000 men on board, is waiting at Sebastopol for sailing orders: considerable bodies of troops are advancing in the direction of the Danube; and by a late ukase, the 60,000 men raised in Moldavia and Wallachia have, though Turkish subjects, been incorporated in the Russian army."

"Excepting Lord Palmerston, no one, we imagine, places any confidence in the pacific professions of Russia. These warlike preparations give the lie to all such palaver."

A letter from Constantinople, dated the 4th ult., the statements in which, if founded in truth, seem greatly exaggerated, has the following: "It is certain that the steam packet which recently conveyed Halil Pacha to the Dardanelles had a detachment of artillerymen on board; it is also certain that the fleet and Turkish army are recruiting with extraordinary activity, and that Russia has just levied troops in Moldavia and Wallachia. By what right? All that we know is, that the Russian fleet stationed in the port Sebastopol is ready to set sail, at the first signal, for Constantinople; that Nicholas has sent to Achmet Pacha 1,000,000 of ducats, proceeding from the debt of Turkey to Russia; that he has granted the Sultan eight years to pay off his debt; that a serious revolt, the instigators of which are unknown, had broken out in Bagdad, and in Kurdistan, and that the Porte has been obliged to send an imposing force there; that Constantinople is in a deplorable condition; that its trade has never been so slack; that nothing but a miracle can save the Ottoman Empire, and unfortunately the times for miracles are past."

The *Augsburg Gazette* of the 1st inst. has the following, of the 26th ult., from Vienna:—"It is thought that the Congress will hold a grand sitting this week, which will be attended by M. Ancillon. Resolutions will then be agreed to, sufficient of themselves to contradict the injurious reports sent abroad by the French journals relative to the intentions of the Germanic Governments, and to the debates of the Congress."

The *Madrid Gazette* of March 27, announces that a Plymouth vessel, called the *Express Packet*, laden with 2,500 muskets, 200 barrels of cartridges, 180 barrels of gunpowder, and other warlike stores for Don Carlos, has been captured in Vigo Bay by the Government Guardacosta brig the *Argus*. The same *Gazette* contains two decrees, signed on the 26th, at Aranjuez, one of which orders the seizure of the temporal property of all the ecclesiastics who have quitted, or may quit, their churches to join the rebels; and the other commands the suppression of all convents the members of which shall have mixed themselves up with the plots of the Carlists, either by joining the insurgents, concealing ammunition or warlike stores, or assembling clandestine juntas.

PORTUGAL, OPORTO, MARCH 24, four o'clock p. m.—The governor of the city has just received a despatch of four lines from Admiral Napier, who says—"This morning I took Camina by surprise, and Viana will be shortly in our possession." The Admiral landed there with about 500 men, brought from Lisbon in the steamers *George the Fourth* and *Lord of the Isles* and mastered the place (where the feeling is strongly in favor of the constitutional cause) without opposition.—[*Times*.]

Before the arrival of M. de Sarmiento it was resolved, as I advised you at the time, to pass the Portuguese frontier in considerable force, for the purpose of

protecting the frontier provinces from the menaces of Don Carlos and his ally of the House of Braganza.—Instead of a mere inroad however, in quest of a fugitive pretender, the troops of the Queen of Spain, whether with or without a formal declaration of war, will assume an attitude directly hostile to one branch of the House of Braganza, and will act of course in perfect accordance with the views of the other. This was one of the leading objects of the mission of M. de Sarmiento to Madrid, and it will not be completed to the satisfaction of men of liberal principles in either of the two kingdoms, until the whole peninsula is united in action, as it is already in interest, by the conclusion and ratification of a treaty of alliance offensive and defensive.

NAPLES, March 15.—The union of Prince Leopold, Viceroy of Sicily, and second brother of the King, with the Princess Mary, daughter of the King of the French, is no longer a matter of doubt: the marriage is to be celebrated in the course of this spring. Much hope is placed in the alliance, the young Princess having been educated under the immediate eye of Madame Adelaide, whose cultivated understanding and richly endowed mind are well known. In Palermo, which is to be the residence of the Royal pair, the news has created the liveliest sensation, the young Princess having been born there. It is said that the Queen of the French will accompany her daughter here; at a later period the Dukes of Orleans and Nemours will also pay us a visit. This has given rise to a report that our Sovereign had changed his opinion relative to his sister, the Queen Regent of Spain. Interesting discoveries have been made at Torre del Annunziato; it is not yet known whether the temple being now cleared there, forms part of a grand Roman villa, or whether it be the commencement of a third buried city, like Herculaneum and Pompeii. Communication is now opened with Greece. Vesuvius is sending forth slight eruptions. The *Gazette* quotes the funds at Vienna, on the 22d inst.—Metallics, Five per cents., 98 1-16; Ditto, Four per cents., 88 7-16; Bank Actions, 1,248.—[*Angbarg Gazette*.]

The *Frankfort Gazette* of the 29th ult. announces the death of the reigning Duke of Anhalt-Bernburg, father of the Princess Frederike of Prussia.

Recent accounts from Napoli di Romania announce the death of the Greek Captain Colocotroni, in the prison in which he had been confined several months; or having taken part with several other Chiefs in a conspiracy against the Government.

CASPER HAUSER—whose mysterious story and recent death by violence, caused so much interest, would appear by the annexed paragraph, to have entitled destruction too upon his friend, patron, and biographer, the Jurist *Fuerback*.

According to the Hanoverian paper, the celebrated German Jurist, *Fuerback*, who died lately at Frankfurt, during a journey undertaken for the benefit of his health, is now generally believed to have been poisoned. He was a kind patron of the unfortunate Casper Hauser, and the most zealous in his endeavour to discover the murderers of that mysterious youth.—[*German Paper*.]

COAL vs. GOLD.—In a work lately published by a Spaniard, there is a comparison between the produce of the gold and silver mines in America and the coal mines in England, from which it appears that the gross value of the annual produce of the coal mines, which is 18,000,000 tons, amounts to 450,000,000 francs, including the wages and other charges; whilst the produce of the gold and silver mines, including the same charges, is only 220,500,000 francs; showing a balance in favor of the coal mines of England, over the gold and silver mines of the New World, of no less a sum than 227,500,000 francs.

The Prince of Orange, if we are to credit the private correspondence of the *Times*, is still suspected of having made away with his wife's jewels, notwithstanding the man named Polari has confessed that he was the thief. It is said that Polari, who might have escaped by taking advantage of a technical blunder in the proceedings against him, appeared eager to be convicted; and now it is supposed he will be pardoned.

SUMMARY.

The Georgetown Union, of the 23d inst., says—"We are informed all the Pee Dee country is under water, and the injury to the rice field banks must, in consequence, be very serious. The tides for several days past, were higher than we recollect, without the agency of a heavy gale."

CURIOUS PHENOMENON.—The Montreal Herald of 28th, states that—

"On Saturday morning, a very singular phenomenon was observable from the river bank in front of our city. Those who are blessed with a very strong sight perceived, as they supposed, an immense number of small birds in the air, but at such a height as to render even birds, in that situation, a curiosity.—We happened to be passing, and in vain strained our eyes to discover the objects which others were contemplating with so much eagerness—by the help of a glass, however, we at last perceived what was to all appearance an immense flock of small birds.—These objects passed away in millions before the current of the light wind then blowing, but many descended lower than the rest, until easily discernable by the naked eye. At length they approached the earth, and proved to be maple leaves of an unusually large size. Many of them were picked up by the citizens, and we have kept one. Whence they came, or how they got there, are questions which furnish a wide field for conjecture. One shrewd fellow observed, 'that this must be the fall of the year in the moon, and that they certainly came from thence.'"

[From the Baltimore American of Saturday.]

Great Aeronautic Expedition.—The circumstances attending the second splendid balloon ascension of Mr. Mills, on Thursday afternoon, render it one of the most lengthened and interesting aeronautic expeditions ever made. We mentioned in yesterday's paper the particulars of his departure from Fairmount, and the apparent course he had taken; and are now enabled to supply some very interesting details of his long and rapid flight through the upper regions. His first course, after ascending, was about south east, but in a short time a counter current of air wafted him in an opposite or westerly direction, immediately over the city. His flight westward was only as far as a point above the long bridge over the Patapsco, when he encountered an adverse current, which carried him back again in an easterly course.

During all this time Mr. Mills continued to rise, by occasionally throwing out ballast. His compass now proved of no service to him, from the constant rotary motion which the balloon assumed, first swinging round in one direction and then revolving in a contrary one. The course of the balloon was eastwardly. At forty minutes after five, Mr. M. encountered a violent snow storm, with the thermometer down to 34 deg. Besides being obliged to endure its peltings he was subjected to a thorough drenching from the melted snow, which thawed as it fell on the balloon, and ran down from its neck to the car immediately under it. At the same time, also, a body of clouds passed beneath him, and he lost sight of the earth altogether. The storm, however, soon passed off, and, except the drenching, left him unharmed.

At six o'clock he had attained his greatest elevation, which according to his estimate and the indications of the barometer, was upwards of two miles.—The thermometer was now down to 33 deg., or only one degree above freezing point. Mr. M. all the while was going eastwardly, passing over the light house at North Point, and across the expanse of the Chesapeake Bay towards Kent County, on the Eastern Shore. He had now had recourse to his valves, and was gradually descending. After having passed into Kent County about half a mile, he made preparations to land, and had descended within about five hundred feet of the earth, when the balloon was taken by a sudden and violent gust or current of wind from the east. This was at 35 minutes after six. In an instant after the wind struck the balloon, it was driven with the swiftness of an arrow, and in the short space of seventeen minutes, he was carried back to North Point, a distance of fourteen miles across the Chesapeake Bay!

Now as heretofore, Mr. M. preserved an undaunted coolness and self-possession, and as he was careering across the waters with the fleetness of the wind itself, he discharged gas enough to bring him within two hundred feet of the surface. As the anchors struck the water they rebounded with a force that gave him a pretty distinct notion of the rate at which he was travelling. As soon as he came over the land at North Point, the wind greatly abated, and at ten minutes before seven he effected a safe landing on the farm of Mr. Lynde Goodwin, from whom and his family he received every assistance in securing his balloon and apparatus in perfect order.

Thus terminated this most extraordinary aerial voyage, prosecuted for three hours, to the distance of about fifty miles; and for the greater part at an elevation of one to two and a quarter miles. After this feat, Mr. Mills, who, it should be borne in mind, is a young Mechanic of Baltimore—self taught, and

dependent alone on his own unaided efforts,—may fairly take rank with the most successful aeronauts of the age.

The following table shows the observations made by Mr. Mills on the barometer and thermometer, at various periods during his voyage. He left Fairmount at ten minutes before four o'clock, P. M.

TABLE OF OBSERVATION.

Time.	Barometer.	Thermometer.
h. min.	in. 10th.	deg.
3 57	20 6	63
4 15	25 8	59
4 25	24 2	54
4 40	24 1	51
4 55	23 9	43
5 10	23 4	41
5 25	23 0	46
5 40	22 9	34
5 55	22 8	34
6	22 7	33

6 35	27 0	58

Appointments by the Governor, by and with the advice and consent of the Senate, May 3.

New York.—Stephen Allen, Benj. M. Brown, Saul Alley, Charles Dusenbury and William W. Fox, for Water Commissioners for supplying the city of New York with pure and wholesome water.

NAVAL EXAMINATION.—The Board for the examination of Midshipmen whose warrants bear date prior to 1829, will convene at Baltimore on the first Monday of May next. Commodore Jacob Jones will be the President of his Board.

AMERICAN LYCEUM.—The Fourth Annual Meeting of the Society opened yesterday morning in the United States District Court Room, east end of the New City Hall, or Old Alms House.

President Duer presided, and Wm. B. Kinney officiated as Secretary.

Forty-two Delegates were reported from different Lyceums and kindred associations in different States; among others we heard the names of Judge Clayton of Georgia, Hon. Wm. B. Calhoun and A. H. Everett of Massachusetts, Dr. Weeks, President of the New Jersey State Lyceum, &c. Among the invited guests are Don Tomas Gener, the President of the Cortes of Spain, the Marquis Aycena, and other foreigners of distinction.

The morning sessions will commence at 9, and the afternoon at 4. The following subjects will be particularly discussed:

1. The propriety of establishing central schools for the education of teachers.
 2. The applicability of the monitorial system to schools generally.
 3. Corporal punishments.
 4. The means of introducing the elements of natural history into common education.
 5. The propriety of teaching the ancient languages in common schools.
- Interesting reports and essays may be expected on various subjects.—[Daily Advertiser.]

The following useful Table of Bank Notes received in deposit at our Banks, was politely presented to us yesterday by the receiving Teller of the Phoenix Bank.—[Gazette.]

Farmers' Bank, Troy,
Bank of Troy, do
New York State Bank, Albany,
Canal Bank, do
Mechanics' and Farmers' Bank, do
Saratoga County Bank,
Ulster County Bank,
Bank of Newburgh,
Catskill Bank, Catskill,
Farmers' Bank, do
Westchester County Bank,
Hudson River Bank,
Dutchess County Bank,
Bank of Poughkeepsie.

And \$100 bills only of Troy City Bank.

100's of Merch's & Mechanics' Bank, Troy.
100's and 50's of Com'l Bank, Albany.
100's and 50's of Lansingburg Bank.
10's and upwards of Sussex Bank, Commercial Bank of Amboy, and Farmers' and Merchants' Bank of Middle Point.
5's and upwards of State Bank, Elizabethtown; State Bank, New Brunswick; State Bank, Newark; State Bank, Morris; Mechanics' Bank, Newark; Newark Banking Insurance Co.; Farmers' Bank, Rahway; Orange Bank, county of Essex; Norwich Bank.

All denominations received in deposit by the several Banks of this City.

Splendid Fire Engines.—We do not believe there is in the world a more magnificent thing of the sort, than the new Engine belonging to the Columbian Company, and which that spirited association have been exhibiting to their fellow citizens at the Engine House in the rear of St. Paul's Church, at the corner of Vesey and Church streets. The frame of this elegant machine is of very superior construction, and the ornamental appointments are of the costliest and most tasteful description, as well indeed they may be, since some of our most meritorious artists have been employed in the work. The carving, which is the work of Watkins & Barry, Chatham square, is done in mahogany, but so beautiful is the gilding and bronzing, (by Riley Beardman, 249 William st.) that it would be taken at once for solid metal. The plating is superb, and is by George Rudd, 549 Broadway; the casting by Wallace & Bunce, of Spruce street. The painting is by Weir, and of course is excellent, as well in design as in execution. The back is painted by John Quidor, 46 Canal street, and deserves great praise. The motto of the company—"Actuated by benevolence, impelled by emulation"—is not only beautifully engraved, but is much truer to the intent and nearer to the actual character of our gallant fire companies than most mottoes are. The back scene, representing the parting of Otwa and Azula, from the curse of Talhoosin, is uncommonly fine. In short, the whole work reflects the highest credit, as well to the various artists who have been employed in its construction and decoration, as to the deserving Company of enterprising young men to whom it belongs.

By the by, the whole existence of such a body as our firemen—volunteers as they are altogether in arduous, fatiguing, and often perilous duties, seems to us, in a degree, characteristic and peculiar.

In London, the firemen receive regular pay, and are a body apart. In Paris, they are a military corps—*Sapeurs et Pompiers*. In our American cities they are young men of all pursuits, who spend time, labor, and money—much money sometimes, as the decorations of the engine above described will prove—for the general good without any compensation to be named: for the exemption from jury duty and a portion of taxes is nothing in comparison with their sacrifices. Yet there is among these volunteers much skill, and probably more emulation, than in the paid servants or soldiers of other countries.

The Lost Mail.—A letter from the Post Office at Columbia, to the Post Master in this city, dated the 18th, says, "I have been informed that it was the Great Mail which was lost in the river on Sunday last. They have succeeded in getting the way mail out of the river."

THE LOST MAIL FOUND.

Post Office, Camden, April, 21st, 1834.

Mr. MICOV:—Sir—The large Augusta Mailbag from this Office, that was lost in the river on Sunday the 13th, was found by a negro, nine miles below the Ferry, lodged in a raft, and brought to this Office last evening. It is in a very wet, bad state. Your letters, with the Way-bill dated 12th, were all safe, and I think all the rest will be safe. I am drying and putting them up in as good a state as I can, before I forward them.

Yours, &c.
T. THORNTON, P. M.

Shipwreck.—The Boston Transcript says—"We have seen a letter from Captain Isaac Percival, of the schr. General Jackson, from this port, on a sealing voyage, dated at the Isle of France, in December last. He states that after leaving St. Salvador (no date given) he proceeded to the Island of St. Paul's, where he found twenty-one poor unfortunate beings, the only survivors of ninety-one men, women and children—crew and passengers of the English ship Lady Monro, cast away there. They had been shipwrecked ten days, but the bodies of the dead remained unburied. After performing the unpleasant task of committing the putrid bodies to the earth, he embarked with the survivors, on board his vessel, and carried them in safety to Port Louis, in the Isle of France. The Lady Monro was commanded by Capt. John Aiken. She sailed from Calcutta on the 27th June, and was wrecked on the night of the 11th October."

We have been informed that a young man, son of Mr. Brass, near Kingston, was attacked and devoured by wolves last week in the woods 14 miles from this place. The young man was connected with some Indians in the vicinity, and had been missing two or three days; search was made and part of his skull, and some other bones were found. Our information

is positive, or else we should be inclined to doubt the report. The wolves are very numerous in the woods this season.—[Kingston (U. C.) Herald.]

STEAMBOAT DISASTER.—A letter to the Postmaster of New York, from Columbus, Geo., announces that the mail boat "Star of the West," plying between New Orleans and Mobile, burst her boiler on the 18th ult.,—killed two persons and injured others—all in confusion, and no mail from New Orleans, says a bill from the Mobile Post Office.

ANOTHER.—The St. Louis Republican of 17th ult., says—"By an arrival from the Upper Mississippi, we learn that the Steamboat *St. Louis*, bound to *Galena*, has burst her boiler, by which 12 or 14 persons were killed."

The accident happened in attempting to pass the Des Moines Rapids. The stern of the boat struck upon a rock and careened her over—the water in the boilers of course running to the lower side. In this situation the boat remained for twenty minutes or half an hour, when she righted, and the sudden return of the water into the boiler produced an instantaneous explosion. The names of the sufferers are—Perkins, the Engineer, killed; Miss More, blown overboard and lost; Mrs. Moore and son, dangerously scalded, and three other children killed; Mrs. Luckett, from Mill Creek, Illinois, badly scalded; Isaac Mars, dying when the account left; three Germans dangerously scalded, and three other persons slightly injured. The *St. Louis* was chartered for the trip from New Orleans to Galena.

There seems to be a considerable excitement among the lawyers, and in the newspapers of Cincinnati, on the subject of a Clerk to the Court. The grounds of the original dismissions are not stated, but we notice among the prominent facts, stated in large capitals, the certificate of one of the Judges that an offer of *one thousand dollars* had been made to him for his influence in obtaining the office for the successful applicant. It must be a snug birth, and as the judge did not take the money, there is a handsome sum saved in the outfit.

THE EARTHQUAKE IN PASTO.

[From the *Journal of Commerce*.]

PROVINCE OF PASTO, 5th FEBRUARY, 1834.

To the Honorable the Secretary of State for Home and Foreign Affairs.

SIR—In my communication of the 29th of January, No. 5, I promised, through the medium of your Excellency, to detail to the Supreme Government, the remarkable events occasioned by the Earthquake of the 20th of the same month; and I take the present occasion of fulfilling my promise with reference to whatever information I have received from the Political Chiefs of Pasto and Tuquerres, touching this subject, in compliance with my directions to them.

The Executive ordered a survey to be made of all the buildings which remained standing in the former city; and the result has been, that the ward of Francisco, is ascertained to have suffered least, since the greatest part of the houses in that district, although injured, may be nevertheless inhabited, because they are not bulged out, but the rest of the edifices in the city, which remain not destroyed, would be pulled down to their foundations, from their utter insecurity and their danger to the public; also the number of the dead hitherto found is 51, and of the mutilated 50.

The Temples and Cloisters of Monjas, of Merced, of San Augustin, of San Francisco, and Santa Domingo, must be raised anew from their foundations, as also the churches of San Sebastian and Santiago, the Public Bakery and Town gate.

To restore the cathedral to its former condition will be attended with the least expense of any of the churches; because the steeple and Frontispiece have alone fallen, and the fissures in the main walls are but trifling.

The villages in the neighbourhood of the city of Pasto, namely, Laguna, Mocandino, Buessaquillo, Pejundino, Puerres, Cunchalla, Tamondino, Tongovito, Gualmatan, Pandiaco and Tesucal, have all lost their churches, and the two first named towns lost some of their thatched houses and five of their inhabitants.

The parishes of Malatuy, Yacuanquer, Tambo, Buiaico, Funes, and their neighbouring parishes, have likewise had their churches destroyed, their Plantations and tiled houses; but that lamentable loss of life has not been incurred there, which befel Pasto and the parish of Sibundoy, whither I have sent two Commissioners to examine whether the origin of the

Earthquake may be traced to one of its mountains or lakes.

The Commissioners report, that at the right of a large Lake in the District of Sibandoy, a small rising ground is observed, which has vomited from its bosom large pieces of rock, and that huge and profound caverns are in the neighborhood surrounding the Desert called Bordoncillo; that almost the half of this Desert has been precipitated into the bowels of the Earth and the other part raised as it were above the surface, till it had formed a mountain of similar origin, situate between Sibundoy and Aguavico, which in its formation overspread a great deal of the original soil. The Commissioners further state, that this mountain has, from the successive convulsions of the earth, mouldered away, covering the high roads, and causing the formation of immense marshes in the neighborhood; that portions of the earth, precipitated occasionally from its tops, fell into the bed of the river Balsayaco, and obstructed its course, the sudden and impetuous overflow of which destroyed the lands and houses of the people of Santiago, forcing its waters even as far as Putumayo, being increased by nearly ninety tributary streams; and they state that the church and ten houses have been reduced to ruins, and the remainder of the inhabitants have fled into a high mountain, with all the images which they were able to save from the wreck. Almost the whole of this Canton is overspread with large abysses, principally in the parish of Yacuanquer, where its numerous eruptions have fortunately not disturbed the course of the river Guitara.

The Churches of the Parishes Zuassuyes and Ipiales of the District of Tuquerres have been likewise overthrown; and there considerable chasms in the territory of Guachucal, but Divine Providence has graciously been pleased to preserve its inhabitants from other evils.

Motions of the earth are even still felt there, and its frightful growlings terrify us every instant, and the one as well as the other, are felt to proceed from that part of Mocoa, whence they seem to originate; but up to this moment I have had no account of that unfortunate people. The heat of the sun has been excessive and destructive of the crops, but it has moderated since morning, and rained heavily last night, which affords us much consolation, as it prognosticates approaching winter.

Hoping your Excellency will be pleased to communicate the above to the proper authority, may God preserve your Excellency many years.

THOMAS ESPANA.

CIRCULAR.

Colombia, State of New Granada, Home and Foreign Office, Bogota, February 11, 1834.

ON HIS EXCELLENCY

The Governor of the Province of —.

On the 20th of January last, at seven o'clock, in the morning, the City of Pasto had been converted into ruins in an instant, by a violent earthquake, followed up by continual motions of the earth, and occasional severe shocks, which were felt even to the eve of the 22nd at the moment of the departure of the last post. More than fifty dead bodies, and as many others in an expiring state have been already extracted in the rubbish on the remote outskirts of the city; and a nameless multitude of victims are altogether buried beneath the wreck. The infection of the air and the absolute state of destitution, being without clothes or food, to which those are reduced, who have survived this lamentable catastrophe, in a season of extraordinary heat by day, and most rigorous frosts by night, give menacing forebodings of an approaching plague. The desolating effects of the season, itself scorching up the crops or nipping them in their bud, threaten the surrounding country with a future famine. Similar scenes of misery and of death, have been exhibited amongst all the neighboring villages, and must also have taken place in the other towns of the Province, situated to the South, and which are of most importance, because the movement of the Earth has taken its origin and direction, from the Volcanoes of the Province of Imbabura in the State of the Equator, and it is known likewise that this Earthquake has destroyed the City of Almaguer, which is in the meridian of the City of Popayan.

To events of such dismal and affecting nature, neither the Government nor the inhabitants of New Granada can be insensible or indifferent.

The President has given for transmission by the Post which departs to-morrow morning, three thousand dollars, to relieve the first necessities of the loyal and Industrious PASTORIANS. But this scanty supply being disproportionate to the pressing wants of the survivors, I am directed hereby to request

your Excellency will solicit other greater and suitable contributions from the patriotism and philanthropy of the inhabitants of your Province, who, if persuaded, will not be deaf to the cries of afflicted humanity. In the following parts of the Province of Popayan, a subscription has been collected from the sufferers, to which almost all have contributed with a prompt and generous liberality: and Pasto will quickly re-ascend from its ruins, if all the other districts of the Republic but imitate this laudable example, in fulfilling a solemn and sacred duty.

LINO DE POBLO.

A GOOD STORY.—"One seldom hears a good story now-a-days: the following is not bad. A year or two ago there came to the Lion, at —, a pleasant-looking, bustling, great-coated, commercial-traveller sort of a body. 'Well, landlord, what have you got, rump steak, eh? oyster sauce, eh? bottle of sherry, good, eh? send 'em up.' Dinner was served, the wine despatched, and a glass of brandy and water comfortably settled the dinner.

'Waiter,' said the traveller, coolly and dispassionately wiping his mouth with a napkin, 'Waiter I am awkwardly situated.'

'Sir?' said the waiter, 'expecting a love-letter.'

'I cannot pay you.'

'Sorry for that, sir; I must call master.'—(Enter landlord.)

'My good sir, you see this is rather awkward—good dinner! capital! famous wine! glorious grog!—but no cash.'

The landlord looked black.

'Pay next time—often come this road—done nothing to-day—good house yours—a great deal in the bill way.'

The landlord looked blue.

'No difference to you, of course?—pleasant house here—plenty of business—happy to take your order—long credit—good bill.'

'There is my bill, sir—prompt payment—I pay as I go.'

'Ah, but I must go without paying. Let us see—bill 17s. 6d. let us have a pint of sherry together—make it up a pound—that will square it.'

'Sir, I say you are a swindler, sir!—I will have my money.'

'Sir, I tell you I will call and pay you in three weeks from this time exactly, for I shall have to pass this road again.'

'None of that, sir—it won't do with me—pay my money, or I'll kick you out.'

The stranger remonstrated—the landlord kicked him out.

'You will repent of this,' said he stranger.

The landlord did repent it. Three weeks after that day, punctual to his word the stranger re-entered the Lion Inn—the landlord looked very foolish—the stranger smiled, and held out his hand—'I've come to pay you my score, as I promised.'

The landlord made a thousand apologies for his rudeness—'So many swindlers about, there's no knowing whom to trust. Hoped the gentleman would pardon him. 'Never mind, landlord; but come, let's have some dinner together—let us be friends. What have you got, eh?—a couple of boiled fowls, eh?—nice little nam of your own curing? good!—greens from your own garden? famous!—bottle of sherry and two bottles of port—waiter, this is excellent.'

Dinner passed over—the landlord hobbled and nobbed with the stranger—they passed a pleasant afternoon. The landlord retired to attend to his avocations—the stranger finished his 'comforter' of brandy and water, and addressed the waiter—

'Waiter, what is to pay?'

'Two pounds ten shillings and threepence, sir, including the former account.'

'And half a crown for yourself?'

'Makes two pounds twelve shillings and ninepence, sir,' replied the waiter, rubbing his hands.

'Say two pounds thirteen shillings!' said the stranger, with a benevolent smile, 'and call in your master.'

(Enter landlord, smiling and hospitable.)—'Sorry you are going so soon, sir.'

'The stranger merely said, with a fierce look, 'I owed you seventeen and sixpence, three weeks ago, and you kicked me out of your house for it.'

The landlord began to apologize.

'No words, sir; I owed you seventeen and sixpence, and you kicked me out of your house for it. I told you you would be sorry for it. I now owe you two pounds thirteen shillings, (and quietly turning aside his coat-tail,) you must pay yourself by a check on the same bank; for I have no money now.—[Bell's Weekly Messenger.]

Cholera in the West.—The New Orleans *Rec.*, of the 24th ult. says: "The Cholera had broken out on board the steamer Philadelphia—She landed a detachment of U. S. troops at Montgomery's Point on Sunday morning, the commanding officer of which, stated to our informant that six of his corps had been attacked with the disease, one of whom had died; two others were supposed to be dangerous—There had been a few cases among the passengers of the boat, one of whom had died.—[Charleston Patriot.]

In our paper of yesterday morning, we stated that the "Etna" of H. B. Majesty's navy, had impressed two men from the American ship "Rosanna," of Boston, commanded by Capt. George H. Jennings, while lying in port Praya, St. Jago, although no other sailors could be obtained in that port. It may not therefore be amiss to state, that by a letter dated 17th Feb. ult. we learn that Capt. J. protested against him in the usual form: upon this the 1st lieutenant of the "Etna" challenged him to fight. On the American captain's offering the terms on which he would accept the challenge, namely, to fight across a table with pistols, the British officer declined.

The commander of the "Rosanna" was presented with a handsome silver set by his passengers, while lying in the said port, in testimony of their approval of his conduct during the voyage from Havana.—[Daily Adv.]

Texas.—This country is likely to be convulsed in civil war, in consequence of the imprisonment of Col. Austin, founder of Austin's colony. The Colonel is accused by the Mexican government of having excited the colony to insurrection, and driving away the Mexican troops. The Colonel is now undergoing his trial in the city of Mexico, and fears are entertained for his life. Should he be executed, his death will be revenged, and a civil war must be the result.—[N. O. Mer. Adv.]

List of Subscribers to the Railroad Journal who have paid in advance to Jan. 1, 1835, continued from April 19, 1834.

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch, Flat Bars in lengths of 14 to 16 feet counter sunk holes, end cut at an angle of 45 degrees with splitting plates, nails to suit.

240 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.
Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 3 3/4, and 4 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.
A. & G. RALSTON,
9 South Front street, Philadelphia.

TO IRON MANUFACTURERS AND OWNERS OF IRON ORE BEDS.

JOSEPH GOULDING, of Keeseville, Essex county, N. Y., has invented and patented a *Magnetic Separating Machine*, for separating Iron Ore from the extraneous matter usually found in connection with it; and he begs leave to recommend it to the especial notice of owners of Ore Beds as possessing qualities of great importance, as by the use of this machine ore beds can be made very valuable, it being applicable in all cases when the Ore is magnetic.

The quality of the iron made is much improved by the process of separation, indeed good iron can, after separation, be made from ore which would without it be considered not worth working. There is also found to be a great saving in the transportation of ore, and in time and fuel required to work the same into iron.

Mechanics can be furnished at short notice which will separate from half a ton to twenty tons each in twenty-four hours.
J. Goulding also manufactures to order, *Cylindrical Forges and Blast Furnace Bolsters*, of the most improved construction, and which are successfully used in nearly all the Forges and Furnaces in Clinton and all the adjoining counties.
January 20th, 1834.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, blue wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, **WILLIAM NORRIS**, Secretary.

December 2d, 1833.

For further information on this subject see No. 40, page 772 of this Journal.

RAILROAD TURNOUTS, REVOLVING PLATFORMS AND SIDELINGS.

The subscriber having been for some years engaged in constructing turnouts, and inserting the necessary switches and fixtures appertaining to the same, on the Baltimore and Ohio Railroad, and as those works on that road will be shortly completed, he is desirous of being employed by any Railroad Company requiring work of the above description.

He will either contract at a fixed price to execute the work, he providing all the necessary materials and fixtures, or otherwise,—or he will engage himself at a stated salary.

In relation to his abilities and general character he begs to refer any Company, disposed to engage him, to the Baltimore and Ohio Railroad Company.

Letters can be addressed to him at the Office of Construction Baltimore and Ohio Railroad, Baltimore.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by **E. & G. W. BLUNT**, 154 Water street, corner of Maidenlane.
J31 6t

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.
WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.
Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Gra-
duation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.
E. M. GILL, Civil Engineer.
Germantown, February, 1833.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.
HENRY R. CAMPBELL, Eng. Philad.,
German and Norrist. Railroad

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bloeker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J35 15

RAILROAD CAR WHEELS, BOXES AND AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.
m18

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTZ, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Hertz.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and surveyor's Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing and Hertz.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

E. H. LATROBE,
Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MAY 17, 1834.

NEW-YORK AND ERIE RAILROAD.—We stated in our last that an appropriation had been made for a complete survey of this great work. We have since been informed, that the appropriation is only \$15,000, a sum much less than will be required to make a thorough survey. It is, however, sufficient to make a beginning, and we have no doubt but that an equal amount, or nearly so, will be subscribed by the owners of real estate in this city and along the line of the road.

An early survey of this route is highly important, and an early commencement of the work of equal importance to this city, quite as much so, indeed, as to the country through which it will pass; as Pennsylvania is pushing her works up to the State line, in order to intercept the trade of the southern counties; and she will not be disappointed either, unless New-York throws aside her sectional policy, and deals equally liberal with all parts of the State as she has with the northern section, and opens another outlet to her own markets, for the produce of her own soil. The southern tier of counties, or some parts of them, can obtain, (and have done it this season,) their supply of merchandise from New-York, or Philadelphia, through the Pennsylvania canals, several weeks before the ERIE CANAL was navigable. New-York can only counteract this by opening a more ready—an earlier communication, and this may be done by a railroad.

We shall give in our next a communication

handed to us, which has been before published in a different form, containing some very good reasons why the State should not only survey the route, but also contribute largely to its construction after it is surveyed.

Railroad from Tuscaloosa to Tusculumbia. To the Editor of the American Railroad Journal and Advocate of Internal Improvements.

North Port, Ala., April 25, 1834.

SIR,—Sometime in the fall of 1832, No. 36 of the Railroad Journal came into my hands. I am not absolutely certain that it is still published in New-York, though I am informed that it is. My object in writing at this time is, to request you to send me a Number of the Journal, if it is still published. On the receipt of it I will transmit to you the subscription price of one copy for one year, and perhaps more. The reason for my wishing to subscribe for the Railroad Journal is, that through the medium of it, to give publicity to the designs and wishes of so many of the people of this State who are anxious for a railroad between Tuscaloosa to Tusculumbia, a distance of about 100 miles, or a little over. It is not my intention to dilate on this subject at this time. It is sufficient, for the present, to mention, briefly, that in the event of the existence of this road, 100,000 bales of cotton, now raised in Tennessee valley, could get to market in going one-third the distance that it is now carried. The goods taken in exchange would return on the same road. There would then be a direct communication, by means of the Tennessee river, which runs nearly north from Tusculumbia into the Ohio, from Cincinnati and the immense country of the West, to Mobile, consequently, all the rope, bagging, twine, flour, bacon, potatoes, whiskey, and a variety of other articles, that now go the long route to New-Orleans, Mobile, and thence up our rivers, would come down the railroad to Tuscaloosa, and through the middle of Alabama to Mobile. The goods taken in exchange would return back on the road. Flour, bacon, and potatoes, on account of the delay in going to New-Orleans, and the hot weather, are frequently spoiled before arriving here. The great north and south travel is another important consideration; and also that the country through which this road would pass abounds in stone coal. Tuscaloosa is at the head of navigation, on the Black Warrior river. North Port is opposite the town of Tuscaloosa, on the other side of the river, and ships between 3 and 4000 bales of cotton annually.

Very respectfully, C. S.

A railroad from the Tusculumbia and Decatur Railroad to Tuscaloosa will add greatly to

the facilities and conveniences of business men in the interior of Alabama. We consider the projectors of the Tusculumbia, Courtland, and Decatur Railroad among the true benefactors of the State. That road, short as it is, will become the centre of action. It will, within a few years, be continued to the Atlantic on the east, the Mississippi on the west, the gulf of Mexico on the south, and the Ohio on the north; and will be intersected by numerous other shorter railroads from all the principal towns in their vicinity.

Newly Invented Railways. Communicated by the INVENTOR. To the Editor of the American Railroad Journal, and Advocate of Internal Improvements.

DEAR SIR,—I have now finished planting trees, for the present season at least, and snatch the first moment's time to fulfil the promise I have made you respecting my newly invented railways. I now give you a description, though an imperfect one, of this notable contrivance.

The supports of the railways are constructed out of common dock logs, which, in the first instance, are to be subjected to the operation of being well charred. Their butt ends are then to be inserted in the ground three or four feet deep, and surrounded by ruple stones well rammed in. The height of these supports will depend upon circumstances, from one hundred feet high down to not less than ten.

In order to give to these supports a due degree of stiffness and strength, I propose making the ways double, which will afford sufficient room to give them these properties. The spaces longitudinally between these supports, according to circumstances, may be occasionally extended to 500 feet, perhaps to a thousand. Whenever the extension is considerable, a sufficient number of lighter supports may be used. These may probably be made to give the necessary support without being inserted in the ground.

I shall now proceed to describe the mode of constructing the rails. In the first place, round iron, from a quarter to a half an inch in thickness, must be stretched across from pillar to pillar. These iron rods must be placed immediately under the rails—three to each rail. On these the rails are formed of common plank, extending the whole length, placed one on the top of the other, breaking joints. The whole number of the plank thus layed will depend on circumstances, perhaps 8 or 10 may prove sufficient. A proper cement must be used between each layer of the plank, to connect the whole into one solid mass. When the rails are thus formed,

a shoeing of some species of hard wood must be laid on, for the wheels to run on. These wheels must be tired with hard wood instead of iron. It is contemplated that, thus elevated above the dust and mud of common roads, they will last a long time.

The expense of a rail constructed as above would be small indeed when compared with the railroads now in use. It probably would not cost one-fourth of the latter, where iron is universally in use. But, independently of the difference of expense in the construction, as well as in the reparation of such a road, the advantages to be derived from its use are numerous and important. Its elevation not only protects it from dust, &c., but places it out of the reach of all interruptions, and permits also the passage across its path below of all sorts of other carriages in all directions. The farmer, instead of his usual dread of a railroad across his premises, will, on the contrary, court the approach of such a railroad as above described, as a great convenience in his various transportations, without incommoding him in any way. Whilst the railroad is passing over his head, he pursues his different agricultural avocations on the surface of the ground uninterrupted. The room the supports occupy is too trivial to be noticed; but another most important circumstance is, that it completely does away with all necessity of embankments and deep cuttings, leaving the ordinary surface of the ground free and clear; and, should the undulating project prove really advantageous, it would enjoy all the benefits arising from that source, exempted from all extra expense.

But there is one source of improvement which had nearly escaped my memory. The forward wheels, perhaps all the wheels, should have attached to each of them a wheel of a foot or 18 inches diameter, revolving horizontally, so placed that its periphery shall approach the inner side of the rails within half an inch, when the carriage is passing through the middle of the road, so as to prevent much deviation the reform whenever the wheels come in contact with either side of the rails. The mode now in use of preventing the carriage wheels from running off the ways is clumsy, and attended with much friction, so as to occasion considerable wear and tear. In order to prevent the carriage wheels from slipping on the ways, the periphery thereof should be covered with Indian rubber or leather made perfectly water tight.

Your obedient servant, J. S.

Hoboken, May 10, 1834.

The following Report of the Engineer to the President and Directors of the Tuscumbia, Courtland and Decatur Railroad Company will be found highly cheering to the friends of railroads, especially to those who look forward to the construction of a railroad from New-York through the Atlantic States to the Mississippi.

We also publish to-day two letters from gentlemen, one in Tennessee, and the other in Alabama, by which it will be seen that the Southern States are even taking the lead of the North.

Report of the Engineer to the President and Directors of the Tuscumbia, Courtland and Decatur Railroad Company.

Engineer's Office, Tuscumbia, March 4, 1834.

GENTLEMEN,—In presenting my second annual report, I have pleasure in stating that the different parts of the work have been steadily progressing; although not with that celerity and dispatch that was anticipated in our last annual exposition. The causes that have retarded the progress of the work are divers: the principal, however, may be attributed to the fact of the whole line being in the hands of one company of contractors.

Competition, it is acknowledged, in almost every pursuit, gives life to business, and had the work been let in smaller contracts, there is

reason to believe the whole would have been accomplished in due time.

LOCATION OF THE ROUTE.

At the date of the last annual report, it will be recollected, the location had then been established to a point on the East branch of Big Nance Creek, near Courtland. Since that time, and indeed quite lately, the line has been located to the termination on the Tennessee river, at the town of Decatur. The total length of the railroad, between its terminations on the Tennessee river, is 45.214 miles, viz.:

The Tuscumbia railway, extending from the depot on the Tennessee river to Maine street in Tuscumbia	2.100
1st division of the Tuscumbia, Courtland and Decatur railroad, from Main street in Tuscumbia to the West bank of Town Creek	14.784
2d division, from point last named to the East boundary of the town of Courtland	8.850
3d division, from Courtland to the termination at Decatur	19.480

Total in length, 45.214

The field work having only just been completed, no maps or profiles of the line can, at this time, be furnished; but these, as also the estimates upon the final location, will be made out and reported as soon as practicable.

I will merely remark that the limits and restrictions as to grade and curvature, which have heretofore been adopted, have been strictly obtained, viz.: 25 feet per mile as the maximum inclination, and 1,512 as the minimum radius of curvature.

There has been no curve laid on the first 13 miles of the road above Courtland on a less radius than 3,793 feet. One straight line has been obtained of a little over 4 miles, and another of $3\frac{1}{2}$ miles in length. The route, as now located, is the same in almost every particular described as letter A in my report upon the experimental surveys, above Courtland, submitted to your Board, 9th December last, a copy of which is herewith submitted, marked No. 1, for reference.

The general result of the estimates, as presented in the said report, will not, I apprehend, be materially changed upon the final estimates. The line, through the town of Courtland, has been located somewhat differently from what was anticipated when the report above referred to was presented. In order to comply with an arrangement made and agreed to by your Board, with the citizens of Courtland, it was found necessary to change the location as formerly made from station No. 296, being half a mile West of Big Nance, by curving to the right, and after crossing the public road, taking a direction for the street, through the centre of the public square in town, crossing the creek above the present bridge, at right angles with the stream. The principal disadvantage in this location is a high embankment, which has to be made immediately East of the creek. But it was deemed preferable to encounter this than the extra length of bridge that would have been required on the other route. The bridge will have one of its abutments on solid rock foundation and will be only a little over 100 feet long. The curves are also more agreeable, not being so sharp. Upon the other route, crossing below the road bridge, the bridge must have been 180 feet long, and located diagonally upon the stream.

An inclined plane is to be located in the town of Decatur, to overcome the difference of level between high water in the Tennessee river and the elevation of the Railroad. The grade of the road where the inclined plane commences is 25.41 feet above high water. The length of the inclined plane will be 330 feet, and its inclination 1 in 13.5, or say 4 degrees and 15 minutes.

This plane is designed to be worked by stationary horse power; the mode and manner of which will be best explained by reference to a

drawing heretofore furnished, relating to the depot and other buildings to be erected at Decatur.

THE GRADUATION.

At the date of the last annual report there had been $6\frac{1}{2}$ miles of the road graded above Tuscumbia. At this time the graduation may be said to be completed to station No. 178, on the second division, a distance of $19\frac{1}{2}$ miles, and about a mile more is graded a short distance West from Courtland; making say $20\frac{1}{2}$ miles of graduation accomplished. Deduct $6\frac{1}{2}$ and it leaves $12\frac{1}{2}$ miles done during the present year. It is to be remarked that much the heaviest portion of the whole line, in proportion to distance, has been finished. Contracts for the graduation of the whole line from Courtland to Decatur, except the first 3 miles above Courtland, were entered into, as your Board will remember, on the 16th day of January last, divided as follows, viz.: H. W. Rhodes, to extend 5 miles west from Decatur; Wm. Ellett, 1 mile west from Dr. Rhodes; Amos Kemble, the next 2 miles; A. & J. B. Hill, the next 4 miles; and Messrs. Combs and Dobbin, the next 4 miles. The first 8 miles extending from Decatur towards Courtland are taken at the estimate that shall be put upon the work by the engineer. The remainder, or the next 8 miles, at 11 cents per cubic yard, for excavation and embankment; and the grubbing, chopping and masonry, at the estimates to be fixed by the engineer. I am happy to state that three of the principal contractors commenced immediately after their engagement, with the company, and are progressing handsomely with their work. The grading from Big Nance to the Public Square in Courtland, was undertaken by Mr. Pearsoll, who has also commenced operations. The whole of the graduation is promised [by the contracts] to be accomplished by the 1st day of July next.

CONSTRUCTION.

Of this branch of the work there had only been one $\frac{1}{4}$ mile completed at the date of the last annual report, upon $2\frac{1}{2}$ miles the sleepers and strings had been laid, and upon a little over 2 miles, the sleepers only had been laid down.

At this time the construction may be said to be entirely completed to Town Creek, a distance of $14\frac{1}{2}$ miles above Tuscumbia, deducting $\frac{1}{4}$ mile, and it leaves $14\frac{1}{2}$ miles which have been finished during the past year. There remains now a distance of about $8\frac{1}{2}$ miles to be done to reach the town of Courtland, which it is expected will certainly be completed by the 1st day of July next. Contracts for the construction of the road above Courtland were also entered into, as your Board are aware—at Courtland, on the 16th of January last, viz.: with Dr. H. W. Rhodes, 5 miles, extending west from Decatur, the same ground of which he has the grading; Wm. Ellett, one mile, next to Dr. R.; Mr. Kemble, two next miles; Messrs. Pope & Thompson, four miles next to Mr. Kemble, and two miles extending from Big Nance Creek, eastwardly; Messrs. Combs and Dobbin have undertaken the next four miles, of which they have the grading; and Mr. S. Stevens has the balance, being about two miles.

The whole line is taken at the uniform price of \$2 13 $\frac{1}{4}$ per rod run, for the complete construction of the road, including the filling in of the horse-path of earth, and the covering of the ends of the sleepers.

Contracts for a sufficiency of timber of all kinds have also been entered into. Cedar sleepers at 30 cents per sleeper, and cedar strings at \$5 per 100 ft., oak at \$4 50; all to be delivered upon the line, at the proper points, by the 1st June next. The complete construction of the road is promised in the contracts by the 1st day of October next.

There has been delivered and received upon the line of railroad [including all above Tuscumbia] as appears from the inspector's reports, 28,235 cedar sleepers, 233 mulberry ditto, 56,410 feet cedar string pieces, 116,414 feet oak ditto, 12,632 feet poplar ditto, 11,880 feet mixed parcels oak and poplar.

There has been imported from Liverpool, and landed at the company's depot, 18,898 bars of railroad iron, weighing 929,562 pounds, being about a sufficiency to make 26½ miles of single track of railroad. There has also been received in all, from the Troy iron and nail factory, New-York, 37,696 lbs. of spikes and joint plates; castings for four complete turnouts have been obtained from Nappier's works in Tennessee.

An order for the necessary quantity of iron, spikes, and end plates, which will be required for the completion of the railroad, was made out and forwarded in December last.

DEPOTS, &c.

The depot and inclined plane at the termination of the Tusculumbia railway was nearly completed at the date of the last annual report, and was soon after finished, but it was feared that a want of sufficient room would be felt when the business season should arrive. With a view of obviating any difficulties on this head, several plans for the enlargement of the warehouse were suggested and discussed, and finally it was concluded to build storage rooms for cotton alone, immediately below the warehouse; and accordingly a building of frame, underpinned with rock, has been erected, 60 by 60 feet, and although measures were taken in due time, as was supposed, for the accomplishment of this business, I am sorry to say, the said building is not even now entirely completed, and, as must readily be seen, much inconvenience, and even actual damage, has been sustained in consequence thereof.

It is also true, that had the said building been entirely completed, there would still have been a deficiency in room for the storage of cotton, as well as for goods, even the present year, limited as the business of the road is, compared with what it must be another year, or when the road shall have been completed to Decatur. In view, therefore, of the entire accomplishment of the road, during the present year, and in order to meet the immense business that must offer itself to the company the next season, and with a determination to give satisfaction to the patrons of the road, it has been determined by a committee appointed by your Board, that a considerable enlargement of the depot is indispensable, and that the engineer furnish plans and specifications, and advertise for proposals for the building of the same. Accordingly, an advertisement has been made, soliciting proposals until the 24th of the present month, for the building of a permanent wharf, 250 feet long, upon which will be erected a frame warehouse, of the same length, by 60 feet in width, also the extension of the present depot 75 feet at the east end, and the full width of the said house. Those buildings being erected, it is believed business will be done with economy and credit to the company, and entire satisfaction to the community. The sheds in the town of Tusculumbia remain as they were this time last year. The company has lately purchased three lots of half an acre each, contiguous to the railroad, and very near the business part of the town; which lots are designed to be occupied by the warehouse, sheds and offices, that will be needed in the plan.

[To be continued.]

FORCE OF TRACTION.—Experiments, in every way show, that the force of traction is uniform, nearly in an exact proportion to the strength and hardness of a road. The following are the results: On a well made pavement, the power required to draw a wagon is 33 lbs.; on a road made with six inches of broken stone of great hardness, laid on a foundation of large stones, set in the form of a pavement, is 46 lbs.; on a road made with a thick coating of broken stone, laid on earth, the power required is 65 lbs.; and on a road made with a thick coating of gravel, laid on earth, the power required is 147 lbs. Thus it appears that the results of actual experiments fully correspond with those deduced from the laws of science.—[Parnell's Treatise on Roads.]

HANCOCK'S WEDGE WHEELS.

Fig. 1.

Hancock's Wedge Wheels. [From the London Mechanics' Magazine.]

SIR,—I forward you a sketch and description of the wedge wheels which I have adopted for my steam carriages, having found those of other constructions insufficient for the purpose. Being desirous of employing vertical wheels, and knowing that those on the common plan could not stand in this position, I determined on trying a pair constructed in the manner I am about to describe, and which description I am induced to send you, from a belief they may be found useful generally, and more particularly to those who are engaged in similar pursuits with myself.

Fig. 1 is a front view of a wheel, with the front bindplate removed, to show the meeting of the wedged spokes, which are of straight grained, well seasoned ash, tenoned into the felloes as in common wheels, but the nave ends are very accurately fitted to each other in radial joints, butting against the iron box of the axle, and forming around it, to the circumference of the bind-plate (shown by a dotted circle), a solid connection of timber.

Fig. 2 is a horizontal central section of the above. The tire is secured by a bolt and nut, or rivets, through each felloe, the heads being countersunk, so as to stand flush with the outside of the tire. The box, which contains a reservoir for oil, is formed with its flange in one casting, the outside diameter of the flange being the same as that of the front bind-plate, which is like a large wrought iron washer, and shown detached at fig. 3.

Screw bolts pass through the back flange, spokes, and front bindplate, the nuts turning against the face of which brace all together as one solid nave. There is one of these bolts to each spoke, as shown in figs. 1 and 3.

The spokes throughout are of a parallel thickness, as shown in fig. 2, the edges being slightly rounded off.

I have not entered into the details of the substance of metal and wood, as this must necessarily depend upon the size of the wheel, as well as the work it is required to perform. Having worked many such wheels on my carriages, I can say, from experience,

Fig. 2.

that they are all that can be required in a wheel; they combine permanent strength with comparative lightness, and are by no means expensive in their first cost.

I am, sir, yours, &c.

WALTER HANCOCK.

Stratford, Essex, January, 1834.

P. S.—The Infant has a set of dished wheels on this principle, now in good condition, after having performed work which would have worn out two or three sets of wheels of the common construction.

Specification of a Patent for Furnaces for Generating Heat by Friction, and applying the same to economical purposes. Granted to JOHN W. COCHRAN, Lowell, Middlesex county, Massachusetts, November 19, 1834.

To all whom it may concern, be it known, that I, John W. Cochran, of Lowell, in the county of Middlesex, and state of Massachusetts, have invented a *Friction Furnace* for generating heat without the consumption of fuel, and applying the same to economical purposes; and I do hereby declare that the following is a full and exact description of my said invention.

Although the fact that heat may be generated by friction is one of universal notoriety, it does not appear that the idea of applying this heat to economical purposes has ever been practically acted upon; I, however, have ascertained by satisfactory experiments that it may be done to great advantage. The most convenient way of effecting the object is to prepare two metallic disks, or cylinders, say of cast iron, in the form of common mill stones, and to cause one of them to revolve against the other, under considerable pressure, which pressure may be given by the weight of one of the disks, or by that of a vessel containing water, or other fluid, to be heated, the bottom of which may take the place of one of the disks; or by weighted levers, or in any other way of producing pressure which may be preferred. When I make two

disks of this description to rub against each other, I form one or both of them somewhat hollow towards the centre, on the touching sides, as a bearing on that part would tend to diminish the friction towards the periphery, where the motion is the most rapid.

There are many ways in which I contemplate the application of this principle, as, for example, I intend sometimes to cause two disks, such as I have described, to revolve one against the other, by power derived from a water wheel, or from any other convenient source, and to enclose them within a drum, or chamber, into which a current of cold air shall be admitted, and whence it shall be conducted by suitable tubes, after it has been heated by being brought in contact with the disks; thus using it to warm the apartments of any building, or for other purposes. Where steam is preferred, I intend sometimes to allow water to fall in a small stream upon the heated disks, and to conduct it thence through tubes to wherever it may be required. Where steam is to be generated to drive machinery, the bottom of the boiler may be made of suitable form, and to bear upon a disk revolving below it; or the bottom may be perforated, to allow the shaft of a disk revolving in the inside thereof to pass through, and to be turned by any suitable apparatus, by power derived from the steam generated by the heat from the friction, or from any other source.

These various modes will sufficiently illustrate the principle upon which I depend for rendering the heat which was latent, sensible, and active; but I do not intend by this enunciation to restrict or confine myself to the form of apparatus herein described, or to the objects to which it may be applied, but to vary the same in any manner which I may find most convenient and efficient.

It may at first appear that the powerful friction necessary to engender sufficient heat to be usefully employed as a substitute for that extricated in the combustion of fuel, will produce a rapid wearing out and destruction of the rubbing apparatus; I, however, have ascertained, satisfactorily, that when the metals become heated, there is a degree of repulsion produced between them which admits of but little abrasion of their substance.

What I claim as my invention, and for which I ask a patent, is the application of the heat generated by the friction of pieces of metal against each other, to the purpose of heating air, generating steam, and, in fine, to all the economical purposes to which such heat is applicable, proceeding, in its production, upon the principles herein before set forth. JOHN W. COCHRAN.

Railroad from Memphis to Bolivar.—Extract of a letter, dated Memphis, Ten., April 22, 1834, addressed to the Editor of the Railroad Journal, &c.

"SIR,—I am now engaged in the preliminary survey of a railroad from Memphis, through Summerville, to Bolivar. It is intended to connect this with Jackson, and thence to Columbia, and thence probably to Nashville. Probably, in a few years, Nashville will be connected to Louisville on the Ohio River. Casting your eye on a map of Tennessee and Kentucky, you will see the extent of such a railroad. We strongly anticipate a connection with Charleston via Tusculum. Numbers in this place wish to take your Journal. I hope to send you something more substantial than words when next I write.

"Very respectfully,

"JOHN THOMPSON."

The writer of the above has our best wishes for his success, as well in his survey as in obtaining subscribers to the Journal.

THE IRON STEAMBOAT ALBURKHA.—This vessel is now in the river Niger, with the Quorra steamboat, and seems to have been the favorite of the two vessels since they departed on

their interesting expedition. The advantages of iron vessels in warm climates are ably pointed out in a short extract we gave in our last number from Chambers' Journal; and these advantages seem in no wise exaggerated in the instance of the Alburkha, according to reports received from those embarked in her. This vessel was built by Mr. Laird, of Liverpool, for the purpose of navigating the shoal water of the river, and we understand that he has since constructed another for the interior navigation of Ireland. We have no doubt that these vessels, from their vast superiority over those of wood, and their durable quality, will speedily be numerous employed.—[Nautical Magazine.]

NEITHER LIGHTING NOR HEATING BY GAS OF MODERN ORIGIN.*—In several situations removed from any volcanic action, so far as is visible on the surface, natural jets of inflammable gases are seen to issue, affording decisive evidence of chemical changes that are taking place at various depths beneath. Of these, some have served the purpose of the priest to delude mankind, while part of the others have been more usefully employed.

Carburetted hydrogen gas is well known to be the "fire-damp" of the coal districts, and to issue from the coal strata; collecting in the ill-ventilated galleries of collieries, and, when sufficiently mixed with atmospheric air, exploding with great violence when approached incautiously with an unprotected flame, spreading mourning and misery among the families of the miners. If the genius of Davy had merely produced his safety lamp, it would alone have united him to the applause and thanks of mankind.

As carburetted hydrogen is so freely liberated in coal mines, it would be expected that it should occasionally be detected on the surface, and accordingly it has been so discovered.* Inflammable gas also occurs in other situations, where there is no reason to suspect the presence of coal strata. Of this the well-known jets of gas in the limestone and serpentine district of the Pietra Mala, between Bologna and Florence, afford an example.

Captain Beaufort describes an ignited jet of inflammable gas, named the Yanar, near Deliktash, on the coast of Karamania, which perhaps once figured in some religious rites. He states that, "in the inner corner of a ruined building, the wall is undermined so as to leave an aperture of about three feet in diameter, and shaped like the mouth of an oven; from hence the flame issues, giving out an intense heat, yet producing no smoke on the wall." Though the wall was scarcely discolored, small lumps of caked soot were formed in the neck of the opening. The hill is composed of crumbly serpentine and loose blocks of limestone. A short distance down the hill there is another aperture, which, from its appearance, seems once to have given out a similar discharge of gas. The Yanar is supposed to be very ancient, and is possibly the jet described by Pliny.

Colonel Rooke informed Captain Beaufort, that high upon the western mountain at Samos there was an intermittent flame of the same kind; and Major Rennel stated, that a natural jet of inflammable gas, inclosed in a temple at Chittagong, in Bengal, is made use of by the priests, who even cooked with it.

According to M. Imbert, gaseous exhalations are employed at Thsee-Lieon-Tsing, in China, to distil saline water, obtained from wells in the neighborhood. Bamboo pipes carry the gas from the spring to the place where it is to be consumed. These tubes are terminated by a tube of pipe clay, to prevent their being burnt. A single well (of gas) heats more than three hundred kettles. The fire thus produced is ex-

* From Mr. De la Beche's Geological Manual (third edition, considerably enlarged in 1833), one of the most instructive and entertaining works which the new and important science of geology has yet produced.—Ed. M. M.

It appears very remarkable, that in the coal districts of the British isles, where such a large amount of carburetted hydrogen is annually produced, means have not been adopted for making an economical use of this gas, both as it respects light and heat.

ceedingly brisk, and the caldrons are rendered useless in a few months. Other bamboos conduct the gas intended for lighting the streets and great rooms or kitchens.

M. Klaproth notices other jets of inflammable gas in China; one, now extinguished, is stated to have burnt from the second to the thirteenth century of our era.

It also appears that M. Røeders, inspector of the salt mines of Gottésagabe, at Reine, in the country of Tecklenberg, has for two or three years used an inflammable gas, which issues from these mines not only as a light, but for all the purposes of cookery. He obtains it from the pits that have been abandoned, and conveys it by pipes to his house. From one pit alone a continuous stream of this gas has issued for sixty years. It is supposed to consist of carburetted hydrogen and olefant gas.

Inflammable gases are also found to proceed from ground charged with petroleum and naphtha. The inhabitants of Baku, a port on the Caspian Sea, are supplied with no other fuel than that derived from the petroleum and naphtha, with which the earth in the neighborhood is strongly impregnated. About ten miles to the north-east of this town there are many old temples of Guebres, in each of which there is a jet of inflammable gas rising from apertures in the earth. The flame is pale and clear, and smells strongly of sulphur. Another and a larger jet issues from the side of a hill. If, in the circumference of two miles, holes be made in the earth, gas immediately issues, and inflames when a torch is applied. The inhabitants place hollow canes into the ground, to convey the gas upwards, when it is employed for the purposes of cookery, as well as for light.

REMARKS ON THE GYPSIES.—There are few questions in the history of the human species more curious than that of the origin and characters of these singular people. A race of men which presents the most extraordinary phenomenon in social life, has existed nearly four centuries in Europe; and yet remains but imperfectly known. Neither time, climate, politics, nor example, have produced any change in their institutions, their manners, their language, or their religious ideas. The Israelites are the only people, who have preserved, like them, their primitive character in foreign lands.*

Different writers have assigned to these people a very different origin—one traces them from the eastern part of Tunis—another from Zanguebar—one from Mount Caucasus—one considers them as German Jews—and others bring them from Egypt, Colchos, the Ukraine, &c.

We know of but three writers who have placed this question in a true point of view. The two first whose opinions are admitted by the learned generally, are Grellman and David Richardson, who consider India as the cradle of Tzengoris or Gypsies; Abbe Dubois places them among the Kouravers of

* Names by which they are known in the different countries in which they reside.—The Arabs and Moors call them Harami, (robbers); the Hungarians Cingany, and Pharaoh Nepek (people of Pharaoh); the latter name is also given them in Transylvania; the English have adopted the name of Gypsies, an alteration of the word Egyptians; the Scotch, that of Caird; the Spanish call them Gitanos; the Portuguese, Ciganos; the Dutch, Heidenen, (idolators); the Russians, Tzengani; the Italians, Zingari; the Swedes, Spakaring; the Danish and Norwegians, Tatars; the Wallachians, Bessarabians, Moldavians, Servians and Sclavonians, Cigani; the Germans, Zigeuner; in France they at first received the name of Egyptians and more recently that of Bohemians, because the earliest of the tribe came into France from Bohemia. Historians of the middle ages designate them by the name of Azinghans, the modern Greeks under that of Atinghans; in Adzerbaidjan, they are called Hindou Karuch, (black Hindoos); in Persia, Louri; the Bucharians and inhabitants of Turkistan, call them Tziaghi, which appears to be the root of Tehingeni, the term given by the Turks to this wandering race. I have been acquainted in Europe with three of their Rabers of chiefs, who assure me they call themselves Rouma Chal.—These two words belong to the Mahratta language and signify men who wander in the plains. I consider Tzengarie as their primitive name, and which is still preserved in their mother country.

Mohissoun, while others trace them to the country of the Maharrattas as their original position where, indeed, they are still found united in tribes.

The Primitive tribes of the Tzengaris is a subdivision of the different tribes of Parias or men out of caste. The origin of Parias is very ancient. This sub-caste is formed by the union of individuals driven from different castes for offences committed against the religion and laws, and includes a great number of tribes, among whom may be reckoned Vallouvers the Chakalis, the Moutchiers, &c., and lastly the Tzengaris, the primitive tribe of our Bohemians and Egyptians, or the Zingari of the nations, which term still resembles the original name.

The tribe of Tzengaris, called also Vangaris on the coast of Concan and of Malabar, is nomadic.—They are often met in whole bands near the ancient and magnificent city of Visapour, and in the vicinity of Bangalore and Mahicour, which is called Mysore, from a habit of disfiguring eastern names. They are in general a dark complexion, which justifies the Persian appellation of Black Hindoos. Their religion, institutions, manners, and language differ from those of other tribes of Hindoos. During a war they are addicted to pillage, carry provision for the armies, and fill them with spies and dancers. During peace they make coarse stuffs, and deal in rice, butter, salt and opium, &c. Their women are as handsome and agreeable as the generality of Hindoos, but are very lascivious. They often carry off young girls whom they sell to natives and Europeans. They are accused of immolating human victims to their demons and eating human flesh. They every where follow the trade of errand runners and procurers.—The women are fortune-tellers, a business which they practice by striking on a drum in order to invoke the demon; then pronouncing with the air of a sybil, and with rare volubility, a string of mystical words, and after having gazed at the sky and examined the lineaments of the hand of the person who consults them, they gravely predict the good or evil which is to be his destiny. The women also practise tattooing, and the figures of stars, flowers, animals, &c. which they imprint upon the skin by puncturation and vegetable juices, are ineffaceable. They live in families, and it is not rare to see father and daughter, and uncle and niece, brother and sister, living like beasts together. They are suspicious, liars, gamblers, drunkards, cowards, poltroons, and altogether illiterate; they despise religion, and have no other creed than the fear of evil genii and of fatality. They originated in the province of Mahrat, among the eastern Ghauts.

The celebrated Cherif Eddin assures us that Timur sullied his conquests by the massacre of 100,000 prisoners, Persians, and Hindoos. The Monguls spread such terror in all parts of India, that great numbers abandoned that unhappy country.—The Hindoos of the three first castes, indeed, remained firm to their country;—their religion made it a duty;—but no place could retain the Soudras and Parias. They are such vagabonds that travelers have met with them in Abyssinia, in Arabia, at Tzouakem in the Persian Gulf, at Penang, at Singapore, at Malacca, at Manila, at Celebes, at Anyer, and even in China.

It is not natural to believe that the Tzengaris, who are so accustomed to a camp life, and excluded from Hindoo communion, should practise, or feign to practise, religion which offered them so many advantages, that they should act as spies and purveyors to the Mongul armies, and that a portion of them should accompany Timur in his long traverse through Kandahar, Persia, and Burkahra; and after passing through the Caucasian regions, and leaving behind them a train of detached families, they should have come to a stand, some in Russia, others in Asia Minor; that a second column should have passed from Kandahar into Mekran and Irak Arabia; and a third stayed into Syria, Palestine, and Arabia Petrea, and should have reached Egypt by the Isthmus of Suez, and thence should have passed into Mauritania.

It is not improbable that those rude travelers landed from the Black Sea and Asia Minor in Europe, by the intervention of the Turks during their wars with the Greek empire; and it is equally probable that the first of them who came to Europe, sojourned in European Turkey, as Aventine informs us, and proceeded thence to Wallachia and Moldavia. In 1714, they were found in Hungary, and at the conclusion of that year they were seen in Germany and Bohemia; the next year in Switzerland, and in 1422 in Italy. Pasquier carries their origin in France to 1417, and says that they styled themselves Christians from Lower Egypt, expelled thence by the Saracens, but that in reality they came from Bohemia. From

France they passed into Spain and Portugal, and afterwards under Henry VIII. into England. Their hordes commonly consist of two or three hundred persons of both sexes.

Although it is difficult to explain how they acquired the name of Gypsies or Egyptians, it is certain they neither have an Egyptian origin, nor came from Egypt to Europe, as Crantz and Munster have proved.

Countries in which the Tzengaris or Gypsies are now found.—These people constitute part of the population of all the countries of Europe and of a large portion of Asia. In Africa they are found only in Egypt, Nubia, Abyssinia, Soudan and Barbary.—They have never appeared in America.

They are most numerous in Spain, Ireland, Turkey and Hungary, but especially in Transylvania, Moldavia, Wallachia, Slavonia, Courland, Lithuania, and the Caucasian provinces.

In England they are still pretty numerous, but are found only in distant places, seldom coming into the towns excepting in small companies of two or three persons. In Germany, Sweden, and Denmark, they have become rare, as also in Switzerland and the Low Countries. In Italy their numbers are diminished. In Spain it is said that there are fifty or sixty thousand of them, and in Hungary, according to the best information, about fifty thousand. In Transylvania, they are most numerous, for in a population of 1,720,000 souls, there are reckoned 104,000 Tzengaris. We do not exaggerate in estimating the Tzengarian or Gypsey population of Europe at nearly a million: in Africa, at 400,000; in India, at 1,500,000; and about 2,000,000 in all the rest of Asia, for except in Asiatic Russia, China, Siam, Annam and Japan, they are every where to be found. Hence we may deem the total population of these people to be five millions.

We have thus a considerable portion of the human race thrown, as it were, beyond the common rights of nations; so many men wandering about without any claims which can attach them to the soil, encamping in places remote from civilization, living by theft and deception, and every where diffused, notwithstanding the persecution and contempt which are heaped upon them.—G. Louis Domyer De Rienzi.

From a Life of Sir John Moore, by his brother recently published in London, the following extract, descriptive of the close of the battle of Corunna, and the death of Moore, is made:

"Moore then turned to where the 59th regiment, commanded by Majors Charles Napier and Stanhope, was warmly engaged. They leaped over an enclosure, and charged the enemy, Moore exclaiming, 'Well done, the fiftieth! well done, my majors!'—The French were driven out of the village of Elvina with great slaughter; but Major Stanhope was killed, and Major Napier, advancing too far, was wounded and made prisoner. The contiguous regiment was the 42d, to whom Moore called loudly, 'Highlanders! remember Egypt!' They heard his voice, and rushed forward, bearing down every thing before them, until stopped by a wall, over which they poured their shot. He accompanied them in this charge, and told the soldiers he was well pleased with their conduct. Then he sent Captain Hardinge to order up the guards to the left of the Highlanders. This order was misunderstood by the captain of the Highland light company, whose ammunition, from being early engaged, was expended. He conceived that the guards were to relieve his men, and was withdrawing them, when the general, apprized of the mistake, rectified it, by saying, 'My brave 42d, join your comrades; ammunition is coming, and you still have your bayonets!' They instantly obeyed. The French having brought up reserves, the battle raged fiercely—fire flashing amidst the smoke, and shot flying from the adverse guns; when Hardinge rode up and reported that the guards were coming quickly. As he spoke, Sir John Moore was struck to the ground by a cannon-ball, which lacerated his left shoulder and chest. He had half-raised himself, when Hardinge, having dismounted, caught his hand, and the general grasped his strongly, and gazed with anxiety at the Highlanders, who were fighting courageously; and when Hardinge said, 'they are advancing,' his countenance lightened. Colonel Graham now came up, and imagined, from the composure of the general's features, that he had only fallen accidentally, until he saw blood swelling from his wound. Shocked at the sight, he rode off for surgeons. Hardinge tried in vain to stop the effusion of blood with his sash; then, by the help of some Highlanders and guardsmen, he placed the general upon a blanket.—

In lifting him, his sword became entangled, and Hardinge endeavoured to unbuckle the belt to take it off, when he said with soldierly feelings, 'It is as well as it is: I had rather it should go out of the field with me.' His serenity was so striking, that Hardinge began to hope the wound was not mortal; he expressed this opinion, and said, that he trusted the surgeons would confirm it, and that he would still be spared to them. Sir John turned his head, and cast his eyes steadily on the wounded part, and then replied, 'No, Hardinge: I feel that to be impossible. You need not go with me; report to General Hope that I am wounded and carried to the rear.' He was then raised from the ground by a Highland sergeant and three soldiers, and slowly conveyed towards Corunna.

The soldiers had not carried Sir John Moore far, when two surgeons came running to his aid. They had been employed in dressing the shattered arm of Sir David Baird, who, hearing of the disaster which had occurred to the commander, generously ordered them to desist, and hasten to give him help. But Moore, who was bleeding fast, said to them, 'You can be of no service to me: go to the wounded soldiers, to whom you may be useful; and he ordered the bearers to move on. But as they proceeded, he repeatedly made them turn round to view the battle, and to listen to the firing; the sound of which, becoming gradually fainter, indicated that the French were retreating. Before he reached Corunna it was almost dark, and Col. Anderson met him; who, seeing his general borne from the field of battle for the third and last time, and steeped in blood, became speechless with anguish. Moore pressed his hand, and said in a low tone, 'Anderson, do not leave me. As he was carried into the house, his faithful servant, Francois, came out, and stood aghast with horror; but his master, to console him, said, smiling, 'My friend, this is nothing.' He was then placed on a mattress on the floor, and supported by Anderson, who had saved his life at St. Lucia; and some of the gentlemen of his staff came into the room by turns. He asked each, as they entered, if the French were beaten, and was answered affirmatively. They stood around; the pain of his wound became excessive, and deadly paleness overspread his fine features; yet, with unshaken fortitude, he said, at intervals, 'Anderson, you know that I have always wished to die this way.—I hope the people of England will be satisfied! I hope my country will do me justice! Anderson, you will see my friends as soon as you can. Tell them—every thing.—Say to my mother—' Here his voice faltered; he became excessively agitated, and not being able to proceed, changed the subject. 'Hope!—Hope! I have much to say to him—but cannot get it out. Are Colonel Graham and all my aides-de-camp safe?' (At this question, Anderson, who knew the warm regard of the general towards the officers of his staff, made a private sign not to mention that Captain Burrard was mortally wounded.) He then continued, 'I have made my will, and have remembered my servants. Colborne has my will, and all my papers. As he spoke these words, Major Colborne, his military secretary, entered the room. He addressed him with his wonted kindness; then, turning to Anderson, said, 'Remember you go to Willoughby Gordon, and tell him it is my request, and that I expect he will give a lieutenant-colonelcy to Major Colborne;—he has been long with me—and I know him to be most worthy of it.' He then asked the major, who had come last from the field, 'Have the French been beaten?' He assured him they had on every point. 'It's a great satisfaction,' he said, 'for me to know that we have beat the French. Is Paget in the room?' On being told he was not, he resumed, 'Remember me to him; he is a fine fellow.' 'Though visibly sinking, he then said, 'I feel myself so strong, I fear I shall be long dying. It's great uneasiness—it's great, great pain!—Every thing Francois says is right—I have great confidence in him.' He thanked the surgeons for their attendance. Then seeing Captains Percy and Stanhope, two of his aides-de-camp, enter, he spoke to them kindly, and repeated to them the question, 'If all his aides-de-camp were safe; and was pleased on being told they were. After a pause, Stanhope caught his eye, and said to him, 'Stanhope! remember me to your sister.' He then became silent. Death, undreaded, approached; and the spirit departed, leaving the bleeding body an oblation offered up to his country."

TO TAKE OUT INK FROM MAHOGANY.—Wet a piece of blotting paper, rolled into a ball, and rub the places where the ink was with a dry cloth.

[From the *Mechanics' Magazine*.]

NEW ERA OF STEAM POWER.—Mr. BURDEN is progressing rapidly in the construction of his boat; it will be in operation on or before the first of June, and we have no doubt will realize the most sanguine expectations of the inventor—if inventor we dare call him, for, as will be perceived from the annexed communications, there are several who set up a previous claim. But, as a contemporary well observes,—“Other men broke stones before MACADAM, but he broke them to such effect as to be justly deemed an inventor. Other men, in like manner, may have observed the extreme buoyancy of the barrel before Mr. Burden; but the successful application of these principles we do think should entitle Mr. Burden to the title of inventor.”

We have received the following from Mr. HARRIS, in reply to ARCHIMEDES, published in our last number.

NORFOLK, Va., April 12, 1834.

SIR,—I have read with no little amusement, in your last number, a communication relative to my Twin Boat, by a writer who signs himself ARCHIMEDES. As he manifests a very laudable desire to prevent people from being “imposed upon by plausible appearances,” I have been induced to present for his consideration, through the medium of your valuable journal, some few facts and views which I have no doubt will disperse from his mind the mists of error by which he now appears to be so completely and unconsciously enveloped, and enable him hereafter to direct with the confidence of truth the patronage of “persons possessing both the means and disposition” to patronise valuable improvements. As in my letter, published in your last number, I have publicly condemned Mr. Burden's boat, I deem it proper to state here that I did not intend that letter for the public. Had that been my purpose I should have made no particular allusion to Mr. Burden's boat, but should have left the public to make their own comparisons. I would not be understood as condemning that letter on account of such particular allusion, (for the publication of Mr. B.'s invention made it a fair subject of public discussion, however rigid,) but merely as intimating that, having no wish to make strictures publicly on any man's concerns, and especially to commence a discussion, I should have been for that reason unwilling to have singled out Mr. Burden's invention, as if for the purpose, it would seem, of inviting controversy. My agent, to whom, and for whom alone, I intended that letter, not knowing my sentiments on this subject, judged that, as an advertisement of my invention, that letter would serve a good purpose, and on that account, and not with a view to the injury of Mr. Burden, published it, being perfectly justified in the act by the general principle, that whoever voluntarily introduces his opinions, conduct, or concerns, to public notice, renders them ipso facto justly amenable to public discussion, and in that sense public property, respecting which any man possesses the indubitable right of expressing his opinions, temperately, whether adverse or otherwise. As that letter is published, and as the remarks of ARCHIMEDES call for a reply, I am now, of course, compelled to sustain, as well as I may, by all fair means, my unfavorable opinions of Mr. Burden's invention, which I shall do, entertaining not the least personal hostility against that gentleman, with whom, in fact, I am unacquainted and whom I never saw. If Mr. Burden's plan of constructing twin boats is superior to any yet discovered, ARCHIMEDES may rest assured that a comparison of it with mine will redound to the advantage only of Mr. B.

ARCHIMEDES denies to me the merit of invention, because it appears that a Mr. Simon Fairman, in 1817, at Middletown, in Connecticut,

made a very “wonderful discovery” of what was, all persons must allow, according to ARCHIMEDES' statement, a “wonderful” boat indeed. This boat of Mr. Fairman's, only 35 feet long, was, it appears, sufficiently buoyant to carry men enough to propel it at the rate of considerably more than five miles per hour, carrying also the weight of passengers, their baggage, &c.

Now, sir, this boat could not have been “in all respects precisely” like mine, for had it been constructed on my plan it would not have been sufficiently buoyant to have carried all the weight above mentioned, and have ventured in to the sound, because its length (35 feet) would have of necessity rendered its other dimensions altogether too contracted for that purpose. What is called a six knot sailing breeze would have raised a sea sufficient to have subjected the passengers and workmen to a rather disagreeable and continued cold bath of several inches on deck; and as for cabins, not one fourth of a moderate number of passengers could have stowed themselves in the narrow and shallow holds of so small a twin boat as one built on my plan, only 35 feet long, must of necessity have been. Why, sir, a boy of eight years only could not have sat upright in one of them. But I do not by any means rest on this difference in proportions as a proof that my invention is one sui generis and not identical with Mr. Fairman's boat. That difference, although in itself strong, is comparatively my weakest point, and on that account I present it first. Had I, after splitting, as it were, a single boat apart, left the inner, or, as A. terms them, “approximate” sides, perpendicular, I should have arrived but half way to the completion of my invention. I found by inclining those sides at a very considerable angle towards each other, either in a right lined or curvilinear angle, that many various and important advantages were thereby attained, without losing the advantages resulting from the longitudinal parallelism of those sides. This inclination destroyed their vertical parallelism to each other, and thereby rendered the boat essentially different in form as well as in properties from Mr. Fairman's or any other kind of boat.

In my published letter I did not even mention the curvilinear inclination, for wishing to illustrate my plans by figures, I perceived that no figure which I could draw would be likely to convey a correct idea of that peculiar form, but, on the other hand, would rather be apt to create the impression that I had resorted to something like the five mile “swell” of which ARCHIMEDES speaks. That my agent might obtain a full and clear understanding of my invention, I went regularly to work and first built on paper a single boat, of such dimensions, he it observed, that she would be rendered by them, as a single boat, entirely useless. I then proceeded to divide her, and by the division made the straight inner sides perpendicular. Before altering this perpendicularity, I proved her to be superior to Mr. Burden's boat, on account of the straightness of the inner sides being “a principal point of superiority.” In this particular, a half stage only to the completion of my invention, it appears that Mr. F. had preceded me, though it would seem in so inefficient and imperfect a manner as to cause him to condemn it and resort to curved inner sides. It appears that he preceded Mr. Burden in building twin boats, and therefore, on that ground, (namely, their being twins,) may as well dispute the merit of invention with Mr. B. as with me. These (Mr. F.'s) inner sides, by being ultimately curved, exactly resembled Mr. Burden's, but even in their original perpendicular-

ity they were essentially different from my inclined sides, both in form and properties. It will not do for ARCHIMEDES, or any one else, to say that Fairman's boat was composed of timbers and plank, and therefore not similar to Burden's, which is composed of staves. The materials have nothing to do with the question, but the form only. I may with as much propriety build a commonly modelled boat of tin, and then get out a patent to prevent people from building such modelled boats from wood. If Mr. Burden chooses to build vessels from coopers' ware, and get out a patent for a new application of staves, why, let him do so; but he certainly cannot prevent men from using the common materials of vessels in constructing long, narrow, shallow, twin boats, having curved inner sides. I claim to have invented the right lined and curvilinear inclined inner sides as an “important and original improvement” on the straight parallel inner sides, which latter resemble mine only in their straightness and parallelism to each other.

After having proved in my published letter the superiority of the perpendicular, straight, parallel inner sides over Mr. Burden's curved inner sides, I then brought forward the inclination, which, I take pleasure in informing ARCHIMEDES, is a great distinctive and original merit of my invention. If ARCHIMEDES desires it, I can send him a copy of my specifications, in which I distinctly state that, “as an original and important improvement, the horizontally straight perpendicular inner side of each twin can be inclined at any desired angle;” and then proceed to lay down the various advantages obtained by this inclination, from which he can perceive that I do not consider the straight perpendicular sides as any thing very superior, though he can perceive from my published letter, and I now repeat, that I think them far superior to Mr. Burden's curved inner sides. Did I suppose you would allow room enough in this number of your journal for the subsequent matter of this communication and for the advantages, and their reasons, resulting from the inclined under sides, I would give them now. However, if A. desires it, he shall have them in a future number.

I would inform ARCHIMEDES, as a further distinguishing mark of originality, that in proportion as my crescent-shaped keels rise from a horizontal line they have a certain lateral inclination, such inclination being proportioned to the inclination of the inner sides; by which contrivance no curve is created on, but perfect parallelism of the inner sides is preserved. This lateral inclination of the keels, as they rise fore and aft towards each extremity, would cause a person, not critically viewing the matter, to suppose that the space between the twins at the centre would be greater, or wider, than that at either extremity; but an ocular examination of a model, (which my agent will with pleasure exhibit,) need only be made to prove that the parallelism of the inner sides could not otherwise be preserved, and that the space referred to is not wider than that at either extremity. Were the keels horizontal, or level, then not they, but the stem and stern posts only should be laterally inclined. Properly speaking, my boat has no stem and stern posts, for the pieces of timber which in common vessels would form those parts, are in my invention nothing more than a continuation and portions of my curved and laterally inclined keels. I have now, Mr. Editor, I think, fairly and clearly proved that my invention is a different thing altogether from Mr. Fairman's; and any man who, after reading the foregoing matter, would say that it is not different, and at the same time assert that Mr. Burden's invention is different from Mr. F.'s “swell” boat, would not excite the least surprise in my mind, if he should forthwith seriously set about proving that the moon is made of green cheese. But I have not done with Mr. Fairman's boat: I must sail a few miles further in her, and fully test her qualities.

* Strictly they are not approximate, for the two sides of either one of the twins being nearer to each other than the inner side of one twin is to that of the other, are, of course, what would come under the term “approximate,” from the very derivation and meaning of that word. I grant that the reader of A.'s remarks would know by the term “approximate” that he means the inner sides, because he speaks of their peculiar characteristics, straightness and parallelism; still, the term used as A. would is not correct.

* The very words of my specification.

It plainly appears, from the astounding "swell" mentioned by A., that there must have been some radical malconformation in Mr. F.'s boat not made public, perhaps unknown, by A.; for were it otherwise, Mr. F. never would have applied an obstruction to speed, and a cause of dead or back water, for the purpose of *diminishing* back-water. I say obstruction, for no man will have the hardihood to assert, that two boards set on edge, perpendicularly, in the water, whose ends at each extremity are at equal distances apart, but whose centres are sprung or bent in towards each other, can be moved in the direction of their length with a facility equal to that of the same boards when perfectly parallel from end to end. Yet a man who asserts that the "swell" increased the speed of Mr. F.'s boat, makes a much more unreasonable assertion.

Archimedes must not misunderstand me. I do not mean that he asserts what he does not believe, but I mean to say that the increase of speed could not have been the result of this swell, but of some other cause not observed, or not now recollected by Mr. F. Another glaring absurdity is involved in the assertion that Mr. F.'s swell increased the speed of his boat. Any person in the least acquainted with the subject must be aware that, of two boats having equal draft of water, the one which is *wider* will not under the same power move so fast as the other and narrower boat. Now, sir, Mr. F., besides partially choking up the straight passage between his twins, adds to their width by applying his swell, and yet, through his friend A., tells us that in consequence thereof his boat moved faster!! I do not call in question Mr. Fairman's veracity, or impute to him a designed omission of any particular necessary to be known in arriving at a correct understanding of his invention; but I must be allowed to suggest, whether he has, after the lapse of seventeen years, called to mind *all* the particulars of an experiment, which, it appears, after all, resulted in proving his invention to be useless. His friend A. evidently believes, and endeavors to prove, that it was a failure, for he says it was "previously like" mine, (but "I wish to inform him that he is completely mistaken, and he could not be more so;") and the whole drift and scope of his argument goes to prove (in his estimation) that my invention will not succeed.

If he thinks it is so manifest a failure, I think he pays, by arguing on it, no great compliment to the northern capitalists, a body of men of whose intelligence and general information I have always entertained so high an estimate as to suppose that no addition could be made to their ideas by the slight amount of argument which A. has deemed sufficient to expose the futility of my plans.

Some of the *facts* stated (no doubt sincerely) by Archimedes, are in direct opposition to previous and subsequent experience: the cause of back-water, the result of the "swell," and the comparative resistance experienced by the inner and exterior curves, being instances.

If *all* the particulars of Mr. Fairman's experiment have been recollected and told us, and if there has been no mistake, then, sir, I stand prepared to prove, that a hollow tin cylinder, perfectly open at both ends, will move on end horizontally through the water with more difficulty than a common tin tunnel in the same position, whose mouth or larger orifice shall be the forward end, and in diameter equal to that of the cylinder.

The fact is, that enough, fully enough, has been stated by Archimedes, to prove that Mr. Fairman's useless invention was nothing more than a division into two parts of a single boat of the usual model and proportions. Archimedes does not tell us how fast Mr. F.'s boat moved before the application of the wonderful swell, although he says the average gain resulting from the swell was *five* miles per hour; but, allowing, for arguments sake, that this swell was no obstruction, still no man in his senses can believe that the gain was ten

per cent. on the original speed. Allow this gain, however, and by calculation we find her *improved* speed was just 55 miles per hour!! As a low rate of increase produces such astounding results, we will endeavor to get this famous boat out of difficulty by supposing the gain to have been equal to the incredible quantity of 50 per cent. and we then find that her ultimate speed must have been 15 miles per hour!

This will never do: we will therefore make one more effort to bring her within reasonable bounds as to actual speed, by going *out* of all reasonable bounds in assigning her increase of speed, from the application of this unmanageable swell, to have been 100! per cent.; yet, allowing the increase to have been this, I may safely say, physically impossible quantity, and we then find that Mr. F.'s boat moved at the rate of 10 miles per hour, a velocity equal, if not superior, to the rates of any steamboat of that day, and which should therefore have been immediately instrumental in covering our waters with Fairman's *swell* boats, worked by men or horses. What the Connecticut people could have been about, when they permitted such an invention to slip through their fingers and be carried to Demerara, I cannot conceive, for it certainly must have been amongst Connecticut vessels a *swell* dandy of the first order. At all events, Archimedes, who alludes to my prudence respecting my heirs, must allow that Mr. F. did not manifest the usual prudence of the sharp-witted New-Englanders, when he sold so *valuable* a boat for the pittance \$300, and took no further steps for the benefit therefrom of himself and heirs. Archimedes has put his friend between the horns of a most provoking dilemma. Should he state the gain resulting from the "swell" to have been within any reasonable bounds, say 5 to 10 per cent., he virtually asserts that the improved speed of the boat was 55 to 105 miles per hour!! If, while advancing through the air at such a rate, he should be able to catch his breath and tell us that this astonishing speed is imaginary, and the result only of stubborn, unbending arithmetic, and that the actual velocity of the boat was only 8 or 10 miles per hour, he thereby makes the incredible statement, that this magic swell conferred a gain of 100 to 166 per cent.!! Why, sir, had I been the proprietor of that "wonderful" boat, I should have gone on *swelling* her at so swelling a rate, that in my exultation, not recollecting the well known catastrophe of the frog *aping* the ox, I should have probably paid so little attention to her powers of endurance as to have absolutely caused her explosion into thin air. With respect to the back-water mentioned by A., I will inform him that it could not by any means have been created by the straight *unobstructing* sides. Does not A. know that back-water is caused by *obstructions*? If he needs explanation, I beg to refer him to "OBSERVATIONS ON THE PREVAILING CURRENTS OF THE OCEAN," as published in your last number, and he will there find the subject handled in a masterly manner, and I trust to his satisfaction. The hollow in the water which he alludes to, with the evident intent that the reader should consider it as a result of the straight sides, was caused by the action of the wheel, and was by no means an evidence of back-water. He ought to know that all paddle wheels, revolving in the water, create waves, and of necessity hollows, and that hollows resulting from such a cause are no evidence of back-water. He, or rather Mr. F., saw the hollow; and A., without further ceremony, assumes it to have been back-water.

I have now done, Mr. Editor, with Fairman's famous swell boat, unless, indeed, some one of the water gods should buoy her up to the surface, and by putting her in my way render it necessary for me to run her down again.

I have, sir, more than once in my life, had occasion to observe how very easily a false issue can be made up on any subject, and the weaker side of an argument be thereby made to appear the strongest. This remark is called

forth by the "best way to decide the point" of strength between Mr. B.'s and my inventions, as suggested by Archimedes. I will grant, to his utmost desire, that arches are stronger than angles, and that a barrel will resist external pressure longer, and of a greater amount, than a box would, made of the same kind and quantity of materials. Granting all this, I still assert, with perfect confidence of its truth, that my twin boat, (that is, the *whole* fabric,) can be constructed vastly stronger than Mr. Burden's, and would in consequence be enabled to endure firmly and uninjured the severity of a gale at sea, which would be sufficient to rend Mr. B.'s twins asunder, and scatter them and their superincumbent cabins and fixtures on the surface of the waters. I said a false issue can be easily made up, not meaning that Archimedes would desiguedly do so. He, I have no doubt, is fully persuaded in his own mind, that the barrel and box test decides the question, and is not aware that when he proposed that test he was making up a false issue. The question is not whether *one* barrel thrown into the water is enabled by its circular or arch-like form to endure greater pressure therefrom than *one* box, but whether two barrels can by any possibility be *connected* externally in a manner better to resist the violent tendency of the waves to separate them than two boxes: said boxes, please to observe, having the advantage of stout internal frames, *upon* which the exterior planks are secured, and the connecting pieces or timbers of which boxes are not secured upon those planks, but inserted through them into the boxes, and forming part and parcel of those frames. Were my twins formed merely of the exterior planking, having no keels and timbers, or internal frames, I would by no means assert that *one* of them would be in itself stronger than one of Mr. Burden's, and better able to resist the compressive power of water. But whoever heard of any the least detriment happening to vessels as now usually constructed with keels, and timbers, from compression of the water. Why, sir, this unalterable property of water is a source of safety to vessels properly put together, for were it suddenly to be annihilated, and its other properties still exist, every *freighted* ship on the ocean would be so much ruptured by the expansive weight of her cargo as to soon go to the bottom. Whether *one* of Mr. Burden's twins is or is not able to resist the compressive power of water better than one of mine is a question in which no one can take any interest, until the heretofore immutable laws of nature become so altered that the power in question shall be able to crush together the two sides of vessels as now usually built. When that period arrives I think it will be time to discuss the question, and I am strongly of opinion, that I should find ample ground upon which to uphold the keel and timbers, (that is, the *back-bone* and *ribs*,) the knees, braces, and planks, against mere planks alone, whether those solitary planks are put together arch-like or otherwise.

If Mr. Burden pierces his twins, (thereby, observe, injuring the arch principle of his invention,) and introduces therein frames similar in any respect to keels and timbers, or to any thing else, into which he would secure his connecting timbers, he does just what I do, and therefore cannot connect his twins by that means stronger together than I do mine. But, as I am informed, and agreeable to the published description of his boat, he does not introduce frame work within his twins for the purpose of securing them together, and therefore must connect them by external fastenings, that is, fastenings secured to the *exterior* of the twins. When practical, scientific ship-builders pronounce such a mode of fastening twins together to be superior to mine, I shall then begin to think I am in error, but the opinion of Archimedes is not a lever of sufficient power to disturb my confidence on that point in the least.

Before I let the barrel of Archimedes off, I

feel bound to give it a few more buffets, which its arch-like structure may perhaps enable it to withstand.

Arches, we all know, when sustaining a very severe pressure, especially if it comes against them with a sudden and forcible momentum, are intended to receive that pressure spread equally over all parts, or else it might, by being concentrated at one or two points, be sufficient to break an arch which it could not even shake were it to bear equally on all points. Recollecting this, we will take Mr. Burden's and my inventions to sea, in a heavy gale, and in endeavoring to escape its fury we both unconsciously steer towards a hard sand bank, upon the ridge of which our boats strike for some time before we can force them over. The sides of this ridge being known to be quite shelving and steep, we thereby ascertain that at every blow or descent in the trough of the sea, a surface of twelve square feet only of the bottoms of our boats is brought in contact with it. Now, sir, here is violent and sudden pressure concentrated to a point with a vengeance, and I think, if you were on board my boat, that you would congratulate yourself that you had gotten a firm stout frame and planking outside of that between yourself and the ridge, instead of the bare staves of Mr. Burden's boat. I doubt not that you could tell without hesitation which boat would be soonest broken through. "So much" for the comparative strength of the two inventions. Archimedes asserts, that by making the inner sides straight I only remove the angle of resistance to the exterior side. I beg you to observe, that he here calls the curve of the inner sides, that is, the "swell," an angle of resistance, and yet, by applying this resistance, Mr. F. increased the speed of his boat!

I agree with A. that I remove an angle of resistance; but is he not aware that I diminish the degree of resistance by that removal? The last paragraph but one before the postscript of my published letter I should think ought to have suggested to him the reason why I diminish the resistance. His not perceiving it satisfies me, that, like his great namesake, he knows better how to set about destroying vessels than how they act upon, or are effected by, the water.

But to the point: we will suppose that the water impinges upon the two bows of a vessel sailing at a certain known rate, with a constant force of 1000 lbs., which force, setting aside the inertia resulting from the gravity of the vessel, is the only opposition to her keeping pace with the wind.

Of course, two such vessels, not at all connected, would be impinged upon, sailing at the same rate, with a total force of 2000 lbs. Connect those vessels, so as with them to form a common twin boat, and then, sir, although the two exterior bows would be resisted only by the original force of 1000 lbs. the two inner ones would immediately experience a greater opposition, which would be in proportion to the proximity of those inner bows to each other, as well as proportionate to other particulars, such as moving power, angle of the bows, &c. Why? Because the exterior bows could, as when the boats were unconnected, easily dissipate and disperse the impinging water in the shape of a swell, or wave, that would be left behind rolling along on either side; but the two inner bows would, as to this dispersion, act in opposition, and would thereby immediately accumulate a head of water, which they would have to force along before them constantly, and make it keep pace with them at any rate of speed, because more water would make its entrance in any one moment of time between those inner bows than could in the same space of time pass out from between them at the point where they converge towards each other. It must be admitted, of course, that, as connected twins, these two vessels would experience more opposition to their motion than 2000 lbs., the amount experienced when single. By removing the inner bows, or

angles, and placing them wholly on the outside, I should have to work against the original amount of resistance 2000 lbs. only.

Mr. Burden's inner as well as exterior bows, or angles of resistance, are so very acute, as to the careless spectator thereof might appear too trifling to create much opposition; but, let that spectator reflect on the degree of opposition which must inevitably result from the motion of a volume of water 21 or 22 feet wide, with a velocity of 12 or 15 miles per hour, through a passage not over 150 feet long, and whose width decreases gradually to its outlet, until it is there only 16 feet.

If dead water, as sailors term it, or back-water, according to Archimedes, would not be created thereby, both at the head and stern, I must confess that I am at sea on this matter without rudder or compass. That a twin boat built on my plan would be superior to one on Mr. Burden's, in point of draft, was, I think, clearly proved in my first letter, and therefore needs no further argument. Archimedes does not deny it. After having read the foregoing matter, Archimedes must in candor allow—

1st, That I am the inventor of the boat described as mine;

2d, That it is different from Mr. Firman's;

3d, That it is superior to Mr. Burden's, in the matter of its parts being strongly connected together;

4th, That it has less draft than his; and

5th, That the straight passage in the centre of Mr. Fairman's boat, as originally planned, or of mine according to its unchanged plan, is an advantage over Mr. Burden's boat.

That this communication will operate "for A.'s future benefit, and the benefit of others," is my sincere wish and its object.

Before concluding, I deem it necessary to state, that my letter, as published in the Evening Star, from which I suppose you copied it, was printed very imperfectly; several omissions of single words, and, in one instance, of a whole line, having been made, by which the true meaning in some parts is almost wholly obscured. When I learned that it was to be republished by you, I forthwith sent on directions for it to be corrected, but they arrived too late. I am, sir, very respectfully, your obedient servant,

CHARLES HARRIS.

Harris' Steamboat. By A KNICKERBOCKER. To the Editor of the Mechanics' Magazine, and Register of Inventions and Improvements.

Sir,—In your last number I saw a description of a twin-boat patented by Mr. Charles Harris, which he appears to value very highly, and thinks that his boat will supersede that of Mr. Burden.

There were also some remarks from "Archimedes," respecting the above invention, and stating that a Mr. Fairman, of Middletown, Ct., had constructed a similar boat in 1817.

I wish to inform Mr. Harris, (as it may probably save him or his friends considerable expense,)—also Archimedes,—that during the late war, Robert Fulton built for the United States Government the steam-frigate "Fulton the First," and that she was "split into equal parts longitudinally, from stem to stern, down through the keel, and the two halves placed a distance from each other in parallel lines, and joined above water by timbers and decks in the most substantial manner." Previous to or about the same time, I saw a boat built on a similar plan, called the "Happy Couple." Not answering the expectations of the projector, the Couple were cut asunder, the beams shortened, and the two halves fastened together by the keels, stems, &c., and thus made a single boat. She was then used as a sail-boat. I have sailed in her often. Her projector, Mr. I. J., now resides in this city.

A KNICKERBOCKER.

New-York, April 7, 1834.

The following communication, disputing the claim of Mr. Burden to be considered as an in-

ventor, appeared in the Quebec Gazette of 2d April, 1834.

To the Editor: Sir,—It is generally the case that those who bring into practical operation any invention in the arts,—if that operation be attended with great public advantages,—the enterprising individual who has been the means of securing them receives the merit of the invention.

The steamboat first practically introduced on the Hudson, by Fulton, had many years before been put in operation near Glasgow, and then Fulton, a native mechanic, assisted the real inventor, and brought with him to America the labor, genius, and experience of his master.

What is now called *Burden's boat* is not new. A boat exactly of a similar construction as to form, and differing in no wise except in the hull, which in the latter is on the principle of a common barrel, has been publicly moving across the Frith of Tay, at Dundee, in Scotland. A simple description given in the London Penny Magazine, for July last, will convince every one that Mr. Burden's invention is, so far as we know, limited to a mere barrel build, (and even this may not be his own, as *Annesley's ships*, built in Quebec, were at least nearly similar,) which affords lightness and buoyancy, but which is attended with great danger on the boat's striking.

"The common road from Edinburgh to Dundee runs in nearly a straight line from Pettycur through the county of Fife, and across the Frith of Tay, which at Dundee is about two miles in breadth. There is, on this passage, an excellent steamboat of a peculiar construction, the paddles being placed in the middle, as if there were two boats joined, and the form being such that it moves equally well with either end foremost."—[From the Penny Magazine, Monthly Supplement for July, 1833, page 293.]

AGRICULTURE, &c.

Planting Embankments of Railroads with Mulberry for Silk Establishments. By E. SAYRES. [For the New-York Farmer.]

MR. FLEET,—I have at different times noticed railroads, especially the Schenectady railroad, much injured where the embankments have been made, by frost and rain, by the earth slipping in large bodies after the winter season. This I think might be greatly obviated by planting the embankments with some hardy plant, that would root into and connect the soil together on the outer surface, so far as the frost generally enters. The white mulberry, or the Chinese *Morus multicaulis*, is perhaps deserving a trial for this purpose. The plant is hardy, and grows on a sandy soil, which is generally to be found on railroads. It roots deep, and is very fibrous, which would net the soil together, as it were. There is also another consideration which might be taken into the account, viz., the formation of a silk establishment, which under such auspices might be carried on advantageously and extensively. I hope this will bear the consideration of some abler pen. Many hundred thousand trees may be planted in this way on an extensive railroad. The trees might be planted a yard apart each way, and headed down every spring to 18 inches, by which young wood would be obtained, and the plants would be very convenient to pick the leaves. This method would give almost any required quantity of leaves to carry on an extensive establishment. The leaves could easily be conveyed to some central place by the cars for the worms, and the silk when manufactured might also be conveyed in the same

manner to a market, or to places of conveyance thither.

In conclusion, I have some reason to believe, were this method to be adopted, that the appearance of the embankments would present a very interesting scene to the traveller, and the surrounding country. Comfort would also be something in favor, as the dust that often annoys the traveller would be allayed by this planting, and, I trust, were it once adopted, it would become general in most parts where railroads are formed.

Much more might be said on the subject, which I leave for a more able pen.

With respect, &c.

EDWARD SAYRES.

Hyde Park.

Laying out and Management of Gardens. By WM. SCOTT. [For the New-York Farmer and American Gardener's Magazine.]

MR. EDITOR,—This being the season of the year when almost every one is in some way delighted and interested in gardening, I take the liberty to submit a few hints, which I hope may not be unacceptable to your readers. The importance and utility of gardening require no advocacy; all being agreed that its departments are fraught with lessons of interest to every man. The floral department in particular yields the most economical, healthful, and delightful pleasures that can be procured. The culinary department cannot, it is well known, be dispensed with by those who have regard to the delights of a wholesome table. By an outlay, not to be mentioned with hundreds of other daily and yearly expenses of every man, who has any property, a table may be supplied the whole year round with the choicest kinds of vegetables. The fruit garden is not to be overlooked, although this is a land where it grows by the highways and byways. No fruit is so grateful as that plucked by one's own hand and produced by one's own culture. There is nothing more enchanting than the boughs of faithful trees bending with the weight of their luscious load.

I shall point out a few rules by which the most useful productions of the garden may be more easily obtained than is generally imagined. As the season is too far advanced for either pruning or planting fruit trees to any extent, I will merely observe that they should never be planted too deep nor too close. New planted trees should be kept from drought by laying some litter or inverted turf over their roots. Almost all vegetables intended for a full crop should be put in the ground in this month or early in May. It is, however, never too late in the season to lay out flower or fancy gardens, with the exception of transplanting shrubbery, which, indeed, can be done if in pots or boxes, or if they can be raised without disturbing the roots or the soil about them. A garden may be laid out and furnished in the heat of summer, so as to look as well as if it had been done earlier in the spring. The first season it seldom meets the proprietor's wishes, let it be done at what time it may; therefore, he has through the course of the summer the advantage of getting his work done at a time when other gardening operations are not crowding on the gardener's time. He will also have an opportunity by the succeeding fall or spring to make his selection of plants. All things considered, I prefer summer for laying out new pleasure grounds, or making improvements on old ones. When commencing, the

first thing to be done is to fix on the levels of the ground. Having accomplished this, and regard having been had to the appearance of the figures from the most prominent station, drawings of the whole plan should be taken, and an accurate measurement of each figure made on geometrical principles. Accuracy in this part of the business is of first importance, because a small mistake at one place from which measurements are frequently taken, great blunders may occur. Having ascertained how the ground holds out, you must next proceed to make up the edge with boxwood, &c. This is done by making them very firm by trampling, beating, and smoothing them off to the proper levels, and cutting it cleanly out for receiving the box. This should never be omitted to be done first, for otherwise it is impossible to be so neatly finished. The plantation of shrubs next follow, which should be done with the greatest care, making large pits, spreading the roots horizontally out at their own level, and watering immediately after. The whole arrangement would be too tedious to describe in this article. No person can arrange them properly unless he be fully acquainted with the habits of all of them. Generally, however, the free growers should be put in the most exposed situation on poorest soil, and the tender and more shy in the most sheltered places and best soil, keeping the largest always at the greatest distance, and filling up the spaces amongst them with herbaceous plants in the same manner. The laying down of grass plats is so simple that I would not mention it but for the great improvement that could be made on those of this city. The want of neatness and order greatly detract from the pleasure these portions of ornamental grounds should afford. Nothing looks better than a fine smooth lawn or grass plat. To obtain this, the place intended for it may be made up of any coarse stuff to within six inches of the top. Then lay on that thickness of good earth, but no ways enriched. Tread it and beat it as firm as possible when in a dry friable state, and when perfectly even either turf or sow it. Some people contend that it is owing to the climate that the grass cannot be made as fine here as in England; but the writer has only to refer to several places in this city under a proper management, to prove the contrary. The difference is owing almost entirely to the laying down and keeping. Yours, respectfully,

WM. SCOTT.

REMARKS.—If florists and nurserymen were more in the habit of keeping perennial flowering plants, grape vines, and dwarf fruit trees, in pots and boxes, it would be very convenient for those living in cities and towns to lay out and ornament their yards and lawns in the summer. Merchants and traders in cities have more leisure from the beginning of June to the end of August, than either in the spring or fall. From the fact that neither they nor their families find it convenient to have yards laid out in April and May, it is omitted altogether. We presume one reason why English grass plats and lawns retain a more fresh and lively green than they do in this country, is that they have a greater variety of natural grasses. At the seed store in Barclay street may be obtained upwards of twenty kinds of English grasses, in small or large quantities. Also, a mixture of the kinds suitable for grass plats, put up in small packages.

GREAT IMPROVEMENT IN MILL STONES.—

The accompanying drawing represents an improvement in mill stones, which, from the following certificates, would seem to be of very great importance. It consists principally in letting in the air, as is denoted in the drawing, on the flour while grinding, and in expediting the operation. The patentee, James Preslow, and the original purchaser, George B. Jeffery, reside at Auburn.

Auburn, March 18, 1833.

We, the subscribers, having examined the plan for which James Preslow has obtained a patent for the discovery of an improvement of preparing mill stones to expedite the grinding of grain, and also seen an experiment of the grinding of grain at the mills of Carhart and Polhemus, in the village of Auburn, with mill stones prepared and dressed according to the improvement for which said patent is obtained, do hereby certify that we were present at said mills, and saw fifteen and a half bushels of wheat ground with one run of stones in a superior manner, for flour, within the space of one hour.

AMBROSE COCK,
I. S. MILLER,
E. MILLER.

Manlius, May 18, 1833

We, the subscribers, having had our plaster mill stones dressed by Mr. James Preslow, according to his method of dressing, and from the experiment do believe it to be the greatest improvement that has ever been offered to the public, feel bound to say in this certificate, that by the experiment tried, our mill ground twice the quantity in the same given time, and equally fine. And we believe that in dressing plaster mill stones according to said Preslow's method, that the quantity can be quite or nearly doubled, we therefore cordially recommend it to the patronage of the public.

JACOB R. DE PREY,
JAMES I. D'ELERY.

Milford, June 4, 1833.

Fifty-two bushels and a half in four hours and forty-nine minutes, the flour very good. We have no hesitation in recommending the improvement, from our own experiment as well as from the science and respectability of the gentlemen engaged in the improvement.

DISBOROUGH & LUDLOW.

Auburn, April 1, 1833.

We certify that the patent of James Preslow, for an improvement on mill stones, for facilitating the grinding of grain, &c., has been in operation in our mill at Auburn for several months, which we consider a valuable improvement; it more than doubles the grinding, grinds much cooler, and separates the flour altogether better in the bolts, and greatly improves the quality.

CARHART & POLHEMUS.

Application may be made to Mrs. White, corner of Beekman and Pearl streets, New-York.

Manufacture of Madder. By S. W. ABBOTT.
[For the New-York Farmer and American
Gardener's Magazine.]

Philadelphia, April 19, 1834.

MR. EDITOR.—Dear Sir: From the interest you feel in the dissemination of knowledge in promoting the culture of profitable productions, which our country so eminently calls for, I have taken the liberty to ask your advice with regard to the cultivation of an article of much importance in commerce. I allude to Madder. Your means of possessing information are no doubt such that will be of importance. The mode of cultivation I can gather from the Encyclopedia, but it does not go into the details necessary in preparing for the merchant or the manufacturer. The soil of most parts of our State, and particularly of the State of New-York, must be admirably adapted to its culture. If you can give me any light on the subject, it will afford me pleasure to reciprocate the kindness. Yours, very respectfully,

S. W. ABBOTT, 127 Market street.

REMARKS.—In the Encyclopedia of Agriculture, we find the following paragraph:

"Madder is sometimes cultivated, but only on land of the best quality, and with plenty of manure. At the end of April or May, according as the young plants are large enough to be transplanted, the land must be ploughed in beds of two feet and two feet and a half wide; the beds are then to be harrowed and raked, and the young suckers of the roots or plants are to be put down in rows, at intervals of a foot or a foot and a half, and at six or eight inches distance in the row.

"During the entire summer the land should be frequently stirred, and kept free from weeds. In the month of November, when the leaves are faded, the plants are covered with two inches of earth by a plough, having the point of the coulter a little raised or rounded, so as not to injure the young plants.

"In the following spring, when the young shoots are four or five inches long, they are gathered or torn off, and planted in new beds, in the same manner as has been pointed out above; and then in the month of September or October, after the faded leaves have been removed, the old roots are taken up.

"The madder thus taken up should be deposited under cover, to protect it from the rain; and after ten or twelve days, placed in an oven moderately heated. When dried sufficiently, it is gently beaten with a flail, to get rid of any clay that may adhere to the plants; and by means of a small windmill, is ground and sifted, to separate it from any remaining earth or dirt. It is then replaced in the oven for a short time, and when taken out is spread upon a hair-cloth to cool; after which it is ground and cleaned once more. It is then carried to a bruising-mill, and reduced to a fine powder, and is packed in casks or barrels for market."

Madder commands in the New-York market from 10 to 16 cents per pound, in its dried and sifted state. It is almost entirely imported from Holland. It is raised in some parts of Connecticut, but in quantities so small, that the dealers in the article, in this city, are scarcely aware of the fact. We shall endeavor to obtain particulars from the growers in that section. We would thank any of our readers to furnish us with further information.

WONDERS IN NATURAL HISTORY.—They last week, as the newspapers record, murdered a venerable ram at Eaton Hall (well may it be called, who, if he had been suffered to live to his birth-day, which he was preparing to keep next month, would have been twenty-three years old. He was born without ears, though he lived so many. The inhabitants of Derby are said to be in great distress at having their ram beat by a Chester 23 yearling.

NEW-YORK AMERICAN.

MAY 10—16, 1834.

LITERARY NOTICES.

No. XXIII.

Prairie du Chien, Upper Miss. Feb. 1834.

The shadows of its western bluffs had deepened far over the broad surface of the ice-bound Mississippi, though a flood of yellow light still bathed the gray walls of Fort Crawford, as its long low barracks lay in the form of an isolated square on the level meadow beneath us; while further to the north, a number of dingy wooden buildings, which showed like a fishing-hamlet on the immediate bank of the river, were momentarily growing more indistinct in the advancing twilight as we approached their purlieus, and drove up to a tavern about half a mile from the garrison.

It was within pistol-shot of the river, a comfortable looking frame building with a stockade fence around it, made with picket some ten or fifteen feet high; a voyageur or two, with a few half breed looking "gumbo" French loitering about the door, and a tall Menominee Indian, with a tuft of drooping feathers on his crown, standing with folded arms apart from the rest.

A portly good-looking German, who had formerly been a non-commissioned officer in the Infantry, proved to be the landlord, and bowed me, like a master of his business, into a room heated to suffocation by a large Canadian stove, placing at the same time a strip of neatly written paper in my hands. Imagine my surprise when I discovered it to be a play-bill! 'The public' were respectfully informed, that the sterling English comedy of 'Who wants a Guinea,' with Fielding's after-piece of 'Don Quixote in England,' with songs, recitations, &c. would be presented that evening, by the soldiers of the First Regiment at Fort Armstrong. Nothing could be more apropos. I had just ascertained that on account of the present deep snows, with the prospect of an early thaw, it would be almost impossible to get up to the Falls of St. Anthony, whither my ambition led me, at this season; and having now no further plans to arrange during the evening, and being wholly unprovided with letters to the officers of the garrison, I was really rejoiced at such an opportunity of entering its walls incognito.

The sleigh in which I had come here carried me in a few minutes within the sallyport, and handing the ticket, with which my host had provided me, to a soldier who stood as door-keeper, I entered a large barrack room, fitted up very neatly as a theatre by the soldiers themselves; the scenery, quite cleverly done, being all painted by them, and the lights ingeniously placed in bayonets, prettily arranged, a contrivance suggested by their own taste. The seats, rising like the pit of a theatre, were so adjusted as to separate the audience into three divisions, the officers, with their families, furnished one, the soldiers another, and gumbo Indians, and a negro servant or two making up the motley third. A superb-looking squaw of the Fox tribe attracted my attention as I entered the room, and prevented me from advancing beyond the worshipful part of the assemblage last mentioned, as she sat between two pretty but plainly dressed Menominee girls, in a more rich and beautiful costume than I ever saw at a fancy ball. The curtain rose while I was studying her noble features and tasteful finery, and contrasting the striking and somewhat voluptuous character of both, with the simple attire and less mature charms of the two nut-brown beauties beside her. Every eye was then directed to the stage, and I remained standing against the door-post till the act was concluded: and then, just as I was wishing for some one to whom to express my surprise at the degree of skill and judgment with which the soldiers played, considering they were but amateurs, an officer made his way up to me, and very politely insisted upon my taking his seat in the more favored part of the house. The ordinary interchange of commonplaces between gentlemen who are strangers to each other ensued, and then, without his knowing my name or the slightest circumstance in relation to me, an invitation to take up my quarters in the garrison followed. I declined the invitation, but we exchanged cards; and I had hardly got through breakfast in the morning, when my new and gentle-

manlike acquaintance, accompanied by Colonel T., commanding officer, and a young subaltern, called to repeat the invitation of the evening before, bringing a soldier, with a sled to transport my baggage, and a led horse to carry myself over to the garrison. It would have been absurd to meet such cordial and unfeigned proffers of hospitality with further ceremony; and an hour after found me with a handsomely furnished room of my own, a fine saddle horse placed at my disposal, and a servant always in attendance, sitting down to the mess with as fine a set of young fellows as I ever met with. I have been particular in describing my initiation into this agreeable and accomplished circle, merely to give you some idea of the gentlemanlike courtesy and frank hospitality, which distinguish the officers of the army, wherever I have been fortunate enough to meet with them.

I have now been here nearly two weeks. The weather has been mild and beautiful, and my time, in such congenial society, passes delightfully—so much so indeed, that when I wake each morn at reveille, it is with a kind of sad feeling I remember that the twenty-four hours just past, brings me nearer to the time when I must start again on my solitary tour, through regions where fortune can hardly throw me a second time among such companions. The scenery around *Prairie du Chien* would please you much. The snow has now entirely left the bosom of the prairie, though it still hangs like flakes of morning mist around the rocky brows of the adjacent bluffs. The singular landscape created by these bold heights, has been called monotonous; but I do not find it so. Not a day, not an hour passes, but they present some new appearance. Each shifting cloud brings out some new angle of the gigantic blocks; and, whether the rosy tints of dawn warm their steep sullen brows, or the glare of noon settles on their round summits, and tries to pierce the deep ravines which block them out from each other, or sunset, with its mellow hues, lingers among the long grass which points their "umbered face," when they first swell from the plain, to me they are always lovely, grand and peculiar. I ascended one of these, accompanied by an officer on horseback the other day, by winding up a ravine in the rear, which brought us on a round, bold grassy height, about 400 feet above the prairie; to which the bluff descended by two sheer precipices of rock, of about a hundred feet each, with alternate slopes of soil, covered with long yellow grass,—the whole having the appearance of some vast fortification—an enormous bastion thrown up in huge layers of earth and stone. On the very summit was one of those ancient fortifications, the mysterious mementos of an unknown race, whose gigantic and enduring works are scattered over thousands of leagues of this Continent, to puzzle the curious and set at nought the surmises of the antiquarian. I trod each winding of the turf-covered rampart, and counted what appeared to be the embrasures for artillery, as my military friend commented upon the position, and described a number of similar remains which he had examined in different parts of the Western country, while we laughed together over the self-satisfying explanations of those closet theorists, who would attribute the fortified appearances of this tall elevation, and the enormous mounds in the vicinity of St. Louis, with the sunken remains on the alluvial bottoms of Illinois, the perfect forms which give its name to Circleville in Ohio, and the deep entrenchments which channel the rocky hills of eastern Kentucky, alike to the action of water: suppositions upon a par for ingenuity with those which account for the existence of the prairies by the sudden withdrawal of the same element from what was formerly the beds of a chain of vast inland lakes; the same prairies, in every instance that I have yet seen, except the single one of *Prairie du Chien*, being high table land, some sixty or a hundred feet above the streams and groves which occasionally chequer them. I forget whether I have before mentioned that the Indian name for prairie (*scutay*) which means also *fire*, would explain their origin to any one whose own dullness prevented him from observing how the action of that element extends these grassy domains every season in one direction, while it leaves them to shoot up into a luxuriant growth of young forest in another.

But turn with me to yonder view of the Mississippi, where a hundred wooded islets of every possible form repose upon the glistening ice that silvers its broad bosom. How grandly does the bold promontory of 'Pike's Hill,' interlocked as it seems with the gray crags of the Quiseconsin, shut in the lordly stream on the south; and there, where the blue water has broken its white fetters, and those diminutive figures are leaping from one ice cake to another, as they sparkle in the sun along the smooth eastern

shore, how beautifully the tall brown grass bends over the pebbly margin! You may look now, though it is two miles off, into the very centre of Fort Armstrong, where the gleam of arms flashing over the sanded parade, tells of troops in motion, though the sound of their drums can hardly reach your ears. What a point would this be from which to view the meeting of hostile forces! The armies of Europe might manoeuvre on the smooth prairie below, and not a guide could indicate a position without its being manifest to your eye long before a battalion could attain it.

There are a great many high bred dogs kept at this place, and shooting and hunting of all kinds of course form one of the chief amusements of the officers of the post. Indeed if an enumeration of the setters, greyhounds, and Newfoundlanders, which are severally kept for grouse, wolves and ducks were made, without counting the curs and Indian dogs kept by the gumbos and Indians around, the place, as I have heard it observed, might rather be called prairie des chiens, than left as at present in the singular number. A very successful experiment has been made here in crossing the greyhound and Newfoundland, the offspring, I am told, being highly sagacious, and a match for a full grown bear. If the race be continued, they ought to be dubbed Elkhounds, from their adaptability to the pursuit of that fine game, which abounds over the river. I was on a wolf-hunt by moonlight several hours before dawn a few mornings since; and though we were not fortunate enough to start any game, I for my own part had a very good chase.—Among the other dogs of the pack was a greyhound of the wolf species, a breed which Sir Walter Scott says is so rare in the British dominions that I had no idea that there was one of the blood on our continent. This long haired rascal I mistook, by the doubtful light of the moon, for a real wolf; and my horse, the hero of a hundred wolf hunts, seemed to share the blunder. I came upon the dog suddenly in some long grass, and spurring my horse upon him, he made at once for the bluff on the further side of the plain, thinking doubtless, from the eager bounds of my horse, that there was game in view. Convinced of my good fortune from the course he took, I shouted to my companions, while the rest of the pack broke out into full cry, and away we went together. We ran more than a mile before the sagacious brute I rode seemed to discover the blunder, and checked his gait. The officers, after enjoying a tolerable laugh at my expense, relieved my chagrin by mentioning that the same dog had repeatedly come nigh being shot by some of the oldest hunters of the country, who, in broad day, had, as they expressed it, "mistrusted him for some wild varmint."

I have amused myself somewhat here in studying the Indian languages, though I cannot say with much industry; the amount of my exertions consisting in learning some eight or ten phrases in the morning, and then strolling off to repeat them in the afternoon at the straggling lodges which may be found within a mile of the garrison. To one of these, where an old Sauk squaw was making a pair of embroidered mochasons for me, I went last night several hours after nightfall. The wigwam was formed of mats of woven rushes, subtended around a frame work of osiers in the form of a hemisphere, with an opening at the top to let out the smoke. Approaching this primitive abode, I heard the shrill voice of the hag within in what sounded like high altercation with some one who answered in a different language from herself; and, raising the dirty blankets which formed a door, while I crawled on all fours within the low threshold, I found that the lady of the castle was only gambling amicably with an old Menominee Indian, who sat cross-legged on a mat opposite to her. A finger ring belonging to the squaw lay upon the mat between them, and they were trying which of the two could throw the scalping knife of the Indian most often within the golden circle, a score being in the meantime kept by each on the edge of the mat, where sundry marks, made with a dead coal, supplied the place of the ordinary pearl counters used by card players. Having always despised gambling as one of the most effeminate and mean sources of excitement—the fitting employment of hands that were never made to handle arms or curb a charger—the refuge of those emaciated minds that smoulder over the kindling page of the poet and historian, or stagnate in listlessness amid the thousand spirit-stirring encounters of the breathing world around them—I had neither English nor Indian phraseology to participate in their comments upon the varying chances of the game. The squaw briefly answered my inquiries about the mochasons, while I raked the embers of her fire together and dried my boots by its cheerful blaze; and then, while she tossed the long elf locks from her high cheek bones and the upper

part of her loosely arrayed person swept the ground while bending low to view the mark of the knife which gleamed aloft in her shrivelled hand, I glanced from her weird features and squat form to the calm, but piercing ken, and still erect figure, of her savage companion, and raising the blanket, left them once more alone together.

Let me conclude this letter by furnishing you with an Indian serenade. It is written in a sort of Lingua Franca, or mongrel tongue, made up of words taken alike from the Menominee and Ojibeeay or Chippeway, and possibly other languages, much used on the frontier. From the manner in which it was taken down, I do not hold myself answerable for its correctness; but, uncouth and jaw-breaking as the words may look upon paper, they really sound musical from the silver tongue of an Indian girl.

INDIAN SERENADE.

Onaiweh! Paikessal meteequon, quonadhj cuakenoed masco-taiwenin.
Awake! flower of the forest; beautiful bird of the Prairie.
Onaiweh! Onaiweh! kepshoshe moscalhecon.
Awake! awake! thou with the eyes of the fawn.
Taupai kaisainopenayan, mannehatuk ashenah pahkeesal-kew taupai cotainen aissaw.
When you look at me I am happy, like the flowers when they feel the dew.

Nodin keokeneta waikon ashenah menouqt paik salwen o-kenega kshecut-waikon ashenah menouqtin pahwepemuk-kasho nabgosing.
The breath of thy mouth is as sweet as the fragrance of flowers in the morning—sweet as their fragrance at evening in the moon of the fading leaf.

Nekaugewahnaitahsee neshalinomen abchewaukee, ashenah mokeketchevun kezhis aschew au wahsekoseekasho?
Does not the blood of my veins spring towards thee like the bubbling springs to the sun in the moon of the bright night?—(April).

Nemeceta's nuggahna taupai keeshlah payshoo ashenah oke-noga meteequon weneemenin nodin otalhiminkasho.
My heart sings to thee when thou art near like the dancing branches to the wind in the moon of strawberries. (June).
Taupai nicaudize saugittewun, nemeceta muccudduwah ashenah wahlskash sebewun taupai nahcut endosh wainje lahmping.

When thou art not pleased, my beloved, my heart is darkened like the shining river, when shadows fall from the clouds above.

Kutiyahnim gozhetone monenandum, nemeceta suannugesev ashenah kezhis gozhetone ashenah asauwahshouah te-gowugainse kisenah nodin wainjenetahhahwajink.

Thy smiles cause my troubled heart to be brightened as the sun makes in look like gold the ripples, which the cold wind has created.

Neshwena, wahlundummo, keshalnon nemeceta pokkaume-nin.

Myself! behold me! blood of my beating heart.
Ah ke tahyahnim, nepesh tahyahnim, lahmping tahyahnim—knoweth none!—Nemah kaukekendun mekuunuh tahyahnim uokeshce taupai kaukeshlah—Onaiweh! Onaiweh! aoush saugittewun!

The earth smiles—the waters smile—the heavens smile, but I lose the way of smiling when thou art not near—awake! awake! my beloved.

Have you no poetical friend who will throw this designedly literal but very bald English translation into a happier dress?—*Adios.* H.

THE PILGRIMS OF THE RHINE, by the author of Pelham. 1 vol. New York: HARPER & BROTHERS.—Published originally in England, with all the splendor of an annual—adorned with most exquisite engravings of the Rhine scenery—we can hardly conceive of a book more calculated to win its way among the imaginative than this. Even in the ordinary and unadorned form in which it is presented to the American reader, there is that in its free and fervid fancy and discursive topics, which imparts to it a wonderful charm. But we are talking, we dare say, about a book which already the greater portion of our readers have devoured, but which we have only just now found time to look into. We will therefore only add a few detached passages—meaning hereafter to present many more.

Behold, throughout the universe, all things at war with one another, the lion with the lamb, the serpent with the bird; and even the gentlest bird itself, with the moth of the air, or the worm of the humble earth. What then to men, and to the spirits transcending men, is so lovely and so sacred as a being that harmeth none, and what so beautiful as Innocence? what so mournful as its timely tomb? and shall not that tomb be sacred? Shall it not be our peculiar care? May we not mourn over it as at the passing away of some fair miracle in nature; too tender to endure, too rare to be forgotten?

The prose of the heart enlightens, touches, rouses far more than poetry. Your most philosophical poets would be commonplace if turned into prose.—Childe Harold, seemingly so profound, owes its profundity to its style, in reality it contains nothing that is new, except the mechanism of its diction. Verse cannot contain the refining subtle thoughts which a great prose writer embodies; the rhyme eternally cripples it; it properly deals with the common prob-

lems of human nature which are now hackneyed, and not with the nice and philosophizing corollaries which may be drawn from them. Thus, though it would seem a paradox, commonplace is more the element of poetry than of prose. And sensible of this, even Schiller wrote the deepest of modern tragedies, his Fiesco, in prose.

It is perhaps for others, rather than ourselves, that the fond heart requires an Hereafter. The tranquil rest, the shadow and the silence, the mere pause of the wheel of life, have no terror for the wise, who know the due value of the world—

"After the billows of a stormy sea,
Sweet is at last the haven of repose!"

But not so when that stillness is to divide us eternally from others; when those who have loved with all the passion, the devotion, the watchful sanctity of the weak human heart; are to exist to us no more. When after long years of desertion and widowhood on earth, there is to be no hope of re-union in that In-visible beyond the stars; when the torch not of life only, but of love, is to be quenched in the Dark Fountain; and the grave that we should fain hope, is the great restorer of broken ties, is but the dumb seal of hopeless—utter—inexorable separation! And it is this thought—this sentiment, which makes religion out of wo, and teacheth belief to the mourning heart, that in the gladness of united affections felt not the necessity of a heaven. To how many is the death of the beloved the parent of faith!

Life has always action; it is our own fault if it ever be dull; youth has its enterprise, manhood its schemes, and even if infirmity creeps upon age, the mind, the mind still triumphs over the mortal clay, and in the quiet hermitage, among books, and from thoughts, keeps the great wheel within everlastingly in motion. No, the better class of spirits have always an antidote to the insipidity of a common career; they have ever energy at will.

For action is that Lethe in which we alone forget our former dreams; and the mind that, too stern to wrestle with its emotions, seeks to conquer regret, must leave itself no leisure to look behind. Who knows what benefits to the world may have sprung from the sorrows of the benefactor? As the harvest that gladdens mankind in suns of autumn, was called forth by the rains of spring, so the griefs of youth may make the fame of maturity.

There was a certain vastness of mind, in the adoption of utter solitude in which the first enthusiasts of our religion indulged. The remote desert, the solitary rock, the rude dwelling hollowed from the cave, the eternal commune with their own hearts, with nature, and their dreams of God, all made a picture of severe and preterhuman grandeur. Say what we will of the necessity and charm of social life, there is a greatness about man when he dispenses with mankind.

There is something in travel which constantly even amid the most retired spots, impresses us with the exuberance of life. We come to these quiet nooks, and find a race whose existence we never dreamed of. In their humble path they know the same passions and tread the same career as ourselves. The mountains shut them out from the great world, but their village is a world in itself. And they know and need no more of the turbulent scenes of remote cities, than our own planet recks of the inhabitants of the distant stars.

SUMMARY.

The following persons are elected Directors of the New York Athenæum for the ensuing year:

James Kent, John McVickar, James Renwick, Isaac S. Hone, John A. Stevens, Samuel Ward, Benjamin W. Rogers, Francis Olmsted, James Heard, John Delafield, Stephen C. Williams, Gulian C. Verplanck, William Beach Lawrence, Peter Schermerhorn, J. Augustine Smith, Edward W. Laight, Joseph Kerochan.

[From the Tuscaloosa (Alab.) Intelligencer.]

CHURCH AND TABLE.—We cannot let a good domestic joke pass, even if it should be at the expense of our own town. It is known to all who have visited Tuscaloosa that the place is famous for bells.—There are five taverns, each of which is supplied with a clamorous bell, to invite its guests at the proper time to the table. There are also three churches that have very large bells. A reverend divine, speaking of the taverns, observed on a late occasion, that there was a more fine ringing of bells, and less good eating, in this place, than in any place where he was acquainted. Yes, said a tavernkeeper, who stood by, and it is just so with the churches; there is more ring of bells for church, and less good preaching, than in any place I ever lived.

We do not ourselves acknowledge the justice of

either remark; except as to the ringing of bells.—That we have rather an oversupply, especially on Sunday morning, cannot be denied.

THE BALMY MONTH OF MAY.—For the last week the weather has been cold and gusty. On Tuesday night ice was formed in the vicinity of the city, and last night a violent and cold storm of rain, was succeeded by a slight fall of snow—and this morning at sunrise there was in the upper parts of the city ice of the thickness of a dollar.

The poets who have celebrated the charms of May lived in a different climate.

ONE DAY LATER intelligence from England has reached us, by the ship Nimrod, from Liverpool, but nothing of interest is added to former accounts.—Spain is said to have decided on an armed movement in favor of Donna Maria, but nothing decisive is given. No change in markets.

Col. Tewson, whom to name is to praise, has been confirmed by the Senate as Paymaster General.

R. W. WIER, of this city, whose taste and skill as an artist are only surpassed by the excellence of his character, and his fine social qualities, has in like manner been confirmed by the Senate, as Professor of Drawing at Westpoint, in the place of C. R. Leslie, resigned.

THE NEW YORK INFANT SCHOOL SOCIETY.—This Society met in Chatham street Chapel, on Saturday at 11 o'clock, an immense multitude attending. The scholars of three District Schools were present, averaging generally from four to seven years of age, and some less than four. The meeting was opened by the singing of a hymn by the different scholars, which was followed by prayer, when the Seventh Annual Report of the Society was read, which spoke of encouraging prospects, and of considerable increase in numbers of the scholars. From this it appeared that the number of scholars in the Infant Schools of this Society are 460, and in all other Societies in the city, including this, 2,880, besides which there are 17 primary schools, with 1700 children, and a number of private Infant Schools, not associated with this or any other Society. The examination of the pupils in spelling, reading, singing, and in catechism, or Scripture facts, then proceeded, and gave evidence of the astonishing amount of knowledge they had acquired, for infants of their age. A few then recited and went through a number of elliptical lessons on the oriental plan; then they sung several hymns, and afterwards followed the benediction.—[Daily Adv.]

[From the Jacksonville (Ill.) Patriot, April 26th.]
THE GALE.—On Monday night last, (21st.) at 12 o'clock, this town was visited by a violent tempest, which for a few seconds seemed to threaten the demolition of every building within its range. Happily, no personal injury was sustained, but the damage to individuals, in the destruction of property, was considerable.

The Market House, on the Public Square, entirely demolished.

The new Brick Jail, attic story, do. do.

A new two story frame, near the Tan Yard, do. do.

A one story brick Blacksmith's shop, occupied by Mr. Philips, do. do.

A new two story frame building belonging to Wm. Hunter, opposite the jail, was moved between one and two feet from its foundation, with loss of chimney.

The large stable, belonging to Col. Miller, unroofed and otherwise injured.

The chimneys of Dr. Gillett's house blown down, together with the roof of his stable.

The roof of Widow Barton's Kitchen, blown off.

The workshop of Theodore Barton, demolished.

The roof of Widow Johnson's house, injured, with loss of chimney.

Chimneys attached to the houses of Messrs. Rockwell, Brockenbrough, Scruggs and a few others, blown down.

The Tinner's Shop of Mr. Catlin, considerably injured.

The brick wall of a new house, belonging to Mr. Seymour, demolished.

The attic story of a new frame, belonging to Mr. Allen, together with the chimney, blown down.

In addition to the above, many stables were unroofed, and considerable damage was done to out-houses, window sashes, &c. &c.

The house of Mr. Coddington was struck with lightning, during the storm, but no material damage was done.

We are happy to hear that but little injury was sustained in the country.

It appeared almost impossible to trace the course of the wind, the morning after the disaster, on account of the opposite directions in which the fragments were deposited. For instance, one half the roof of a stable near the centre of the town was carried several feet in a northwest direction, while the other half was carried in a northeast direction. We are inclined to think that in addition to the gale, there was a whirlwind, which, owing to the strong current of wind passing through so narrow a space was probably formed in the valley between the high land on College Hill and the Diamond Grove.—Meeting with no great obstruction until it reached about the centre of the town, it apparently met the strong current of the gale, from the S. S. E. and there in the destruction of the Market House and other substantial buildings, may be seen the last struggles of this tremendous storm.

[From the New Bedford Mercury.]

The following extract from a table in Brown's Sylva Americana, will be found valuable to housekeepers, in aiding them to form an estimate of the comparative value of the different kinds of fire-wood.

The table at large shows the weight of a cord of different woods, seasoned; the quantity of charcoal each will make, and other valuable information, founded on experiments. It assumes as a standard the shell-bark hickory, of which none is offered in our market. The most valuable which is common in this region is the White Oak, and assuming this to be worth six dollars per cord, we find the price affixed in the table to be the value of each.

	Lbs. in a cord.	Comp. value.
1 Shellbark Hickory,	4469	100 \$7 40
2 Pignut Hickory, } common Walnut, }	4241	95 7 63
3 White Oak,	3821	81 5 00
4 White Ash,	3450	77 5 70
5 Swamp Whortleberry,	3361	73 5 40
6 Scrub Oak,	3339	73 5 40
7 Appletree,	3115	70 5 18
8 Red Oak,	3254	69 5 11
9 Black Oak,	3102	66 4 89
10 White Beech,	3236	65 4 81
11 Black Birch,	3115	63 4 67
12 Yellow Oak,	2919	60 4 44
13 White Elm,	2592	58 4 29
14 Maple,	2668	54 4 00
15 Buttonwood,	2391	52 3 85
16 Spanish Oak,	2449	42 3 85
17 White Birch,	2369	48 3 56
18 Pitch Pine,	1994	43 3 18
19 White Pine,	1868	42 3 11
20 Lombardy Poplar,	1774	40 2 96

So much for the purchaser—and now a word to the seller.

It is estimated that a cord of wood contains when green 1543 lbs. of water; so that a farmer who brings into market a cord of green wood, has no less load for his team, than another who should put on the top of his cord of dry White Oak, three quarters of a cord of seasoned pine, or one hoghead and two barrels of water; either of which would seem like overburdening his poor beasts.

[From Williams' New Register.]

AUCTION DUTIES.—The total amount of sales by auction, in this State, (nearly all in this city,) in the year ending Sept. 30, 1833, was \$34,392,320 35.—The auction duty paid to the State in the same year, was \$238,719 45, of which sum, \$236,924, was paid by auctioneers of this city, as follows, (omitting the odd cents,) viz:

David Austen	52,924	John Pearson	80
Lindley M. Hoffman	34,185	Allen Smith	61
Henry L. Patterson	22,587	L. Power	56
Thos. W. Pearell	18,010	Thos. P. Bowne	46
Edwd. G. Thompson	15,790	Jas. C. Smith	43
Wm. Timpson	15,654	Win. J. Brown	37
R. R. Miltum	8,992	A. L. Fontaine	33
Rich'd Lawrence	8,751	Wm. McLaughlin	27
Jos. W. Corlies	8,043	Jacob Van Winkle	23
A. W. Bleeker	7,932	John Fellows	23
Samuel Phillips	6,333	S. Selas	22
Wm. Girard	5,534	Thos. Bell	21
Henry Hone	4,544	Thos. Austen	19
Dun's Sparks	2,290	Geo. S. Mann	18
G. M'Kay Morrell	1,784	J. P. Deltcher	16
J. J. Bedient	1,137	S. M. Isaacs	15
A. B. Nunes	760	A. Sergeant	14
Wm. McDonald	596	Jos. Damon	13
A. Levy	463	J. Langdon	7
Wm. D. McCarty	313	A. A. Waterhouse	3
Wm. G. Bull	135	Rich'd Crawford	2
Jesse Cady	121	Gilbert Lewis	1
Cornelius Agnew	121	J. T. Dougherty	1
S. P. Ingraham	91	Jas. Goutray, 21 cents	

Total amount, \$236,924.

Captain Hodge, arrived at New Bedford, informing that there was an insurrection at Callao; and bombarding from Bonavisto, Callao, and Lima—caused, it was supposed, by the then President.

GREAT DIVIDEND.—The American Insurance Company have this day declared a dividend of Twelve per cent. out of the profits of the last six months, payable on the 1st June.

[From the Mercantile Advertiser.]

SPONTANEOUS COMBUSTION.—It is not generally known that oil in cotton, wool, or linen, may produce spontaneous combustion, and that very destructive fires have had this origin. A number of such instances are well known to the Insurance Companies. It is important that the community should be better apprised of the danger, that they may guard against it. We are informed that an extensive importing house in this city recently had a quantity of sheet iron cleaned of rust by rubbing it with pieces of linnen cloth dipped in oil. After the work was done the pieces were thrown together in a corner. The next day they were accidentally discovered to be on fire, and just in time to prevent the communication to articles near by. Had the combustion taken place at night, it is probable that the whole building, and a very valuable stock of merchandize, would have been enveloped in flames, and perhaps entirely destroyed.

CONVENTION OF INDEMNITY WITH FRANCE.—We copy from the National Gazette, of yesterday, two interesting articles respecting this Convention, of which the effect has been—suspended only we hope—by the refusal of the Chamber of Deputies to vote the money for satisfying the American claims

[From the National Gazette.]

Extract of a Letter from General Lafayette to his correspondent in this city, dated April 2.

"It is with the deepest affliction and with the liveliest displeasure that I write to you, and to you alone, on the subject of what happened yesterday; the American treaty was rejected by a majority of a few votes. M. de Broglie very honorably sent in his resignation this morning; General Sebastiani, the author of the treaty, has done the same. You will be, as I have been, surprised to see that several members of the *cote grache* have sided against the treaty. I am still sick, but with a fair way of recovery, provided I do not commit any imprudence; that danger, however, would not have prevented me, as you may well suppose, from appearing in the House; but my friends used so much argument to dissuade me from going, that I, at last, was obliged to yield. It is best, perhaps, that I should repress the expression of my feelings upon this subject; I shall therefore speak of my sentiments for you, &c."

DEBATE ON THE AMERICAN TREATY.

(Translated from a Paris newspaper.)

Mr. George Lafayette rose to speak on a personal subject. (Attention.) I have been, said the honorable member, so clearly designated by the member who spoke last, that I think myself entitled to request of the Chamber a moment's attention. I do not rise to defend the Commission, of which I had the honor to be a member, from the charge of being under any influence whatever, while deliberating on the important subject committed to it; but I wish to state a matter of fact, on which I find there is some misapprehension. My father was not a member of that Commission; I, alone, was one of the Commissioners. Surely, I did not pretend to exercise there any personal influence; but the strength of my conviction was not sufficient to induce the majority to agree in opinion with me, and I remained in the minority, though strongly convinced that there was more due to the United States, than the majority were willing to grant.

Mr. Jay, the reporter of the Committee, then rose, and in support of the Bill of Appropriation, he read a letter, addressed to him by General Lafayette, (detained at home by sickness,) in order to prove the good faith of the United States. The letter is in these words:

"While I regret that I cannot take part in the debate respecting the American Treaty, the almost unanimous report of the Committee, and the more profound knowledge acquired during this year respecting this great interest, in which justice, policy, commerce, and the freedom of the seas are involved, render it useless for me to repeat the observations, which I made at the last session, but there are facts, which I might have attested as a witness, and which

I now submit to my honorable colleague, the reporter of the Committee.

"1. I know that the date of the repeal of the Berlin and Milan decrees, is anterior to the seizures and destructions for which an indemnity is claimed I was myself the bearer of a message on the subject.

"2. Although the United States are the only power that remained unconnected with the coalitions against France, an offer was made to them by the allies, then all powerful, to join their claims to those which they preferred, and the payment of which they obtained. That offer was worthily declined by Mr. Crawford, the American Minister at Paris. He declared that the United States, far from making common cause with the enemies of France, would wait until their accounts could be settled as between friends.

"3. I saw Mr. Barlow set off for Wilna in the full conviction, from the correspondence of the Imperial Cabinet, that the American claims should obtain a favorable decision; and at the moment of our Revolution of July, Mr. Rives thought himself sure of terminating his negotiation, even with the Ministry of the Restoration; which, nevertheless, felt no obligation to the United States, for having remained the friends of France, while France was in friendship with her enemies.

"4. Among the classes of claims admitted in the Report, I do not perceive the *Antwerp Seizures*; although my memory was perfectly clear on the subject, I had recourse to the recollections of the Duke of Bassano, whose contemporaneous authority, in his situation at that time, is superior to any distant and posthumous assertion. I am then able to say, that no confiscation was decreed, and that the sale of the property had no other object than to prevent its deterioration; that there was a disposition to admit the justice of a claim, supported by the act of the government itself, which, in short, considered the merchandise deposited in the *caisse d'amortissement*, as *American property*, which makes an additional sum of more than two millions, without reckoning the *Maria* and her cargo, involved in the same measure.

"It is from these positive data, and others of the same kind, founded on the fact of monies, which, in my opinion, unjustly, but nevertheless, have entered into the public treasury, that even after allowing for the French claims, I had in my conscience, as an honest arbitrator, estimated the American claims at the sum of thirty millions, and this amount is not so unjustifiable as some have thought proper to say, while I yield all the honor due to the administration which has reduced the treaty to narrower limits."

[From the *Quebec Mercury*.]

THE BIRTH PLACE OF CHRISTOPHER COLUMBUS.

SIR:—To a native of this Continent, to which, however, by a strange injustice, posterity has not given his name, the birth-place of Columbus must always be an object of interest. A house is still shown in the village of Cogoletto, near Genoa, as that in which he was born. At the door of the building is a stone, on which the following inscription in Italian has been inscribed since 1650. It bears the name of a Priest of the same family. The two other inscriptions in Latin have been recently added. Like the birth place of our own Shakspeare, at Stratford-on-Avon, that of Columbus is visited by all curious travellers. Some time ago, a party made a pilgrimage to the spot, and entered the house in silence with their heads uncovered, regarding the birth-place of the great discoverer of the New World, as one of the most interesting sites of their route. I subjoin the inscriptions, and have attempted an imitation.—It will be perceived that in the Italian, there is a play upon the meaning of Colombo, which would be ineffective in the translation.

ELOGIUM.

Di Cristoforo Colombo, scopritore dell' America l'anno 1492—scritti nella casa di sua nascita, nel paese di Cogoletto, ontra-da Giuggiole:

I.

Con generoso ardir dall' arca all' onde
l'insolente il vol Colombo prende.
Corre, s'aggira, tennen' scopre, e fronde
D'olive, in segno, al gran Nido se rende.
L'imita in cio Colombo, ne s'accorde,
E da sua patria il mar solcando fonde;
Terreno al fin scoprendo disse fando,
Offende al' Ispano un novo Mondo.

113 Dicembre, 1650.

FRATE ANTONIO COLOMBO.

II.

Nonces sile gradum; Fuit H I Clux prima Colombo,
Orbe viro majori, Hen! nimis arcta Domus;

III.

Unus erat Mundus; Duo sunt, ait ISTE; fuerunt.
1626.

The above imitated:

IN PRAISE

Of Christopher Columbus, discoverer of America in the year

1492—written in the house of his birth, in the country of Cogoletto, in the district of Giuggiole.

Swift from the Ark, above the watery waste,
The Dove, obedient, flies with generous haste;
Still onward speeds, nor pauses in her flight
Until the long sought land relieves her sight—
Thence as a token of the welcome strand,
An olive branch she bears to Noah's hand:
Like her Columbus scorns inglorious ease,
Far from his country ploughs the maiden seas—
Nor cast he anchor, nor a sail was furled,
Until to Spain he gave another world!

II.

Stay, traveller, stay! before these narrow walls
Awhile thy weary pilgrimage restrain—
Here first Columbus breath'd the vital air:
This roof held out—the world could not contain!

III.

The world was one—Columbus said, they're two—
He found a world, and made the saying true!

I am, Sir, &c.,

J. C. F.

QUEBEC, APRIL 12, 1834.

"Gather them to their graves again,
And solemnly and softly lay
Beneath the verdure of the plain
The warriors' scattered bones away."

Among the disclosures made the past week in excavating the vault for the new Presbyterian Church on the site of the ancient burial ground in this city, was a coffin supposed to contain the remains of the gallant Major Holmes. This brave officer, it will be recollected, was killed in the assault on Fort Mackinac in 1814, while forming his men for a charge under the very batteries which the British had erected, and which, despite his fall, were carried at the point of the bayonet. His body, together with that of Captain Van Horn, who was mortally wounded at the same time, was the next morning obtained under a flag of truce, and despatched down the Lake for interment. Van Horn is said to have been buried at Fort Gratiot, while the body of Major Holmes in a coffin heavily loaded with balls for the purpose of sinking it, should accident induce the necessity of its being thrown overboard, was conveyed hither.—These facts were communicated by an old resident of the place, who imagined he identified the body from the circumstance that a quantity of cannon shot together with a military stock were found in the coffin.

There were other evidences appealing loudly to the sympathies of both young and old, and which vividly recalled to the youthful bystanders the tales of bolder horrors and the perils of the frontier so often listened to with shuddering as they sat on the knees of their fathers. The chests containing the bones of a part of the chivalrous but unfortunate Kentucky corps so barbarously butchered at the River Raisin, were likewise exposed. Many of these skulls exhibited appalling marks of the atrocities of savage warfare, being both perforated with bullets, cleft with the broadsword, and hacked with the tomahawk. The fate of this detachment which embodied within it the young volunteers from Lexington, composed of the flower of that city, under the command of Capt. Hart, created an excitement, which, rife as was that epoch with scenes of horror, has scarcely been equalled by any event in the bloody annals of the past. A few bodies only were rescued by friendly interposition from the mingled heaps of the wounded, the dying and the dead, which, notwithstanding the capitulation, were first wantonly riddled with balls and mangled by the knives of the Indians and afterwards burnt in heaps in their cantonments. These few were sometime after raised from their secret graves, and brought to Detroit, where they were again interred with the respect due to the brave but ill-fated soldier; and an appropriate tribute to the honored dead was paid them in the eloquent and pathetic address pronounced on the occasion. Their remains have now been removed to the upper cemetery of this city.—[Detroit Courier.]

[From "Tutti Frutti" of Prince Puckler Muskau.]

A REMARKABLE CHARACTER.—It is by no means necessary to travel far in order to meet with something remarkable. During a visit which I lately made to Leipzig (says the Prince) for the purpose of seeing my much-esteemed friend the Prussian General Baumgartner, I met at his table a highly interesting person, whom I beg leave to introduce to the acquaintance of my readers.

He was no other than the French captain of the guards, Dr. Emir, Chan Alcibiades de Tavernier, grandson of the celebrated traveller of that name, and himself even a greater traveller than his renowned ancestor.

Having been restored to health from severe wounds which he had received in the great battle of Leipzig, M. de Tavernier resolved to renounce the military career, and, in pursuance of a long cherished incli-

nation, to devote himself to the study of medicine and surgery.

Having completed his studies, he commenced his extensive travels in Africa and Asia, especially through Egypt, Abyssinia, Syria, Arabia, Persia, the ancient empire of the Great Mogul, Armenia, and by far the most remarkable portion in the vast and almost entirely unknown regions of Central Asia, as far as the wall of China. Thence he traversed Chinese Tartary to Kiachta, and at last returned, by way of the new Russian military road through Siberia, to Europe, where he had the misfortune to suffer shipwreck as it were in sight of port. On approaching the gate of Bucharest, where he at present resides, he was attacked by a band of robbers, who carried off the greater part of his effects, collections, and papers. With his son, a boy of ten years of age, who fired a gun from the carriage at the leader of the band, and killed him, he was left almost lifeless on the spot; he was wounded in ten different places, and recovered slowly and with great difficulty.

The singular details of these travels, which often seem to border upon the marvellous, surpass in variety the most interesting romance, while they promise the most valuable acquisitions to science. At one time we see the hero, like Marco Polo, the favorite and minister of a mighty Tartar prince, and raised by him to a princely dignity; at another, devoted to a romantic passion for the pride of the harem of his new master, encountering the greatest dangers, and obtaining ultimate success; here commanding armies and giving battles; there, again, appearing as the leader of savage hordes, among which he discovered the aboriginal breed of the horse of Central Asia, which is said to excel all the Arabian races; and, again, inventing a new conductor, which seems destined to supersede that of Franklin.

As we hope soon to be favoured with a more detailed account of this distinguished traveller from his own pen, we shall content ourselves (and this chiefly for the purpose of drawing the attention of the public to the work itself) with adding merely a few general particulars respecting Dr. Tavernier.

The principal object that induced him to visit the same quarter of the globe which had illustrated the life of his grandfather, was to form, by accurate personal observation, a fixed system on the nature of the plague and similar disorders. According to the opinion of Dr. Tavernier, if we rightly comprehend it, the ground of the form which it assumes may be considered as lying more in the juices of the body itself than as originating in contagion, which is rather only the occasional cause of the *manifestation* of the disease; "for," he says, "I have more than once seen contagion produce, in the same forms of disease, here the yellow fever, there the plague, and there the cholera, merely according to the difference of the *individual dispositions*. For this reason I even then called that singular scourge *le fleau tricephal*; when I, at the same time, discovered in the mountains of Mongolia, which no European had ever before visited, the secret that snow and ice are the real specifics against every form of this disease; and I there delivered entire hordes from it, merely by leading them from the plain into the middle icy regions.

"Surrounded by those sublime scenes of nature, proud and happy at one of the most salutary discoveries for the welfare of the human race, I wrote in my memorandum book the lines which my friends have placed under my portrait, lithographed at Leipzig:

Aux montagnes de la Mongolie,
Je vis, dans vos frimas, l'ame du feu vital,
Et lui du foudroyer le fleau tricephal . . .
Dei ama benedicta et penibile carriere,
Put desormais briller d'une douce lumiere."

It was principally among these mountains, and on the eastern bank of Lake Aral, that the doctor convinced himself that ice is the true antidote against contagion of every kind; and he has since applied it in innumerable cases, not only in the above mentioned disorders, but also in epilepsy, typhus malignant, bilious and nervous fevers, nay, even in hydrophobia.

He affirms, it was owing to this system alone that the Vienna physicians: ely succeeded in saving the young King of Hungary, as he himself had opportunities, while the cholera raged in Vienna and other cities, to convince the most incredulous of the surprising and happy effects of his mode of treatment. He therefore complains bitterly, that so many who have stolen his system, without fully comprehending it, have taken good care not to acknowledge the source to which alone they are indebted for it. This, however, he does not regard; as his object was far less personal renown and advantage, than the welfare of his fellow-creatures, to promote which he devoted his whole life, and had encountered, not without honor, so many dangers.

EXTRAORDINARY AND DESTRUCTIVE TORNADO IN VIRGINIA.—The Petersburg Intelligencer, of Thursday last, gives the following description of a tornado and its effects, that occurred the Monday previous.

The most terrific tornado ever witnessed in this part of Virginia, occurred on Monday last. The destruction of human life and property of every kind is truly appalling. It would be impossible to give more than a faint outline of its desolating fury. The scene is represented by those who had an opportunity of witnessing it, as one of surpassing and inexpressible grandeur and sublimity. Every thing, within its range, was laid prostrate; the largest trees were torn up by the roots and carried a considerable distance; dwelling and out houses were levelled with the earth, and their fragments scattered in every direction.—The day had been cloudy, with occasional showers. About 3 o'clock the clouds assumed a black and lowering aspect: in a few minutes after, the whirlwind commenced its ravages. A correspondent who witnessed its violence, says, "it was in the form of an inverted cone, and every cloud near seemed to rush into the vortex. As it approached, you might see the limbs of the forests careering through the darkened air. Its duration, at any point, was not more than one or two minutes." Its general course was from West to East; its width varied from two hundred yards to half a mile; and, from what we have already heard of its destructive march, its extent could not have been less than seventy miles. The following details will, we fear, present but a very imperfect sketch of its devastations.

A gentleman writes us that the tornado "appears to have commenced in the county of Lunenburg, near Hungry Town, where almost all the heavy timber was torn up by the roots, and where it proved very fatal. Near this place, it seems that the poor (who lived in log houses) were the principal sufferers, several negroes and children being killed. Hence it passed by Nottoway Courthouse, where the storm instead of abating increased—the public road being rendered utterly impassable. From Nottoway Courthouse, or near that place, the wind passing in a North-east direction, reached the plantation of Mr. R. Fitzgerald, where great injury was done, but no lives lost. Near his residence was that of Mr. John Fitz, who suffered immensely, having one negro killed, another's arm broke, and various others injured. Hence it pursued the same course to the house of Mr. Justice, where great injury was likewise sustained, several persons severely injured, and the life of one despaired of. The next death was that of Mr. Joshua Hawks, an honest, upright citizen, who was literally crushed, his wife at the same time receiving injury so severe, as to leave but little hopes of recovery.

The next place from whence we have any authentic particulars, is Curtis's (formerly Reese's) on Cox Road, where the storm appears to have been equally destructive. Mr. Curtis writes us "that every house on Mr. Herbert Reese's plantation, except his dwelling house, was blown to atoms; Mr. Frank Reese, the Overseer, and 3 negroes, lost their lives; several other negroes badly crippled; his wagon, which was nearly new, was hurled to atoms, even the wheels broken in fragments, and the hubs blown two or three hundred yards. Mrs. Jincy Crowder had every house on her farm (dwelling house and all) torn to pieces. Old farmer Reams lost every house except his dwelling house. No lives at either of the two last named places. I understand from a gentleman traveller that it passed on in the neighborhood of Col. Jeter's. Several lives lost in that neighborhood. I also hear that it has done considerable damage in the neighborhood of Thos. Jordan's, with the loss of lives, &c. It appears that it passed from west to east near on the north side and nearly parallel with Cox Road."

We have no certain accounts of the ravages of the tornado after it passed the neighborhood of Curtis's, until it reached the plantation of Mr. Wm. E. Boisseau, about four miles from town. The scene at this place baffles every attempt at description.—Here its desolating fury spared nothing. The dwelling house, kitchen, barn, &c. were entirely demolished, and their timbers, plank, &c. separated into fragments and scattered over the farm in every direction. Nothing is left to mark the site of the dwelling house but a small portion of the brick foundation. The family escaped from the house, and attempted to take refuge in the garden, but were overtaken by the whirlwind, and knocked down by the flying wreck of their former dwelling. Mr. B's brother, a fine youth of about 14 years of age, was killed: and Mr. B., his wife, and four other inmates of his family, were wounded, though not dangerously. In the negro quarters the injury was equally

severe—one woman was killed, and six or eight others were wounded, one very dangerously. The loss sustained by Mr. B. is very great. The persons who have subsequently visited the place describe it as though the genius of destruction had made it his temporary abode.

From Mr. Boisseau's it passed along near the Southern boundary line of this town, without doing much injury until it reached the plantation of Mr. Augustine Burge in Prince George. A friend has given us the following account of its devastations in that direction: "At Mr. Augustine Burge's it blew down his stable, and almost all his negro houses; fortunately no person was killed, but several were slightly hurt. At Hall's Field, the plantation of Mr. Wm. Baird, every house was blown down except the dwelling, a two storied house near it, a kitchen or two, and the machine house. The Wagoner, John, a faithful servant, was killed in the woods by the falling of a tree; the two horses in the wagon were likewise killed. At Hickory Hill, the residence of Mr. Wm. Shands, jr. a cotton gin, a stable and kitchen were blown down. There were two negro men in the kitchen, both of whom were badly hurt;—one of them was carried with the wreck of the house at least fifty yards. So tremendous was the storm, that, from Walnut Hill, Mr. J. V. Wilcox's country residence, to Preston, the residence of Mrs. Ann Thweatt, you have a vista scarcely interrupted by a solitary tree, a distance of four or five miles.—The forests, too, through which the tornado passed, were wooded with as majestic a growth as can be found probably in Virginia."

At Preston, the residence of Mrs. Ann H. Thweatt, there is not a house except the dwelling and one small out house left standing. One negro was killed and ten or twelve wounded. A gentleman who has seen the effects of the storm on this plantation says, that it presents the appearance of having been visited by a heavy freshet.

We have no further particulars of its progress to the East, but we learn that it crossed the James river, between Tarbay and Coggins' Point.

STATE OF SPAIN.

[From the London Courier, of 2d April.]

The state of Spain is anomalous; no less so, because of the anomalies of the Spanish character; (and these, Heaven knows, are strong enough,) but also, because of the peculiar circumstances which have led that country into an unintended, and, therefore, imperfect revolution.

The French *Juste Milieu* stands upon a large base, whether a solid one or not, is a question which time only can solve. But, whether it be called the monopoly of a too restricted, and nearly oligarchical constituency, or the legitimate influence of the most wealthy and intelligent part of the French nation, it is equally certain that the Government, which is nevertheless representative of a party, rests upon the majority of the electors and National Guards, and, with few exceptions, upon the monitored interest. Now, is that the case in Spain? Is there in that country anything settled, whereon a Government of the *Juste Milieu* can be founded? We think not.

We must not dissemble one thing. The Crown in Spain is in abeyance. It was one of the best sayings of Napoleon, that "*thrones were but a few boards and a piece of velvet*," and now, the Spanish crown is a mere empty bauble.

The title of the young Queen to the throne is a dubious one. True it is, that by the ancient laws of Spain, the rights of the females to the succession were acknowledged; and it is equally true that the Cortes of 1789, petitioned that the Salic law, introduced into Spain by Philip the Fifth, should be repudiated. But then, on the other hand, the acts of the Cortes of Philip the Fifth, in favor of that Salic law, was a valid one, and published as such, whilst the act of 1789, lately alluded to, though, it is said, agreed to by the King, had not been published, and can hardly be considered as a law.

It is no less certain that the Cortes of 1810 declared in favor of the female succession, but their decision is of no value in the eyes of Ferdinand's widow and daughter, by whom that famous and patriotic assembly is still viewed, at least officially, as no better than a revolutionary and illegal power.

Even the meeting of the mock Deputies of the Spanish nation in 1833, though intended to sanction the title of the young Princess, had a tendency to render it still more dubious than it was before. By precluding the discussion of it, the Spanish Government seemed to fear that the decision might, nay probably would, be unfavorable to its own views, and by a curious infelicity that ludicrous assembly met, we may say, to enter a silent protest against

the act, the sanctioning of which was the ostensible object of its convocation.

The consequence of such an accumulation of blunders and follies, which might have been anticipated, are most unfortunate. By a large party of the Spanish nation, Don Carlos is considered to be the legitimate King of Spain. And we are not rash in saying that among the supporters of the young Queen, a large portion care but little about her title, and look upon her as a rallying word—a motto or a banner under which the battle of the *good old cause* of the Constitution against the ancient despotism is to be fought over again.

But if the title of the young Queen of Spain is liable to objection, the situation of her mother, the present Regent, to whose lot it had fallen to enforce and support the rights of the Royal infant, is eminently calculated to embarrass and endanger the cause of female succession. Regencies, particularly under a despotic form of government, are proverbially weak and unsettled. The government of a female and a foreigner seldom commands respect or popularity.—There is besides in Spain a prejudice against Italian Princesses. The effects of all this are already felt. There are *ugly reports* abroad which we do not believe, on the principle of our laws, which forbid us to look upon an individual as guilty until after conviction, founded upon convincing evidence. Yet, admitting those loud whispers to be foul calumnies, they are not the less likely to be attended with injurious consequences. The reported levities of Marie Anoinette, whether the reports were totally false or only exaggerated, had a very important share in her own misfortunes and those of her husband and family. The present regent of Spain has done little to enlist in her favor the feelings of any party in Spain. The Queen Regent should be like Cesar's wife; for, to be suspected, is, in her case, as far as that can influence the public mind, for all practical purposes, tantamount to being guilty.

Don Carlos is differently situated. Of talent and energy he has been found hitherto sadly deficient, and yet his popularity among the Spaniards is even unto this moment unimpaired. He is still supposed to be a man of strong principle and sound public and private morality. He undoubtedly possesses many, and is held to possess all the qualities that best suit the ruler of a grave and religious people. Unlike his departed brother, his sincerity never was nor is doubted. Those virtues which he may want, he receives credit for, and upon that credit he can largely draw upon the resources and zeal of an enthusiastically devoted population. During the Peninsular war the bright halo which surrounded the distant Ferdinand, made him appear in the eyes of his subjects as a being invested with more than earthly perfection. His inglorious captivity within the walls of Valencay was mainly serviceable to the triumph of Spanish Independence. In that respect Don Carlos has now succeeded his brother, and is in full possession of the benefits of a succession of which no law can deprive him.

When we take all those things into consideration we shall see that the Pretender to the Spanish throne has some chance of success. We know that such is the view entertained, by those—good judges, too—who were heretofore inclined to think otherwise.—One European Government, which has hitherto shown great zeal for the cause of the young Queen, betrays present symptoms of a contrary tendency, be it owing to want of faith in her power, or to dislike of a cause which must become connected with that of political liberty. The announced dispersion of the French army stationed on the Spanish frontier is truly a most unaccountable measure, unless it be meant to assist the Spanish Carlists, since the reasons which led to the assembling of that body are still subsisting, as the rebellion in the Spanish provinces is far from being subdued.

We are far, however, from despairing of success to the cause of the Queen. She has some favorable circumstances on her side, which only the folly or guilt of an imbecile or designing administration can render unavailing. It is no mean advantage to be in possession of the actual powers of the Government, particularly when we consider that the Constitutionalists of 1820, notwithstanding a strong opposition both at home and abroad, were enabled to keep their ground, till the insurgent Royalists brought in an overwhelming French force on their own side.

The Queen Regent can now depend on a larger party than the old Constitutionalists were able to command, provided she knew the way to form and consolidate it. In the list of her supporters we find the names of Quesada, Llauder, and Morillo—that is to say, a leader of the Royalist Army of the Faith, a moderate though still a steadfast Royalist, and a deserter from the Constitutional cause, in addition to

all the staunch and unfortunate defenders of the fallen Cortes. These men, heretofore, and perhaps even now, disagreeing in principle, are yet bound together by the strong tie of common interest. There is no salvation for them except in the triumph of the Queen's cause, and that cause cannot be saved except by its being identified with that of free institutions.

A farther and strong chance in favor of the Queen may be found in the conduct of her adversaries.—Had they left the Constitutionalists alone, perhaps the Regent could not at present rely upon their support, which indeed she never did nor does now deserve. But the blind fury and party zeal of the Carlists made it a necessity for the intended victims of a forthcoming and clearly denounced persecution, to arm themselves in their own and the Queen's defence.

The Regent of Spain and her ostensible and real advisers must be blinded indeed if they do not perceive their true situation, or if they neglect to improve those chances of success which they still have on their own side.

The path they have to follow lies clear before them; there is no mistaking it; and let it be kept in mind that no other path is safe.

They must arm the Constitutionalists, and they must assemble the Cortes.

These are no metaphysical principles—no delusive theories—but, on the contrary, practical questions, which involve security for life, for limb, and property.

It is a mere absurdity to talk about the qualifications for the national militia. Those men ought to be armed who are willing and ready to fight, and are likely to fight well.

Nor is the meeting of the Cortes a question of a less practical character. A bill of exclusion against the President and his offspring must needs be the first act of the Legislature. This is no time for idling and procrastinating, and closing the eyes to dangers that look upon you full in the face. Something more than the repeal of the Salic law and an insurance for two lives, is required by those men whose lives are threatened by an exasperated party. The doctrine of the sovereignty of the people may be disliked by many of the Queen's supporters, but they all must know what fate awaits them should the death of two infants place the legitimate power in the hands of Don Carlos.

The necessary consequences of such measures as are here urged may well be anticipated. They will be no less than the establishment in Spain of a representative government, whereby the liberties of the Spaniards, and the interests of the ruling party among them, may be secured and consolidated.

It is both to the enthusiasm for liberty, and the sense of security, that the Queen Regent of Spain must, and can only be, indebted for success. To the enthusiasm and rightly understood interests of her adversaries she must oppose the influence of equally solid and energetic principles. She has to appeal at once to the noblest, and the most vulgar passions—to call to her aid the patriotic zeal of the truly liberal, and the vigorous efforts of selfish interests threatened in their tenderest points. Let her appeal quickly to the devotedness of the patriot, and the common sense of the people, or she will perish, and leave behind her a name significant of folly, feebleness, and guilt, which will excite, perhaps, more than any name in history, indignation and contempt.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver there in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon date, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, {
January 22, 1833.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 18, 1833.

Adopted by R.M. & F.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroad.
No. 264 Elizabethstreet, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J 13 15

RAILROAD CAR WHEELS, BOXES AND AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8

ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 58 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable.

They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyor's Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing and Heartt.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary.

December 24, 1833.

For further information on this subject see No. 40, page 778 of this Journal.

RAILROAD TURNOUTS, REVOLVING PLATFORMS AND SIDELINGS.

The subscriber having been for some years engaged in constructing turnouts, and inserting the necessary switches and fixtures appertaining to the same, on the Baltimore and Ohio Railroad, and as those works on that road will be shortly completed, he is desirous of being employed by any Railroad Company requiring work of the above description.

He will either contract at a fixed price to execute the work, he providing all the necessary materials and fixtures, or otherwise,—or he will engage himself at a stated salary.

In relation to his abilities and general character he begs to refer any Company, disposed to engage him, to the Baltimore and Ohio Railroad Company.

Letters can be addressed to him at the Office of Construction Baltimore and Ohio Railroad, Baltimore.

REUBEN ALER.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & G. W. BLUNT, 134 Water street, corner of Maidenlane.

J81 6t

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy;—a Railroad Goniometer, with two Telescopes;—and a Leveling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street,
Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all Instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying off rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Superintendent of Construction
of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY B. CAMPBELL, Eng. Philad.,
German and Norrist. Railroad

"LAZY SAM."

The following story will not be worth the less for being true. A Kentucky horse drover being in South Carolina with a drove, happened to take it to the neighbourhood of Gen. H——, whose character for jockeying and manoeuvring in trade is much more celebrated than his feats in arms. The Kentuckian having perfect acquaintance with his character, went to see him to sell him some horses, or to swap—or to run a race, as the fates and destinies might order and decree.

He was one of our careless unconcerned knock down and drag out looking sort of fellows: who would assume just as much simplicity of countenance and address, as circumstances might require. He had the appearance of being about twenty-two or twenty-three years of age, as usual was dressed in blue mixed jeans, to hide dirt, and wore a drab colored hat for the same reason.

'General,' said he, 'I am just from old Kentuck with some powerful nice horses, and may be you want some. Daddy told me if I came in your parts to call on you, and he reckoned may be you would buy a pair of matches, or help me out in tradin, for he said you had a power of money, and understood tradin to a scribe. Here's a letter from him,' handing one. 'And besides I've as nice a pair of matches, as you could shake a stick at; and as tight a nag for a quarter, Daddy says, as any in the parts: but he says I must run no races, caze mought lose, and we want all the money we can scrape to pay for land. But I reckon he'd suit you to a fraction, caze you are a sportin character, mought win a powerful chance of money on him.'

While he was thus introducing himself and telling his business, the General opened the letter which read as follows:

'Dear General—I take this opportunity to wright to you by my Job, who is taken the first drove he ever driv, and I want you to roll a log a leetle for him, if so be it suits you. Job's spry enough at home, but has'nt cut his eye teeth yet, and you'll lend him a hand, I'll due as much for any of your boys if you've got any, whenever they come to these parts tradin or any thing else. So no more at present, but remain your affectionet friend till death.'

PETER TOMPKINS.'

The hero of horse races, cotton bags and sugar hogsheds, thought that he perceived a neat speculation, and acted accordingly. Mr. Job Tompkins was received with much courtesy; his man and boy entertained with the best in the larder, whilar the five and twenty horses were not neglected. It is true the General had not the slightest recollection of his friend and correspondent, Peter Tompkins. He might have once known him, or not. It was the same thing. Here was Job, a raw Kentucky stripping, with twenty-five fine horses, as easily squeezed as a ripe lemon. It was not in his nature to forbear.

In the meantime Mr. Job Tompkins made himself quite free and easy, and swaggered about the costly furnished apartment as if he had been in a log cabin. He viewed the silver plate on the sideboard with much apparent astonishment, and a pair of silver snuffers, especially, excited his curiosity.

'Lord General! ar them thar candle snuffers made out of the pure stuff? I never see'd any afore but in ones, and mamma uses her sheers. And all them ar things on thar ar big chist (the sideboard) are the r'al Spanish castins! I heard talk of this afore, but never seed it. Now if I was to tell this in our settlement, may be they would'n thop straddle of me, and ride over me rough shod, for a liar. But they say you're a powerful sight the richest man in the South States, aint you?'

To all which the General returned suitable answers; and Mr. Job and he were hand in glove, for the time being. Each man resolutely bent to make a successful lodgment in his neighbor's pocket with the view of clearing it out, a Herculean labor to be sure;—when Job heard in the next room the sound of music. Several Kentucky reels were played, anon the sweet breathings of a melodious voice sung Sweet—sweet home.'

'May I be ——d' said Job, 'if that dont beat Bob Walker, and he's a patch above common. But that aint none of your music boxes I know; it cant be. Is it?'

'My daughter is playing on the piano,' said the General, 'we will walk in the room and hear her.'—Here were blandishments to strike Job dumb, and entrance all his senses.

"The man who has no music in his soul,
And is not moved with concord of sweet sounds
Is fit for treason, stratagems and spoils."

Job thought a man might love music and spoils also.

He felt a liking for both. Therefore he applied the music in his own way most rapturously.

Said Job, 'May I never pull another trigger, if she's not a priming above any thing I heard talk about. Why she's chartered! She's a r'al one, I assure you. Why its enough to make a fellow swim that cant; and if it was'nt for all thes fine kivorlids over the track, (the carpet) and I had a partner to my mind, I'd go my drove to nothing or less, I can shake the sticks off of any boy you can produce.'

The General now thought the Kentuckian ripe enough. To aid in which he had been well plied with choice liquor as he denominated the Brandy and Madeira.

The horses were brought out and examined, and praised, and cheapened, and faults found with all.

They could agree upon nothing.

'Well, where is your quarter horse?' asked the General. 'Oh, ho! I sort o' tho't what you were after,' answered Job, 'for you hardly looked at them thar matches, and these fine geldings.' So you must be after the quarter nag, Jim fetch up Lazy Sam, will you! Now General I'll tell you, honor bright, he's never been lick't in a quarter spurt, but once; by Joe Miller's sorrel mare, which runs like a streak of lightning. She's a r-al screamer. Daddy swept for him last fall after she tanned him out. If I knowed her I'd give you her marks, so as you might'nt be tuct in. For I heard Joe was bringing her to the South to win the expenses. But here's the horse any how, and I assure you he's not slow.'

Now be it remembered that honest Job was not ignorant, that General H—— was at that time the owner of this identical mare, and for reasons best known to himself he wished to make a race between her and Lazy Sam.

The General examined Lazy Sam with the eye of a Jockey.

'Fish,' said he very contemptuously, 'why this thing cannot run; why it's as flab-sided as a sheep, and as heavy shouldered as a hog, and cut hammed besides: I would not give a good mule for three of it. Why did you not bring a lot of mules to market? I would have bought some at a fair price. Your horses do not suit me. Pray what do you ask for this thing which you call a running nag? It may de to plough a season or two. Does it work?'

Unlike the Job of ancient days, Job Tompkins suffered his anger to rise and master him. At least he made the General think so. To use his own words, he corvorted. He screamed out.

'Hello! Mister, I wonder you're so mighty wise considering you know so little. Why you make me feel all over in spots, to listen at you. I reckon may be you've got a quarter nag yourself: aint you?'

'I have a plough nag here' said the General very coolly, 'that I am sure can run away from that thing of yours.'

'Thing?' holloed Job, 'why you make me feel all sort of wolfy, and I've a good mind to go my whole lot again any thing you can parade in the whole South.'

'I would not spoil a good mind then,' quoth the General. 'But I suppose you are afraid to run, as your father has forbid it.'

'I dont care a solitary flint what Daddy says when my Irish is up,' exclaimed Job indignantly. 'Bring out your nag and let's see it.'

The General gave the order; and as Job expected, the sorrel mare, (once Joe Miller's) was brought forward.

While Job examined her, his adversary endeavored all he could to fret him by dispraising his horse; and Job appeared to be worked up to fever heat.

To cut short the story, the drove was staked against twenty-five hundred dollars in a check upon the C— Bank. And the company adjourned to the General's track, to see the race. On the way Job stopped short, and facing the General, asked very earnestly,

'Now you're sure this aint Joe Miller's Nag? My mind sort o' misgives me, caze from what I've heard they sort o' favor like.'

'D—n you Joe Miller and his nag also,' replied the General, 'the mare is mine I tell you.'

This appeared to be satisfactory.

I have given you the General's description of Job's running horse—done to fret him. It was by no means a correct one. Lazy Sam was a well made poney of the *Printer* stock, but was of a mild, sleepy, sluggish disposition, until his mettle was roused.—He generally went with his eyes half shut, and his head drooping at an angle of forty-five degrees.—

When the General viewed him he was in this condition.

The horses were in the General's stable and the check for two thousand five hundred dollars in the hands of a gentleman present. The General had no doubt about keeping all Job's fine horses and sending him home on his ten tees. Job thought differently. Lazy Sam was led along by Job's boy, as sleepy as usual. The preliminaries were adjusted, and riders mounted. As Job threw Jim on Lazy Sam, he sprang all fours off the ground; and his dull sleepy look, was changed into a wild, almost devilish expression.

He looked as Job did when he 'corvorted.'

The General lost his usual mahogany color, and looked pale; but he said nothing.

Lazy Sam won the race by thirty feet.

Job was suddenly cool as a cucumber. And as he put the twenty-five hundred dollar check in his greasy pocket book which he did very deliberately, he looked round cunningly.

'Isort o' think that's first rate and a half,' said Job, 'and a little past common. Why Gin'ral, Sam's laid you as cold as a wedge.' He turned round suddenly to his rider, 'Jim' said he, here's five dollars, why it all goes in a man's life time. But the General looks as if he'd been squeezed through the leetle end of nothin, or less.'

TO IRON MANUFACTURERS AND OWNERS OF IRON ORE BEDS.

JOSEPH GOULDING, of Karsville, Essex county, N. Y., has invented and patented a *Magnetic Separating Machine*, for separating Iron Ore from the extraneous matter usually found in connection with it; and he begs leave to recommend it to the special notice of owners of Ore Beds as possessing qualities of great importance, as by the use of it many ore beds can be made very valuable, it being applicable in all cases when the Ore is magnetic.

The quality of the iron made is much improved by the process of separation, indeed so good iron can, after separation, be made from ore which would without it be considered not worth working. There is also found to be a great saving in the transportation of ore, and in time and fuel required to work the same into iron.

Mechanics can be furnished at short notice which will separate from half a ton to twenty tons each in twenty-four hours.

J. Goulding also manufactures to order, *Cylindrical Forges* and *Blast Furnace Bellows*, of the most improved construction, and which are successfully used in nearly all the Forges and Furnaces in Clinton and all the adjoining counties.

January 20th, 1834.

RAILWAY IRON.

	Ninety-five tons of 1 inch by 1 inch.	Flat Bars to length of 14 to 15 feet counter sunk holes, ends cut at an angle of 45 degrees with splitting plates, nails to suit
300	do. 1 1/2 do.	do.
40	do. 1 1/2 do.	do.
900	do. 2 do.	do.
800	do. 3 1/2 do.	do.
	soon expected.	

350 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axes of 2 1/2, 3, 3 1/2, 3 3/4, and 4 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splitting Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* * Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MAY 24, 1834.

NEW-YORK AND ERIE RAILROAD.—We understand that JUDOR WRIGHT has been employed, and left this city on the 22d, with two parties for Deepark Gap, to commence the preliminary survey of the route for this road. The survey now to be made is not of course to locate, but merely to ascertain the practicability of the route.

We promised in our last to give in the present number some good reasons why the state should aid in the construction of a railroad through the southern tier of counties, but are obliged to omit them until our next.

We acknowledge the receipt of the first annual report to the stockholders of the S. Carolina Railroad and Canal Company, since the completion of the work. From the report we learn that the business of the road has been regularly increasing since the opening of the road, from about \$600 to \$3,400 per week. This increase has been effected, too, without the aid of the cotton crop, of which only about 4,000 bales have been transported on the railroad.

The earnings of the road have been, from 1st January to 1st May, \$39,518.31.

It should be borne in mind, at the same time, that there has not been at any time, not even now, although great efforts have been made to obtain, a sufficient number of cars, both passenger and freight, of which 8 to 10 per week are added, to meet the demand. Two new locomotives are expected daily from Europe, and two others in this country are in a state of forwardness, which, when in use, will give them twelve or fourteen engines, twenty-four pas-

senger, and one hundred and fifty freight cars, all of which will probably find constant employment through the business season. It is, indeed, gratifying to witness the success of this road. It will give an impetus to the prosperity, not only of South Carolina, but of the whole South. Alabama is already pushing her railroads in a direction to join South Carolina; and Tennessee, also, as will be seen in this number of the Journal, is following closely upon her heels, so that the time is not distant—not five years—when the Charleston railroad will be extended to the Mississippi, and not only to the Mississippi, but also to the Ohio, and to the navigable waters emptying into the Gulf of Mexico, thus opening an easy, cheap, and rapid communication to the ocean for the products of the most fertile country in the world.

We have not, to-day, room for extracts from this report, and shall therefore refer to it again.

We have also to acknowledge the receipt of another report, the report of J. Edgar Thompson, Esq., Engineer of the Oxford railroad in Pennsylvania—another link in the grand Atlantic line. The Oxford railroad is only nineteen and two-fifths miles in length, commencing at the Columbia Railroad, forty-five and a half miles from Philadelphia, and terminating at the Maryland line. By the completion of this road, Pennsylvania will have performed her part towards the accomplishment of the grandest scheme of internal improvement ever contemplated in this or any other country. She will have forged another link of a chain which, when completed, will tend more to the permanence of the Union than all the plans of all the politicians of the age. We must lay this, also, on the table until another week.

TENNESSEE RAILROADS.—We are indebted to Col. PETITVAL, formerly of the Charleston, S. C. Railroad, but at present of Tennessee, for the following communication, relative to the works in contemplation in that State, and also for his reports upon two routes, one from Jackson to the Mississippi, and the other from Columbia, through Mount Pleasant, to the Tennessee river, which will be found in the present number of the Journal.

We are the more indebted to Col. Petitval for these reports, as they are, we think, the first which have come to hand from Tennessee since the establishment of the Journal; they are not, we trust, the last from the same quarter, as no State in the Union will be more benefitted by the introduction of railroads than Tennessee.

Nashville, May 2, 1834.

To the Editor of the Railroad Journal.

DEAR SIR,—A constant employment during all the winter in reconnoitering different routes for railroads in the western part of the State of Tennessee, prevented me from giving you any account of the situation of the internal improvements in that State. The companies being now organised, the officers elected, and the stock subscribed, I take the advantage of my first leisure hour to send you my two reports to the stockholders of the Jackson and Columbia Companies.

In January last, stock to the amount of \$500,000 was subscribed for a line of railroad to the Mississippi river, and in March a like subscription was made for another line, in the same direction, from Columbia, Maury county to the Tennessee river; and as, by the charter of the Jackson Company, they have a right to extend their road in the western districts, increasing the stock to the amount of one million of dollars, the two roads will be soon connected by an intermediate line.

I examined all the country, and furnished the companies with estimates of the probable cost of the work, and it is on account of those reports that the stock has been so liberally subscribed. In Jackson the commissioners were obliged to strike out \$430,000, the amount subscribed over the capital of the Company, thereby reducing the subscription of the largest stockholders to 159 shares each.

East Tennessee has had a charter for a railroad since 1831, and is now making preparation to join the west in improving the internal communication of the State; and I can assure you that within 6 or 7 years an uninterrupted communication will be opened between New-York and New-Orleans, either by the Valley of the Clinch, through Abingdon, Virginia, joining the Petersburg railroad; or through the Valley of the French Broad, by Ashville, North Carolina, joining Athens, Georgia, or Hamburg, South Carolina, by which the mail will be carried over the route in 5 or 6 days.

A railroad through the centre of the State of Tennessee will be of inestimable advantage, not only to that State, but to the whole Union, as it will be the great rendezvous of all the emigrants to the Valley of the Mississippi, affording a speedy and easy transportation; opening the markets of the north-east and south-west for the products of her rich soil and mild climate, so well calculated for wheat, hemp, tobacco, and cotton; and also for her inexhaustible quarries of marble, beds of coal, veins of ore of every metal, found amongst her beautiful and picturesque mountains.

I am sincerely yours, &c.

J. B. PETITVAL, Civil Engineer.

On the Color of the Air and of Deep Waters, and on some other Analogous Fugitive Colors. By COUNT XAVIER DE MAISTRE. Translated from the Bib. Univ. by Prof. J. Griscom. [From the American Journal of Science and Arts.]

The blue color of the sky is accounted for, by supposing that the sun's light, reflected by the surface of the earth, is not entirely transmitted by the atmosphere and lost in space, but that the molecules of air reflect and disperse the blue ray. Why this ray is reflected in preference to the indigo and violet, which are more refrangible, and appear to be more easily reflected, is a circumstance not accounted for.

The same blue reflection is observed in deep sea water, and in lakes, and rivers, when they are limpid.

The same singular phenomenon is also witnessed in various substances of different natures, which have no apparent analogy: thus, opaline substances are blue by reflection; the noble opal, (independently of the partial rays which give so high a value to this stone, and which are attributed to natural fissures,*) reflects a general blue color, which is also observed in some other siliceous stones, and which is still more obvious in opaline glass. A weak solution of soap is slightly blue; the jelly of ichthyocolla is more so, and an infusion of the bark of the large chesnut tree, (*maronnier*), which is perfectly opaline, still more. Newton speaks of a wood which he calls nephritic, the infusion of which is opaline. In the Sicilian sea, at the mouth of the Giaretta, (the ancient Simethus,) specimens of amber are found which are in great request on account of their highly opaline properties.

A blue reflection is also observed in certain bodies which are opaque-white when reduced to plates thin enough to transmit light. A familiar example occurs in the skin covering the veins, which transmits a blue, although neither the skin nor the blood is of that color.

The mixture of white with black and with transparent colors gives in painting numerous examples of opaline blue.

This blue color is the only one which can be explained on the theory of thin plates, by supposing that the particles of opaline bodies have just the dimensions requisite to reflect the blue ray. This explanation derives some probability from observing that the color transmitted by these bodies is the complementary yellow of the reflected blue. This theory, however, presents great difficulties, and it is not intended absolutely to admit it in this essay.

The analogy between the colors of opaline substances and those observed in the air and waters, will become obvious by an examination of their action on reflected and transmitted light, proving that the phenomena are owing to the same cause.

Opaline glass is produced by mingling in the common metal of white glass a portion of calcined bones, which gives a blue shade without much impairing the transparency. The bone powder appears to be in a state of extreme division, or a kind of demi-solution, which does not disperse the transmitted light.

The color of the light transmitted by opaline bodies varies according to the volume of the mass; it is yellow if the body is thin, and becomes successively orange and red in

proportion to the increase of thickness. The analogy of the air with opaline substances is not only manifest in the blue reflection, but also in its action on transmitted light, which becomes successively yellow, orange, and red, according to the volume of air and the kind of aqueous vapors with which it is impregnated. When the sun is high, and his light crosses only the purest and thinnest portions of the atmosphere to reach the clouds, they are white, with a slight tinge of yellow; they become sometimes yellow and orange as the sun declines; and at length red and purple when his light grazes the earth, and is transmitted by the densest portion of the air, and loaded with the vapors of the evening.

But it often happens that the colors do not appear, and that the sun sets without producing them. It is not, therefore, to the purity of the air alone that we must attribute the opaline property of the atmosphere, but to the mixture of air and vapor mingled in a special manner, and producing an effect similar to bone dust in opaline glass; neither is it the quantity of water in the air which occasions the colors, for when the weather is very damp it is more transparent than during a time of drought. Distant mountains are seen more distinctly, a well known prognostic of rain; the sun then sets without producing colors, it looks white through the fog and damp vapors of the morning, but when the clouds are colored red by the setting sun, the phenomenon is generally deemed the signal of fine weather, because these colors are a proof of the dryness of the air when these contain only the peculiar diffused vapors which give it its opaline quality. In this state of things the disc of the sun appears like a red fiery globe divested of rays.

The blueness of the sky, therefore, varies according to the kind of vapor which is spread through the air; and what renders it unquestionable that its blue color is caused by these vapors is, that it appears black when seen from the highest points of the globe, above which there is not sufficient vapor to reflect the blue color.

Limpid waters, when they have sufficient depth, reflect like air a blue color from below; it is of a deeper shade, because it is not mixed with white light; very often it is not perceived at all; the reflection from the surface, on which the sky and surrounding objects are painted as in a mirror, often occasions the disappearance of the internal reflection, or forms with it complex shades.

We have seen that the property which air possesses of producing colors is derived from the presence of watery vapor; analogy leads us to presume that this property in water arises from a mixture of air which it always contains to a greater or less amount.

Although the blue color of water is often masked by numerous causes, it is sometimes exhibited in all its intensity; a fine example of it is witnessed in looking at the Rhone from the bridge at Geneva. The river seems to flow from an ultramarine* source. The spectator is in the most favorable situation for observing the internal reflection disengaged, as much as possible under an open sky, from the reflection at the surface.

Agitation of the surface has a great effect on the color. A tranquil sea sometimes reflects the warm color of the horizon, re-

presenting all the tints of a luminous sky so exactly, that the sky and sea appear to be blended with each other; but if a gentle breeze ruffles the surface, the brilliant tints vanish, and the blue from the interior immediately predominates.

Such is also the cause which enables one to distinguish the course of the Rhone far into the waters of the Leman: the progressive motion of the river in the motionless water of the lake produces an agitation which diminishes the brilliant reflection of the sky and renders the color of the water more sensible.

The green tint which the sea often assumes may seem to throw some doubt on this property of reflecting the blue ray, regarded as inherent in the nature of water; but this green color is observable only when the depth of the sea is insufficient, that is, when the bottom may reflect the transmitted light.

In looking at the sea from an elevation of about fifty toises, on the shore of the island of Capri, I observed spots which were of the finest green, much more luminous than the dark blue sea with which they were surrounded. To ascertain the cause, I took a boat and proceeded to the place. The spots then were no longer perceptible, but I soon re-discovered them, and found that the color was occasioned by white rocks, which were easily distinguished, notwithstanding their great depth, from the dark sandy bottom in which they reposed. These rocks, viewed in a vertical direction, were of a lighter green than when seen from the height, but I could not doubt that they were the cause of the phenomenon.

To settle the point by direct experiment, I prepared a square sheet of tinned iron, fourteen inches long, painted it white on one side, suspended it horizontally to a cord, and sunk it in a deep place, where the water under the boat was blue, without any mixture of green, watching the effect under the shade of an umbrella which was held over my head. At the depth of twenty-five feet it acquired a very sensible green tinge, and this color became more and more intense to the depth of forty feet, when it was of a beautiful green, inclining to yellow; at sixty feet the color was the same, but of a darker shade, and the square figure of the plate was no longer distinguishable; until at eighty feet there was apparent only an uncertain glimmering of green, which soon disappeared.

We thus perceive that the light of the sun transmitted through water, and reflected from a white surface, produces green. The cause may be readily conceived by admitting in deep waters the same opaline property which we recognize in air. The light, after penetrating a mass of one hundred feet of water, to reach the plate and return to the surface, ought to be yellow, like that which would be transmitted by an opaline fluid; this color reflected by the plate, mixed with the blue which reaches the eye from all quarters, produces the green. If the bottom of the sea were white, like ceruse, the waters near the shore would present the same green tint which the plate produced at different depths; but the bottom is generally of a dark grey, which reflects less light, and therefore yields only a dark and uncertain green: hence the green color of the sea, as witnessed near the shore, is owing to the reflection of light from its bottom. To leave no room for doubt in this matter, I took a

* This was the opinion of the celebrated Haüy.

* Having the blue color of the ultramarine paint.

boat and pushed out from the shore, under a clear July sun, at eleven in the morning, to examine the changes which might be perceptible in the color of the water viewed on the side of the boat opposite to the sun.

At fifty toises from the shore the water was decidedly green, the shade of which remained during fifteen minutes; it then became a bluish green, and, in advancing, the blue continued to increase, and at length to predominate, and in an hour's time the water under the boat was a pure blue without a mixture of green.

In returning to the shore I was attentive to the re-appearance of the green, and as soon as I found it clearly marked I sounded and found the depth one hundred and fifty feet; thus the light which renders the sea of a green color passes through three hundred feet of water. But in that part of the gulf another cause contributed to the green color, viz. the impurity of the water as it exists to the extent of some miles from the shore. The bay of Naples receives no river that can give motion to the waters charged with all the filth of that populous city. On the shore of the islands of Capri the water is perfectly blue at eighty feet, while near Naples it requires one hundred and fifty feet, a difference which must be ascribed to the impurity of the water in the bay.

If the bottom be of a black, or very dark color, the water may be blue at a much less depth than eighty feet. Besides, if an obstacle intercept the direct rays of the sun, so as to throw a shade over the bottom, while the water itself is illuminated, the latter will be blue, because no longer colored by yellow rays from the bottom; this effect may take place near shore in deep waters, by projecting cliffs or high shores.

It is thus ascertained, that when the sun's light transmitted through water is not lost in its depth, but is partially reflected by the bottom, the water is of a green color.

This effect may arise in deep water from beds of submarine plants, or by myriads of microscopic mollusca, which, covering a vast extent of sea, may act upon the light, or even exist in mass sufficient to produce a permanent color.*

The colors transmitted by deep waters cannot be directly observed like those of air, which are visible among the clouds; observations agree on this point. The learned Hatley, in descending in a diving bell, observed that a ray of light, which reached him through a small opening closed by glass, gave to the upper part of his hand a rose color. Had his hand been white, instead of being itself more or less red, the experiment would have been more conclusive. The depth to which he descended was probably not more than thirty or forty feet, at which the transmitted light could not differ much from yellow, which, mixed with shades of white, and with the natural color of his hand, would produce a rosy tint. He observed that the under part of his hand was green, which must have been occasioned by reflection from the bottom.

The bluish green color of crevices in the glaciers is occasioned in the same manner as that of water near shore; if the mass of ice was as great and as homogeneous as

that of the sea, the interior of the crevices would be blue; but the ice contains air bubbles, particles of snow, and fissures which reflect the transmitted light, throwing it from one face to another of the crevice until it finds an escape. These opaque substances in the glacier produce the same effect as a white surface in the depths of the sea.

There is on the shore of Capri a grotto, which nature seems to have constructed to exhibit in all its beauty the green color of the sea, and which on this account is called the *azure grotto*; it is situated under a cliff on the north side of the island. As it could not be entered by a common boat, it remained unknown until 1828, when two Prussian artists, Kopitch, and Frisi, swam into it, and made it known. Their account excited public curiosity, and boats of convenient size were made, which now serve to introduce amateurs. Its entrance is triangular, having a base of four feet five inches wide and about the same height. The summit is rounded, and having but little thickness the entrance is easily effected by stooping, when the traveller finds himself in a spacious grotto, the sides and roof of which are remarkably regular. Its extent from the front to the rear, which is the only landing place, is one hundred and twenty-five feet, and it measures one hundred and forty-five feet in a transverse direction. The depth of the water at the entrance is sixty-seven feet, in the middle of the grotto sixty-two feet, and at the landing place fifty-eight feet. The rock is limestone, of a clear grey fracture, and there are no indications of stratification.

On entering, every thing appears dark except the water, which is luminous, and of a splendid blue, contrasting with the general obscurity. In advancing from the entrance, the ends of the white oars shine in the water with a splendid blue light, which disappears as soon as they are raised: this is the most singular phenomenon of the *azure grotto*, for people are puzzled to conceive why objects are so vividly luminous in the water, and no longer so when above the surface. In dipping the hand or a cloth into the water, one would think it a blue dye; the whole immersed part is luminous and colored, while the parts without are dark and uncolored.

At the bottom of the grotto there is a small space on a level with the water, where debarkation is effected, and which is the only spot which leads to any suspicion of the work of human hands in the grotto. It is a kind of bench in the rock, about three feet high, on which several persons may conveniently place themselves and examine at leisure the phenomenon of the *azure grotto*. The light, which comes in at the small opening, produces a train of white light, like the reflection of the moon from the water when rising, and which extends half way over the sheet. The rest of the surface is blue, even to the feet of the observer. This color gradually diminishes to the right, where the walls of the grotto are farther from the entrance. The train of white light illuminates also the vault, and exhibits it in its natural color, but when the entrance is closed by a boat, or more perfectly by a dark cloth, the vault itself becomes blue, reminding one of the effect of burning spirits of wine in a dark chamber. There is, then, no light but that which proceeds from the water. The experiment of the cloth ought to be made by

all who wish to enjoy the spectacle in its full beauty.

If, when the observer is seated on the bench, a boat passes in front, it forms no reflection nor shade in the water. If the eyes are then covered with the hands, so as to hide the boat and the water, the former appears suspended in the air like a dark silhouette crossing the sky. This spectacle is so striking when first observed, that one cannot avoid some apprehension on account of those who furnish the occasion of it. In passing to the dark side mentioned on the right, the water is no longer blue, but remarkably transparent. The rock below is so illuminated as to show its fissures at a considerable depth, while above the water it is very obscure. The water line is clearly marked, and has a yellowish tint. The depth seems to increase the longer it is observed, and at length the bottom is seen, although forty feet below. The white plate which I let down was very distinguishable on the darker sand. Its color, instead of being green, as when tried in the sun, was slightly yellow.

The feeble yellow light which illuminates the submarine walls in this part of the grotto, proceeds by reflection from the bottom, and from the walls opposite, which receive the exterior light; this light, which has traversed a great mass of water, should be yellow, like that transmitted by opaline fluids, and thus the opaline quality of the sea affords a satisfactory explanation of the principal phenomena of the grotto. I have endeavored to give an idea of this construction by means of the subjoined figure, which represents the exterior rock or shell of the grotto, as it exists both in the sea and above the surface.

The little entrance is shown at *a*, above the level of the sea, represented by the line *b b*. The eastern side of this entrance extends almost perpendicularly to the depth of thirty or forty feet, when it appears to be cut horizontally at *d d*, and suspended on the dark blue water of the sea; *d e c* is the supposed continuation of the eastern side of the entrance, to the bottom, which, as we have seen, is sixty-seven feet deep. The western side of the entrance, *f f f*, forms an angle at ten or twelve feet below the surface, and is prolonged horizontally from twenty to twenty-five feet, and then descends obliquely, probably to the bottom of the sea, where it cannot be seen beyond thirty or forty feet.

This construction gives an immense opening for the light to enter the grotto through the water, even when the little opening above the surface is closed, and it thus occasions over a great mass of water, that dispersion of the blue ray which always takes place in deep and limpid waters, and which is manifested in greater splendor in the *azure grotto*

* The theory of the author derives confirmation from the beautifully green appearance of large fish as they turn upon their backs in rising towards the surface, and sporting round a ship, during her passage through a dark blue sea.—[*Trans.*]

n consequence of its being mingled with no other light.
(To be continued.)

Report to the Commissioners of the Columbia Railroad, in the State of Tennessee, on the practicability of the project, with the probable cost of Construction. By JOHN B. PETITVAL, Civil Engineer. [Communicated for the Railroad Journal, &c.]

COLUMBIA, March, 1834.

To Samuel H. Williams, John Miller, Edmund W. Dale, P. R. Booker, John Brown, Alexander Brown, H. Langtry, and Francis S. Walker, Esquires, Commissioners of the Columbia and Tennessee Railroad :

Gentlemen,—In conformity with your instructions of the 19th of February last, directing me to make the preliminary surveys, exploration, and reconnoitering, in regard to the practicability of constructing a railroad from the town of Columbia, passing by the village of Mount Pleasant, to a point on Tennessee river, between a landing place, five miles above Carrolls ville, and the mouth of Tom's Creek, also the probable cost of construction, I have the honor to report, that,

Leaving the village of Mount Pleasant in a south-west direction, and following the Valley of the Bigby Creek, by Mrs. Nightingall's Hollow, and avoiding the head waters of Swan Creek, the line of railroad will arrive to the culminating point of the hills of the Big Buffalo, crossing only Saw creek, in a distance of about 13 miles.

The spinning factory built in the hollow is the only material obstruction ; but in bargaining for the place, the company will have the advantage of a good water-power for a saw-mill.

Four streams will be successively crossed at right angles, viz.: the Big Buffalo, the Little Buffalo, the Forty-eight, and Green river, in a distance of 26 miles.

Bending the course more to the south, for to take advantage of the valley of Green river, near Waynesboro', the line has to pass afterward over a very hilly country ; but the valley of Eagle Creek will be followed for some time, and, by a gentle undulating ground, the road will reach a landing-place on Tennessee river, between Ellis' Ferry and Roche's Farm, where a good spot will be selected in a distance of about 15 miles from Waynesboro'.

The estimate for that southern route will be as follows :

5 miles at \$5,000	-	-	-	\$25,000
The Factory	-	-	-	4,500
1 mile at \$7,000	-	-	-	7,000
2 " 5,000	-	-	-	10,000
2 " 4,000	-	-	-	12,000
2 " 5,000	-	-	-	10,000
Crossing the Buffalo river	-	-	-	1,000
2 miles at \$6,000	-	-	-	12,000
15 " 5,000	-	-	-	75,000
9 " 6,000	-	-	-	54,000
1 " 5,000	-	-	-	5,000
4 " 10,000	-	-	-	40,000
4 " 4,000	-	-	-	16,000
6 " 5,000	-	-	-	30,000

54 \$301,500
Contingent expenses at 5 per cent. \$15,075

Whole amount of construction for the Southern Line - \$316,575

For the iron plates at the same price as for the Charleston and Hamburg Railroad, 17 tons per mile, at \$45, \$765
1,000 lbs. 5-in. spikes at 9 cts. 90

\$855
For 45 miles of road at \$855 - \$46,170

Leaving Mount Pleasant in a western direction, the ridge of the Bigby Creek will be avoided by Gordon's Hollow, and Swan Creek crossed between W. Thomas's and ———'s mill ; then, passing about half a mile north of Grinder's old stand, and avoiding the head waters of Grinder's Little Rock house and Trace

Creeks, the line will follow a straight course for about 20 miles in the barren, and bending a little to the south, take advantage of the valley of Sinking Creek, cross Buffalo river, at Thompson, and reach Cotton's Ferry, by the valley of Bee Creek.

The estimate for this line will be as follows :

4 miles at \$5,000	-	-	-	\$20,000
3 " 7,000	-	-	-	21,000
3 " 4,000	-	-	-	12,000
Crossing Swan creek	-	-	-	700
20 miles at \$4,000	-	-	-	80,000
6 " 5,000	-	-	-	30,000
Crossing Buffalo river	-	-	-	1,000
3 miles at \$10,000	-	-	-	30,000
3 " 6,000	-	-	-	18,000
4 " 8,000	-	-	-	32,000

46 \$244,700
Contingent expenses, at 5 per cent. \$12,235

\$256,935
Iron plates for 46 m. of road at \$855, \$39,330

\$296,265

The country between Bee and March Creeks being generally inundated at common high water, no convenient landing place will be found above Jennings' Bluff the line of railroad will reach that point in three different directions.

1st,—By the Valley of Cedar Creek.

For the foregoing line from			
Mount Pleasant to Buffalo \$164,700			
1 mile at	\$10,000	-	10,000
5 "	5,000	-	25,000
5 "	6,000	-	30,000
4 "	8,000	-	32,000

3d North Line.

11 miles from Columbia to Mount Pleasant	-	-	-	\$78,705
47 miles from Mount Pleasant to Jennings' Bluff, by the Valley of Hurricane Creek	-	-	-	\$307,620
58 Whole amount	-	-	-	\$386,325

The foregoing estimates are made on the supposition that the company will follow the plan of construction adopted in the Charleston and Hamburg railroad, with some modifications and improvements indispensable in the rocky soil of Maury County, the steam power also being the only in operation for locomotion on the road.

It is very satisfactory to me, in closing this report, to inform you that your great and advantageous undertaking will be very well received in the community at large, and that the relinquishment of land and timber will be easily obtained in any direction where the railroad may pass. I take this opportunity also to thank two of your members, Messrs. P. R. Booker and Alexander Brown, who joined with me in that journey, regardless of the inclemency of the weather, or the difficulty of the roads. Their great knowledge of the country has been extremely useful, and their polite and kind attention very agreeable.

Report to the Commissioners of the Western Railroad, of the State of Tennessee, on the practicability, utility, and advantage of the project. By JOHN B. PETITVAL, Civil Engineer.

For the information of the public, we the subscribers, four of the Western Railroad Commissioners, beg leave to report, that with Col. Petitval, an experienced and scientific engineer, who has been engaged for the last five years in the general survey, location, and construction of the Charleston and Hamburg Railroad, now in operation, we have viewed and explored the country and ground from Jackson in the direction of Randolph, and of Fulton, and of the mouth of Cole Creek, and of Ashport, all on the Mississippi river, for the purpose of ascertaining the practicability of the establishment of a railroad from Jackson to the said river. And, we are satisfied, beyond a possible doubt, of the practicability of the project ; and that the expense thereof will be much less than has been generally supposed. But, for a particular detail on the subject, we refer to the

report of said Engineer, which is herewith submitted for public consideration.

BENJAMIN PARSONS,
JOS. H. TALBOT,
FRANCIS S. COLE,
JAMES ELROD.

Jackson, January 21, 1834.

To Col. Joseph H. Talbot, James Elrod, Francis S. Cox, and Benjamin Parsons, Esqs., Commissioners of the Western Railroad.

Gentlemen,—In conformity with your instruction of the 7th inst. directing me to make the preliminary surveys, exploration and reconnoitering, of several routes, in regard to the practicability of a railroad from four points on the Mississippi river, viz.:

- 1st. Randolph,
- 2d. Fulton,
- 3d. The mouth of Coal Creek,
- 4th. Ashport, to Jackson, passing by Brownsville;

as well as every statistical document and information which can be collected, in regard to the productions and resources of that part of the country, furnishing an adequate freight to the probable expenditure in the construction of said railroad, and the necessary engines to the same, I have the honor to report, that,

In taking advantage of the Low-ground at about half a mile below the town of Randolph, and following for about three miles the same valley in an eastern direction, deep excavations near the river-bluff will be unnecessary; the bridging over Indian Creek is of no consequence, but the crossing of the head waters of McLeomore's Creek, the country for two miles near Covington, the bottom and crossing of Hatchie river, over which a draw-bridge will be probably necessary, require minute observations to locate the railway on the most advantageous ground. The balance of the route following an undulating country gives the advantage of a graduated road.

The distance from Randolph to Brownsville is about 40 miles, reducible to nearly 37 miles; in adopting the mode of construction which has been used in the Charleston and Hamburg Railroad, of piles and sleepers as suitable to the different nature of the soil, and graduation, constructing also the road for steam power only, the average estimate is at \$3,850 per mile, making for

37 miles \$138,750
Contingent expenses at 5 per cent. 6,937 50

Whole distance from Randolph to Brownsville \$145,687 50

FULTON.—The bluff at Fulton requires some deep excavation, and the country for about four miles is hilly and broken; the distance to Brownsville, following the gradual slope of the hills of the north bank of Hatchie river, crossing Cane and Town creeks, and avoiding the head waters of Rhea's and Lagoon creeks, is about 36 miles, on the following average estimate:

Excavations \$4,000
6 miles at 5,200 . . . 31,200
15 do. at 3,850 . . . 57,750
15 do. at 4,000 . . . 35,000
\$137,950

Contingent expenses at 5 per cent. \$6,897 50

Whole distance from Fulton to Brownsville \$144,847 50

COAL CREEK.—The mouth of Coal creek presents a very high bluff, surrounded by hills which require great excavations. The distance to Brownsville is about 33 miles, following for the last 20 miles the same route as the Fulton line. The estimate is as follows:

Excavations, \$6,000
4 miles at \$5,550 per mile 22,200
4 do. at 4,675 do. . . 18,700
5 do. at 4,200 do. . . 21,000

5 do. at 3,850 do. . . 19,250
15 do. at 3,000 do. . . 45,000
\$132,150

Contingent expenses at 5 per cent. \$6,607 50

Whole distance from Coal creek to Brownsville \$138,757 50

ASHPORT.—The country from Ashport, on the bank of the Mississippi river, extends for about 7 miles on a low level ground, intersected by lakes, slough, cane brakes, partly overflowed every year, and exposed to inundation once or twice in the course of 15 or 20 years; leaving the low ground, the line of road will cross a very hilly country for about 5 miles, and a rolling ground for about 4 miles. The continuation will be by the same route as the two foregoing. The whole distance to Brownsville is about 31 miles, estimated at an average of \$4,475 per mile,

giving for 31 miles, \$138,725
Contingent expenses of 10 per cent. 13,872 50
\$152,597 50

As the foundation through the Mississippi bottom appears to me soft and unsettled, requiring mud sills or braces, I thought proper to increase the contingent expenses at 10 per cent.

JACKSON.—The ground one-fourth of a mile north of Brownsville being very advantageous, the line will pass that place at about that distance, and curving to the south follow an easy undulating country for about five miles; then taking advantage of some valleys in the eastern direction, retake a perfectly level land heading the waters of Cypress and Cub creeks. Johnson creek will be crossed without bridge by common piling. The bottom of the south fork of Forked Deer river being good and hard will be crossed also without additional expense; and a substantial bridge built over the river at a moderate price. The railroad reaching the west end of Jackson in a very nearly straight line of about 24 miles, at the average estimate of \$3,875 per mile; making . . . \$93,000
Contingent expenses at 5 per cent, 4,650

Whole distance from Brownsville to Jackson \$97,650

The ratios of the four points of departure from the bank of the Mississippi river and the different estimate to Brownsville are, viz.:

Distance 34 miles, amounting to \$145,172 50
Brownsville to Jackson 24 miles, 97,650 00

58 miles of wood construction, \$243,022 50
For the iron plates at the same price as for the Charleston and Hamburg Railroad, 17 tons per mile, at \$45 each . . . \$765
1000 lbs. of 5 inch spikes at 8 cents . . . 90
\$855

For 58 miles of road at \$855 each \$49,590
Whole amount of construction 292,612 50
The necessary utensils, and employments for the road are as follows:

2 Locomotive engines, \$5,500 each, . . . \$11,000
10 Freight cars, at \$110 each, and 1,100
4 Passenger cars, at \$400 each to an engine, equals \$2,700 x 2 . . . 5,400
4 Turnouts, with water stations, revolving platforms, &c., at \$500 each 2,000

For three depositories, with regular tracks, tools, work shops, offices, &c. 4,000

Engineer department, superintendence, surveys, &c. 18,000

\$40,400

Contingent expenses at 10 per cent. 4,040
44,440

Total amount of expenditures for the completion of the whole line of railway to be put in operation in the first quarter of 1837, \$337,052 50

In compliance with the second part of my instructions, I submit to you the following statement of exports and imports taken from the latest statistical data and information collected from the more enlightened farmers and merchants.

Madison county, 9,000 bales of cotton at a toll of \$1 40 per bale, \$12,600

Henderson county, 6,000 bales of cotton, at a toll of \$1 40 per bale, . . . 8,400

Carroll county, 4,000 bales of cotton, at a toll of \$1 40 per bale, . . . 5,600

Gibson county, 2,000 bales of cotton, at a toll of 1 40, 2,800

Haywood county, 8,000 bales of cotton, at a toll of 90 cents, . . . 7,200

Tipton county, including the cotton from Hardeman and Fayette counties, deposited at Covington, 10,000 bales at a toll of 40 cents, 4,000

Corn, flour, hay, oats, tobacco, lumber, &c., equal to one-fourth of the cotton receipts, 10,300

The imports are equal to the exports of cotton, as regards the toll, 40,600

Transportation of the daily mail, . . . 3,000

Passengers 6,000

Supposed receipt per annum . . . \$100,500

Yearly expenses; repairs on 58 miles of road, at \$75 per mile, \$4,350

Superintendence, salary of officers, clerks, laborers, &c. 15,000
\$19,350

Nett receipts per annum \$81,150

I cannot close this report without expressing all my gratitude to every settler whom I visited in Madison, Haywood and Tipton counties, for their prompt and accurate information received in regard to the undertaking, and their kind hospitality offered to me in every house; and among others, by Col. W. H. Henderson, Maj. John T. Brown, Maj. W. Conner, Col. Boulier, Col. W. Gilliland, R. C. Campbell, Esq., Henry Williams, Esq., and W. Potter, Esq., volunteering themselves as guides and pilots, without regard to the inclemency of the weather or the difficulty of the roads.

J. B. PETITVAL, Civil Engineer.
Jackson, Jan. 20, 1834.

[From the London Court Magazine.]
SUMMER SONGS, BY MRS. HEMANS.
(I) YE HOURS.

O! ye hours, ye sunny hours!
Floating lightly by,
Are ye come with birds and flowers,
Odours and the blue sky?

Yes, we come, again we come,
Through the wood paths free,
Bringing many a wanderer home,
With the bird and bee.

O! ye hours, ye sunny hours,
Are ye wafting song?
Doth wild music strain in showers
All the groves among?

Yes, the nightingale is there,
While the starlight reigns,
Making young leaves and sweet air
Tremble with her strains.

O! ye hours, ye sunny hours!
In your silent flow,
Ye are mighty powers!
Bring me bliss or woe?

Ask not this!—oh! ask not this!
Yield your hearts awhile
To the soft wind's balmy kiss,
And the heaven's bright smile.

Throw not shades of anxious thought
O'er the glowing flowers!
We are come with sunshine fraught;
Question not the hours!

DRY ROT.—An officer of the navy, now dead, was informed by the Rev. G. Williams, of Rhicolas, in North Wales, that it had been found, from long experience, that the water in the reservoirs for supplying the precipitate pits at the copper-mine works at Parry's mountain in Anglesea, has the property of preserving timber from decay and dry rot in a surprising manner, by the short process of steeping it therein a few weeks only, and that it has such a powerful effect in hardening the wood, as to blunt the sharpest tools. It, consequently, is found necessary to shape and fit the wood completely for the use intended, before it is put into this water for seasoning.

The water at Parry's mine is impregnated with copper, sulphuric and vitriolic acids. It is preserved in large reservoirs for supplying the precipitate pits, which are filled with old iron, that attracts the copper from the water.

It appears that the farmers, when they find their timber for agricultural purposes too green for immediate use, steep it for a few days in the copper-water, which has the power of extracting the sap, and fitting it for use properly seasoned.

I understand that a complete transmutation takes place in the iron, it gradually becomes incrustated with the copper, whilst at the same time the acids act as a corrodent; so that a piece of iron thrown in, after a certain time, comes out copper, but whether weight for weight, or size for size, I do not recollect.

The Admiralty, I believe, are in the possession of this information; if, however, the present method of immersing ships and timber in sea-water is successful in curing or preventing the dry rot, we certainly cannot obtain a more easy or cheap method for gaining the desired end. The component parts of sea-water, common salt, marine magnesia, and salenite, are very dissimilar to those of the mineral waters of Parry's mine, and it will be curious if both, nevertheless, produce the same effect upon wood.—[U. S. Journal.]

AGRICULTURE, &c.

[From the New-York Farmer.]

CREDIT—SHEEP.—There are two requisites to obtain credit, good character and business capabilities or habits. These are the poor man's riches. Credit, like all other good things, must be judiciously resorted to, and carefully guarded, otherwise it will prove a source of misfortune and pain. The following is from the Genesee Farmer:

Late in the summer of 1830, I borrowed \$100, and went into the neighboring towns and purchased sixty-eight sheep, at the average cost of \$1.30 per head, which left me remaining on hand \$13 of my borrowed money. At this time I had on hand twelve sheep, which, with those I bought, made me a flock of eighty head. The next winter I kept them on good fine hay, without any grain, until the first of March, when as the ground was bare, I quit feeding hay, and turned them out upon my old pastures, and commenced feeding a little corn. The winter of 1830-31, it will be recollected, was one of uncommon severity; but notwithstanding its length and coldness, I lost but one sheep, and that by casualty. I continued feeding grain until the first of May, when, as the grass had got a considerable growth, I thought it unnecessary and quit entirely. That season I raised thirty-six lambs, which increased my flock to 115. In June I sold the wool produced by my old sheep for \$150.06. I went and redeemed my note, and had left of money I received for wool \$44. The winter of 1831-32 I fed my sheep as before, but lost three head; consequently, in the spring, had but 112 to shear, which produced 300 pounds; this I sold at the very low price of 35 cents the pound, or \$105 for 300 pounds. The same season I raised 45 lambs, and sold 60 head of my old sheep for \$78.60; making the amount of sales from my flock that season

\$181.60. In the winter of 1832-33, I lost 6 sheep; in the spring sheared 91; but in consequence of the great proportion of lambs, the produce of wool was small. I retained a number of fleeces for home use, and sold the remainder (176 pounds) for 50 cents the pound, or \$88 for what I had to sell.

Thus it will be seen that my flock, for three years, has averaged 94 head, and that the actual sales from it have amounted to \$419. The last summer I raised 30 lambs, and sold none of my old sheep; consequently, in August last, when the three years had expired since my purchase, I had on hand 119 sheep, which is 25 above the average for three years past, and which 25 sheep were worth at that time \$2 the head—making \$50 for 25. This added to my sales would make \$469 for the produce of 94 sheep for three years, or \$156.33 for one—equal to \$1.66 per head annually.

I have made the following estimate of the expense of keeping 100 sheep for one year. I may be incorrect; if so, I hope some of your correspondents will correct me.

Twenty acres of good land, well turfed, will keep 100 sheep a year, viz.: five acres of meadow, producing two tons of hay to the acre, will winter, and fifteen acres of good pasture land will summer them. Twenty acres of land at \$40 per acre would cost \$800, and 100 sheep, at \$2 the head, \$200: making the cost of land and sheep \$1,000.

Interest on \$1000 one year, is	- - -	\$70.00
Cutting and securing 5 acres of grass	-	5.00
Thirty bushels of corn, at 4s.	- - -	15.00
One barrel of salt, at 16s.	- - -	2.00
Washing and shearing 100 sheep	- - -	5.00
		\$97.00

If the above estimate be correct, it will be seen that I have realized from my flock a net profit of more than fifty per cent. for three years together.

W. G. B.
Genoa, March 31, 1834.

DOG POWER.—John Farley, of Danville, Vt., advertises a patent "Dog Churn." He says, that churning is performed by the labor of dogs; and that the machine may be applied to other uses, such as turning grindstones and washing clothes. Women may now introduce "dog power" into their kitchens and dairy rooms, and seat themselves in the parlor.

APPLES IN ENGLAND.—The reporter of the Covent Garden Market, in Loudon's Magazine, observes that, apples are supplied altogether from our own growth; very few foreign have yet been imported, or are likely to be, as our own stock is yet very good: indeed, with tolerable seasons, we shall always have enough, as our plantations are now much extended, and, from the introduction of so many new varieties, generally more productive. Of pears we have no supply at present: it will require time, care, and attention, to effect a change in this article, equal to the present demand for it.

CULTIVATION OF VINES, Cucurbita cee.—Lay out your ground in hills four and a half feet asunder, each way, raising them considerably above the natural surface of the ground, with the hills inclined towards the south. Having prepared your hills you are ready to commence planting. Distribute no less than ten or fifteen seeds in a hill, covering them one quarter of an inch in depth. As soon as the plants have made their appearance, take of ashes or soot two parts, plaster one part, pulverized charcoal one part, mix these ingredients together, until the mixture is well incorporated. With this composition enter your garden or field, in the morning, while the dew is on, and with a quantity in your hand throw it over the plants, dusting them as much as possible, in order to suffocate the insects, taking particular care to dust the under part of the leaves:

By following these directions you will have the pleasure of seeing your plants in a thriving condition, and in a few days entirely out of the way of these troublesome insects.

As soon as the plants begin to interfere with one another, commence thinning them out. Pull out all but two or three in a hill, leaving those that look the most promising. There are many persons who leave no less than half a dozen in a hill; this is a *mistaken notion*, for I am confident that could you rest assured that no worms would molest the roots, it would be better to pull all out but one; and I am fully persuaded too, that you would gather more fruit from the vines where there was but one or two plants in a hill, than you would were you to leave half a dozen.

Where you leave too many, the vines will become so thick that, when they set for bearing, most of the fruit will decay before it comes to any maturity.—MILES BEACH. N. Lebanon, March 20, 1834.—[Goodsell's Far.]

PROTECTING YOUNG TREES AGAINST SWINE.—Dr. Dean, in his New England Farmer, after speaking of the great advantages of pasturing swine in orchards, adds, "when the trees are young, the swine will be apt to injure them by tearing the bark." We have been in the practice of planting out young trees, however, in an enclosure where not less than twelve or fifteen hogs continually pasture, and we meet with no such accidents or injuries. It is not owing to our swine being better bred than others, or that they have acquired any higher moral tone. Their love of mischief is occasionally exhibited, but not against our young trees. These they never touch, always keeping at a safe, and commonly at a respectful, distance. The secret (if such it be) is soon told. We only tie fast to the tree two or three stems of the sweet briar in an upright position.—[Gen. Far.]

ON SUCKERING CORN.—I had the pleasure, about four years ago, to spend a day in company with old Mr. Macon of North Carolina, when our conversation was principally on subjects of agriculture; and among others, the cultivation of Indian corn. After having inquired whether I had the suckers which grew from the roots of the corn pulled off, as is the common practice, and received my answer in the affirmative, he informed me that he had suffered them to remain, having, from repeated experiments, ascertained that they did not injure the corn; but on the contrary, the suckers more frequently than otherwise produced good ears of corn; and that if they failed to do so, there was an increase of fodder. I have since tried the experiment, and witnessed the following results. That after carefully examining the ears of corn on the stalks producing suckers, they were found to be as good as the ears on the surrounding stalks not producing them—that a large majority of the suckers produced good corn, though the ears generally were smaller than those on the mother stalk, and that (of course) there was an increase of fodder. Without entering into an inquiry, whether corn ought not to be planted so thick as to prevent its producing suckers, (if thick planting will prevent it, of which I am not sure,) or whether the pulling them off may not injure the corn, by inflicting wounds on the stalks, I can now safely recommend Mr. Macon's practice, as saving the time and labor of pulling off suckers, and what is of

more consequence, as producing an increase of the crop of corn and fodder. I ought to add, that none but the suckers growing from the root ought to be suffered to remain.—W. M. WATKINS. Charlotte county, March 20, 1834.—[Farmers' Register.]

TO DESTROY CATERPILLARS.—*Mr. Fleet:* If you think this worth insertion in your paper, it is at your disposal.

To destroy worms or caterpillars on fruit trees, take a gimblet and bore a hole about one-third of the way through the body of the tree, and then fill up the hole with the flour or sulphur, and plug up the hole tight. This will inhale through the tree in the sap. This should be done just as the leaves begin to put forth, and it will kill the worms as soon as they begin their work of destruction. I have tried it and found it worth my trouble.

O. G. BUTTS.

REMARKS.—The above is not new; but the effect assigned to the sulphur has been denied. Now is the season to repeat the experiment.

SORREL SAUCE.—Wash a quantity of sorrel, and boil it tender in the smallest quantity of water you can: strain and chop it; stew it with a little butter, pepper, and salt; and if you like it high, add a spoonful of gravy.

Be careful to do it in a very well tinned sauce-pan; or if you have a silver one, or a silver mug, it is far better, as the sorrel is very sour, especially in spring.—D. C.

TARRAGON is a fragrant, aromatic, perennial plant, cultivated in gardens, and used to impart a pleasant flavor to different dishes; to mix with salads, and for flavoring vinegar.

The common mode of increasing this plant is by dividing the roots.

The stalks grow from two to four feet high, and bear a strong resemblance to the common golden rod of the fields. One bunch is sufficient for a garden.

RYE IN THE GRAIN, AS FOOD FOR HORSES.—A friend, in whom I have every confidence, who is a gentleman of scientific acquirements, and a practical agriculturist, has just given me the following information, relative to horses' feed.

While travelling recently on one of our public roads, he fell in company with a farmer, from one of the northern counties of Virginia, and in the course of conversation the subject of feeding horses was mentioned; when the farmer observed, that for four years past he had pursued a new plan, greatly to his advantage, as well as to that of his horses. The new plan was that of feeding rye, in the grain, without grinding. He said, that after four years experience, he had become perfectly satisfied that less rye produced a better effect than if it were chopped or ground. After much difficulty, he had prevailed on some of his neighbors to try it; and thus, gradually, all the horse owners in his neighborhood had become converts, and now all fed rye in the grain; all agreeing that a large proportion of grain was saved by it, besides a marked difference in the condition of the horses for the better. He said, he could not give the "why and because;" it was different from the universal prescription of science, and the almost universal practice of intelligent husbandmen; but that the fact was before him, and challenged his belief in such a way, that to have continued incredulous,

would have been to shut his eyes against the most palpable demonstration. The best of this is, that an experiment is easily made, and, even if unsuccessful, cannot result in material loss. But should it prove to be true, that rye in the grain is better, or even as good as when ground, a considerable saving would result to the farmer, in avoiding the trouble and expense of going to mill. The farmer stated, that he had observed grains of rye passed off in the dung, but that they seemed to have left their substance in the body of the horse. In this he is doubtless mistaken; but may not the *modus operandi* of this new diet be explained thus: The grain that escapes crushing by the teeth prevents the mass in the stomach from concreting into lumps, and thus permits the free action of the juices of the stomach upon the whole. Persons afflicted with dyspepsia swallow white mustard seed, with great advantage; but I believe it is not pretended that the mustard seed has any other action than a mechanical one—that of keeping the contents of the stomach from forming a dense mass; keeping the food light and penetrable by the gastric juices, &c.

The anecdote was given to me in so earnest a manner, and by so respectable a gentleman, that I thought, as I was about writing to you, I would give it to you for insertion in the Farmers' Register. Very respectfully. GIDEON B. SMITH.—Baltimore, March 15, 1834.—[Farmers' Reg.]

CULTURE OF RAPE SEED FOR OIL.—Colchicum or rape seed is of the greatest importance, and produces an oil which is, and has long been, much wanted for manufacturing purposes. This seed is grown abundantly in all parts of Europe, and the oil made from it is extensively used in the process of manufacturing cloth: it is, I believe, the cheapest oil they have, and takes the place of common kinds of olive oil, which the manufacturers of this country are obliged to use at a great cost. This is a matter of great importance, when it is known that to every 100 pounds of wool carded there is consumed from two to three gallons of oil. The rape seed oil is so cheap and abundant in Germany, that it is much used in adulterating linseed oil; hence the bad quality of some of the German paint oils, as the rape seed oil does not possess the drying qualities of that from flax seed, and is therefore unfit for the purposes of painting, &c.

Having been for a long time engaged in the manufacture of flax seed oil, and having made various experiments on other seeds, I have, of course, had some experience on the subject. In relation to rape seed, I had an excellent opportunity of making full and satisfactory experiments. In the year 1822 or 1823, an English gentleman, who was familiar with the culture of rape seed, and who had a farm somewhere in the neighborhood of Salem, N. J. brought to my establishment about forty bushels of rape seed, which he had produced upon his farm. The account he gave of its culture was this. Two acres were sown with this seed (broad cast) in the month of August; it sprouted, and was growing very handsomely, but late in the fall the cattle broke into it, and, as he thought, completely destroyed it. He abandoned the experiment, and suffered his cattle to roam in it all winter; but in the spring, observing it sprouting again, he put up the fence, and as he expressed himself, "let it take its chance." The two acres, with this, as he considered it, unfair experiment, produced him about forty-four bushels of seed, for which I offered him four dollars per bushel, which he refused to take. I expressed it for him; and although my apparatus was not by any means perfectly adapted to the purpose, the manufacture differing in some respects, not necessary to state, from that

of flax seed oil, I produced three and a half gallons of oil per bushel. The cake, that is, the pulp, after the oil is expressed from it, he valued highly for fattening cattle, and refused to take seventy-five cents per bushel for it; the oil he sold to a woollen manufacturer for one dollar and thirty cents per gallon, thus, including the cake, realizing five dollars and thirty cents per bushel, out of which he paid the expense of manufacturing. It is, I am told, considered in England a profitable crop, although the price is not much, if at all, above two dollars per bushel. The gentleman was in high spirits as to the result, and told me he intended to go into the culture of it more extensively; but, from what cause I do not know, I have never seen him or heard from him since—whether he failed in his experiments, died, or returned to England, I do not know. I have not, however, the least doubt that our soil and climate are well adapted to the culture of this seed; it is of the same family with the cabbage, which every one knows grows luxuriantly here. We have, besides, such a variety of soils and climates in our country, that if it will not succeed in one district it certainly will in some other.—[Journal Franklin Institute.]

SPRING AND WINTER VETCH.—"It is impossible to distinguish a difference between the spring and winter vetch seed; but if any imposition is practised on a farmer by his seedman, it may be detected as soon as the plants spring up; the winter vetch comes up green, and the spring vetch of a deep brown purple color: this observation may be useful, as it enables the farmer, in case of sowing a spurious sort in the autumn, to detect the imposition: if he finds he has sown the spring kind at that time, he must plough his land again, and apply it to some other purpose, for the spring kind will not stand the winter. I should recommend every farmer purchasing the winter vetch to have the seed warranted; and when he has got the right sort, afterwards to raise his own.—[R. W. Lloyd.]

BLOODY MURRAIN.—About two years since, Mr. Benjamin Bailey, a farmer of the town of Clarence, Erie County, handed us a statement of an examination which he made (assisted by two of his neighbors, Col. Miner and Mr. Goff,) of a cow which he had lost by the above disease, which has proved very common and fatal to cattle in this section within a few years. The statement was mislaid at the time—but having been accidentally discovered a few days since, we think we cannot do a better service to the farming community than to lay it before them, as the season for the disease is approaching, and by knowing what is, *probably*, the true cause of it, they may be enabled to guard against its effects.

Mr. Bailey states, that on opening the cow he found about two pails' full of blood in the stomach; the liver was completely rotten, covered with purple spots, and full of holes, filled with clotted blood. On searching the liver in the direction of these holes, he found a dead worm, similar to that which produces the butterfly, and a *live leech*. The liver was perforated in all directions, and a hole made through the main artery, near the gall, about large enough to admit of a pipe stem. When the holes came near the skin of the liver they ran off in another direction, as though the animals making them had turned back—and it was where these holes thus approached the skin, that the purple spots on the liver were visible. The leech lived about twelve hours after it was taken from the liver.

As several of Mr. Bailey's cattle were affected in a similar manner with the cow which died, he prepared a draught of alum and sulphur, and gave it to them, which soon relieved them.

Mr. B. imagines that the cattle swallow the leeches when drinking from stagnant pools of water in the warm season, when the streams are in a measure dried up.—[Lockport. Cou.]

The following account of the proceedings of a meeting held in Tennessee, together with the reports of Col. Pettitval, also published in this number, will show the degree of interest felt in that section of the country.

RAILROAD CONVENTION.—At a convention of Delegates from the Counties of Madison, Hardeman, Fayette, McNairy, and Shelby, held in accordance with previous notice, at the Court-House in the town of Bolivar, on Friday the 11th day of October, 1833: the convention being called to order, on motion of Wm. B. Turley, Esq., of Hardeman, Gen. E. P. Gaines, of Shelby, was unanimously chosen President, Col. Jas. Trezvant, of Fayette, Vice President, and R. A. Parker, of Somerville, appointed Secretary.

On taking a list of the members present, it appeared that the following counties were represented in this convention, viz.: Madison, McNairy, Hardeman, Fayette, and Shelby.

From Madison—Messrs. Milton Brown, S. J. Hays, and A. R. Heron.

McNairy—Col. John Deberry.

Hardeman—Messrs. Wm. B. Turley, Gen. Jones, David Fentress, E. R. Belcher, J. J. Williams, Gen. J. C. N. Robertson, J. H. Bills, Levi Joy, E. W. Kenny, W. J. Riddle, E. D. Tarver, T. Shaw, A. Kirkpatrick.

Fayette—Messrs. Lewis P. Williamson, W. Gray, James Hamilton, B. M. Patterson, Col. James Trezvant, Durant Hatch, Wm. Davis, West H. Humphrys, D. J. Johnson, James Ruffin, and R. A. Parker.

Shelby—Messrs. Adair R. Alexander, Gen. E. P. Gaines, John Pope, Robertson Topp, David Dunn, Joel W. Royster, and Isaac Rawlings.

E. R. Belcher, Esq., of Hardeman, presented the following resolutions:

Resolved, that a committee, composed of one member from each county, be appointed to take into consideration the purpose for which the present convention was called, and to classify the order in which the business of this convention shall be conducted.

Which resolution being adopted, on Saturday morning the convention met according to adjournment.

Kemp S. Holland, a delegate from Fayette; W. Howard, a delegate from Hardeman; H. B. Mitchell, a delegate from McNairy; Gen. Jacob Tipton, Major D. A. Dunham, Nathaniel Potter, Marcus Calmes, Philip B. Glenn, and Major A. Morehead, delegates from Tipton county, appeared, produced their certificates, and took their seats as members of this convention.

The committee to whom were assigned the duty of drafting resolutions expressive of the purposes for which the convention was called, through their chairman, Gen. E. P. Gaines, made the following report:

1st. Resolved, as the opinion of this meeting, that a railroad between the Mississippi river and the Atlantic Ocean, to pass through the south-west border of the State of Tennessee, the northern parts of the States of Mississippi, Alabama and Georgia, and the southern part of South Carolina, is practicable and desirable; that its anticipated local benefits and national advantages may reasonably be estimated as greatly to exceed the whole expense of its construction, and that it ought to be commenced forthwith.

3d. Resolved, as the opinion of this meeting, that the proposed work, as a measure of national defence, would contribute more, by the facilities it will afford in the transportation of troops and munitions of war to the protection and security of the south-eastern States and East Florida, than all the fortifications constructed or designed to be constructed south of Chesapeake Bay; for it is obvious to every man of military mind that the strongest of fortifications must depend mainly for defence and preservation on prompt and seasonable supplies of fighting men, with arms and subsistence; and that these cannot be promptly wielded from the interior to the frontier without good

roads, railways, canals, or large navigable streams—and a railway will cost much less than a McAdamized road.

4th. Resolved, as the opinion of this meeting, that the proposed railroad, in a political point of view, will be found to be one of the strongest links in the chain of the union of the twenty-four States.

And whereas, the growth and prosperity of the western district of Tennessee would be greatly promoted by the construction of a railroad from the interior of the district to the bank of the Mississippi river; and whereas, union of action is necessary in order to give success to the enterprising efforts making to effect that desirable object, we, the delegates representing our respective counties, do therefore

Resolve, that we will unite in petitioning the legislature of Tennessee to grant a charter to a company to be formed for the purpose of constructing a railroad from Jackson, in Madison county, to the Mississippi river, at Memphis, or to any other point on said river which the company may designate, or permitting said company, if they should find it necessary to do so, to run said road so as to intersect the contemplated road from Memphis to Tusculumbia, leaving the route said road is to run to the determination of the stockholders, voting according to the number of shares held by each.

After a warm and lengthy discussion, in which several gentlemen took part, the resolutions were finally adopted.

Five counties, viz.: Madison, McNairy, Hardeman, Fayette, and Shelby, voting in the affirmative, and Tipton county alone in the negative.

Judge Turley, of Hardeman, moved to strike out all after the word railroad in the sixth resolution, and insert the following: "commencing at or near Memphis, in Shelby county, and running thence to Jackson, in Madison county, over the ground that may be selected by the agents of the company," which amendment was adopted unanimously, without discussion.

The convention then adjourned *sine die*.

EDMUND P. GAINES, President.

R. A. PARKER, Secretary.

We are indebted to Capt. Tinsley, of the brig Hunter, for Panama papers to March 23d, inclusive.

A subscription of \$90,800 had been made in Panama for the construction of a rail road from Porto-bello to Panama, i. e. from the Pacific to the Atlantic. The speedy achievement of the undertaking was considered certain.

A gentleman by the name of Ventura Marroguin, has discovered a passage from Cruces to Porto-bello, i. e. from sea to sea, in a great measure free from hills, which can be accomplished, and which he has actually accomplished, in less than one day. The paper before us anticipates immense advantages from this discovery, and says it will be one of the most splendid triumphs which the Isthmus could achieve for commerce and civilization. The authorities of Panama had sent a commission, accompanied by Mr. Marroguin, to explore more fully the route referred to.—[Jour. of Com.]

INLAND NAVIGATION.—From the New-York Observer, we make an extract from the proceedings at the recent anniversary of the Seamen's Friend Society.

Mr. Peet, in moving the second resolution, presented an interesting statistical view of the canals, rivers, lakes, and inland navigation, of the great west. In New-York alone, he said, the canals now completed and in operation extend 500 miles through a populous country, having on their banks 100 villages and cities, and bearing on their bosom 1,800 boats, navigated by between 10 and 12,000 men. The great lakes were also navigated by numerous large vessels the number on lake Erie alone being 170, including 30 steamboats. Passing through these lakes, and the Ohio canal, on which the number of boats and boatmen is increasing with great rapidity, we come to the river Ohio which stretches a thousand miles through a fine country to the Mississippi, the father of

rivers, with its twenty-three tributaries, affording navigation for 8000 miles in various directions. The whole line of inland navigation in the United States, including canals, rivers, and lakes, Mr. P. estimated at 20,000 miles, and the whole number of boats employed on these waters at between 6 and 7,000, viz. 4,000 flat boats, 2,000 canal boats, between 3 and 400 steam-boats, and 200 sloops and schooners. The number of men employed in inland navigation is 60 or 70,000, and the number of passengers transported annually is more than 200,000. Through nearly the whole extent of this immense line of navigation, Mr. P. said, the sabbath is shamefully violated. With few exceptions the arrangements of men of business were such as to require the labor of the boatmen and others connected with inland navigation on the Sabbath, as on other days, and thus they were deprived of the opportunity of receiving religious instruction, and the way was prepared for the introduction of every species of immorality.

ON THE BURNING OF WATER.—From a recent number of Silliman's Journal, we copy the following respecting the "American Water Burner," which we have several times mentioned. We omit several pages of theoretical reasoning, and confine our extracts entirely to the results.

"The experiments which I have made have proved practically, that an engine with a power equal to driving a boat four miles an hour, and a railroad car twice that distance in the same time, with ten or twelve passengers, may be made for one hundred dollars: and that the engine with its preparing vessel (a substitute for the boiler in the steam engine) need not weigh one hundred pounds—and the expense of working it will not exceed ten or twelve cents per hour. There are certainly no difficulties to be removed. These facts have been verified practically and repeatedly before hundreds of people.

"Some recent improvements in the mode of constructing lamps for burning water, to produce light and heat, have perfected the operation for these purposes. It now carries demonstration in every form. For instance, when you put by one fourth of a gill of spirits of turpentine into the lamp, and as much water, and raise the temperature to less than that of boiling water, the vapor that comes over will be in the ratio of about equal parts of each. If, in the combustion of these vapors, a due proportion of air is mixed and inflamed, it will in a few minutes boil a two quart copper tea kettle. If small brass wire is brought over and in contact with the flame, it instantly drops in pieces—small copper wire is readily melted—fine iron wire, if the proportion be right, is instantly inflamed—and thin sheet copper, with a small piece of silver, or silver soldered on it with borax, being exposed to the same, the silver melts in a few seconds, and the copper very soon; and this is done while the vapor is not concentrated in any way, and issues only with a velocity about the same as that of gas in gas lights.

"This discovery gives every promise of supplying a much cheaper fuel, (as a fuel,) exclusive of a clear saving of light, than any one now in use. It is my intention to introduce my lamps, &c. into use as soon as I conveniently can."

The following remarks by Professor Silliman will show how much importance may be attached to these discoveries:

"We have seen some of Mr. Morey's experiments, and can testify to the correctness of his statements, as regards the great amount of heat and light evolved by combustion of the vapor of water mixed with that of spirits of turpentine, or alcohol, and duly modified by common air. The results are very striking and beautiful, and we can see no reason why they should not prove of great practical utility."

NEW-YORK AMERICAN.

MAY 17—23, 1834.

LITERARY NOTICES.

No. XXIV.

Upper Mississippi, February, 1834.

I hardly know whence to date this letter, unless it be from the sources of the Sinsinnoway, between Prairie du Chien and Galena. I left Prairie du Chien in a furious squall of snow, which, violent as it was, however, could not affect the politeness of the young officer, who insisted upon driving me 6 or 7 miles, to the banks of the Ouisconsin, in a cariole. A gentleman who fills a civil station of some importance on the frontier, while he also acts as sutler to the post at Fort Crawford, was waiting for me at the crossing place, where several squaws, with immense packs sustained, after the usual Indian fashion of carrying burthens, by a band around the forehead, collected with two or three Frenchmen, and half breeds, under a shed appertaining to a large stone mansion on the immediate bank of the river, gave to the place the appearance of an extensive trading establishment. Entering the house for a moment, I found two rather pretty and very well dressed young girls of sixteen or eighteen, whose raven locks and eyes of jet, alone proclaimed their half blood origin. One of the ladies sketched; and we had just got into a discussion upon the plates of a new English Annual which she had in her hands, when a call from without compelled me at once to bid my friend farewell, and leave him the agreeable task of entertaining the backwood beauties by himself. I have, at different places on the frontier, seen some of these half-breed fair ones, the piquancy of whose charms would excite no slight sensation in the gay circles of the Atlantic States. But, like the full-blooded Indian females, they lose their beauty very soon: like them, too, when faded, they exhibit a harshness of feature which is almost forbidding. An aged Indian has often something interesting and even attractive in his countenance, but an aged squaw, or one even in whose face the light of youth no longer lingers, is any thing but prepossessing—is even haggish. It is to this frail and fleeting condition of their charms, the early desertion of their husbands, whether red or white, is chiefly to be attributed: for the affection, the tenderness, the devotedness of an Indian girl to her lover know no bounds, and her truth is beyond impeachment. In the strange intermixture of population on the frontiers, these qualities are of course of tender tried and better tested, than in those distant wilds where the Indian still roves free from the perilous influence of the white man, untaught in those principles of morality which are made to depend upon degrees of latitude and longitude, and unskilled in that system of dealing which takes its color of fairness according to the blood of the person dealt with. I have said that, though their features are not often regular, there is at times something very attractive, even to piquancy, about them. You would think so, I know, could you see one that I have in "my mind's eye" at this moment.

I have fallen in with so many straggling parties and broken bands of different tribes upon the borders, any where between Detroit and Prairie du Chien, that it matters not to say at what point I had an opportunity of studying the large, dark, and eloquent eyes that beam in swimming lustre before me. The straight forehead is, perhaps, a thought too low; and yet, while those tresses, dark as night, are gathered so far away from its broad polished surface, it were too masculine if an atom higher. I said her features were not regular; the nose is too *retroussé* for a sculptor's model, yet never did his chisel set that feature with more beautiful distinctness. Between a pair of clear and pencilled brows, like those. How much of manhood's force and woman's fondness dwells around that mouth: and when its dewy portals disclose teeth, whiter than "snow upon a raven's wing," one need not be a Mahometan, to fancy Houris' lips, like those. But what shall I say of her figure? It is too much below the standard height to create a sensation in a ball-room; and the untrained waist, were it not for the plump though falling shoulders, and full outline above,

would not appear too slender to dispense with some of Mrs. Cantelo's discipline: yet such a form would Hebe choose, should she roam the world for a new tenement to dwell in.

To repeat the unspeakable and ludicrously expressive name of this Indian beauty, would destroy any interest this attempt at describing her may have created; and I am half disposed to steal the finely appropriate name of a Menominee belle, strongly resembling her, who is called *Mochechéwon*, or "The Bubbling Spring."

But I am too long a truant from my fellow traveler. We descended the steep bluff together, and got upon the now frail ice of the Ouisconsin, by means of poles and pieces of loose timber thrown out from the shore, while we slid our baggage upon a smooth board over a broad opening near the margin of the rapid current. Once on the main body of the ice, I was dragged over in a train by Indians, while a Canadian or two went ahead with long poles to try the ice, and then on reaching the opposite shore the same ceremonies being repeated, we after some delay made good our landing. A tall, ricketty old Barouche, (I should as soon think of driving an ox cart into my bed room, as bringing such a machine among these hills at this season) stood waiting for us in a frozen swamp; after stowing our baggage, and making the crank craft shorten sail by lowering the leathern top, we got fairly under way. We had not gone a mile before the swingle-tree broke, while crossing a brisk stream, and our driver having repaired the difficulty after an hours delay in a heavy snow storm, by cutting a piece of timber with his knife from a grove at hand, we started afresh, and reached the foot of the bluff by which you first descend into the valley of the Ouisconsin, at about three o'clock. The ascent—perhaps two hundred feet high, was in two pitches, either of which, on a summer's day, would trouble a man to walk up, who wanted wind and a firm tread. They were now covered with fresh snow, having an underlayer of smooth ice, created by the previous thaw, and the office of our two half-starved horses in getting up the old barouche, you may readily imagine, was no sinecure. The driver (from my own State) was a forward, two-third witted sort of a chap, grafting the impudence of a New York hackney coachman upon the not disagreeable freedom of Western character, and having a head coated without with a mass of hair, which curled so tight as to keep his eyes always open on the stars, while it was lined within with an accumulation of conceit that swelled his cheeks nearly to bursting, yet bold, active, and with all his disagreeable familiarity, probably meaning well. His two nags (which looked like frames of that interesting quadruped, the horse, set up for further finishing, he honestly believed, with Goldfinch, were "equal to any pair of tits that ever touched harness;" and therefore treated our suggestion that they would not be able to make good their footing to the top of the hill with just disdain. Like Bonaparte, however, he paused to harangue his forces before scaling the Alps: "Now, you, Doctor, be careful how you tread, you infernal villain—and Fanny, you know better, you hussy, than to let the Doctor be always a-dragging you his side the road—now go ahead. G—d— you!" This pithy address seemed to be as well understood by the sagacious brutes, as if our friend had spoken in the Hounhym language, like Gulliver himself. The learned M. D. and the gentle Fanny gave such a violent start, that what with our pushing behind the vehicle and our conductor's urging them on with an enormous ox-goad before, the first ascent was, with much floundering, soon made good: but they could no more.—Like Saunders Supplejaw in Quentin Durward, "there they stuck." They did indeed make little excursions up the side of the hill, but it was only to slip back to the same place. Nor did I wonder at it. I was obliged myself to climb the slippery steep on my hands and knees, at the risk of having my neck broke by the floundering horses, who once nearly gained the top, when their footing giving way, they came tumbling down, carriage and all, jumbled together like the picture of Phæton's mishap in the school edition of Tooke's Pantheon. In this last attempt they fortunately broke the carriage, or we might have cooled our heels on the spot till midnight. In the existing wreck of matter, however we determined at once to mount the two horses' bare backs, while our conductor should try and keep up with us on foot till we gained the house of a settler some six or seven miles off, and could send back a conveyance for our baggage. The horses being with some difficulty led up the hill, our conductor began at once trying the strength of his legs, by kicking the poor brutes in their ribs, an application

which the Doctor took with as much quiet as if he felt that he deserved it for his mal-practices. The gentle Fanny, however, seemed determined to show her humane master, that however he might excel her in the use of the whip, she was more than a match for him when it came to a flourish of heels; and accordingly, she handled her hoofs with such dexterity that one of them descended so plumply upon the epigastrium of the offending conductor, as nearly to drive the breath out of his body. He recoiled a few paces in the snow, but did not seem the least hurt, while I mounted his assailant before another round could be had between the combatants, and my companion taking the other horse, we all pushed off together as fast as we could from the scene of our misfortunes. Commend me to an afternoon's canter on the back of a broadsword, but never let my limbs cross the naked chine of such a beast again in a trot of six miles. My companion dismounted and walked a part of the way, but I clung to my bed of down the whole of the route, twisting and turning the whiles thereon at a rate that made the wolves—of which we passed several—stop and stare at me, as if I had the St. Vitus' dance. The cabin at which we stopped belonged to an emigrant originally from New Hampshire, but now for fifteen years a rover in the West. From his present residence he had been several times driven off by the Indians, and of course like most of the settlers, hated them cordially. He had two or three loaded rifles suspended by wooden hooks over his fire place; and assigned to me as a reason for keeping them always thus ready, "that he was a lone man, and didn't want any rascally Indian to come snooping for hogs about his place."—"Surely, sir," I observed, "you would not shoot them unless they did you mischief?" "Why, I don't say as to that stranger, but the varmint give us a heap of trouble; and I'd rather for their own sakes that none of their rifles would come cracking about my door." "Well, I always get rid of the red devils," pursued an old backwoodsman, standing by, "with out shooting any on them, and its only by catching two that came hunting near me last spring, and making them understand that they run a smart chance of their lives if they ever come within rifle shot of my cornfield again. Government's bought their land, and it's wrong for them to be cavorting round quiet people's houses any more."—Contrast such views and feelings with the hospitable conduct toward the Indians, of recent settlers from your own State, which I have commemorated in former letters, and you will for the moment feel a glow of pride for the generous dealings of the New York emigrant. Examine the subject deeper, and that just pride will not be diminished, but you will at least have charity for the startling creed of the old backwoodsman.

The cause of the existing hatred of many of the old borderers to the very name of Indian must be sought for far back in the bloody annals of our frontiers. Its origin may there be found in the fierce collisions, the midnight burnings, the massacres and cruel devastations which are familiar to us in a thousand tales of our infancy. The bitter feelings, the recollection of wrongs committed or incurred—of vengeance wreaked or reaped in these desperate scenes,—have lived for generations in the families of their daring and much enduring actors. In the solitary life of a frontier-man, so far removed from the ordinary objects which engage the thoughts of men of his class in thickly-settled parts of the country, they form his chief subject for reflection, when roving the forest, or laboring alone in the field by day, and they are the theme upon which he descants when his young offspring gather around their humble hearth by night. His children drink in the black story with all the greediness of infant ears, and when wishing for the detail of further horrors, they are placed perforce by their mother on their pallet of straw, she stills their cries by whispering the name of some dreaded Chieftain in their ears—as I have more than once myself heard the name of Black Hawk used to still the murmurs of a nursing. The lessons thus taught are ineradicable, while the accumulated passions and prejudices of generations are thus transmitted and kept alive. A peculiar class of men is thus created, or rather was created, years and years ago;—a class of men as distinct in many respects from the more happily situated inhabitants of countries sheltered by the strong arm of the law, as if it had its birth in another planet; and the chief characteristic of its members is—(I do not speak ironically)—that they have two consciences—one for the white and another for the red man. You smile credulously at such an anomaly in morals; but however paradoxical it may appear upon paper, it is a fact as notorious as the open day that there have

been and are men on the frontiers, whose dealings with civilized society, whose general humanity, whose exact attendance even to their religious duties, are such as to ensure them respect, if it did not give them weight, in any well-ordered community, and that with these very men the rights and privileges, the property, the life of an Indian, do not weigh a feather. For some most remarkable and deeply interesting facts in relation to this strange incongruity of disposition, I refer you to several admirable articles on frontier life and "Indian Hating" in the back numbers of Judge Hall's *Western Magazine*.*

Now this is the class, bold, enterprising and hardy, true to each other, and just and hospitable to the white stranger, but having no place in their system of doing good for the unfriended Indian, which since the English settlement of the back countries, have been brought continually in contact with the original possessors of the soil. They alone are the real pioneers. Wave after wave of Western immigration has rolled from our cultivated coast over the Alleghanies and the Mississippi, but while each shot beyond its predecessor, and left it settling far behind, it has only thrust in advance, it has never absorbed, or commingled with, the distinct and narrow currents that first led the way. These pioneers do indeed continually penetrate beyond the immediate Indian boundaries, and there, as is the case in the Peninsula of Michigan, you may see the hereditary enemies they have left behind living upon the kindest terms with the new white population that succeeds, until their land becomes so valuable as to be coveted by their neighbors, when government steps in and removes them once more to struggle with their old enemies beyond the border. Driven from their favorite hunting grounds—torn from the graves of their fathers—(and the attachment of an Indian to the last is like his love of vengeance and his propensity for gambling, and his devotion to spirituous liquor—when once tasted a perfect passion with him)—he goes to dwell among a strange and often a hostile people, with whom his unremembered and broken tribe soon passes into a by-word. There, generally, the terms he is upon with the scattered pioneers that often have reached even that remote place before him, preclude him from a market for his venison and skins in his immediate neighborhood. And if he does not take to shooting his white neighbors' hogs, and get brought down himself by a rifle ball in return, he wanders off to some distant trading post, where he either runs himself incurably in debt by taking goods at credit from the American Fur Company, at a thousand per cent. above their market value, or else learns from the Scotch and English trader to love the *Sagarnash* and the *Chemocomon*, and to go with the various tribes within our borders, which the British Government at this moment religiously keep in their pay, to receive arms and presents at Malden, and to hold himself ready to join the first marauding party of his red brethren which shall raise the warwhoop on the border, and add new venom to the deadly feud of the pioneer. Sometimes indeed he becomes a dealer in small peltries on his own account, and usually visits the home of his childhood, where some thriving village has in the meantime sprung up, to dispose of the fruits of the chase, and get his supply of little necessities in return. Several instances of the last were mentioned to me at the pretty hamlets of Ottawa and Hennepin, on the Illinois, where I was told that the storekeepers dealt with different Indians, whom they had repeatedly trusted to the amount of several hundred dollars for the term of a year, without their confidence being ever abused. But the Indian returning hence to his wildwood haunts, still in passing the frontier avoids the beings between whom and himself there is such a fearful account of mutual wrong and injury left unbalanced; and if he lies down at night beneath the shelter of a white man's roof, it is one that covers the family of some new wanderer to the west, to whom the wild deeds of frontier life are only known through the softened medium of fiction, as a tale of other days. But much more likely is he,

if his blanket alone be not his bed, to betake himself to some tenantless mansion, where the charred shell of what was formerly the family dwelling of a once happy but now desolated pioneer, blackens the lonely heath. Here, while the prairie blast whistles through the gaping timbers, the Indian, crouched upon the floor, where the feet of his red brothers have slipped in the blood their ruthless hands have shed, may well be supposed to exult in the demoniac feelings of gratified revenge, so dear to his race, to brood through the hours of midnight over the accumulated wrongs under which he believes himself to be suffering, and to emerge from his gloomy lair in the morning, eager for an encounter that may relieve his swollen feelings. Imagine now the white man, who once thought himself the possessor of that spot;—he, the ruined parent of that shattered home, hanging around the only remains of all that was dear to him! and then conceive what would be the meeting of two such beings. There is not another touch required to the picture;—and yet it is no picture; it is reality. The deserted dwellings I have seen again and again. The stories connected with them are so familiar in their neighborhood, as to be told without emotion. The state of feeling they keep alive among the whites I have already explained. The isolated condition of the Indian is also too well known.

But enough of this for the present; when I have delivered the letters which I have for individuals high in the Indian department further down the country, you shall have my own crude notions in relation to our national policy toward this singular people.

Having recovered our baggage, I started with my fellow traveller at about ten o'clock the next morning, in a jamper, trusting to his knowledge of the different groves, which are the landmarks of the prairies, for finding our way to a neighbor's, between thirty and forty miles off. We had proceeded a very few miles, when every sign of a trail being snowed up, we became completely lost, and wandered over the prairie for eleven hours; sometimes, indeed, we would get a snatch of a track where the snow had drifted it bare, but a few moments afterwards we would be driving just as much at random as ever.—The night at last closed in extremely cold, and the wind swept over the prairie so piercingly, that the very wolves seemed to shiver as they stood looking at us in the bright moonlight—(the number and impudence of these rascals on the prairies is almost incredible)—but the glorious sky above us seemed to lend some of its influence to our spirits; and, so long as our poor horse held out, we determined to keep on. His strength, however, began to be too much tried as we passed along the mouth of a number of ravines scooped out of the prairie, and descended occasionally into the groves that filled them, to see if we could discover a house. The wearied brute seemed so loathe to leave the last one we entered, that, after pausing and hallooing in vain for sometime, I proposed that we should turn him loose to browse on the trees, and, making a fire, lay down in the snow for the night. My friend preferred trying one more ravine for the house, as we were both very sharp set; and, starting anew to take a short cut up the hill side, we came to the brink of a narrow and deep gully, which my companion got out to examine. "Jump him over," he cried.

"Jump the devil!—the horse can hardly step."

"Try him."

"He'll break the jumper."

"Then we'll camp upon the spot."

The grave echoed with a single application I made with a flat stick to the poor brute's back, and the flying car (emphatically a jumper) landed safely with me in it on the other side of the gully. We gained the open prairie once more—heard the bark of a watch dog—and descending another ravine, were comfortably housed, an hour before midnight, in the log dwelling of a miner. H.

AN ESSAY ON NEW TRIALS, by DAVID GRAHAM, Counsellor at Law. *New York: HALSTEAD & VOOKHES.* 8vo. pp. 636.—"The principal object of this work is to aid the junior members of the profession, in a branch of practice of daily occurrence."—The arrangement of the work appears well suited to accomplish the object announced in the first sentence of the preface, which we have extracted above. The work is divided into sixteen chapters; the first thirteen of which are devoted to the various grounds of motion for new trials, as, for example, want of due notice of trial, irregularity in impanelling the Jury misconduct of the party or his Counsel on the trial—misconduct of the Jury—defects of the verdict as

being void or against law, or against evidence, or by reason of the damages, &c.

The fourteenth chapter is devoted to applications for new trials, in what are termed "Hard Actions," under which head are classed actions arising *ex delicto, qui tam*, and *penal actions*, and criminal cases.

The fifteenth chapter relates to applications, after two trials, and trials at bar; and the sixteenth to applications in Equity, "after verdicts on feigned issues and issues at law."

The subject is one with which we are personally little conversant; but of the execution of the work, and its general accuracy and fidelity, we willingly accept the experience of its author, whose name has been long known at the bar, as a sufficient guarantee.

THE PHILOSOPHY OF SLEEP, by Robt. Macnish; 1st American edition: 1. vol.; N. York, D. APPLETON & Co.—Is not this, gentle reader, a very taking title—"the Philosophy of Sleep!" and does it not forthwith set the waking faculties upon inquiring into that state, which the author denominates "the suspension of animal life," during the continuance of which "the creature is under the influence of organic life alone?"

Such, we think, will be its general effect, and we may promise in all safety, that whether philosophers or not, those who take up this volume will find themselves both instructed and interested by it.

We make a short extract about dreams:

There is a strong analogy between dreaming and insanity. Dr Abercrombie defines the difference between the two states to be, that in the latter the erroneous impression, being permanent, affects the conduct; whereas in dreaming, no influence on the conduct is produced, because the vision is dissipated on awaking. This definition is nearly, but not wholly correct; for in somnambulism and sleep-talking, the conduct is influenced by the prevailing dream. Dr. Rush has, with great shrewdness, remarked, that a dream may be considered as a transient paroxysm of delirium, and delirium as a permanent dream.

Man is not the only animal subject to dreaming. We have every reason to believe that many of the lower animals do the same. Horses neigh and rear, and dogs bark and growl in their sleep. Probably, at such times, the remembrance of the chase or the combat was passing through the minds of these creatures; and they also not unfrequently manifest signs of fear, joy, playfulness, and almost every other passion.* Ruminating animals, such as the sheep and cow, dream less; but, even they are sometimes so affected, especially at the period of rearing their young. The parrot is said to dream, and I should suppose some other birds do the same. Indeed the more intellectual the animal is, the more likely it is to be subject to dreaming.—Whether the fishes dream, it is impossible to conjecture: nor can it be guessed, with any thing like certainty, at what point in the scale of animal intellect, the capability of dreaming ceases, although it is very certain there is such a point. I apprehend that dreaming is a much more general law than is commonly supposed, and that many animals dream which are never suspected of doing so.

Some men are said never to dream, and others only when their health is disordered: Dr. Beattie mentions a case of the latter [description]. For many years before his death, Dr. Reid had no consciousness of ever having dreamed; and Mr. Locke takes notice of a person who never did so till his twenty-sixth year, when he began to dream in consequence of having had a fever. It is not impossible, however, but that, in these cases, the individuals may have had dreams from the same age as other people, and under the same circumstances, although probably they were of so vague a nature, as to have soon faded away from the memory.

Dreams occur more frequently in the morning than in the early part of the night; a proof that the sleep is much more profound in the latter period than in the former. Towards morning, the faculties being refreshed by sleep, are more disposed to enter into activity: and this explains why, as we approach the

* "The stag-hounds, weary with the chase,
Lay stretched upon the rushy floor,
And urged in dreams the forest race
From Teviot stone to Eskdale-moor."
Lay of the Last Minstrel.

* If I am not very much mistaken the records of the criminal Court in the county of Montgomery, State of New York, will supply some facts in relation to Indian Hating nearer home. I think it was last October only that I saw a statement in a Johnstown newspaper in relation to an Indian murder committed by an old man of sixty, who had been in past years tried and acquitted by Mohawk juries, several times, upon different indictments for Indian murders. He destroyed his victim, whom he had never seen till that moment, by picking him off with his rifle, while fishing in his canoe between two white men.

hours of waking, our dreams are more fresh and vivid. Owing to the comparatively active state of the faculties, morning dreams are the more rational—whence the old adage, that such dreams are true.

Children dream almost from their birth; and if we may judge from what, on many occasions, they may endure during sleep, we must suppose that the visions which haunt their young minds are often of a very frightful kind. Children, from many causes, are more apt to have dreams of terror than adults. In the first place, they are peculiarly subject to various diseases, such as teething, convulsions, and bowel complaints, those fertile sources of mental terror in sleep; and, in the second place, their minds are exceedingly susceptible of dread, in all its forms, and prone to be acted on by it, whatever shape it assumes. Many of the dreams experienced at this early period, leave an indelible impression on the mind. They are remembered in after-years with feelings of pain; and, blending with the more delightful reminiscences of childhood, demonstrate that this era, which we are apt to consider one varied scene of sunshine and happiness, had, as well as future life, its shadows of melancholy, and was not untinged with hues of sorrow and care. The sleep of infancy, therefore, is far from being that ideal state of felicity which is commonly supposed. It is haunted with its own terrors, even more than that of adults; and, if many of the visions which people it are equally delightful, there can be little doubt that it is also tortured by dreams of a more painful character than often fall to the share of after-life.

In health, when the mind is at ease, we seldom dream; and when we do so our visions are generally of a pleasing character. In disease, especially of the brain, liver, and stomach, dreams are both common and of a very distressing kind.

WILLIAMS' N. Y. ANNUAL REGISTER for 1834; N. York, Jas. Van Norden.—This is the fifth year of this valuable, elaborate, comprehensive and accurate publication; and now only, as we learn, does it begin to afford to its enterprising and persevering Editor some compensation. Heretofore he has lost, not only time and labor, but money, by each publication. Its character is now, however, so justly established, that he may, we think, calculate upon at last reaping a harvest from his toils. The contents are of so miscellaneous a character, that it is impossible to enumerate any considerable portion of them. It must, therefore, suffice to say that every thing relating to the civil, literary, political, commercial and statistical affairs of this great State, together with much similar information with regard to the United States, is to be found in its pages, which, by the way, are more numerous by nearly one hundred in this Register than in any preceding one. The Register is for sale by the Editor alone at 41 Courtlandt street.

THE MECHANICS' MAGAZINE, AND REGISTER OF INVENTIONS AND IMPROVEMENTS, Nos. 1, 2, 3 and 4, of Vol. III; N. York, D. K. MINOR & J. E. CHALLIS.—We take blame to ourselves for not having before called attention to the progress made in its second year by this excellent and useful periodical. It seems however, to be so well established now in public favor as to be able to win its way alone, and without the notice of the contemporary press. It is, nevertheless, but just to say, that these numbers exhibit good judgment in the selection of topics, and as far as we are competent to judge, skill in the mode of treating them. The work is now stereotyped, so that back numbers can always be had; and no one who has any should be without all. It is also published in weekly sheets of 16 pp. each, like the London work of the same name, in order that those who desire it oftener than monthly may be accommodated. According to the wish of the parties, too, it may be had either in monthly parts, or in a bound volume once every six months.

The Editorial department is conducted by John Knight, who was long connected in that capacity with the London Mechanics' Magazine.

TRAVELS AND RESEARCHES IN CAFFRARIA, &c. &c. By STEPHEN KAY. 1 vol. N. Y.—HARPER & BROTHERS.—The writer of this volume, abounding in in-

teresting details of a region and peoples little known, is a Missionary, who passed six or seven years among them, in the discharge of his self-sacrificing labors. It is designed, and we think well calculated, to arouse attention to the condition of Africa, so deeply wronged by her intercourse with the other quarters of the world.

As a mere book of adventures, privations, and unaccustomed expedients—Independently of any higher motive—this work will repay the attention bestowed on it.

THE KNICKERBOCKER, for May; N. York, J. Dis. TURNELL.

THE MONTHLY MAGAZINE, for May; New York, MONSON BANCROFT.

The first named of these periodicals has changed proprietors and editor, and has improved by the change both in the matter and the manner of its articles. A vain glorious tone of superiority, unsustained by real merit of any sort, has given place to the quiet and gentle address of men who respect the judgment of their readers, and aim not, by proclaiming their own excellence, to forestall opinion. The biography of Talleyrand in this number is capital, though unsparing. The chapter on Cats is very good too.

The new Editors are *Lewis Gaylord Clark* and *Clement M. Edson*.

This number of the *Monthly* is excellent. Varied, sprightly, gay and wise by turns, it must work its way to favor and fortune—though as yet, both have been rather hoped for than realized. We commend this periodical to our friends.

HOOKE'S PLAN OF NEW-YORK.—We spoke some weeks ago of a Plan of this City by Burr, for sale by *Disturnell*, which was very neatly and portably put up. We have now another, by Hooker, not quite so neat as that by Burr, but comprehending more explanatory matter, as to public buildings, and designating the fire limits. These are very useful companions.

THE TOURIST; or Pocket Manual for Travellers—3d edition: N. Y., HARPER AND BROTHERS.—This speaks for itself; a little volume it is, but of indispensable necessity to travellers who perambulate our great State and the Canadas. It tells them all that is needful to comfort, speed and economy in their movements; and throws into the bargain a very considerable sprinkling of amusing historical lore.

LANDSCAPE ILLUSTRATIONS OF THE BIBLE, by W. & E. FINDEN. London: JOHN MURRAY. Part I.—The success which has attended this tasteful manner of illustrating profane story, has encouraged the publisher to essay it in regard to the Bible. The drawings are made by *Turner, Calcot, Stanfield*, and other eminent artists, from Sketches taken on the spot—the engravings by the *Findens*—and the descriptive parts are from the pen of the *Rev. Hartwell Horne*, of Cambridge. Each number is to contain four plates, and the work is to be completed in 24 monthly numbers. The price is half a crown, or about 56 cents per number. This first number gives views—of *Mount Ararat, of the brook Kedron, of the Dead Sea and mouth of the Jordan, and of Tadmor in the Desert*. It is a beautiful specimen; and if, as it may be anticipated, it is followed up in the same style, the work cannot but be popular.

PAUL AND VIRGINIA—translated from St. Pierre. 1 vol. Boston: LILLY, WAIT & Co.—A republication, in a small and neatly printed volume, embellished for the attraction of children and young persons, of one of the prettiest stories ever written for their entertainment.

HISTORY OF BOSTON, by ROBIN CARVER. Boston: LILLY, WAIT, COLMAN & HOLDEN.—We are glad thus to see our own histories popularized. With the records of Boston are connected some of the noblest acts of our struggle to become a nation; and we re-

joice to see them so told, as without losing any thing of their authenticity to become familiar and eagerly sought schoolboy tales.

SKETCHES—by Mrs. SIGOURNEY. Philadelphia: KEY & BIDDLE.—The pen of Mrs. Sigourney, which heretofore has chiefly been employed in poetry—pure, spiritual and most happily inspired—now adventures into a field where competitors are more frequent, but where success is not less gratifying.

We are compelled by want of room, to postpone to-day our further remarks, suggested by these "sketches" from her pen; but could not let another week pass without, at least, this brief notice.

We have several works yet on hand—some of them long in arrear: among them, the attractive volume prepared for publication by *S. De Witt Bloodgood*, of Albany, from the M.S. of the Ettrick Shepherd. We have, too, Vol. I. of the life of *ALEXANDER HAMILTON*, by his son, *I. C. Hamilton*, to which we hope to do justice in next Saturday's Review.

SUMMARY.

Mr. Wise, Mr. John Quincy Adams, Mr. Thomas, of Louisiana, Mr. Pinckney, and Mr. Murphey, have been appointed a Select Committee in the House of Representatives, to take into consideration the expediency of carrying into operation the Resolution of the Revolutionary Congress, concerning the erection of a monument at Yorktown, Va.

APPOINTMENTS BY THE PRESIDENT.

By and with the advice and consent of the Senate.
Uriel Sebee, to be Receiver of Public Monies at Fayette, Missouri, 17th December, 1833, when his commission expired.

Thomas Gillespie, to be Register of the Land Office at Bucyrus, in the State of Ohio, from the 26th day of May, 1834.

Finis Ewing, to be Register of the Land Office at Lexington, Missouri, from the 23d day of May, 1834.

William Wright, to be Register of the Land Office at Palmyra, Missouri, from the 29th day of May, 1834.

Hilary B. Cenas, to be Register of the Land Office at New Orleans, Louisiana, from the 17th of December, 1833.

Valentine King, to be Register of the Land Office at Opelousas, Louisiana, from the 28th of January, 1834.

John Killian, to be Register of the Land Office at St. Helena, Louisiana, vice G. Davidson, resigned.

Shelden S. Clark, to be an Appraiser of Customs for the port of New Orleans, in the place of R. F. Canfield, removed.

John P. Morton, to be Collector and Inspector of Edgartown, Massachusetts.

Pierre A. Barker, to be Collector and Inspector of the Revenue for the port of Buffalo Creek, New York.

Gabriel Holmes, Surveyor and Inspector of Wilmington, in the State of North Carolina, April, 1834, in the room of Richard Bradley deceased.

James Wade, to be Surveyor and Inspector of the Revenue, Swansborough North Carolina.

John D. Jones to be Naval Officer, Wilmington North Carolina.

James McGuire, to be Surveyor and Inspector, in the District of Columbia.

Robert Mitchell, to be Collector of the Customs, Pensacola, Florida.

Woodson Wren, to be Surveyor and Inspector, Natchez, Mississippi, in the place of Andrew Marchalk, rejected by the Senate.

Charles Barnett, to be Consul for Genoa, in the place of Robert Cambell, removed.

Ceran St. Vrain, to be Consul for Santa Fe, in Mexico, in the place of James Davis, removed.

George Adams, to be Attorney for the District of Mississippi, re-appointed.

All reappointments except those otherwise specified.

Coffee House Slip.—The bulk head recently put down on a line with South street, started a day or two since, left its bed, and slid into the river. A new one will have to be placed on the foundation of the old, before the slip can be filled in. Old slip is filled up, and in a short time will be regulated and paved.—[Daily Adv.]

WOODAUX, (N. J.)—A copper mine, the ore of which yields from 60 to 70 per cent. has been open-

ed near Flemington, in this State. In addition to the mine, which is said to be inexhaustible, a vein of four or five feet in thickness, and as many in breadth, has been discovered in its immediate vicinity.—[Village Herald.]

SHIP BUILDING.—We find in the Journal of Commerce of this morning the following paragraph:

In addition to the three ships now building in this city, as mentioned by us a day or two since, we learn that a fourth has been contracted for, to be built by Brown & Bell.

Among the list of passengers by the Paragon, for Vera Cruz, we notice Mr. Aaron Leggett, Merchant, of this city, who we learn is bearer of despatches from our Government to Col. Butler, Chargé d'Affaires at the city of Mexico.

[From the Baltimore American.]

The new Convention with Chili, recently ratified by the United States Senate, has been officially promulgated. It consists of thirty-one original, and four explanatory articles.

The commerce and navigation of the two countries with each other, are put on the footing of those of the most favored nations, and every subsequent grant, by either, to other nations, is to become as common to the other, as though specially granted,—freely, if given freely, or on the same terms, if compensation is required. The Republic of Chili reserves out of this stipulation its existing treaties with other South American Governments and with Mexico, and both parties except their own coasting trade.

The 5th, 6th, 7th, and 8th articles provide for the security of the property of the citizens of either country in the other, against embargoes, or imprisonment for military purposes, without indemnification, for protection and aid in their harbors, against pirates or other enemies, or in distress, for the restoration of property carried by pirates into the ports of either, and for exempting the cargoes of wrecked and damaged vessels of either party, not intended for consumption in the country, from all duties and imposts.

The right of disposing of personal estate is secured to the citizens of either party in the territory of the other, according to the laws which regulate the property of its own citizens, and successions, by testament or from intestates, follow the same rules.—In the case of real estate, three years is given to alien heirs to dispose of it, and withdraw the proceeds. Security of property, free access to the courts, and liberty of religious worship are mutually guarantees to the resident citizens of either.

From article 12 to 24 inclusive, relate to the questions of neutral commerce, contraband, and bloc ade.

They establish succinctly that free ships make free goods; that commerce in time of war shall be free from neutrals, direct to the ports of the enemies of either, and from port to port; and that on board of the ships of neutrals, every thing is free, (contraband excepted;) although the whole or part of the lading belong to belligerents. The same principle of protection extends to persons, except officers or soldiers in actual service; it further limits the benefit of this protection to the property and persons of belligerents, who acknowledge the same principles.

An alternative stipulation is made, that when the neutral flag protects the property of the belligerent, the flag of the belligerent shall not protect neutral property, and *conversos*,—where the neutral flag does not, the enemy's shall.

Article 14, defines what shall be contraband.—Contraband does not subject the vessel or cargo to confiscation, except of the contraband articles, nor to detention, if those articles are given up on demand. Sufficient notice of blockades is to be given, and vessels entering or departing are to be warned, and liable to confiscation only on persisting in spite of warning and notice.

Captains of armed vessels are made personally liable for all extortion or ill treatment in searching for contraband, and no commander of a merchant vessel is to be summoned on board of an armed vessel.—When vessels are under convoy, the word of honor of the commander of the convoy is to be taken as final evidence of the character and cargoes of the merchant vessels under his charge. Mutual stipulations are made, for the regulation of prize cases, that the reasons for condemnation in each case may be fully stated, and authentic evidence furnished to the party.

In case of war between the United States and Chili, a specific time is to be allowed to resident merchants to wind up their affairs, and safe conduct given them.

Persons of other occupations may remain, under the protection of the laws,—responsible for their personal conduct towards the State. No debts or property to be confiscated or sequestered.

A series of articles provides for the reception and treatment of Ministers, and their powers, and those of consuls.

Deserters from public and private vessels are to be given up to the consuls. An explanatory article except *slaves* as such, serving in any capacity in our vessels.

The other explanatory articles are not important, only making more explicit some of the provisions of the original articles.

The treaty is to continued for twelve years, and to be terminated then and thereafter only on a previous notice of twelve months.

FROM LIMA.—By the ship Leonidas, Capt. Woodbury, we learn that the time of his sailing, there was a revolution in Lima, and that Obregoso had been elected by a large majority. His opponent, Gen. Gamarra, late President, had possession of the capital with 800 troops. Obregoso was in the fortress of Callao with about the same number, and it was expected he would get the mastery, as the people were in his favor. Every prospect of a speedy peace prevailed.—[Gazette.]

CAPT. BACK.—A letter has been received this morning by Mr. Buchanan, his British Majesty's Consul, from Capt. Back, dated Fort Reliance, east end of Great Slave Lake, 7th December, 1833.

The following is an extract:—After detailing various matters of a private nature—

“And now, my dear sir, I must inform you that the expedition has advanced steadily in its humane and interesting object, without having experienced any of those untoward circumstances that sometimes paralyze and cast a gloom over our best and most strenuous exertions. Every thing is in a fair train; and next year, under the guidance of Divine Providence, I trust, we may be still in time to rescue suffering mortality from destruction.”

[From the Boston Courier.]

MADAWASKA.—The people living in the disputed territory, are, it appears in rather a singular position, belonging to no nation and yet claimed by two. Under such circumstances they had better “take the responsibility” of setting up for themselves, or remove themselves and their deposits to some other place. The following is from the Kennebec Journal.

Madawaska.—We learn that the inhabitants of Madawaska have been taxed by the British government, and the tax has been collected with much rigor; that the British hold undisturbed possession and have built a court house; that the inhabitants are suffering much from want, their crops having been scanty the last season. As the town had been incorporated by the Legislature of Maine, and the inhabitants assured of the protection of the United States, they prepared a memorial to our government asking assistance and protection, which was signed by a number, but subsequently seized and destroyed by the British authorities. They have, however, sent on a delegate to see Gov. Dunlap, and ask the assistance of the State. This delegate we learn has been to Brunswick, where the Governor now is, and obtained an order on the treasurer for a small sum of money. The authority of the Governor to do this may be questioned, but we are not inclined to urge that point in this case. We have not seen the delegate, but gather the foregoing statement from those who conversed with him. We were told many years ago that if Gen. Jackson could be elected President we should soon have our territory secured; but instead of this we first find him requesting the Governor of New Brunswick to pardon and release from prison, upon condition of *not repeating the offence against his British majesty*, certain persons of Madawaska who had been guilty of the heinous crime of proceeding to incorporate the town in pursuance of a special law of the State of Maine. Next we find him trying to get the Dutchman's award accepted; and this being stopped by the Senate, we have another decree requiring the Legislature of Maine to bargain away the territory for “an ample indemnity” in land or money, in secret session; and now we find the British government taxing the inhabitants and using as full authority as over any part of New Brunswick; while our government, State and National, looks on with apparent unconcern.

Has there been, asks the National Intelligencer of yesterday, an Earthquake in any part of the wide tract of territory which lies between us and New

Orleans? Or what else has interrupted the intercourse between this city and that? For four or five successive mails, no newspaper has reached this city from New Orleans.

[From the United States Gazette.]

THE LOCUSTS ARE COMING.—A very respectable inhabitant, who has resided in Germantown during a life of 74 years, mentions the curious fact that locusts not only appear every seventeen years, but that they make their appearance in great numbers always on the 25th of May. Our informant recollects their advent on the 25th of May, 1766, then six years old. He has since recorded their coming on the

25th of May, 1783,

25th of May, 1800,

25th of May, 1817.

Their holes may now be seen in ploughing, or under boards lying on the ground, preparing to come forth on Sunday week, 25th inst.

It is remarked that occasionally a few locusts are seen creeping out of their hiding places *before* the 25th, but they return again to join the great crowd.

Some two months since, a highly respected friend, who has resided all of his long and useful life in the vicinity, left for us a notice of the approach of the locusts, and an account of their time and customs. The piece did not reach our hand until it had appeared elsewhere. It was instructive with reference to this subject, and contained a remark that the locust seasons had usually been characterized as those of plentiful harvests of grain, &c.

DISTRESSING ACCIDENT AND LOSS OF LIFE.—The Erie, (Pa.) Gazette of last Thursday, gives the following melancholy statement.

Yesterday, about 10 o'clock, a sail boat, with nine passengers on board, put off from the wharf to cross the Bay to the public pier. The wind was blowing very heavy. When about half way across, she capsized and seven out of the nine were lost. Thomas Miles, son of Capt. Miles, of the steam boat New York, and a Mr. Woodbury or Woodford, from French Creek in this county, clung to the boat, and were taken off by a boat that put off to their relief.—Thomas McConkey, deputy Collector of this port, and a Mrs. Thomas, wife of the second mate of the steam boat William Penn, both of this town, were among the number lost. The other five were strangers, who were going to take passage on board the New York, which was then coming into the harbor. We have taken every possible means to ascertain the names and residence of the strangers. From the Register of names in the public Hotels and on the way-bills, and other sources, we gather the following result, which still may not be accurate, to wit: *Amos H. Bishop*, Butternuts, Otsego county, N. Y., *Luther Douglass*, Sherman, Michigan Territory, and a man by the name of *Palmer*, who took passage on board the stage at North East in this county, on the 13th inst. A young man, name not known, said to belong at North East in this county, and a gentleman from the town of *Palmer*, Michigan Territory, name not known, understood from his conversation, to have been a merchant at that place. One of the bodies has been found, but nothing about him, by which his name can be discovered.

The suspension of the New Orleans mails for several days past, until yesterday, is thus explained by the Post Master at Columbus, Geo.

“Four Western Mails are now due at this office. Three successive failures are owing to the destruction of a causeway by the recent heavy rain, over the swamp in the Creek Nation, about 50 miles from this.”—[Jour. of Com.]

The Mormons in motion.—According to a late number of the Painesville Telegraph, General Joe Smith, the leader of the Mormons, has, accompanied by about five hundred of his followers, set out for the purpose of reconquering the “Holy Land,” lately taken from them by the infidels of Missouri.—Joe, it seems, has been stirring up his proselytes for some time, stating that it was the command of God that they should buckle on the armour of their faith, and enrol under the banners of Mormonism; that their church was in danger; and that they must, if necessary, die the death of martyrdom. Accordingly, the deluded fanatics obeyed his summons; a great rise took place in the market for warlike implements, as each had provided himself with an abundant supply of pistols, dirks, swords, &c. The sword of Smith himself, it is said, is more than four feet long. The prophet, professes the expectation of sharing the fate of a martyr at the coming contest. We trust that the good people of Missouri will take care of these fanatics, and see that they do not violate the laws with impunity.—[Phil. Inquirer.]

NEW PERIODICAL.—An association of young men is just formed, as we learn, who mean to publish a monthly magazine, to be issued on the 15th of each month, under the title of the *American Spectator and National Magazine*.

We wish them all success, although we fear the multiplication of such periodicals does not augur permanent success to any of them.

An act relative to the Superior Court of the city of New York. Passed April 24, 1834.

The people of the State of New York, represented in Senate and Assembly, do enact as follows:

§ 1. All writs or process which shall issue out of the said court, may be tested in any day of the term in which such court shall sit, and be made returnable on any other day of the same term, or at the next term.

§ 2. The said court may establish by its rules the time to be allowed for entering and perfecting bail in suits pending therein, and to be given to the sheriff in such cases before an attachment can issue against him; also the time to be allowed for pleading in such suits, and for noticing the issues in fact joined in the same for trial; but in none of the above cases shall such time be less than eight days.

The Mobile Bank has declared an extra dividend of ten per cent. It has always declared semi annual dividends of four and a half per cent. or nine per cent. per annum. The Bank has just obtained an extension of its charter. [Jour. of Com.]

The steam packet William Gibbons, Capt. Pennoyer, arrived last night from Charleston, which place she left on the evening of the 17th, bringing papers to that date. We extract the following:

The Nashville Banner says—"The frost destroyed all the cotton which was situated on high grounds in this vicinity."

HUNTSVILLE, (ALA.) MAY 1.—Great Damage by Frost.—The damage sustained by the frost on Sunday night, has, perhaps, never been greater in this section of the country, so late in the season. For some weeks past the weather had been mild, just such as the planter could desire, and the stand of cotton was exceedingly fine; but the flattering prospects has been sadly reversed. Saturday night was attended with some frost—the weather was cold throughout Sunday, the wind from the north, and a killing frost was the consequence at night. We fear the injury has been general throughout North Alabama, if not the whole cotton growing country. In our immediate vicinity, we hear of some planters who have lost whole fields, others, one half, &c. Many will be unable to replant for the want of seed, which it will be impossible to procure at this late season.

Cholera.—A gentleman in this city, (says the Louisiana Advertiser) whose family were passengers on board the steamboat Warren, which left this city on the 15th inst. for Cincinnati, received accounts on Monday, dated Randolph, stating that the cholera had broke out on board of that boat, that his nephew, and three others were buried that day, and that about 15 or 20 in all had died.

There have been several cases of cholera in the city which have proved fatal, yet we do not think it epidemical, and that it may be avoided by prudence. The cases, so far, have been generally confined to the boats.

Forgery.—A gentleman of this city, (says the New Orleans Advertiser of the 5th inst.) of the highest respectability and large family connexions, and a director of a bank, has disappeared, and it is discovered that he has been for a long time past committing forgeries to a vast amount.

Casualty.—A laboring man in the employ of a grocer at the foot of Franklin street, drank a large quantity of cold water during the extreme heat of yesterday, and returned to his employment. In a short time after he complained of being unwell, and retired into a neighboring store, where he died.—The deceased was in perfect health, apparently about thirty years old. The warmth of the weather makes caution in the free use of cold water necessary. [Times.]

[From the Sackett Harbor Journal.]

We learn that the steamboat Oswego is ashore about five miles west of Oswego. It is said that for the want of a supply of wood, she failed to make sufficient steam to work her engines, and was driven ashore by the severe wind of Sunday night last. The latest report says that her situation is dangerous, and fears are entertained that she will be much injured, if not entirely wrecked. Her situation, we under-

stand, is such, that the engines, furniture, &c. may be saved, should the boat go to pieces.

[From the Evening Post.]

Among the Polish emigrants is an officer of the rank of Captain, who has left behind a wife and family. This gentleman is very anxious to return to Europe. One of the foreign ministers at Washington has liberally granted him a passport for that purpose. The sum of \$100 is necessary to effect the object. Those who are disposed to aid a gentleman, under circumstances that call for no comment, will confer a real favor by sending their contributions to this office, addressed to the care of J. Fenimore Cooper.

Great Haul of Fish.—On or about the middle of last month, at Greenway Landing, (fourteen miles below town,) occupied by Messrs. George H. Smoot and Charles Cooley, one million five hundred thousand Herring, and eleven to twelve hundred Shad, were caught at a single haul of the seine. Again, on the 28th inst., eleven thousand Shad were caught at a single haul of the seine, at the same landing. [Alex. Gaz.]

Great Haul of Great Fish.—On Friday some Fishermen at Carpenter's Point took at a single haul, upwards of eight hundred Rock Fish, of the largest size we ever saw. Some of them weighed upwards of 100lbs. They were selling this morning in market, at from 50 cents to one dollar for the largest, say one cent a pound for such fish as this. [Balt. Gaz.]

Great Fire at Needham.—On Monday night about eleven o'clock, a fire broke out in the paper mill of Messrs Lyon & Co. at Needham, in the village of the Lowell falls, which entirely consumed that establishment, together with the Machine Shop of Ware & Clark, and the small Wrapping Paper Mill of Hurd & Crehore. All the valuable Mills on the Newton side escaped. Messrs Lyon & Co. are insured \$4000 at the Manufacturers office—Hurd & Crehore, \$2000 at the National—Ware & Clark, \$1000 at Roxbury. Total loss, about \$20,000. [Boston Courier.]

LATER FROM ENGLAND.—The packet ship *South America* brings Liverpool dates of the 16th, and London to the 15th ult.

From France we have direct, later intelligence than this arrival furnishes. Of English news, so called, there is nothing, and our extracts therefore relate solely to Portugal, where the *Pedroites* were prospering.

LONDON, Monday Evening April 14.—The private letters received this morning from Oporto, dated the 30th ult. are very encouraging, and state that a considerable force marched out of that garrison on the 25th, towards Guimaraes, which town they entered and made themselves master of on the 26th, driving the Miguelites, about 2000 in number, in great confusion before them, and compelling them to retreat in the direction of Amarante. The Queen's troops then proceeded towards Braga, which they also took possession of, while Admiral Napier on the other side, conquered Viana, thus placing the whole province of Entre Douro e Minho under the command of the Pedroites, the greater part of which had declared in favor of the Queen. A reinforcement of 400 men had arrived at Oporto from Lisbon—and an additional number was shortly expected under the command of Vila Flor, who, immediately on his arrival was to make an attack on Coimbra, which if taken would then place nearly the entire coast of Portugal in the hands of Donna Maria.

Baron Soure, son of Viscount Pezo de Regua, alias Gaspar Texeira, a lieutenant general in the army of Don Miguel, entered Oporto on the 22d ult. to negotiate an amnesty for himself, father and friends. He was well received, his proposals acceded to, and a command on the Coimbra road given to him. This step on the part of the Miguelite officers was considered in Oporto of considerable consequence, particularly to the commercial world, as the Viscount was one of the greatest landed proprietors in Tras os Montes, and possessed the greater part of the vineyards in that province. He is also said to have considerable influence in that part of the country, which hitherto has been considered a strong Miguelite position.

LATE AND IMPORTANT FROM FRANCE.—By the *Turbo* from Havre, on Saturday, we received our Paris papers to the 8th, and yesterday by the *Poland*, Packet Ship to the 15th ult:

France has again been disturbed in her two chief

cities, *Lyons* and *Paris*, by insurrectionary movements—which, however, were put down so decisively, as should demonstrate the hopelessness of such desultory attempts. The details will be found in the extracts. The duration of anarchy, both in Lyons and Paris, was manifestly occasioned by a considerable desire to spare as much as possible the effusion of blood, and especially not to hazard the troops of the line or the National Guard, unnecessarily in narrow streets, of which the houses were filled with adversaries, who might fire upon them, without being themselves accessible. There was, it is clear, force enough to have crushed the insurrection in a moment, if imperious necessity had so required. We look upon the cautious and humane manner in which the insurgents were approached and reduced, as indicative, in a high degree, of the confidence entertained by the government in its own strength.

The disturbances at Brussels do not, we suppose, indicate any general discontent; though they go to prove restlessness and impatience on the part of masses, which must sooner or later lead to a wide spread explosion.

In the *Journal des Debats*, of 4th April, we observe a letter from an American gentleman in Paris, *G. M. Gibbs*, refuting conclusively the allegation made, and apparently relied on the House of Deputies, while discussing the American indemnity, that the Florida treaty between the United States and Spain contained a provision for cases of seizure and condemnation in Spanish ports by French authorities, which same cases to the amount of eight million francs, it was argued in the Chamber, were now again brought forward as claims against France. Mr. Gibbs shows, what indeed *M. de Broglie* did in the House when the objection was first made that it was wholly groundless.

M. Carrel, Editor of the *National*—which paper was sentenced to be suspended for a time from publication—having established a new one under the title of the *National of 1834*, was prosecuted and condemned before the Assize Court, for an evasion of the first sentence. On appeal to the Superior Court, this judgment of the Assize Court was set aside, on the ground that the *National of 1834* was a new paper, and not the paper under interdict of the law.

This may be thought to look like quibbling; but it is right that all penal statutes should be confined within the strictest letter.

In the streets where the barricades were formed, the lamps were all broken by the rioters. The inhabitants of the neighboring houses, in order to supply the deficiency, illuminated their windows.

Two young men arrested for the disturbances in Paris, and passing under guard along one of the bridges, sprang from the parapet into the river. The guard immediately fired upon them and killed one instantly, his body being seen floating in the Seine. The fate of the other, in the confusion, was not ascertained.

It may be the habit of revolutions, or it may be the extent of the city of Paris, but it is certainly curious to find it stated, as we do in one of the papers, "that during the bloody disturbances in and about the Rue St. Martin, the theatres of the boulevards distant from the scene, were thronged as usual, and the shops and coffee houses were all open."

M. Baillot, son of a Deputy, and a Captain in the National Guard, who was wounded while on duty, had died.

M. St. Marc Girardin, one of the Editors of the *Journal des Debats*, and a civil magistrate moreover, had a mischievous trick played on him during the riots, which caused him some very rough treatment. Some persons had, unperceived by him, placed some cartridges in his pocket, which, having been discovered by a patrol of the National Guard, they considerably maltreated this innocent and pacific person.

The latest intelligence from Lyons is annexed. It shows that all was again quiet

Telegraphic Despatch from Lyons, 12th April, 11 o'clock at night.

"TO THE MINISTER OF THE INTERIOR:

Lyons is delivered. The faubourgs occupied by the insurgents have fallen into our power. The intercourse is every where re-established. The mails have this evening again taken usual routes. The anarchists are in the greatest disorder."

The vessel of war despatched from Brest for this country with despatches, will bring, we apprehend, assurances that the French Government will make a second effort, in the next Chamber, to obtain a grant of twenty-five millions, due by treaty to America.

The accounts from London are of the 13th, without any news.

The dates from Madrid are of 6th. That capital was tranquil. General *Martinez de San Martin* was just appointed Captain General at Madrid, in place of *M. Freyre*, who became Inspector of Cavalry.

From a passenger we learn that General *Lafayette* was so much debilitated by reason of his indisposition, that fears were entertained for his life.

HAVRE, APRIL 16, 1834.

I send you herewith the Havre paper of yesterday, which contains some particulars of the attempt at revolution in Paris, which has become so fashionable.

Let not the world accuse Louis Philippe, if this monarchy of the people should finish by a military monarchy. You see nothing will do but force. At Lyons, it appears between 5 and 600 workmen and about 200 of the troops were killed or wounded, during the four days which the affair continued. The number of killed and wounded at Paris is reported to be about 100. The Dukes of Orleans and Nemours were fired on at the head of the cavalry, but not hurt. In our country, we talk of bush-fighting—here it is house-fighting. The insurgents concealed themselves in houses, and fired on the National Guard and troops of the line from the window. Some of the former were *poignarded* on their way to their posts. The barricades were but feebly defended.

Well, you see the Chamber, in spite of the Government, has rejected the bill presented for the first instalment of indemnity due to our citizens, on the ground that Mr. Rives obtained too much—no small compliment, *en passant*, to the negotiator. But what is to be done upon the occasion, is the question with every one. The opposition prints reason as if the Treaty was at an end, and that a fresh negotiation must be entered upon. The Government here, and the King the first, will act with good faith; and it appears to be the opinion of the best informed, that the affair will be brought with better success before the next Chamber.

I refer to the papers for what has happened lately at Brussels.

Events at Paris.

April 12.—Several members of the *Société des Droits de l'Homme* were arrested yesterday.

Government have taken strong precautionary measures for securing the tranquillity of the capital. The troops are consigned to their barracks, with a battalion of each regiment for pickets. Cartridges have been delivered out, and during the last night numerous patrols have paraded the streets. It is satisfactory to be able to announce that perfect tranquillity prevailed. A few groups, assembled in the populous quarters of the city yesterday, at the hour when the workmen usually go to dinner, dispersed on the remonstrances of the police.

April 13.—The band of rioters who last night attempted to renew the scenes of the Cloître St. Mary, in this capital, have been, as we fully anticipated in our account given in a preceding column, which was written between one and two o'clock this morning, defeated at every point by the bravery and devotion of the troops and the National Guards, who vied with each other in zeal and energy to put an end to these lawless and desperate outrages. The insurgents had placed themselves at the windows in the se-

veral streets in which they had taken their stand, whence they could fire in comparative safety upon the troops and National Guards, and thus assassinate their brave antagonists. They kept up in this manner an occasional firing during the entire night, which was not returned by the troops; but when daylight enabled the latter to act, to take possession of every barricade, and every house which afforded them shelter, was but the work of an hour, and, between seven and eight o'clock, they were masters of every hostile position. It is stated (but in the disorder necessarily prevailing at a moment like the present, we cannot vouch for the truth of every statement we receive), that in one of the houses, a number of the rioters were discovered, who had been most active in their murderous assailment of the National Guards and soldiery, and that not one of them were suffered to escape alive. The insurgents were evidently intimidated at the break of day by the display of force which surrounded them on all sides, and by the arrival of the artillery; they immediately abandoned their advanced barricades, and retreated to the houses of the narrow streets and alleys, which were then blockaded by the armed force on all sides, and several prisoners made. The National Guards of the Banlieu arrived in Paris during the night, and were stationed in the Place du Carrousel, and, with other detachments are now patrolling the disturbed quarters. At six in the morning the Dukes of Orleans and Nemours mounted their horses and rode to the scene of disturbance, taking the Quays, the Place de Greve, and the adjacent streets, to the Rue St. Martin. They were received in their progress with the warmest acclamations from the troops, the National Guards and the people. They returned to the Tuileries at eight o'clock.

The following additional particulars have reached us relative to the proceedings of last night:—In the 7th arrondissement the whole population, and especially the workmen, beheld with indignation the assassination of a drummer and a grenadier of the 7th legion who were walking alone. An officer of the staff on his way with orders for the 12th legion, received a bullet, which pierced his arm and entered his side. His life, however, is not despaired of. The National Guards and the Line received each other with cries of *Vive la Garde Nationale! Vive la Ligne!* At the Pointe St. Eustache the barricades were carried by a column of two battalions of the 4th Legion of the National Guards, one of the 10th, one of the 1st, and a battalion of the 54th of the Line.—M. Chapuis, Col. of the 4th Legion, a most gallant officer, was wounded in the arm by a bullet, and was replaced in the command by Gen. Alez. The lamps, as a matter of course, was broken by the insurgents in a part of the Rues St. Denis and St. Martin, as well as in several of the adjacent streets; but their absence was made up for by the inhabitants lighting up their houses. The Minister of the Interior remained almost constantly on horseback during the evening. He was with Gen. Bugeaud at the attack of a barricade; a young auditor of the Council of State, an officer of the National Guards who was on horseback by his side, received a bullet in the collar bone.

P. S.—(One o'clock.)—His Majesty is now reviewing the troops in the Place du Carrousel, preparatory to riding through the quarters of Paris which have become the seat of disorder, as he did in June, 1832. He was received by the troops and National Guards, as well as the assembled crowd, with enthusiastic cheers, and cries of *Vive le Roi! Vive Louis Philippe!* The quarters where the disturbances took place are still occupied by the Military and Municipal Guard, and the vigilance of the Government is unabated. Cavalry, infantry, and masses of the citizen troops remain under arms, ready to act at a moment's notice, should their service be again called for, of which, however, we are happy to announce, no apprehension is entertained. A great number of prisoners were made at the various barricades. As the Dukes of Orleans and Nemours were passing the Rue du Ponceau, two shots were fired at them, happily without effect.

The National announces that the patent of M. Mie, printer of the Tribune, has been withdrawn.—The number of this morning has not appeared.

The Lyons mail is still in arrears, so that we remain without any journal from that town of a date later than the 9th inst. Up to the moment of going to press, we could not learn that the Government had received any further details.

Events at Lyons and the Neighborhood.

The Ministerial Evening Journal gives the following details relative to the events at Lyons:—"The government received this morning by express a report of the proceedings at Lyons on Wednesday—

It presents a lamentable picture, since French blood has been shed, but at the same time affords positive assurances of the triumph of order and the law.—For several days the authorities had been warned, and were prepared for sinister occurrences. Every thing showed that the agitators, despairing of success in the capital, where the magistracy is sustained by the National Guards and the garrison, determined to make an attempt in the provinces, and the unfortunate city of Lyons, the capital of industry, obtained the deplorable preference. The *Mutuellistes* appeared little disposed to engage in the plot, and it has been clearly demonstrated that only such workmen as have become connected with political societies, joined the anarchists. As early as the preceding day, the brave General Aimard made his arrangements. The court was well guarded; reinforcements were called in from the environs. The Prefect went to the place St. Jean to judge of the state of affairs, and to consult with the military commanders. Although the court was sitting, the place St. Jean was completely free from any assemblage of the people, and this solitude evidently proved that the anarchists had determined to come *en masse*. In fact, they made their appearance about 11 o'clock. A man read an incendiary address, and in a few minutes after the barricades were begun. The Prefect, without a moment's hesitation, gave orders for their being destroyed.—[Galignani's Messenger, 12th April.]

Major General Buchet, who commands the department of the Bouches-du-Rhône, under General Aimard, directly brought the troops forward. The Gardarmie under Col. Ganuet, and the Infantry, assailed the barricades with the most determined resolution and carried them under a brisk fire. The Prefect never quitted the troops during the action. The barricades were all thrown down as soon as they were raised, but still there were a great many seriously wounded, and some killed, but the greatest loss was not on the side of the troops. The severest part of the action took place in the Palace de la Prefecture. The Anarchists found their most solid entrenchment in the new temporary hall, and it became necessary to beat down the palisades with cannon shot. They were soon destroyed, and those who had endeavored to defend them were put to flight. The place was then entered by the troops, and a long exchange of musketry ensued between the soldiery and the insurgents, who had stationed themselves in what is called the Organ gallery.—Cannon were again used, the Gallery was forced from the alley, and entered. A house, filled with rioters armed with muskets, was burst open by means of petards. A great number of prisoners were taken, some wounded, and others blackened with gunpowder. At every point the troops had the advantage. Other engagements took place on the bridges, at the Place des Terreaux, and at La Croix Rousse.

The cannon and musketry were firing for several hours together in the midst of this commercial city, where nothing would be heard but the sound of the looms, if factions had not attempted to put a stop to them. During a contest of five hours the troops displayed a firmness which must put an end to the criminal hopes of those who, it is said, relied on their defection. The military and civil authorities rivalled each other in zeal and devotedness. It is painful to have to bestow upon them this praise, but it is a duty to do honor to those who most expose their lives for the maintenance of order and the laws. At four o'clock the action ceased. Some few musket shots resounded afterwards at intervals in the streets in the centre of the town. The troops were in repose. The Government has not received any telegraphic despatch since that of yesterday morning, which announced that Gen. Aimard was in full possession of all the positions, but today no telegraphic communication could come beyond Semur. Despatches from all the surrounding country, as well as from St. Etienne, Macon, and Dijon, announce that all was quiet there."

[From the *Journal de Paris* of 12th April.]

On the reception of despatches, requesting the utmost speed in their transmission, at the Maritime Department, at Brest Capt. Bruix, of the brig *le Cuirassier*, was immediately ordered to be in attendance. The despatches from government were handed to him with instructions to make sail instantly for the United States, and to use the greatest exertions to make a quick passage.

A quarter of an hour afterwards the *Cuirassier* was under sail.

NEWS FROM BELGIUM.—Serious disorders have broken out at Brussels. The Belgian Journals of the afternoon of the 6th April give some details of the occurrences of the preceding day and that

morning, but the *Emancipator* of the 7th, which ought to arrive this morning, has not been received. In default of this journal, we give the following extract of a private letter from Brussels, dated 6th of April, six o'clock in the afternoon.

BRUSSELS, SUNDAY, 6th April, 6 o'clock.

You know that our Orangemen, at the time of the sale by auction of the stad of horses at Tervuren, had made a subscription for the purchase of the finest horses in it, for the purpose of presenting them to the Prince of Orange, to whom the stad belonged before September, 1830. The list of subscribers appeared two days ago in *le Lynx*, and amongst them were the names of many of the first inhabitants of Brussels, among others, the Prince de Ligne, M. de Trazegnier, the Duke d'Ursel, the Count de Bethune, &c.

This publication has produced an effect on the people which it is impossible to describe. All day on Saturday it was evident a disturbance was brewing. The manager of the theatre was called upon and requested to give on the following day *The Dumb Girl of Portici*, which piece is connected with the recollections of the revolution of 1830.

In the evening crowds collected—lists of Orangemen were handed about, at last, after the play, a numerous mob preceded to the office of the Journal *le Lynx*, from whence, as a measure of prudence, the publishers had removed the day before. After having broken some windows and destroyed the printing cases, the mob directed its steps to the *Rue de l'Esque*, where an Orange club was a short time since organized, but all the members, warned of the popular movement, had prudently disappeared.

The mob remained together all night. The next morning early they besieged the hotel of the Duke d'Uthel, where they broke all the windows and threw the furniture in the street. The hotels of the Prince de Ligne and Messieurs de Bethune, and Trazegnier were also sacked. The Orange club in the *Rue de l'Esque*, where on the day before, they had only broken the windows, was again visited and devastated. Numerous mobs paraded the streets with flags flying, and displaying lists of Orangemen whom they threatened to punish.

The troops sent by the Government against the rioters appeared to show little desire to disperse them. They confined themselves to preventing the devastation becoming a pillage. A certain number of arrests were made, but almost entirely of individuals who were carrying off the furniture which had been thrown into the street.

In the afternoon at 3 o'clock, the drum called the civic guard to arms, which, however, assembled but slowly.

It is the general opinion here that all these mobs are excited by those who appear to be the victims of them, and that the object is to bring about a conflict between the troops and the patriot part of the population, and thus give better chances of success to an attack which is preparing by the Prince of Orange, and which is shortly to take place.

What renders this conjecture probable, is the news received here, that two days since the Prince quitted the Hague for his head quarters.

King Leopold went out this morning in the streets of Brussels on horseback, accompanied by a numerous staff. He was very well received by the people, without his presence preventing the continuance of the disorders.

JOSEPH BONAPARTE published the following letter in the London Morning Herald.

To the subscribers of the petitions addressed to the Chamber of Deputies calling for the repeal of the law of banishment, enacted in 1815, against the family of Napoleon.

Gentlemen—Your voice was raised in favor of the family of Napoleon. We love to believe that it expressed a popular wish. Yet it was not favorably received by a majority of the Chamber in the Sitting of the 22d February. Notwithstanding, we are not less bound to offer you the tribute of our hearty gratitude as well as to the members of the minority, the real organs of the national sympathies.

On that occasion the President of the Ministerial Council, the Duke of Dalmatia, Marshal Soult, Major-General of the Emperor at Waterloo, and my old Chief of the Staff in Andalusia, &c. stood forth as our accusers, and not satisfied with proscripting us, was daring enough to assert that the brothers of Napoleon had not refrained in foreign countries, from the intrigues of factions. I alone, of all the brothers of Napoleon, resided in a free country, at the period of the revolution of 1830. I was alone in a condition to testify to France the son of Napoleon, with whose sentiments, although French, I was acquainted. I wrote to the Chamber of Deputies on the 18th of

September, 1830, from New York. The new King was proclaimed when my letter reached Paris; it was not read in the Chamber. I arrived in England after the Reform Bill, and on the same day saw in the public Journals the announcement of the premature death of my brother's orphan. At the same time I learned France was still closed against us. I have waited under the social securities (which are not deceitful illusions here) in expectation of the moment when the voice of the French People, restored to itself, would destroy this monument of national bondage exacted by foreigners in hatred of the French revolution, and of him who was its most formidable representative.

The France of July has erected his statue; his family are still proscribed; their only crime being the name which Napoleon bequeathed to them. I could not but hope for the repeal of an unjust law, which I hastened with all my might, not so much on account of my private interests, but rather in behalf of fifty members of our family, and, still more than all, for the sacred interest of the outraged national dignity.

Such are the intrigues of which I take a pleasure in rendering a full account to my fellow citizens. I appeal to the impartiality of their judgment, and they will persevere in manifesting it in a legal manner, by availing themselves of the sacred and inalienable right of petition. If the Paris police can discover any other intrigues, I urge them to disclose them to the President of the Council—I defy him to produce a single proof in support of his calumnious assertions—I do not wish to recriminate further.

With respect to the proposition for giving us permission to reside in France, according to the good pleasure of the ministers, we trust that no one will believe that a single member of our family would ever wish to return to it stripped of the security of the common law. It would be a strange spectacle, truly, were the family of Napoleon, to constitute, amongst a great people, a class of ministerial hostages! It could not have been, certainly, to degrade us, that you demanded our return; and the members of the Chamber of Deputies who repudiate the law that deprives us of our right as citizens, have been the interpreters of our sentiments and of yours. It is the country, with all the rights and all the responsibilities of a citizen, that we seek for, which you seek for us, and we hope to obtain from the nation's will.

In order to decry us in the eyes of the new generation, and to justify both the banishment and confiscations with which we have been visited, they have made us pretenders. We belong to the age in which we live—we are the creatures of France, in 1804—Frenchmen, subordinate to the French in 1834—we are aware that the generation of to-day is not bound by the will of its ancestors, that nations may perpetuate, alter, modify, restore, and destroy whatever has been established in former times, and under a different state of circumstances—we have ever known that families, as well as individuals, were bound to free nations by duties and not by rights. Had Napoleon been alive at this day, he would have concurred with us—he would have recognized the sovereignty of the French people, who alone have the right to give that government, which seems most to their interest, or according to their pleasure, nay, even according to their caprices. The Dictatorship too long maintained by Napoleon, caused him to be misunderstood by some persons. This Dictatorship was prolonged by the perverseness of the foes of the Revolution, who would have destroyed in his person, the principle of national sovereignty, of which he was but the emanation.

But at the general peace, universal suffrage, the liberty of the press, and all the guarantees of enduring prosperity of a great nation, which he contemplated, must have wholly unveiled him to France, and must have enabled all his contemporaries to form the same judgment of him, as posterity will entertain. His whole thoughts were known to me, and my duty is to proclaim them loudly. He sacrificed himself on two occasions to prevent a civil war in France. Those who inherit his name, would renounce for ever the felicity of breathing the air of that country, could they believe that their presence would be a source of the slightest disturbance to her peace. Never will they relinquish their appeal to the nation.

Such are the principles, opinions, and feelings of the whole of the members of the family of Napoleon; of whom I am the organ—all for the people and by the people.

With such sentiments, gentlemen, and fellow citizens, shall we vindicate, I trust, the patriotic anxiety which you have testified towards us.

JOSEPH NAPOLEON BONAPARTE.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 25 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthen, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 40, page 728 of this Journal.

RAILROAD TURNOUTS, REVOLVING PLATFORMS AND SIDELINGS.

The subscriber having been for some years engaged in constructing turnouts, and inserting the necessary switches and fixtures appertaining to the same, on the Baltimore and Ohio Railroad, and as those works on that road will be shortly completed, he is desirous of being employed by any Railroad Company requiring work of the above description.

He will either contract at a fixed price to execute the work, he providing all the necessary materials and fixtures, or otherwise, or he will engage himself at a stated salary.

In relation to his abilities and general character he begs to refer any Company, disposed to engage him, to the Baltimore and Ohio Railroad Company.

Letters can be addressed to him at the Office of Construction Baltimore and Ohio Railroad, Baltimore.

REUBEN ALER.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by

E. & G. W. BLUNT, 164 Water street, J31 St corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principle of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1833.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. M. GILL, Civil Engineer.

Germanstown, February, 1833.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad., Germantown, and Norris, Railroad

ml 17

LATER FROM EUROPE.

By the *Napoleon*, there are dates from London to the 24th ult.

Parliament reassembled on the 18th, and Mr. O'Connell made along speech on the 22d in favor of a repeal of the Irish Union. He was to be replied to by Mr. S. Rice.

The Ministry had entered with zeal upon some important measures, viz:—for the commutation of tithes—for the abolition of church rates, a tax particularly odious to dissenters, who were made to contribute for the repairs of churches in which they do not worship—for a system of national education, &c.

An immense meeting of the Trades Union, to the number, the Times estimates, of two hundred thousand, paraded London and Westminster with flags and banners on the 22d, in order to petition the King for the mitigation of the sentence of certain *Dorchester rioters*. Every preparation was made by the authorities to preserve the peace, and the meeting passed off quietly and without effecting its object—the King having been advised to refuse to receive a petition from a multitude, or a deputation thereof, while the multitude were at hand, and in motion, as if to overawe the Throne.

The disturbances in Brussels had given to King Leopold a pretext to revive an old law for the exclusion of foreigners from the kingdom; and many, accused of fomenting disturbances, had accordingly been sent off.

From Spain the accounts are encouraging, since the Queen Regent has decided on the convocation of the Cortes, *per estamentos*. We give the decree at length, as it may be looked upon in some sense as a constitutional Charter given to Spain. No time nor place had, however, as yet been named for the meeting. [It will be published in our next.]

Spain has agreed to acknowledge *Donna Maria* as Queen of Portugal. Rumors of changes in the Spanish ministry, by the expulsion of *Burgos*, *Zarco del Valle*, and their partizans, and the substitution of more liberal Ministers, had reached London, but were not confirmed; and the decree requesting the convocation of the Cortes, bears, it will be seen, the signatures of these functionaries.

The motives for calling the Cortes are set forth in a long report, for which we have not room.

In France order was restored, and at Lyons the operatives were returning to their work. The injury and loss, besides that of life, occasioned by the sanguinary tumults in that city, are spoken of as very great and distressing. The dates from Paris are of the 21st.

The telegraphic despatch, purporting to have been sent from Lyons at 11 o'clock at night of the 19th April, and published in the Paris papers of the 15th as official and authentic, proves to have been unfounded,—since the riots and battle continued, as will be seen by our extracts, some days afterwards. The latest intelligence however leaves no doubt now that the disturbances were at an end.

The Journal du Paris of the 18th says—"Government has today received despatches from Lyons, and from all parts of the kingdom where the anarchists had attempted disturbances. Order is re-established everywhere."

PORTUGAL.—There are dates from Lisbon to the 14th April, and they bring an account of the Miguelites having despatched from Santarem a large force, which made an attack upon St. Ubes on the 12th, but was repulsed with considerable loss. The attack served to elicit the zeal of the troops in Lisbon, many of whom, particularly the foreigners who were lately in disgrace, volunteered to go to St. Ubes, to assist in repelling it. Their services were not accepted.

An attempt was made by Lord Howard De Walden and Admiral Parker, on the 31st March, to induce Don Miguel to leave Portugal, upon the following

terms. He was to be allowed a safe conduct out of the country, and a liberal income, guaranteed by England; an amnesty was to be granted to all his followers; and his own right of succession to the throne recognized in default of issue of the Queen. These terms Miguel rejected.

TOWNSEND & DUFFEE, of Palmyra, *Manufacturers of Railroad Rope*, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon Dale, Luzerne county, Pennsylvania. Hudson, Columbia county, New York, { January 29, 1833.

NOTICE TO MANUFACTURERS.
SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 60 nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A29if RM&F

TO IRON MANUFACTURERS AND OWNERS OF IRON ORE BEDS.

JOSEPH GOULDING, of Keeseville, Essex county, N. Y., has invented and patented a *Magnetic Separating Machine*, for separating Iron Ore from the extraneous matter usually found in connection with it; and he begs leave to recommend it to the especial notice of owners of Ore Beds as possessing qualities of great importance, as by the use of it many ore beds can be made very valuable, it being applicable in all cases when the Ore is magnetic.

The quality of the iron made is much improved by the process of separation, indeed good iron can, after separation, be made from ore which would without it be considered not worth working. There is also found to be a great saving in the transportation of ore, and in time and fuel required to work the same into iron.

Mechanics can be furnished at short notice which will separate from half a ton to twenty tons each in twenty-four hours. J. Goulding also manufactures to order, *Cylindrical Forge and Blast Furnace Bellows*, of the most improved construction, and which are successfully used in nearly all the Forges and Furnaces in Clinton and all the adjoining counties. January 20th, 1834. M 14/f

RAILWAY IRON.

Ninety-five tons of 1 inch by 1 inch, Flat Bars in lengths of 14 to 15 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, applicable to suit.

200	do.	1 1/2 do.	1 do.
40	do.	1 3/4 do.	1 do.
800	do.	2 do.	1 do.
800	do.	2 1/2 do.	1 do.

soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 3 3/4, and 4 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Government, and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON,
9 South Front street, Philadelphia.
Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them. d71meowr

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with **FRESH GARDEN SEEDS** upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBUEN,
347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* * * Mr. Thorbuen is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine. MECHANIC'S MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly, either or all of which may be seen and obtained by those who wish them by calling at 347 North Market street, Albany.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation. J 25 if

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.
J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. m18

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Eng. neers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable.

They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,
Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1836
To Messrs Ewing and Heartt.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use.

The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,
Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same. m18

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, MAY 31, 1834.

RAILROAD MAP.—We have again to ask the indulgence of those who have subscribed for the Railroad Map. We were obliged, even after it was nearly ready, to have it *re-engraved*, which of course has very much retarded its appearance. It will, however, be far more complete than at first contemplated, as there will accompany it a concise description of the most important railroads and canals, compiled from the best sources within our reach, which will render it far more useful to those who desire to see at a glance the numerous works of the kind now constructed, constructing, and in contemplation.

It will be forwarded as soon as completed to those who have ordered it. It is desired that those who wish it, but have not ordered it, will let us know at an early period, that all those for a distance may be forwarded at the same time.

It comprises all that section of the U. States and Canada in which there are any works of internal improvement. And in order that the account to accompany the map may be as complete as possible, we desire that a short statement may be forwarded to us at the *earliest possible period*, by the engineer, president, or agent of each company now constructing, or preparing to construct, any work of the kind within the limits of our map. It will cause them very little labor, yet confer upon us a great favor; and we in our turn will endeavor to reciprocate their kindness.

We also ask for a statement of the present

condition of, and amount of business done on, those works which are now in use, excepting the South Carolina Road, the Chesapeake and Ohio Canal—statements relative to which we have already received.

BOSTON AND PROVIDENCE RAILROAD.—We have been favored with a copy of the charter granted by the Rhode Island Legislature, at their late Session, for the continuance of this Road from its termination at the Massachusetts' Line to tide water in Providence. The company, although for a time kept in suspense, have, as will be seen by the following extract from the charter, very little cause to complain. The charter is a very liberal one.

"And the said Corporation are hereby authorized and empowered to locate, construct and finally complete a Railroad in such manner and form as they shall deem most expedient, commencing at the dividing line between this State and the State of Massachusetts, and at that point which shall intersect and connect with the railroad now being constructed by the Boston and Providence Railroad Corporation, from the city of Boston in said State of Massachusetts, towards the State of Rhode Island; and from this dividing line as aforesaid passing into the State of Rhode Island to tide water in the city of Providence, in such place or places as may be deemed most convenient for said company, and with such lateral branches of said road to any part of the waters of Narragansett Bay, or to any villages or factories as the said company shall deem expedient, provided the same do not interfere with the privileges heretofore granted to any other railroad company."

Twelve miles of the road commencing at Boston are completed, and will be opened for use on Tuesday next, the 3d of June. For the purpose of witnessing this event the directors will assemble in Providence, and on Monday pass along the line towards Boston, with such gentlemen as desire to examine the route, and witness its state of forwardness; and on Tuesday they purpose an excursion in their passenger cars, with a locomotive engine, on that part of the road which is completed.

The Agent and Engineer will please accept our thanks for his polite invitation to be one of the party. It would afford us great pleasure, but other engagements will probably prevent.

The railroad between Buffalo and Black Rock, in the State of New-York, has been finished in part, and the cars have commenced running on the Buffalo end of the route. At the Black Rock end, a line of stages conveys passengers to the Falls.

INTERNAL IMPROVEMENTS IN CANADA.—We publish to-day an account of two contemplated works of improvement in Canada, which, when completed, will afford great facilities to the inhabitants of the upper provinces. The first is for a canal from Port Hope, on Lake Ontario, to Rice Lake, and probably to Lake Simcoe, from which there is a water communication with George's Bay and Lake Huron. The other, a railroad from Ancaster, at the extreme west end of Lake Ontario, to the town of London, on the river Thames, and probably to Lake Huron. These are works of great importance to Canada. It will be seen, by a glance at the map, that these works, if completed, taken in conjunction with the improvement of the St. Lawrence, now in contemplation for steamboat and sloop navigation, will divert much of the business now done upon the Erie Canal—and that they will be completed, we have little doubt.

What, then, ought New-York to do to retain her share of the business? She *ought*, and *must*, construct a sloop and steamboat canal from Oswego to the Hudson. That, and only that, will secure her just proportion of the business.

AUGUSTA AND ATHENS (GA.) RAILROAD.—The continuation of the South Carolina Railroad to Athens, (Ga.), or rather the construction of the Augusta and Athens Railroad, which, we hope, will soon be commenced, will constitute another very important link in the great line to the Mississippi River, for short of that point it certainly will not be terminated.

POSTS.—The Maine Farmer states that Mr. North, of Augusta, several years ago, set two posts near the river. One was butt-end up the other butt-end down. Both were equally sound when put into the ground, and now the one with butt-end up is sound and good, while the other is decayed.

CANAL FROM RICE LAKE TO LAKE ONTARIO.—The following is an outline containing the most essential features of a Report to His Excellency Sir John Colborne, on the practicability of connecting Rice Lake with Lake Ontario, by a Canal through Port Hope, by Mr. R. A. Maingy, Civil Engineer.

Mr. Maingy commenced his survey about the middle of December last. The object was to ascertain the cheapest and most direct route from Rice Lake to Ontario.

A very formidable difficulty presents itself within a few yards of Rice Lake, in a high ridge of land stretching in an East and West direction from near the mouth of the river Trent, quite through the country, into the State of Ohio, rising from a few yards to many hundred feet above the level of the waters in Rice Lake. It being necessary to procure a sufficient supply of water from the Lake to feed the Canal for the first three miles—this barrier appeared at first sight as an insurmountable obstacle to the undertaking; but, by persevering in his researches, discovered a natural passage or ravine through it, well calculated to assist in passing through this formidable ridge; although its adoption will occasion the route of Canal to be more circuitous than could be wished, from its being necessary to follow the ravines the whole distance to Port Hope—still it is the only chance there is of bringing the waters of Rice Lake down to Port Hope.

Mr. Maingy's attention was next directed to the choice of a place at which the Canal should commence at the Rice Lake, and Orton's Creek has been determined on, on account of an excellent harbor and many other advantages.

The proposed dimensions of the Canal are twenty-two feet broad at bottom, with a slope of one foot and a half horizontal to a foot perpendicular, and four feet depth of water, with locks seventy feet long, by fourteen feet broad, and in general ten feet lift. It is also proposed, in consequence of the very great distance from the intended line of Canal, at which proper building stone can be procured, that the locks should be built of wood, which, if properly constructed at first, will, with occasional repairs, last from fifteen to twenty years, and be equally as useful as those of stone, the interest on the difference of expense between them will more than repay the cost of maintaining them in repairs, and should it ever be contemplated to increase the dimensions of the Canal, those built of wood can be readily removed.

The route of Canal follows the natural passage before mentioned, in a southerly direction; after crossing the Cobourg Road, the land rises very rapidly until it arrives at the summit of the ridge, distant from the Lake one mile and a quarter, and 63 feet and 15th-hundred part of a foot above its level; on the north and south sides of which summit, (at a few yards asunder,) two springs take their rise, one sending its overplus water into Rice Lake, through Orton's Creek, the other running south from the head of Howe's Creek, and discharges itself into Lake Ontario. Both are, however, very insignificant; from this point the route continues in nearly a straight direction, until it crosses the Cavan Road, at the corner of Howe's Inn, and enters a ravine running in a due west direction to Moon's clearing, the termination of the first section, and three miles distant from the place of starting—the fall of the land from the summit is very rapid until at Moon's, where the route is once more level with the waters of the Lake. The expense of this section will be very great, in consequence of the great depth of cutting, no less than £63,495 14, as per annexed estimate. A guard gate at the head of the lake will be required to protect the Canal against spring and fall floods, that otherwise would have a tendency to obstruct the navigation, as also to shut out the supply of water in case of any accident occurring along the line of Canal. The next section continues in the same direction for a mile, and then turns to the south. The land being considerably below level, and being well adapted for damming, it is proposed, at the point

marked A, (see plan,) to build a dam of such dimensions, that it will not only resist the effects of frost, but also serve the purpose as a road. An embankment to confine the water from drowning too much land will be required on the north side of the ravine, unless the land which is of no value can be procured in gift, (which is not improbable, from the anxiety of the different holders of land along the route of Canal, to see it go into immediate operation,) in which case a saving of £2,005 0s. 6d. may be effected in this section,—to provide against floods, as also to carry off the overplus water, it will be requisite to construct a waste wier in the dam, and two along the embankment; the former will be very valuable for any hydraulic establishment, and would, in the course of a few years, more than pay the expense of erecting the dam, &c., as also keeping it in repair. In the next section, running in a southerly direction through Mr. Trotter's land, being much above the level, there will be some extra excavating, and, as per annexed estimate, the amount required to complete it will be £4,758 7s. 4d. The section commencing near Mr. Riddle's land, follows the same direction as the last, to its termination in the centre of Mr. Seaton's clearing—in this mile nine locks, of ten feet lift each, will be necessary. Smith's stream is frequently crossed in this and the two following sections, but no culverts will be required, as its course can readily be changed, until such time as the work be completed, when it is intended to admit it into the Canal,—the cost of this section, as per detailed estimate, will be £4,533 6s. The next mile, which is somewhat winding, commencing in the 9th lot of the 6th concession, follows the before mentioned creek in the 7th lot, then turns back with a gradual bend into the 10th lot, back again into the 8th lot of the 5th concession, and terminates at Messrs. Boen and Coy's mill pond. In this section 6 locks, of 10 feet lift each, will be necessary—cost of this mile £3,306 19s.

The 8th section, terminating at said mill dam, will cost but little, it being intended to make use of the pond, as being a canal already formed: by raising the present mill dam from 5 to 15 feet, it will drown the ravine as far back as Fye's clearing, the termination of the last section, and afford more than sufficient depth of water for the navigation, at the small cost of £370, and at the same time serve as a reservoir for supplying the locks, and by raising the water on a level with a small ravine, through which it is intended to leave the pond; much extra cutting will be saved in the next section which, commencing at this point, continues in a south-east direction through the lands of Messrs. Jamieson and Quay, and by six locks, (one of five feet, and five of ten feet lift,) descends into Bedford's Creek, which turns its direction to the south. The cost of completing this mile, (in which there is some extra cutting in passing from the mill to the creek,) as per annexed estimate, will be £5,284 3s. 6d. The 10th section continues still to following the course of the same creek, which is admirably adapted for damming, (its banks being very steep, and not more than eighty feet asunder,) were it not for the rapid fall of the land, which will require four locks of ten feet lift each, and cost, agreeably to the annexed estimate, £2,527 17s. From this last section, following the same creek to the termination of the 11th section, at John Brown, Esq.'s mill pond, two locks, of ten feet lift each, will be necessary, and the cost of completing it will be £1,754 3s. 6d. 12th and 13th sections, commencing at the mill pond, which it is intended, by the formation of a tow-path along its bank, and clearing it of its stumps, &c., to use, as part of the Canal, terminates in John D. Smith's property, near the stone quarry. One lock, of ten feet lift, will be required to descend into, and two locks, (one of five and one of ten feet lift,) to descend out of the pond. The expense of this section will be £2,012 15s. 6d. The 14th and last section runs on the east side of Smith's Creek, and passing in front of the post office, terminates at the boundary line

of the Wharf Company's Land. In this section there will unavoidably be some rock excavation, also some embanking, and five locks, one of five feet and four of ten feet lift.

The whole distance, from Orton's Creek, in Rice Lake, to the Wharf, at Port Hope, is 14 miles, within a fraction, and the difference of level between the two lakes is 361 feet, and 32 hundredth parts of a foot, as per annexed estimate, which has been carefully made. The amount required for completing the communication, will be £101,535 15s. 6d.

The ultimate success of any measure for facilitating the communication of the Rice Lake with Lake Ontario, depends wholly upon its connection with an accessible harbor. The reporter considers that he has sufficiently informed himself of the localities of the shores of Lake Ontario, to be able to say with confidence that Port Hope, from its position, is not only the natural, but the most accessible, point of communication to the chain of navigable lakes by which this section of country is every where intersected. Its natural disadvantages are very few, and capable of being greatly improved; the harbor, when completed, (which it will be this summer,) will be one of the safest and most convenient ones between this and Quebec, and capable of sheltering any number of ships that are likely at any time to be found on these waters.

As no natural intercourse, however perfect, if comparatively distant and prolonged, can be of much benefit to the district from whence it proceeds, so neither will a communication, however short, be of much utility, if it does not possess a proper outlet for the produce of the country at some convenient harbor.

That the position of Port Hope is particularly favorable for the termination of such a work, must appear evident to every partial observer; it is not only the shortest possible distance from Lake Ontario to Rice Lake, possessing a safe and commodious harbor, but its eminences present every facility for defence in case of war; and the communication from Lake Ontario to Rice Lake up to Lake Simcoe, can by this route be completed for a sum not greater than is necessary merely to open the navigation from the mouth of the Trent to Rice Lake. These are facts that cannot be refuted, and which the reporter sincerely hopes will induce its being adopted and undertaken by the province in lieu of the round-about and expensive route by the Trent.

An estimate follows the report, which it is not necessary we should particularize; it is sufficient to say that it amounts to £101,426 6s. 6d. currency.

LONDON AND ONTARIO RAILROAD.—We perceive, by the True Patriot, that the first meeting of the friends of the London and Gore Railroad was held in London on the 7th ult. and we rejoice to find that stock to the amount of 400 or 500 shares was taken up before the meeting adjourned. A committee to select subscriptions along the line of the contemplated road was appointed, and stock books placed in their hands, or transmitted by mail to such gentlemen of the committee as were not at the meeting. The Act requires that stock to the amount of £25,000 be taken up, before the company can be completely organized; and it appears by a letter received this day, by E. A. Talbot, Esq., from the Secretary of the Committee at London, that there is no doubt of that sum being subscribed by persons possessing property on the line of the intended road. We have heretofore avoided making any allusion to the act of Incorporation of the London and Gore Company, solely because we felt apprehensive that the undertaking of such magnitude was beyond the means of the persons most interested in carrying it into effect; and friendly as we have ever been to public improvement, and highly appreciating the zeal of the gentleman to whose management the procuring of the charter was committed, we were unwilling to throw any obstacle in his success in so important an

undertaking. When it is considered that every landholder within ten miles of the intended road must be greatly benefitted by its completion, and that the produce of the finest and most fertile part of the country of America must, in a few years, be of little value unless some such improvement is effected, we are not at all surprised to hear that the farmers are coming forward to take stock, solely under the influence of an impression that, should the business on the roads make no return in the way of tolls, their lands would increase in value to such an extent as fully to justify the investment of whatever capital they may possess. The sum of £100,000 is said to be amply sufficient to make an excellent iron or wooden railroad from London to Hamilton, or Dundas, and if any farmer whose land would be increased in value 50 per cent. by the completion of so magnificent an undertaking, was to take up two shares, which for the most would only subject him for two years to a quarterly payment of £3 2s. 6d. it would be unnecessary to open a stock beyond the line of the intended road. Should the Company succeed, (as we hope sincerely they will,) in making the road from the head of the Lake to London, there can be no doubt of its being continued to the navigable waters of the Thames, or of its being one of the most profitable investments of capital in this country. A single glance of Samuel Taylor's new map, on which the intended line of the road is marked, and the extensive region bordering on Canada, west of the St. Clair, will be sufficient to show that in the event of its continuance either to the navigable waters of the Thames, or to the south-western extremity of Lake Huron, the Company must derive all the benefit of the extensive carrying trade and travel now going on between the eastern and western States of the Union.—[Toronto Courier.]

Wedge Wheels—Indian Arts and Manufactures. By JOHN ROBISON. [From the London Mechanics' Magazine.]

SIR,—In the Mechanics' Magazine for April there is an article entitled "Hancock's Wedge Wheels," in which, although no direct claim of novelty of invention is made by your correspondent, most readers will be led to infer that the construction of the wheel is new, and the invention of Mr. Hancock. I beg, therefore, to state that as far back as the year 1811, I had wheels with the spokes and naves of the same identical construction, made at Hyderabad, for some artillery carriages. I had a pair made at the same time for a currie, in which the nave was fixed on the axle by double nuts and an oil-tight cup, like Collinge's patent. In the putting together of these wheels, I used a precaution which appears to have escaped your correspondent. I made the butts of the spokes a little too full to admit of their touching the metal box, leaving a vacuity or near an eighth of an inch between them; a corresponding opening was left at the joints of the felloes, and the consequence was that on the tire hoop being put on, its contraction forced the spokes home to the box, and wedged them so hard together at the shoulder, that, even in the hot climate of India, I never observed a spoke become loose by shrinking; it need hardly be said, that the bolt-holes in the butts of the spokes require to be made of an oval form, to admit of the contraction taking place without bending the bolts. My naves were of gun-metal, and I found it better to have the holes of the inner flanch tapped, than to have nuts on the bolts.

A construction very analogous to this has long been in use in the Madras Artillery, in which service I have always understood that it gave every satisfaction. I once witnessed

a striking proof of its good qualities, in seeing a field-piece upset in the course of a charge over some rocky ground, and dragged some yards on its back, until it again righted, without any thing appearing to have given way; in such cases, when the wheel fails, the butts are all left firmly seated in their place, and the spokes break off near to the edges of the flanges.

I observe you have an Indian correspondent, who occasionally gives you descriptions of tools and practices in use among the native workmen. He has omitted to notice one which may be made useful in this country: the saw of an Indian workman always cuts in the pull, and not in the push; by this means a thin bladed saw may be made to do the work of a strong one, as no application of strength in pulling will cause it to buckle. If small saws, such as key-hole saws, were formed to cut by the pull, they would not be so liable to break as they are at present; and if saws for pruning fruit trees were so made, they might be fixed to the ends of long poles and worked from the ground, without requiring the use of a ladder. The common hand-saw in India is from 14 to 18 inches long, with a handle like that of a duelling pistol.

If you have the means of communicating with your Bombay correspondent, you should ask him to get you an account of the processes followed by the lapidaries of the north-west of India, where they make cups and other things of agates, at so cheap a rate, and yet so much cut, that they must have some expeditious methods which may be useful here if known.

I am, sir, your very obedient servant,
JOHN ROBISON.

On the Color of the Air and of Deep Waters, and on some other Analogous Fugitive Colors. By COUNT XAVIER DE MAISTRE. Translated from the Bib. Univ. by Prof. J. Griscom. [From the American Journal of Science and Arts.]

(Continued from page 308.)

Having considered the opaline property of air and water, let us now examine the production of opaline blue in opaque bodies.

The cause of the blue tint assumed by the fine skin which covers the veins has hitherto been a doubtful question. This phenomenon, which is uniformly connected with the opaline property of the skin, is mentioned by Leonard De Vinci; let us first see the conditions under which it exists.

First, the vein must be deep enough to absorb all the light transmitted by the skin; and the skin must have the thinness requisite to transmit a great portion of the light. If the vein is thin, it reflects the color of the blood and becomes red;* this color, mixing with the opaline blue of the skin, forms those violaceous tints observable on the countenances of persons of dark complexion (brouille). If the vein is still thinner and nearer the epidermis, the transparency of the skin increases and the red color is more distinct; finally, a tissue of imperceptible veins, very near the surface of the skin, colors the cheeks and lips of young people of a fine complexion, with a uniform red; but we may observe that these beautiful colors have not the exact tint of the blood which produ-

* It is thus that a wide barometer tube, filled with colored wine, appears black, while a thin thermometer tube, under like circumstances, is of a beautiful purple.

ces them; it partakes of the opaline blue, which renders the color slightly carmine, and tinges sometimes the lips of sanguine people of a purple or violet hue.

Thus, the difference which may exist in the size of the blood vessels, and in their proximity to the surface, is sufficient to produce all the shades of blue, violet, red and purple, which are seen in the human face, by the mixture of the opaline blue of the skin with the red of the blood.

The red color of the blood is not the cause of the blue tinge of the veins; it might be black or green without occasioning any change; it is enough that the coloring principle absorbs all the light transmitted by the skin. This result may be artificially produced by a very thin plate of ivory, which has nearly the same effect as the skin. If a few drops of ivory black, prussian blue, cochineal, or bile, sufficiently dense to be opaque, be placed on one of its surfaces, they produce alike a blue tint on the opposite surface, because they equally absorb all the light transmitted by the ivory. But if, instead of a coloring matter which absorbs light, we use an opaque reflecting coloring substance, we have a tint compounded of opaline blue and that of the color employed.

The red oxide of lead placed on the ivory gives on the opposite surface a slight tinge of carmine. Some painters avail themselves of this property of ivory, in sketching the cheeks and lips of their portraits, by placing a coat of minium on the opposite surface, and thus obtain indirectly the effect of a slight use of carmine.

But if, instead of minium, Naples yellow be put on, there is on the opposite surface a green spot. In both these cases, then, the opaline blue is mingled with the proper tint of the opaque reflecting color, while the blue alone appears when the applied color absorbs the light transmitted by the ivory.

The mixing of colors in oil painting furnishes still more evidently an opaline blue. The most common case is the mixture of white with vegetable black, which produces a bluish shade. Various writers have adverted to this, and as indigo and prussian blue, in mass, approximate to black, it was thought in former days that blue was a mixture of light and shade; but the blue produced on this occasion belongs exclusively to white and not to black, as is proved by the following process: two plates are painted of a grey color, one by a mixture of ceruse and charcoal ground in oil, the other by superadding to a coat of white a glazing of charcoal, so that they may both have the same depth of shade; the first will be bluish, the second grey, without a mixture of blue.

As transparent colors in oil lose almost wholly the color which they have in a pulverulent state, and thus in mass approach to black, the mixture of them with white produces also opaline blue, which modifies the natural shade of the color.

Every painter knows the striking difference there is between the color of a mixture of cochineal lacker with white, and that which the same lacker produces as a thin coating upon a white ground; the first is of a violet color, and the second has all the purity and splendor which is characteristic of this fine color. Thus artists, who wish to obtain the beautiful red of cochineal or madder in their draperies, always employ these lackers in mixture (en glacis). Opaque reflecting colors, such as Naples yellow, chromate

of lead, yellow ochre, produce, as well as white lead, opaline blue, by a mixture with black, and the effect is still more sensible. These compounds, according to theory, ought to give only shades of yellow; and yet their tints are decidedly green, so that they are often used for painting the deepest verdure of landscapes. In these cases it is the opaque reflecting color which is opaline.

I have stated the most remarkable instances of the singular property which certain colors possess of producing opaline blue by mixture, but there is an infinite number of other modifications less apparent, resulting from mixtures of compound colors, which it would be impossible to describe, but which may always be pre-ascertained by the following rule: *When white lead or opaque reflecting colors are mixed with black, or with transparent colors, there is a production of blue, and a consequent modification of the primitive shade of the coloring matter.*

These modifications are often very slight, but they do not escape attentive observers. In the preceding observations I have described effects, well known, it is true, but which appear to have no analogy to each other, and which appear to me to depend wholly on the peculiar property which the blue ray possesses of being reflected, in preference to other rays more or less refrangible, by the simple mechanical resistance of the molecules of bodies which transmit light. This resistance takes place in large masses of transparent fluids, as in air mixed with watery vapor, and in water mixed with air.

It takes place also in opaque bodies which are less transparent, but under smaller dimensions. Lastly, it is observed in white opaque or colored bodies, as in the fine skin which covers the veins, and in mixtures of colors.

Plan for raising Vessels sunk in Deep Water.

By Mr. JOHN MILNE, Teacher of Architectural and Mechanical Drawing, Edinburgh. [From the London Mechanics' Magazine.]

SIR,—Having read in a recent number of your Magazine, that Dr. Hancock has proposed the use of air as a power for raising goods, &c. from the bottom of the sea, I beg to forward to you a pamphlet of mine published in 1828, which contains, among other plans, two on this very principle. They attracted some share of attention at the time of publication, but neither of them has ever, as far as I am aware, been carried into actual practice. Should you see cause, I shall be glad to find that you have drawn the attention of the public to this important but neglected subject. I am, respectfully, your obedient servant,

JOHN MILNE.

The pamphlet obligingly forwarded to us by Mr. Milne,* is entitled "Plans for the Floating Off of Stranded Vessels; and for raising those that have foundered; with an Improved Method of Carrying Vessels over Banks in Shallow Water." Of the two plans to which Mr. Milne more particularly invites our attention, one is adapted to the case of ships sunk near the shore, and the other to deep sea operations. Both are on the same principle—both exceedingly ingenious, and, in our humble judgment, quite practicable. We shall extract the author's description of the first at length, and beg to

* Author of the excellent "Practical View of the Steam Engine."

refer those who may be desirous of further information on the subject, to the work itself, which is altogether well deserving of perusal.

"I shall now describe the application of these air buoys,† to the raising of a vessel that has been sunk in deep water; but before doing so, it may be proper to mention the disadvantages attending the common practice. At present we pass one or more chains round the wreck, and by means of these chains suspend it by one, or between two floating vessels, a process which in deep water is attended with much expense and uncertainty, because no sufficient power can be applied from the floating vessel to raise the wreck at once to the surface. Moreover, from the great weight of the wreck, and from the manner of placing the chains about it, they are liable to cut the timbers of the ship, as in the case of the Comet steam-boat (see Narrative of the Loss of the Comet steamboat). The operators must wait till the lowest ebb of the tide, then, pulling up the ends of the suspending chains and securing them, the rising of the water acting upon the floating vessels, lifts the wreck from the bottom; and while the tide rises, they proceed with their load towards the land, until the suspended vessel again rests upon the bottom, by the water becoming less in depth. Hence, they cannot, during one flowing tide, raise the sunk vessel more than

the height to which the water had flowed from its lowest ebb, which at a maximum on the British coast does not exceed sixteen feet, and they must now suspend their exertions till the end of nearly twelve hours.

"Before that period arrives, however, a storm comes on, the workmen desist from their operations, and it not unfrequently happens, that before they can again commence their labors, the object of their toils has broken up, or has been imbedded in the sand.

"These inconveniences being obvious, I propose the following methods. The place of the wreck being ascertained by an improved drag, which at present I shall not describe, let her state be ascertained from a diving bell, and let there also be sent down with it a number of the before-mentioned buoys, in a perfectly collapsed state; and let the diving operator stow them away in that condition below decks, also hooking on as many about the ship as shall collectively be sufficient to buoy it up when inflated; for their inflation let him insert a small copper tube, which is attached to a leathern pipe,* into the nozzle of each of the buoys (see engraving, fig. A), which pipe, communicating with the air within the diving bell (air being forced down into the steam-vessel†), will also inject air into the buoys, if they be held up, at the commencement of filling, a little higher than the level of the water at

† "Leathern bags, well sewed and tanned or barked in the best manner"—"made nearly air-tight, and proof against the attacks of vermin." [p. 5.] Mr. Milne, in a manuscript note on this passage, in our copy of the pamphlet, says: "Open-mouthed vessels of tin-plate would be preferable, to be inverted when in use, and packed into each other when not in use."—[Ed. L. M. M.]

* This pipe should be sufficiently long to admit of the operator hooking on other buoys, while one bag is in the act of being filled with air.

† To be stationed over the sunken ship, (as explained in a preceding section of the pamphlet,) and provided with an air-compressing pump and a common blowing pump.—[Ed. L. M. M.]

the mouth of the bell.* Or these envelopes may be speedily filled, by letting down a number of metallic vessels, charged with thirty or more atmospheres, which being discharged will quickly inflate them at the convenience of the operator, by his turning a common stop-cock, which, in either of these methods, is all he has to do.

"Having, by one or other, or by both of these methods, filled a sufficient number of buoys, the wreck will begin to rise whenever the bags have displaced that bulk of water which is equal to the weight of the wreck while immersed in the same fluid. Let the weight to be raised from a depth of 65 feet be 300 tons avoirdupois, = 672,000 lbs. \div 64 lbs., the medium weight of a cubic foot of sea water, = the buoyant effect of 10,500 cubic feet of air discharged from the diving bell at that depth.

"But by using air previously compressed to thirty atmospheres, and discharged at the same depth, and by allowing the capacity of each vessel so charged to be $2\frac{1}{2}$ feet, then $27\frac{1}{2} \times 2\frac{1}{2} = 67\frac{1}{2}$ cubic feet of air discharged from one compressed vessel, \times 64 lbs., the buoyant effect of one foot of air in sea water, = 4,320 lbs. buoyant effect of air originally compressed into one vessel; but the load to be raised was 672,000 lbs., therefore, \div 4,320 lbs., = 155.5, &c. compressed air vessels, allowing the apparatus to have no weight of itself. I would also propose the use of such leather buoys for giving expedition to common diving bell operations, in bringing all kinds of goods, cannon, anchors, &c. from the bottom; and also for clearing such rivers as the Tay, below the town of Perth, and many such places, where navigation and the salmon fishing are greatly impeded by large stones at the bottom of the river. The stones might be Lewis'd† at low water, or they might be bored from a diving bell, the collapsed buoys made fast, and at convenience they could be inflated from a boat by a common forcing pump; the stones being suspended in the water may be towed to any place for the purpose of embanking, where they could be instantly sunk by pulling up the end of the escape pipe, B; the more immediate use of which pipe is to allow the superabundance of air to escape, which, while at the bottom of the sea, is compressed by the hydrostatic action of the surrounding medium; but immediately when the envelope begins to ascend with its load, the pressure of the water becomes less, and in the same proportion will the air expand within these bags, and ultimately would burst them, were it not that this pipe allows it to escape. It should be about nine feet long,

* Even the azotic gas discharged by the operators might be employed for this purpose; the quantity of common air deteriorated by them being very considerable. Pepys and Allen, in their *Essays on Respiration*, state that an easy inspiration is about 16 cubic inches, and that the subject of their experiments made about 19 of these per minute; for which it can be shown by calculation, that four men would discharge from their lungs, in one hour, a volume of air having a buoyant power equal to 2702.08 lbs. avoirdupois, or thereby.

† The air-buoys being at a depth of 65 feet, would be compressed by the water with a force equal to the weight of two atmospheres.

‡ A Lewis consists of three bars of iron, which are square on their section, when cut at right angles to their sides; these being placed side by side, form something like a dove-tail tenon; a corresponding mortice is cut in the stone to be raised, and the two outside bars are first placed within this aperture; the centre bar being throughout of equal thickness, is next placed between them, and a bolt with a clutch-ring is passed through the heads of all the three, by which the stones may be suspended. This instrument has long been in use, and is almost indispensable in a massive building.

having its lower end weighed down by a nose of metal, from which the air will always be retained within the bags till its expansive force becomes more than the pressure of water at the under orifice of this escape-pipe. Indeed, the maximum expansive force of air within its envelope may always be known by the length of this pipe B. Such an escape pipe must also be attached to each of the buoys employed in raising the wreck from the bottom of the sea. I shall only remark, that it would not be necessary for these buoys to be absolutely air tight, because they may be kept sufficiently full by the method already pointed out. Nor would there be any chance of their bursting by their buoyant power, which could never exceed the weight of their bulk, and they would require to be just as strong as to be capable of retaining water without bursting when filled with it, and suspended by their hooks from a pin in the wall. I would also propose the use of these buoys for floating the large stones which are used in forming sea-fences or dykes; the stones are usually carted from low water mark, but the method here proposed would be less expensive."

CAST IRON PUMPS.—The following drawing represents a pump about two and a half feet high, and is designed for cisterns, particularly in kitchens, barns, green-houses, and other out buildings. The pump may be placed within the building, and the water drawn from a cistern without the building by the aid of a bended tube of copper or lead. The following are the directions for setting and using.

Unscrew the three screws in the bottom of the pump, and it will then be separated into three parts.

After placing the pipe into the well, carry the other end through the floor and sink, or where you wish the pump to stand; then put the bottom plate over the end of the pipe about three-fourths of an inch, and with a piece of wood the shape of an hen's egg, you will easily bend the lead into the place left in the plate for it; then hammer it down level with the top of the plate, and screw down the plate with wood screws, placing a piece of leather or cloth under the plate to make it tight, if it is set in the bottom of the sink; then place the leather valve and pump as you took them apart, and screw them together tight, after having wet the leather in warm water.

The pipe should be placed a little descending from the sink to the well, so that the water will

run out freely when necessary. This pump is so constructed, that by raising the brake clear up, the valves are opened, and the water passes off immediately out of the pump and pipe, which operation is necessary in cold weather to prevent it from freezing.

Manufactured by Scott, Keith & Co., East Bridgewater, Mass., Patentees, and sold by H. Huxley & Co. 81 Barclay street, New-York. Price, small size \$3; large size \$10.

THE THAMES TUNNEL.—The completion of this great undertaking seems, if practicable, likely soon to be attempted, as several scientific and distinguished persons have lately visited it, and on Monday last Mr. Brunel received many of the members of the Royal Society to view it, and conducted them to its extreme end, where tables were laid out, having drawings, &c., showing the whole progress of the work, the great difficulties that have already been overcome in carrying the tunnel 600 feet under the Thames, and the data upon which the engineer confidently anticipated being enabled to complete this bold undertaking, were the necessary funds supplied. Mr. Brunel, at considerable length, detailed the exertions that have been used to overcome the difficulties arising from the irruption of the river, and stated that in the course of the work the miners had for twenty-seven days pushed on the tunnel over a quicksand. The members of the Royal Society, after leaving the tunnel, proceeded to view the experimental arch constructed on a new plan by Mr. Brunel. The structure is built with bricks and Roman cement, and consists of two semi-arches, springing from the same pier, without any support. By this plan an arch of the greatest span may be constructed without centering, and demonstrating, as the projector observed, the practicability of building a tower of brick-work 50 feet high, and 200 feet in diameter, and sinking the whole gradually in one mass. By this method it is intended to complete the circular and winding carriage approaches to the tunnel. It may be interesting to observe that of the two semi-arches one is shorter than the other, and it has been loaded with about eleven tons of iron for the last nineteen months, without any sensible change in its position. The company, after expressing their high satisfaction at the novelty of the works of the tunnel, and the last invention, partook of a cold collation.—[English paper.]

MECHANICS IN CANTON.—There is no machinery, properly so called, in Canton. Much of the manufacturing business, required for the supply of commercial houses in the city, is done at a town situated at a short distance; still the amount of labor performed in Canton is very considerable. There are about 17,000 persons in Canton employed in silk weaving. The number of persons engaged in manufacturing different kinds of cloth is about 50,000. They occupy 2,500 shops, averaging usually twenty hands in each shop. Some of the Chinese females, who devote their time to embroidery, secure a profit of from twenty to twenty-five dollars per month. The number of shoemakers is more than 4,000. Those who work in wood, brass, iron, stone, and other materials, are numerous; and those who engage in each of these occupations form a distinct community, and are governed by their own laws and regulations in their business. The barbers form a separate department. No man can act as tonsor without a license. The number of this fraternity in Canton is more than 7,000. The whole number of mechanics in the city is estimated at 250,000.

MORRIS CANAL.—We learn that owing to a difference between the Morris Canal Company and the Jersey City authorities as to the price of property, the contemplated continuation of the Canal will probably pass through Harsimus, and terminate nearly a mile north of the Ferry, instead of the place originally designated, which was contiguous to the termination of the Railroad.—[Newark Daily Advertiser.]

We copy the following from the forthcoming number of the *Mechanics' Magazine* :

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

(Continued from page 248.)

We may perceive the same effect to result from the course of the tendons, and their confinement in sheaths, strengthened by cross straps of ligament. If the tendon, A, (fig. 27) took the shortest course to its ter-

Fig. 27.

mination at B, it would draw up the toe with greater force; but then the toe would lose its velocity of movement. By taking the direction, C, close to the joints, the velocity of motion is secured, and by this arrangement the toes possess their spring, and the fingers their lively movements. We may take this opportunity of noticing how the mechanical opposition is diminished as the living muscular power is exhausted. For example, in lifting a weight, the length of the lever of resistance will be from the centre of the elbow joint, A, (see engraving on the next column, fig. 28,) to the centre of the weight, B. As the muscles of the arm contract, they lose something of their power; but in a greater proportion is the mechanical resistance diminished, for when the weight is raised to C A D, it becomes the measure of the lever of resistance.

A more admirable thing is witnessed by the anatomist—we mean the manner in which the lever, rising or falling, is carried beyond the sphere of action of one class of muscles, and enters the sphere of activity of others. And this adaptation of the organs of motion is finely adjusted to the mechanical resistance which may arise from the form or motion of the bones. In short, whether we contemplate the million of fibres which constitute one muscle, or the many muscles which combine to the movement of the limb, nothing is more surprising and admirable than the adjustment of their power so as to balance mechanical resistance, arising from the change of position of the levers.

In the animal body there is a perfect relation preserved betwixt the parts of the same organ. The muscular fibres forming what is termed the belly of the muscle, and the tendon through which the muscle pulls, are two parts of one organ; and the condition of the tendon indicates the state of the muscle. Thus jockeys discover the qualities of a horse by its sinews or tendons. The most approved form in the leg of the hunter, or hackney, is that in which three convexities can be distinguished,—the bone, the prominence of the elastic ligament behind the bone, and behind that the flexor

Fig. 28.

tendons, large, round, and strong. Strong tendons are provided for strong muscles, and the size of these indicate the muscular strength. Such muscles, being powerful flexors, cause high and round action, and such horses are safe to ride; their feet are generally preserved good, owing to the pressure they sustain from their high action. But this excellence in a horse will not make him a favorite at Newmarket. The circular motion cannot be the swiftest; a blood horse carries his foot near the ground. The speed of a horse depends on the strength of his loins and hind quarters; and what is required in the fore-legs is strength of the extensor tendons, so that the feet may be well thrown out before, for if these tendons be not strong, the joints will be unable to sustain the weight of his body when powerfully thrown forward, by the exertion of his hind quarters, and he will be apt to come with his nose to the ground.

The whole apparatus of bones and joints being thus originally constituted by Nature in accurate relation to the muscular powers, we have next to observe that this apparatus is preserved perfect by exercise. The tendons, the sheaths in which they run, the cross ligaments by which they are restrained, and the *bursae mucosae** which are interposed to diminish friction, can be seen in perfection only when the animal machinery has been kept in full activity. In inflammation and pain, and necessary restraint, they become weak; and even confinement, and want of exercise, without disease, will produce imperfections. Exercise unfolds the muscular system, producing a full bold outline of the limbs, at the same time that the joints are knit, small, and clean. In the loins, thighs, and legs of a dancer, we see the muscular system fully developed; and when we turn our attention to his puny and disproportioned arms we acknowledge the cause—that in the one instance exercise has produced perfection, and that, in the other, the want of it has occasioned deformity. Look to the legs of a poor Irishman travelling to the harvest with bare feet: the thickness and roundness of the calf show that the foot and toes are free to permit the exercise of the muscles of the leg. Look again to the leg of our English peasant, whose foot and ankle are tightly laced in a shoe, with a

wooden sole, and you will perceive, from the manner in which he lifts his legs, that the play of the ankle, foot, and toes, are lost, as much as if he went on stilts, and therefore are his legs small and shapeless.

And this brings us naturally to a subject of some interest at present: we mean the new fashion of exercising our youth in a manner which is to supersede dancing, fencing, boxing, rowing, and cricket, and the natural impulse of youth to activity.

By this fashion of training to what are termed *gymnastics*, children at school are to be urged to feats of strength and activity, not restrained by parental authority, nor left to their own sense of pleasurable exertion. They are made to climb, to throw their limbs over a bar, to press their feet close to their hip, their knees close to their stomach; to hang by the arms and raise the body; to hang by the feet and knees; to struggle against each other by placing the soles of their feet in opposition, and to pull with their hands. No doubt if such exercises be persevered in the muscular powers will be strongly developed. But the first question to be considered is the safety of this practice. We have seen a professor of gymnastics, by such training, acquire great strength and prominence of muscles; but by this unnatural increase of muscular power, through the exercise he recommended, he became ruptured on both sides. The same accident has happened to boys too suddenly put on these efforts.

It is proper to observe, that when the muscular power is thus, we may say preternaturally increased, whether in the instance of a race-horse, an opera-dancer, or a pupil of the Calisthenic school, it is not merely necessary to put them on their exercises gradually in each successive lesson, but each day's exertion must be preceded by a wearisome preparation. In the great schools, like that at Stockholm, the master makes the boys walk in a circle; then run, at first gently; and so he gradually brings them into heat, and the textures of their frame are composed to that state of elasticity and equal resistance, as well as to vital energy, which is necessary for the safe display of the greater feats of strength and activity. This caution in the public exercises is the very demonstration of the dangers of the system. The boys will not be always under this severe control, and yet it is important to their safety.

We may learn how necessary it is to bring

* These *bursae mucosae* (mucous purses) are sacks containing a lubricating fluid. They are interposed wherever there is much pressure or friction, and answer all the purposes of friction wheels in machinery.

the animal system gradually into action from the effects of very moderate exercise on a horse just out of the dealer's hands. The purchaser thinks he may safely drive him ten miles, not aware that the horse has not moved a mile in a week, and the consequence is inflammation and congestion in his lungs. The regulation in the army has been made on a knowledge of these facts. When young horses are brought from the dealer they are ordered to be walked an hour a day the first week, two hours a day the second week, three hours a day in the third week. They are to be fatigued by walking, but they must not be sweated in their exercise. Horses for the turf, under three years old, in training for the Derby, are brought very slowly to their exercise, beginning with the lounge; then a very light weight is put upon them, and that gradually increased. Indeed, nothing can better show the effects of exercise in perfecting the muscular action than the consequence of the loss of one day's training. It will bring the favorite to the bottom of the list, and that without any suspicion of lameness; but from a knowledge of the fact, that even such a slight irregularity in his training will have a sensible effect on his speed. Shall the possibility of pecuniary loss excite the jockey to more care for his horse than we, in our rational and humane attention to the education of our youth, pay to their health and safety?

In reflecting on these many proofs of design in the animal body, it must excite our surprise, that anatomy is so little cultivated by men of science. We crowd to see a piece of machinery, or a new engine, but neglect to raise the covering which would display in the body the most striking proofs of design, surpassing all art in simplicity and effectiveness, and without any thing useless or superfluous.

A more important deduction from the view of the animal structure is, that our conceptions of the perfection and beauty in the design of nature are exactly in proportion to the extent of our capacity. We are familiar with the mechanical powers, and we recognize the principles in the structure of the animal machine; and, in proportion as we understand the principles of hydrostatics and hydraulics, are able to discern the most beautiful adaptation of them in the vessels of an animal body. But when, to our further progress in anatomy, it is necessary that we should study a matter so difficult as the theory of life, imperfect principles or wrong conceptions distort and obscure the appearances: false and presumptuous theories are formed, or we are thrown back in disappointment into scepticism, as if chance only could produce that of which we do not comprehend the perfect arrangement. But studies better directed, and prosecuted in a better spirit, prove that the human body, though deprived of what gave it sense and motion, is still a plan drawn in perfect wisdom.

A man possessed of that humility which is akin to true knowledge, may be depressed by too extensive a survey of the frame of nature. The stupendous changes which the geologist surveys—the incomprehensible magnitude of the heavenly bodies moving in infinite space, bring down his thoughts to a painful sense of his own littleness: "to him, the earth with men upon it will not seem much other than an ant hill, where some ants carry corn, and some carry their

young, and some go empty, and all to and fro a little heap of dust."

He is afraid to think himself an object of Divine care; but when he regards the structure of his own body, he learns to consider space and magnitude as nothing to a Creator. He finds that the living being which he was about to condemn, in comparison with the great system of the universe, exists by the continuance of a power no less admirable than that which rules the heavenly bodies; he sees that there is a revolution, a circle of motions, no less wonderful in his own frame, in the microcosm of man's body, than in the planetary system; that there is not a globule of blood which circulates but possesses attraction as incomprehensible and wonderful as that which retains the planets in their orbits.

The economy of the animal body, as the economy of the universe, is sufficiently known to us to compel us to acknowledge an Almighty Power in the creation. What would be the consequence of a further insight—whether it would conduce to our peace or happiness, whether it would assist us in our duties, or divert us from the performance of them,—is very uncertain.

CHAPTER VII.

BOOKS REFERRING TO THESE SUBJECTS MORE GENERALLY.—Ray, "On the Wisdom of God manifested in the Works of the Creation," has several chapters on the animal economy.

Archdeacon Paley has composed a work of high interest, by taking the common anatomical demonstrations, and presenting them in an elegant and popular form. His work is entitled *Natural Theology*; or *Evidences of the Existence and Attributes of the Deity, collected from the Appearances of Nature*.

The celebrated Fenelon has, with the same pious object, composed a small duodecimo, in which he draws his arguments from the structure of animal bodies.

Wollaston, in the "Religion of Nature delineated," has the same train of reflection to prove that there can be no such thing as chance operating in and about what we see or feel; and he says, with great propriety, "How may a man qualify himself so as to be able to judge of the religions professed in the world; to settle his own opinions in disputable matters; and then to enjoy tranquillity of mind, neither disturbing others, nor being disturbed at what passes among them?"

Derham, in sixteen sermons, preached in 1711, at the lecture founded by Mr. Boyle, treats at length of the structure of our organs. These are also published separately under the title of *Physico-Theology*; and they naturally suggest to learned divines the expediency of sometimes expounding to their hearers the evidences of design apparent in the universe, as a sure means of enlightening their understandings, elevating their views, and awakening their piety.

This cultivation of the mind, by exercising it upon the study of proper objects, is a man's first duty to himself. Without it he can have no steady opinion on points of the nearest concern. He is wrought upon by circumstances which ought not to sway the mind of a sensible man; at one time depressed to the depths of despondency, and

* Bacon.

at another exalted into unreasonable enthusiasm. Without such cultivation, were a man to live a hundred years, he is at last like one cut off in infancy.

AGRICULTURE, &c.

ON THE MANUFACTURE OF POTASH.—It is remarkable that the manufacture of potash, which has formed so considerable and profitable an employment for the industry of the northern states, has never been in operation in Virginia. Of course no satisfactory answer to the following letter of inquiry on this subject was to be obtained at home—and it was therefore sent to a gentleman who resides at Cayuga county, New-York, whose location, as well as his general information, it was inferred, would enable him to give the statements required. He has kindly complied with the request, by sending the communication inserted below. We also add the article on this manufacture in Rees' Cyclopædia.—[Farmers' Register.]

The enormous waste of wood throughout Virginia and the southern states, induces me to inquire whether a considerable saving to the country may not be effected, by converting a portion of it into potashes, and by preparing the bark of certain descriptions of trees, for tanning and dyeing.

In clearing our lands, it is the practice to burn all the wood which is not used for fence rails, and no care is taken of the ashes. It is well known that from the branches and twigs of oak, a larger quantity of potash is obtained than from the same weight of the trunk of the tree, and that the branches are entirely lost with us in clearing land.

Now, my object in addressing you is to request that you will obtain and publish the most simple and clear directions for making and preparing potashes for market, embracing the cost of all requisite apparatus, labor, &c., and the quantity produced from a given weight or measure of white oak, red oak, and other woods common to our country. The preparation of bark for exportation might also be valuable, if the mode of doing it was made known to our farmers.

QUERIST.

William Culver, Esq., from whom the following particulars were obtained, has been concerned in the manufacture of potash for many years.

It is estimated that 450 bushels of good house ashes will make a ton of potash. Some skilful workmen can produce more. The manager of his works contracted to make a ton from every 425 bushels; and he has even made that quantity from 420 bushels; but it is more than common workmen can produce.

Of field ashes about 550 bushels are required to make a ton. This difference is owing to impurities, and to a want of compactness in the ashes. Great care should be used in scraping them up, so as to exclude as much dirt as possible. It requires more care to work them.

At this time, house ashes are worth 10 cents a bushel, at the ashery; and field ashes, 7 cents.

One man can manage an ashery, consisting of the different vessels hereafter to be mentioned. There ought to be six leaches (or leach tubs), each ten feet long, constructed in the following manner: Lay two parallel sills, one a little higher than the other. On these the bottom of the leaches are laid—made of boards four feet long, not grooved and tongued, but breaking joints. These should be a foot high from the ground, so as to admit a trough under the lower edge to catch the ley, and to lead it into the ley tub, which may be a half hogshead sunk in the ground, and which will serve for two leaches.

The boards, four feet in length, which constitute the sides of the leach, are held together by two rectangular frames; the lower one resting on the bottom is eighteen inches, and the

LITERARY NOTICES.

No. XXV.

Galena, Upper Mississippi, February 22d.

When I came to look round, in the morning, at the place where you last left me so fortunately accommodated, I found that our host, an enterprising Kentuckian, had been very fortunate in his choice of a location: it was a rocky land, as I was assured, healthful dell, about a hundred feet below the surrounding prairie, abounding in lead ore, and having a fine stream, with a considerable cascade, winding through its wooded bosom. His house was situated among a clump of ashes and elms, and a crystal spring burst from beneath an ancient sycamore within a few yards of it, in what resembled a torrent rather than an ordinary fountain of water, making altogether in summer a most delicious retreat, and affording even in winter a very agreeable change from the windy prairie above. But inviting as it appeared, this sequestered spot would not seem equally attractive to every one who should see that strong block house, within a few hundred yards of this peaceful dwelling, and know that it is thus placed out in the naked prairie, to prevent the secret approach of a lurking foe, when the family of the miner resort within its wooden walls for protection. Passing this block house, after an early breakfast, we struck a track leading to the Platte Mounds, which were distinctly visible, as they reared their blue tremontane peaks in the morning air: we travelled through a beautiful country of mingled grove and prairie, while large herds of deer were occasionally to be seen roving about for miles away. Frequently, in places where no other traces of man were to be seen, we would come to trenches opened by the miners, who had either been driven away by the Indians, or abandoned the pursuit of mineral in one place to try it in another. These trenches bore exactly the appearance of a grave, and are about the same size, and you meet sometimes in a few miles ride, not one or a dozen, but hundreds; the high price of lead, before the Winnebago difficulties of '28, having attracted a vast number of adventurers to this region, who have since abandoned it for the mineral regions of Missouri. In one place, at last, we saw two miners at work out on the prairie, off far from any house; and finding, on approaching the spot where they were sinking the shaft, that they had a windlass at work, my friend politely consented to wait till I could descend and see how things looked below. I was let down by the rope in a few moments, and passing through an upper crust of rich soil, at least three feet thick, a stratum of gravel succeeded, and then coming down to the clay, I found a solitary miner with his pick, at work upon a vein of lead ore. He was a northern man, from the State of Maine, and seemed glad to see any one from so near home, as he considered New York, when viewed from this remote point. I shook hands with him, and pocketed two or three specimens of the mineral which he struck out for me. A push of the rope then set them turning the windlass above, and my resurrection from the narrow place was effected in a few moments. There was some of the afternoon left when we arrived at the Platte Mounds; but it was late on the fourth day from Prairie Du Chien, when we reached Galena. Here, I have been sorry to lose my late agreeable fellow-traveller; and a fresh thaw having laid an embargo upon travelling by melting the snows, and rendered the streams impassable, I have employed my time, as much as possible, in looking about Galena. The mud is so deep that it is impossible to go afoot, and as these steep hills are unfit for carriages, the children going and returning from school pass the door of my lodgings, on horseback, every morning and evening; three or four boys and girls sometimes being piled on before and behind an old negro, till the mass of heads, arms and legs belonging to the juveniles, makes the fabric look like the wood-cut in the nursery book of that celebrated ancient female's residence, who had so many children, "she did not know what to do."

The population of Galena is about 1000, and that of Jo-Davies county, in which it is situated, is computed at 5000; a very large proportion of which is engaged in mining operations. The town, for its

upper, near the top of the leach, three and a half feet wide.

On the bottom of the leach, lay small sticks crossing each other, to the height of two inches, for the purpose of letting the ley run off freely. On these place straw, to be four inches thick when well pressed down, to prevent the ashes from washing through, and mixing with the ley. Three bushels of lime to each leach are spread on the straw: its effect is to facilitate the melting of the potash. Every third time that the leaches are filled, new lime is to be applied after ejecting the old.

The ashes, when thrown into the leaches, must be made compact by pounding it down. In this way a leach will hold 60 bushels.

The leaches are worked in pairs. One pair may be running while the second is soaking, and the third is being emptied of old ashes, or being filled with new. This arrangement prevents the workman from losing time by waiting, or from being too much hurried at another time.

Two potash kettles, of 90 gallons each, are wanted for boilers, and may cost about \$35 a piece. These are set in arches. Several sugar kettles, containing about 20 gallons each, will also be wanted for coolers.

The manufacture of potash is generally commenced in the spring, when there is no longer any danger from freezing.

Ley, too weak to bear an egg, is not put into the boilers, but is used for wetting such leaches as have not begun to run.

During the boiling, a dipping pan is placed in each boiler, resting on the bottom, to catch the black salts as they settle; and when the pan is full, it is emptied from time to time. By this process, the ley will not become so thick, and consequently evaporate faster.

When the strong ley (such as will bear an egg,) from the two leaches, is all poured into the boilers, then increase the fire. For this purpose, good dry wood is necessary. The black salts are now to be returned to the boilers; and there will be a danger of the liquid running over. This is prevented by dipping it up and pouring it back into the boiler. Repeat it till this disposition to rise over shall disappear. Then raise the heat still more till the potash is perfectly melted, and becomes almost as thin as water. It is then to be dipped out into the coolers, being careful to have them very dry. Let the potash stand till next day—it will crack into four quarters. Turn it out, and it is fit to barrel.

My informant suggests there would be a great advantage in having some person to start the works who was well acquainted with the business. D. T.

Article on Carbonate of Potash in Rees' Encyclopædia.—The potash of commerce, or black potash, as it is also called, is universally procured from the combustion of wood; and therefore its preparation can only be undertaken with success in those uncleared countries where are vast natural forests, and where, from the imperfection or distance of transportation, the value of timber is no more than that of the labor required to fell it. The only districts in Europe in which any considerable quantity of potash is made, are the mountainous forests in Germany, and the extensive woodland tracts of Poland and Russia. The British market is principally supplied from the United States, a country in which, from its rapid increase of population, there is a constant demand for cleared land, for the purpose of agriculture; and therefore, where timber is looked upon rather as an incumbrance than as contributing either to the beauty or the value of the ground on which it stands.

The American method is to pile up the wood, as soon as it is sufficiently dry to burn, in large heaps, and reduce it as quickly as possible to ashes: these ashes are then put into a wooden cistern, with a plug at the bottom of one of its sides, and a quantity of water, sufficient to make a strong lixivium, is added. After standing for

an hour or two, the plug is withdrawn, and the water holding the potash in solution runs out, leaving the earthy parts till impregnated with a portion of alkali in the cistern. This solution is then evaporated to dryness in iron pans, and hastily fused into compact reddish brown masses of semi-caustic potash, in which state it is fit for market.

In Germany, where the value of wood is greater, care is taken to select such kinds as are the richest in potash; the combustion is slower, and of course the temperature lower, in consequence of which, but little is lost by volatilization; the lixiviations also of the ashes are judiciously repeated till the alkali is extracted.

Proportion of potash afforded by 100 parts of wood of different species, which being previously dried, were burned by an open fire to ashes; and which, after being weighed, were lixiviated till all their saline contents were extracted.

[Academy of Sciences at Paris.]

SAVOY CABBAGES.—The green curly savoy cabbage is one of the finest garden vegetables that is grown, and ought to take the place of every kind of cabbage put up for winter's use for the table. It is as hardy and as easily cultivated as any other kind of cabbage; it is much more delicate, sells more readily, and as many, indeed rather more, can be grown from a square in the garden, or from an acre of land.

An acre of land has 4310 square yards—equal to 43,560 square feet: two feet wide each way is enough to plant the savoy cabbage; thus, an acre would yield 10,890 cabbages, which require as little cultivation as potatoes, after the ground is well prepared, and the plants are planted out, and which would bring, at the moderate price of one cent apiece, the enormous sum of one hundred and eight dollars and ninety cents.

PRESERVING AND PLANTING PEACH PITS.—Seeds intended for planting should be buried in the ground immediately after the flesh is taken from them, to prevent their becoming dry, as in that case they are more sure to come up, than when they are allowed to dry and remain out of the ground until late in the fall. Whether the seeds are planted at first in the places where they are to remain, or are buried as preparatory for planting, it is important that they should be put in the ground either before they become dry, or so early in the season that they may swell again before winter, and that they should be so near the surface as to insure their being frozen, otherwise they may lie in the ground, like rose and thorn seed, one year before they will vegetate.

PRESERVING BACON.—Dr. Bartlett: There is much said about preserving Bacon. I have noticed in all the communications on the subject, that it is recommended to have the Bacon well dried; and I think this is the principal thing required. If Bacon is not well dried, there is nothing that it can be packed in, that will keep it sound. When Bacon is hung up for drying, boards or plank should be laid on the joints over it, in order to keep dirt or dust from falling on it, also to keep the smoke from escaping too soon. A smoke should be kept under it till it is thoroughly dry, and be continued in wet weather in the summer. Whoever will follow this plan will save their Bacon.—[Southern Planter.]

NATIONAL WEALTH.—Who promote national prosperity? Those who promote virtue and religion.—Who destroy it? Those who encourage the vicious, either by example or precept.

size, is one of the busiest places in the Union. The value of goods imported into this place, last season, amounted to \$150,000. The exports of lead amounted to 7 millions of lbs. at \$4 50 per cwt. There were 96 departures and 97 arrivals of steam-boats during the last season; three of which were owned by persons engaged directly in the trade. This, for a frontier town, built indifferently of frame and log houses, thrown confusedly together on the side of a hill—is certainly doing very well. People now hold their property by a somewhat precarious tenure, which prevents them from making improvements. When Government gives them title deeds to the lands they occupy, both Galena and the adjacent country will assume a very different appearance.

I took quite an extensive ride in the neighbourhood yesterday. There was to be a public meeting of the miners and other residents held about 12 or 15 miles from town, upon the subject of petitioning Congress in relation to the sale of lands; and having procured a tolerable saddle horse, I started with a gentleman, whose family name is already known among the very first in our history, and whose acknowledged talents and influence in this quarter will insure his making a figure in public life, when the new State of Wisconsin shall take her place in the confederacy.* Having, within the few years that have elapsed since, a mere youth, he left the city of New York, to try his fortunes in the West—followed at different times the various occupations of a Lawyer, a Drover, a Miner, and lastly a Smelter; besides taking an active part in two Indian wars, where his early West Point education came favorably into play, Colonel H. is, perhaps, second only to General Dodge in knowledge of frontier affairs, and popularity with the back-woodsmen in this quarter.

I cannot give you a better idea of the thoroughly Republican state of society here, than by repeating the whimsical conversation in which I first became aware of this gentleman's being a resident of these parts.

"I allow that you know Colonel H. of your city?" asked a sturdy borderer and thriving farmer of me, a few weeks since, while in the lower country.

"Colonel H. the son of General H.? certainly I do: why, what in the world brought him out here at this season. You must be mistaken, my dear sir; the duties of his office, as U. S. District Attorney, would hardly allow him to take such a tour as this."

"Tower, stranger, why, he's living among us."

"Here?"

"No, not exactly on this prairie, but in the mines. The Colonel took a drove of hogs up for me, some time since."

"My dear friend," replied I, laughing heartily at the very idea, "Colonel H. would see you to the devil first, before he'd take ten steps after a drove of hogs, for you or any one else."

"By G—d, sir," rejoined the Backwoodsman, with some excitement, "you don't know little Bill; for though he is the son of General H. and the smartest man in all these parts to boot, he has none of your d—d foolish pride about him; but would just as soon drive any honest man's hogs over the prairie as his own."

"Certainly, sir, the Colonel H. that I mean, would just as soon drive your hogs as he would his own, but I now perceive that your 'little Bill' is a very different person from the one I alluded to: yet no one could admire the independence of character you ascribe to him more than I do."

"Squire, give us your hand! you and little Bill must know each other before you leave this country."

I had an opportunity of hearing Mr. H. address a public meeting on the evening of my arrival in Galena, and was much struck with the logical precision and force with which he spoke; his fluency, clear enunciation, and thorough command of himself and his audience. His features, when animated in speaking, bore a striking resemblance to those of his great and lamented father, as exhibited in the plaster casts which are familiar to every one.

"Colonel H." said the gentleman who introduced

* A period much less remote than you would think it. The country between Rock river and the Wisconsin combines more advantages for emigration than any I have seen in my whole Western tour. That lying between the Fox river and Lake Michigan is celebrated as being equally good, and, supposing the Indian difficulties to be now forever terminated in this quarter, this region will fill with Northern emigrants, the moment it becomes known. A glance at the map will show how favorably it is situated for trade, commanding the markets alike of New York and New Orleans.

me, "is at present disguised in a suit of broad-cloth; to have him in character, sir, you should see him in his leather shirt and drawers, driving his ox team with a load of lead into town." Mr. H. laughed in reply, and our horses being ready we mounted, and soon escaping from the muddy town, found topics enough for conversation while galloping through the oak openings on the hills beyond. The gathering proved to be not so numerous, when we arrived at the place of meeting, as I had hoped; and, though in the grouping of wild looking figures with their variety of strange faces and striking costumes, Inman's bold pencil might have found some fine studies among these miners, yet I was wholly disappointed in any outlandish exhibitions of character. They were, in fact, as civil and well behaved a set as would come to the call of a committee in any of the best inhabited wards in your city. Their politeness to me indeed—being a stranger—could not be exceeded; I never approached the fire but two or three rose to offer me a seat, and scarcely one of the company called for any thing to drink, but turning round, he would add, "stranger, won't you join us?" As we spent several hours among them merely talking and moving round without getting up any formal meeting, I had ample leisure to study the different appearances of the company, as some bent over a card table, where the pieces of dirty pasteboard were rapidly compelling the small piles of money collected there, to change hands, while others lay stretched in the sun upon the wood pile before the open door, listlessly whittling a piece of stick with their long hunting knives. Among the faces and figures that particularly struck me, I remember there was one of a tall young man of about seven or eight and twenty, whose delicate features, though somewhat embrowned with toil and exposure, were only relieved from effeminacy by a dark beard trimmed around his oval face and depending from his chin, much in the style that Sir Walter Raleigh and Shakespeare are painted—either of whose fine heads, his high, pale, and expressive forehead would not have misbecome. His figure, about six feet in height, was set off by a close fitting hunting shirt of black buckskin, lightly embroidered on the collar and arms with straw-colored silk, which, from long use, had grown so dingy as scarcely to be detected upon the rusty leather it was meant to adorn. Others there were with the common cotton hunting of the west belted around them. But the majority were dressed in rough blanket coats of every possible color; while a vest of the most costly description, with pantaloons of Kentucky jean, or vice versa, would often complete their incongruous apparel.* I could form a tolerable estimate of the intelligence of this collection of people, from observing the language which my new friend used in talking to them upon the subject that brought them together; and, when speaking in earnest, it was invariably such as one educated gentleman would use to another when comparing views upon any new topic of interest.—Upon my commenting upon this, after we had bade them farewell, and were riding off together, my companion observed, that there were not only many strong-minded men of ordinary education, who had adopted the way of life which I saw prevailing around me, but that had I time to remain longer in that section of country, he could point out to me a number of regularly educated persons, the graduates of more than one of our eastern colleges, who were seeking their fortunes in this region in the capacity of common miners. While he was yet speaking, we were accosted by a poorly clad, and in every respect ordinary looking, person, to whom my companion replied with great politeness, and then resuming the subject after we had passed the forlorn shanties which the individual called his house—"par exemple," he exclaimed, "that man—and a shrewd, sensible fellow he is—was bred to the bar in your State—he looks poor enough now, it is true, but I hear that he has lately struck a lead, and a few years will probably find him in independent circumstances. We are now, you observe, among his diggings; and though, at this moment, he has hands to help him, I believe he be a man like most of us, with his single pick. Clear that trench now, and guide your horse through those pitfalls on the right, and I will take you to a point where you may see how we get up the mineral." Following my conductor along a mile or two further of pretty rough road, we came up at last to a spot

* A Backwoodsman when he lays aside his buckskins and hunting shirt, is anxious to dress in the finest broadcloth—at least I have derived that impression from what I have seen, and from being told by a merchant in extensive business in Galena, that the very best of dry goods will alone command a sale in the mines.

where a huge mound of dirt, with piles of lead ore scattered here and there on the adjacent ground, showed that a mine was very successfully worked beneath; and giving our horses to an accommodating fellow that stood by, we threw off our overcoats and prepared to descend into it. The orifice on the top of the mound over which a windlass was placed, was about three feet square, being lined with split logs crossing each other at the angles down to the original surface of the soil, below which point the adhesiveness of the earth seemed to be all that kept the sides of the pit together. It was so dark, however, at this part of the passage down that other precautions may have escaped me. Taking the rope from above in my hands, and placing my foot in a wooden hook attached to the end of it, I swung myself from the top, and in a few moments descended some 70 or 80 feet below the surface. The narrow chamber was of course excessively dark to one just coming from the light of day; and landing upon the edge of a tub immediately beneath the aperture through which I had descended, I lost my foothold and pitched head over heels in the water with which the bottom of the mine was flooded. "Any one hurt," cried a voice behind me, and looking round as I sprang to my feet I found myself in a long horizontal passage or narrow gallery with a grim looking miner approaching me with a lantern in one hand and a pickaxe in the other. The next moment the form of my companion darkened the opening above, and then, after landing by my side, he introduced me to the miner, who proceeded to show us about these subterranean premises. They consisted of three or four galleries, generally terminating in a common centre, though one or two short ones just commenced, appeared to run off at right angles to the rest, and the lead ore, which glitters like frosted silver in its native bed, appeared to lie in thick horizontal strata along their side. The masses were readily separated by the pickaxe from the neighboring clay, and we remained long enough to see several tubful hauled up by the conveyance which had admitted us into these dusky regions. The labor and exposure of these miners is very great; but the life, to those who have an interest in the work, is said to be so exciting, that I am told the most indolent man, when he has once fairly burrowed under ground, and got a scent of what is called "a Lead," will vie in devotion to his toil with the most industrious of those who labor in the light of Heaven. His stimulus indeed resembles that of the gold-hunter; for the lead, when delivered at Galena, is as good as coin in his pocket; while if he chances to strike a rich lead of mineral, he at once becomes independent, as if he does not choose to work it on his own account, there are houses in Galena which will purchase him out for a handsome sum, for the sake of speculation.

It was late in the evening, when, after taking this wide circuit, I once more regained my lodgings at Galena. I found the tavern entirely deserted, and upon inquiring the cause, and learning that there was "a play to be acted in town," I rode off at once to the door of the theatre. It proved to be in an unfinished building on the side of a hill, the basement of which entering the lower street, was fitted up as a stable, there being no flooring to the apartment above it, so that you stepped over the naked beams above the horses heads, if deviating from the plank which formed a passage way to a rude staircase leading into the histrionic realms in the uppermost story. The company consisted of four grown persons, and a child of about ten years old, and the play was the Melo-drama of The Woodman's Hut. A thing so easily turned into ridicule would be game not worth hunting down, and I mean therefore to disappoint any ill-natured expectations you may have of the picture I could give of Galena theatricals.—That the rest of the audience were at least as liberal as myself, you may gather from the fact of their showering half dollars like peas upon the stage, to express their delight of the little girls dancing, between the act, which certainly did not surpass that of the Vestris, not to mention Taglioni. In the midst of the performance of the Melo-drama, I happened to be standing in the apartment—if it may be so called, at the foot of the staircase—below, when I was not a little startled at the passage of a heavy missile by my ears, which, striking fire from a beam near to where I was standing, concluded its career by giving a hearty thump to a horse who was ruminating in his stall beneath. The mystery was presently cleared up by a little negro dropping at a bound from the entrance to the Theatrical hall above, and exclaiming, "Did you see a gun come by here, sir? The Count went to stand it in the corner and it slipped between the planks of the floor." I directed the imp to the realms below, and

starting at once for my lodgings, had no further opportunity to study these unrehearsed stage effects. The want of a regular theatre many will think a merit in so small a town as Galena; but there is another defect in the place, and, indeed, in almost all western towns where you get so far beyond the mountains that is not so easily got over, and that is, the want of female society. The number of males in proportion to females on the frontiers, is at least two to one; and girls of fifteen, (I might say twelve) or widows of fifty, are alike snatched up with avidity by the disconsolate bachelors. In the mines a few years since, their eyes were so seldom cheered with the sight of the better part of creation, that I was told by an old borderer, "he had travelled twenty miles, only to get a look at a petticoat, where it was rumored that there was actually one in the neighborhood." Even now they talk seriously in Galena of getting up an importation of ladies, for the especial amelioration and adornment of the place. How so delicate a matter is to be managed, in our fastidious age, I am unable to divine, unless, indeed, they should invite the blooming ones hither, under the ostensible purpose of getting up a fair, and then persuade them to remain and cheer these monastic abodes. I have been more than once feelingly appealed to, to make the languishing condition of these hermits of the prairies, known in more favored parts of the country; while, not wishing to betray the slenderness of my influence with the fair parties they would conciliate, I have avoided making rash promises of using my feeble offices in their favor. The only method of serving their cause I have yet hit upon is, to have inserted in the newspapers, after my arrival home, under the head of "Singular fact," "Remarkable phenomenon," "Unequalled spirit," or "Sudden disappearance," some such paragraph as this: "It is attested by credible witnesses, among whom are some of the oldest and most respectable inhabitants of Galena, that single ladies, visiting their friends in that place, never see 'a second winter.'" H.

COMPLETE WORKS OF WALTER SCOTT, VOL. VI., in seven parts. N. Y.—CONNER & COOK.—Thus far has this very cheap and well printed edition of Scott's works progressed towards its completion: the first and the last volume are now alone wanting. The materials for the first have not yet been published in England; those of the seventh and last are already on hand, and will in due course appear. We have only to commend, as in the past, the materials and typographical execution of this work.

SKETCHES, BY MRS. SIGOURNEY. Philadelphia: KEY & BIDDLE.—We took a hasty and passing notice on Saturday last, of these beautiful Sketches, hoping to-day to have more space to devote to them, but we are little better off in that particular than before. We must, however, at least enumerate the contents of the volume, and give a short extract from one of its highly-wrought tales.

The Sketches are six in number: the Father, the Legend of Oxford, the Family Portraits, Oriana, the Intemperate, and the Patriarch. Some of them, especially the Intemperate, which was published at length in this paper, may be known to our readers: yet in this permanent form, combined as they are with others now for the first time published, they will be valued, as constituting a charming volume. From *The Patriarch*, a sketch of a colony of North Carolina, remote from civilization and from the intercourse of men, where the founder and father of the colony was also its priest, we extract a passage, which, though beautiful in itself, yet is less effective thus torn from the context, than in its original connexion. It relates the death of the Patriarch. The *Lay Reader* was his eldest son.

Never will that scene be effaced from my remembrance: the expressive features, and thrilling responses, of the Patriarch, into whose expiring body the soul returned with power, that it might leave this last testimony of faith and hope to those whom he loved, are among the unfading imagery of my existence. The spirit seemed to rekindle more and more, in its last lingerings around the threshold of time. In a tone, whose clearness and emphasis surprised us, the departing saint breathed forth a blessing on those who surrounded him, in the "name of that God, whose peace passeth all understanding."

There was an interval, during which he seemed to slumber. Whispers of hope were heard around his couch, that he might awake and be refreshed.—At length, his eyes slowly unclosed. They were glazed and deeply sunken in their sockets. Their glance was long and kind upon those who hung over his pillow. His lips moved, but not audibly. Bowing my ear more closely, I found that he was speaking of Him who is the "resurrection and the life." A slight shuddering passed over his frame, and he was at rest, for ever.

A voice of weeping arose, from among the children, who had been summoned to the bed of death. Ere I had attempted consolation, the lay-reader with an unflinching tone pronounced, "the Lord gave, and the Lord hath taken away: *blessed be the name of the Lord.*"

Deep silence ensued. It seemed as if every heart was installing him who spake, in the place of the father and the governor who had departed. It was a spontaneous acknowledgment of the right of primogeniture, which no politician could condemn. He stood among them, in the simple majesty of his birth-right, a ruler and priest to guide his people in the way everlasting. It was as if the mantle of an arisen prophet had descended upon him, as if those ashen lips had broken the seal of death to utter "behold my servant whom I have chosen." Every eye fixed upon him its expression of fealty and love. Gradually the families retired to their respective habitations. Each individual paused at the pillow of the Patriarch, to take a silent farewell; and some of the little ones climbed up to kiss the marble face.

I was left alone with lay-reader, and with the dead. The enthusiasm of the scene had fled, and the feelings of a son triumphed. Past years rushed like a tide over his memory. The distant, but undimmed impressions of infancy and childhood,—the planting of that once wild waste,—the changes of those years which had sprinkled his temples with gray hairs,—all, with their sorrows and their joys, came back, associated with the lifeless image of his beloved sire. In the bitterness of bereavement, he covered his face, and wept. That iron frame which had borne the hardening of more than half a century, shook, like the breast of an infant, when it sobs out its sorrows. I waited until the first shock of grief had subsided. Then, passing my arm gently within his, I repeated, "I heard a voice from heaven saying,—Write, from henceforth, blessed are the dead, who died in the Lord." Instantly raising himself upright, he responded in a voice whose deep inflections sank into my soul, "Even so, saith the spirit, for they rest from their labors, and their works do follow them."

I remained to attend the funeral obsequies of the Patriarch. In the heart of their territory was a shady dell, sacred to the dead. It was surrounded by a neat inclosure, and planted with trees. The drooping branches of a willow, sweep the grave of the mother of the colony. Near her slumbered her youngest son. Several other mounds swelled around them, most of which, by their small size, told of the smitten flowers of infancy. To this goodly company, we bore him, who had been revered as the father and exemplar of all. With solemn steps, his descendants, two and two, followed the corpse. I heard a convulsive and suppressed breathing, among the more tender of the train; but when the burial-service commenced all was hushed. And never have I more fully realized its surpassing pathos and power, than when from the centre of that deep solitude, on the brink of that waiting grave, it poured forth its consolation.

LETTERS OF JOHN RANDOLPH to a young relative, &c. &c.; 1 vol.; Philad., CAREY, LEA & BLANCHARD.—This is a selection, as we learn from a preliminary notice, from several hundred letters written by John Randolph to a young relative, and which extend through a period from early youth to mature manhood.

They indicate very strikingly the peculiarities of the writer's character, and combine with much sagacious observation, sound maxims, and valuable counsels, a good deal that is egotistical, strange and little. The measure of indulgence, however, which the friends of that distinguished individual may be entitled to expect for him from his contemporaries and from posterity, will be judged of by the following sad note to letter CLIX:

"This letter was written during a lucid interval of alienation of mind; which, for the first time, amounted to positive delirium. Fits of caprice and petu-

lance, following days of the deepest gloom, had, for years previously, overshadowed his mind, evincing the existence of some corroding care, for which he neither sought, nor would receive any sympathy.

"For many weeks, his conduct towards myself, who was the only inmate of his household, had been marked by contumelious indignities, which it required almost heroic patience to endure, even when aided by an affectionate devotion, and an anxious wish to alleviate the agonies of such a mind in ruins. All hope of attaining this end, finally failed; and, when he found that I would no longer remain with him, the above letter was written; it is almost needless to say with what effect. I remained with him two years longer.

"The truth and beauty of the eastern allegory, of the man endowed with two souls, was never more forcibly exemplified than in his case. In his dark days, when the evil genius predominated, the austere vindictiveness of his feelings towards those that a distempered fancy depicted as enemies, or as delinquent in truth or honor, was horribly severe and remorseless.

"On the contrary, when the benevolent genius had the ascendant, no one ever knew better how to feel and express the tenderest kindness, or to evince, in countenance and manner, gentler benevolence of heart.

We fear that the disease, for such undoubtedly it became, had originally more connection with the evil passions of the heart, than would seem consistent with the "gentle benevolence" thus imputed to his happier moments. Political disappointment was not, we apprehend, without its share in inducing "the gloom" of his mind—though his aspirations in politics even, seemed always vague, desiring notoriety apparently rather than power—and therefore resenting—indifferences "of which in his later letters he more than once complains, as a personal offence."

We annex some extracts from the Letters:

"Do not undervalue the character of the real gentleman, which is the most respectable amongst men. It consists not of plate, and equipage, and rich living, any more than in the diseases which that mode of life engenders; but in truth, courtesy, bravery, generosity, and learning, which last, although not essential to it, yet does very much to adorn and illustrate the character of the true gentleman. Tommy Merton's gentlemen were no gentlemen, except in the acceptance of innkeepers, (and the great vulgar, as well as the small,) with whom he who rides in a coach and six, is three times as great a gentleman as he who drives a post chaise and pair. Lay down this as a principle, that truth is to the other virtues, what vital air is to the human system. They cannot exist at all without it; and as the body may live under diseases, if supplied with pure air for its consumption, so may the character survive many defects, where there is a rigid attachment to truth. All equivocation and subterfuge belong to falsehood, which consists, not in using false words only, but in conveying false impressions, no matter how; and if a person deceive himself, and I, by my silence, suffer him to remain in that error, I am implicated in the deception, unless he be one who has no right to rely upon me for information, and, in that case 'tis plain, I could not be instrumental in deceiving him."

"To form good habits is almost as easy to fall into bad. What is the difference between an industrious, sober man and an idle drunken one, but their respective habits? 'Tis just as easy for Mr. Harrison to be temperate and active, as 'tis for poor Knowles to be the reverse; with this great difference, that, exclusive of the effects of their respective courses of life on their respectability and fortunes, the exercises of the one are followed by health, pleasure and peace of mind, whilst those of the other engender disease, pain, and discontent, squalid misery, and the contempt of the world, contrasted with affluent plenty, a smiling family, and the esteem of all good men.—Perhaps you cannot believe that there exists a being who would hesitate which of these two lots to choose. Alas! my son, vice puts on such alluring shapes, indolence is so seducing, that (like the flies in Æsop,) we revel whilst the sun shines, and for a few hours temporary pleasure pay the price of perishing miserably in the winter of our old age. The industrious ants are wiser. By a little forbearance at the moment, by setting a just value on the future, and disregarding present temptation, they secure an honorable and comfortable asylum. All nature, my son, is a volume, speaking comfort and offering instruction to the good and wise. But 'the fool saith in his heart,

There is no God: he shuts his eyes to the great book of Nature that lies open before him. Your fate, my dear Theodorick, is in your own hands. Like Hercules, every young man has his choice between pleasure, falsely so called, and infamy, or laborious virtue and a fair fame. In old age, indeed long before, we begin to feel the folly, or wisdom, of our selection. I confidently trust that you, my son, will choose wisely. In seven years from this time, you will repent, or rejoice, at the disposition which you make of the present hour.

"ROMANCE, June 10, 1821.—"You do not overrate the solitariness of the life I lead here. It is dreary beyond conception, except by the actual sufferer. I can only acquiesce in it, as the lot in which I have been cast by the good providence of God; and endeavor to bear it, and the daily increasing infirmities, which threaten total helplessness, as well as I may. Many long weeks have passed since you heard from me. And why should I write? To say that I had made another notch in my tally?—or to enter upon the monotonous list of grievances, mental and bodily, which egotism itself could scarcely bare to relate, and none other to listen to. You say truly: 'there is no substitute' for what you name, 'that can fill the heart.' The bitter conviction has long ago rushed upon my own, and arrested its functions. Not that it is without its paroxysms, which I thank Heaven, itself, alone, is conscious of. Perhaps I am wrong to indulge in this vein; but I must write thus, or not at all. No punishment, except remorse, can exceed the misery I feel. My heart swells to bursting, at past recollections; and, as the present is without enjoyment, so is the future without hope; so far, at least, as respects this world."

"The true cure for maladies like yours, is employment. 'Be not solitary; be not idle' was all that Burton could advise. Rely upon it, life was not given us to be spent in dreams and reverie, but for active, useful exertion; exertion that turns to some account to ourselves, or to others—not laborious idleness. (I say nothing of religion, which is between the heart and its Creator.) This preaching is, I know, foolish enough; but let it pass. We have all two educations; one we have given to us—the other we give ourselves; and, after a certain time of life, when the character has taken its ply, it is idle to attempt to change it."

MONDAY MORNING, JAN. 21, 1822.—"I have just received your letter of Saturday, which I read with much pleasure; although I cannot think you are right in giving up exercise altogether. You know my opinion of female society. Without it we should degenerate into brutes. This observation applies with ten fold force to young men, and those who are in the prime of manhood. For, after a certain time of life, the literary man may make a shift (a poor one, I grant) to do without the society of ladies. To a young man nothing is so important as a spirit of devotion (next to his Creator) to some virtuous and amiable woman, whose image may occupy his heart, and guard it from the pollution which besets it on all sides. Nevertheless, I trust that your fondness for the company of ladies may not rob you of the time which ought to be devoted to reading and meditating on your profession; and, above all, that it may not acquire for you the reputation of *Dangler*—in itself bordering on the contemptible, and seriously detrimental to your professional character. A cautious old squareroes, who might have no objection to employing such a one at the bar, would, perhaps, be shy of introducing him as a practitioner in his family, in case he should have a pretty daughter, or niece, or sister; although all experience shows that, of all male animals, the *Dangler* is the most harmless to the ladies, who quickly learn, with the intuitive sagacity of the sex, to make a convenience of him, while he serves for a butt, also.

"Rely upon it, that to love a woman as 'a mistress,' although a delicious delirium, an intoxication far surpassing that of Champagne, is altogether an essential, nay, *pernicious*, in the choice of a wife; which a man ought to set about in his sober senses—choosing her, as Mrs. Primrose did her wedding-gown, for qualities that 'wear well.' I am well persuaded, that few love-matches are happy ones.—One thing at least, is true, that if matrimony has its cares, celibacy has no pleasures. A Newton, or a mere scholar, may find employment in study; a man of literary taste can receive in books a powerful auxiliary; but a man must have a bosom friend, and children around him, to cherish and support the dreariness of old age. Do you remember A. V.? He could neither read nor think; any wife, even a scolding one, would have been a blessing to that poor man. After all, 'suitability' is the true foundation for marriage. If the parties be suited to one

another, in age, situation in life, (a man indeed, may descend, where all else is fitting,) temper, and constitution, these are the ingredients of a happy marriage—or, at least, a convenient one—which is all that people of experience expect."

LA REVUE FRANCAISE; New York, *Hoskin & Snowden*.—This monthly periodical, now entering upon its second volume, has been united with, or rather has absorbed, the *Bibliothèque Choix de littérature française*, published by Carey & Lea, of Philadelphia—whence its chances of, and claims to, permanent success, are considerably increased. The present number contains much interesting matter, not the least attractive part of which is the article on "*Chateaubriand's Memoirs*."

LA FRANCE LITERAIRE, N. Y.—This, as our readers know, is a semi-monthly periodical, affording at an unusually cheap rate, a great variety of extracts from the current French literature.

Te students of French, both the works here noticed offer, as it seems to us, cheaper and more attractive—because more varied—"school books," than the everlasting *Telemaque*, or *Gil Blas*.

RECOLLECTIONS OF A NAVAL LIFE, by CAPT. SCOTT.—This is the title of a work recently published in London, which adds another to the revolting libels upon this country emanating from the British press, and bearing the names of men whose profession—that of arms—has heretofore been thought to imply the possession of courtesy and honor, even where brains were lacking.

In three successive numbers of the London Literary Gazette, we find extracts from this work, referring chiefly to the capture of Washington, and the attack on Baltimore—at both which the author was present—the whole aim and scope of which seems to be, to represent the freebooter Cockburn, as a *peaux Chevalier*, and the Americans, one and all, as cowards and liars.

We will at another time give some specimens of this precious work.

NEW MUSIC.—The only novelty is "Hail Columbia," arranged as "a brilliant Fantasia" for the piano, by Wm. A. King, and published by Firth & Hall, Franklin Square.

SUMMARY.

[From the National Gazette—communication from an authentic source.]

We are extremely gratified to learn, that the unfavorable statements made in several of the newspapers, regarding the health of the venerable ex-President Madison, are somewhat exaggerated. He does not appear to be in immediate danger, although he is extremely feeble, and laboring under disease of a somewhat complicated character, which prevents him from indulging in the active intellectual and corporeal efforts, to which he has been, through a long life, accustomed. On this account, it has been enjoined on him not to harass himself by inordinate attention to the numerous questions of interest incessantly propounded to him, regarding the constitutional history of the country, or which refer to the various absorbing scenes of which he has formed so important a part, and on many of which his voice is esteemed oracular. At the advanced age of eighty-three, and upwards, and afflicted with rheumatism in his hands, it need scarcely be said that the exertion demanded in replying to such inquiries must be irksome, even as respects the mere manual part, yet many questions require answers, which, if complete, would extend to volumes. For all this kind of labor his feeble frame is inadequate, and when the fact is once known, it will, doubtless, be no longer expected of him. Every patriot and philanthropist burns with a glow of veneration towards this illustrious benefactor of his country and his race, and will pause before he requests of him any exertion of mind or body, which may tend, even in the most remote degree, to curtail the existence, or diminish the comforts of one whose whole life has been so ardently devoted to the good of humanity.

The Board of Brokers on Friday, voted a donation of one hundred dollars to the Colonization Society, to be expended in the colonial supplies to be shipped by the *Jupiter*.

NAVAL.—The United States frigate *Potomac*, J. Downes, Esq. Commander, arrived in Boston on Friday, from the East Indies, after an absence of two years and a half.

The cruise of the *Potomac* has been an extensive one. She was originally intended to relieve the *Guerriere* in the Pacific; but her destination, on the eve of sailing, was so far altered, by the Department, as to direct her to take an easterly route, by the way of the Cape of Good Hope and the Sunda Isles, and China, and after performing special duties assigned her in that quarter, to repair to her station in the Pacific. She has completed a circumnavigation of the Globe, and run, by log, more than sixty-one thousand miles, and been five hundred and fourteen days at sea. During this long period, she has never had a spar carried away, nor a man seriously injured by casualty on board, nor have all hands been called at night, but in one instance.

No one of our public vessels since the last war, has performed a cruise so varied, so extensive, and in many respects so interesting, as the one performed by the *Potomac*.

The *Potomac* left at Rio Janeiro, U. S. sloops of war *Peacock*, Capt. Geissinger, for the United States April 17; *Natchez*, Capt. Zantlinger, and *schr. Boxer*, Capt. Farraght. Hon. E. A. Brown, our Chargé d'Affaires to Brazil, contemplated returning to the United States in the *Peacock*.

The sloop of war *Ontario*, Capt. Salter, was at Buenos Ayres at last dates. The sloop of war *Fairfield*, Capt. Valletté, and schooner *Dolphin*, Lieut. Com. Voorhees, were cruising at last accounts to Lima; the former had been as far as Guayaquil.

The *Potomac* sailed from New York on the 24th of August, 1831, and has therefore been absent two years and nine months. During her cruise she has crossed the Equator six times, and encountered dangers in navigation, unknown in ordinary voyages.—The men have been exposed to disease and pestilence in the most insalubrious regions of the earth; and shared also the risks of war in the assault and capture of the Malay forts. Yet the degree of mortality has been even less than usual on board vessels of war, only twenty-seven having died, (including those killed in battle at Qualla Battoo) out of about 500 souls on board.

OFFICERS OF THE POTOMAC.

Commodore John Downes, Commander; Irvine Shubrick, 1st Lieut.; Stephen B. Wilson, 2d do.; Henry Hoff, 3d do.; Jonathan Ingersoll, 4th do.; Matthew F. Maury, 5th acting do.; Sylvanus Gordon, 6th acting do.; Alvin Edson, 1st Lieut. Marines; George H. Terrott, 2d do.; Samuel Jackson, Fleet Surg.; J. N. Reynolds, Esq., Com. Secretary; Philo White, Purser; John W. Gries, Chaplain; Robert S. Fatem, Sailing Master; M. G. L. Clairborne, Acting do.; Jonathan M. Foltz, Henry D. W. Paulding, Assistant Surgeons; Francis Warrenner, Schoolmaster; David Telfair, Commodore's Clerk; Charles de Selding, Richard Jones, Master's Mates; Henry C. Hart, Wm. H. Pendleton, Levi Lincoln, Jr. John W. Taylor, George T. Sinclair, James B. Lewis, Alonzo B. Davis, Francis P. Hoban, Charles W. Morris, Wm. May, James G. Stanley, Charles Hunter, George M. Totten, Theodore B. Barrett, Eugene Bogle, Wm. B. Whiting, Wm. T. Cooke, and Wm. M. E. Adams, Midshipmen; John McNelly, Boatwain; John R. Covington, Gunner; Wm. E. Sheffield, Carpenter; Christian Nelson, Sail Maker.

Passengers, Lieut. N. C. Lawrence and Mid'n V. L. Williamson, late of U. S. ship *Fairfield*; Assistant Surgeon Cornelius Moore, Midshipman Wm. P. Taylor, and Charles Douglerly, Gunner, late of U. S. schooner *Dolphin*; Mr. Philo White, late Navy Agent at Valparaiso. [Purser Wm. A. Slacum remains at Valparaiso, in charge of the Navy Agency.]

The United States ship *Peacock*, David Geissenger, Esq. Commander, arrived in this port on Sunday, from a cruise in India, and last from Rio Janeiro.—E. A. Brown our Chargé d'Affaires at Brazil, came passenger in the *Peacock*. We annex a list of her officers, and from the Boston papers take a notice of those of the *Potomac*, and some particulars of her cruise.

Officers of the *Peacock*.—David Geissenger, Commander; Robert B. Cunningham, H. Y. Furviance, Edward B. Boutwell, Thomas W. Brent, Lieutenants; Francis B. Stockton, Purser; Benajah Ticknor, Fleet Surgeon; George Hurst, Sailing Master; Augustus S. Baldwin, George R. Carroll, Charles Thomas, William Reynolds, D. R. Crawford, H. T. Wingate, John B. Weed, A. H. Wells, Robert Patton, Midshipmen; H. M. Fowler, Lieut. of Marines;

H. N. Robinson, Schoolmaster; Frederick T. Poor, Captain's Clerk; John Barr, Acting Gunner; William Condy, Acting Carpenter; Charles H. Haven, Purser's Steward.

OFFICIAL—NAVY DEPARTMENT.

Extract from a letter addressed to the Secretary of the Navy from John A. Kearney, Surgeon of the West India Squadron, dated on board the *Vandalia*, Pensacola, May 8, 1834.

"I have been eight months Surgeon of this fleet, and have not lost a man, a circumstance rare in these tropics, and attributable, no doubt, to the excellent police and subordination, so strictly and judiciously enforced."

An Oration in honor of Mr. WIRT, was delivered in Baltimore on Tuesday. The Baltimore American thus speaks of it:

There is but one opinion, among the crowded audience that listened to Mr. Kennedy's Oration on the death and character of Mr. Wirt, delivered in the Rev. Mr. Nevin's church on Tuesday evening, at the request of the Baltimore Bar. It was highly polished, eloquent and affecting—all that was anticipated from the accomplished speaker, and the elevating theme. The spacious building was filled, and as the orator spoke with just praise and merited affection of the genius and virtues of the illustrious dead, dwelling upon his labors, tracing his career, and unfolding the history of his mind, the graces of his life, and the moral beauty of his character—he was heard with profound and delighted attention.

We learn that the Locomotive Engine on the New-Castle and French Town Rail Road, on Friday, when on her way about seven miles from French Town, broke some of her machinery, but we believe no injury was sustained by the passengers. In consequence of the accident, the line did not arrive in Philadelphia until near four o'clock.—[Philadelphia paper.]

[From the Cincinnati Mirror.]

THE FIRST FLAT BOAT ON THE MISSISSIPPI.—A friend called on us a few mornings since to accompany him to the shop of Mr. F. Shields, for the purpose of viewing an iron tablet, recently cast by Hanks & Niles, of this city. It is to be erected to the memory of one of the pioneers of the West, and we should judge that it will perpetuate his name through many ages. It is very spacious, with large and deeply indented letters, and is the first of the kind ever executed west of the Alleghanies.

The following is the inscription:

JACOB YODER,

Was born in Reading, Pennsylvania,
August 11th, 1758.

And was a Soldier in the Revolutionary Army in
1777 and 1778.

He emigrated to the West in 1780, and in May,
1782, from Fort Redstone, on the
Monongahela River,

in the

FIRST FLAT BOAT

that ever descended the Mississippi,
He landed at New Orleans with a cargo of
produce.

He died April 7, 1832, at his Farm in Spencer
County, Kentucky, and lies here
interred beneath this tablet.

Capt. Jacob Yoder was a highly respectable and wealthy farmer of Spencer county, Ky. To him belongs the honor of having descended the Mississippi in the first flat boat. And if no other powers than those of time, and wind, and storm shall assail it, this tablet will preserve the fact recorded upon it thro' a long series of coming ages.

No one who has any pretensions to the possession of a soul can contemplate this tablet without a variety of emotions. A brilliant series of associations enchain the mind of the gazer, as with a spell, to it.—That the man who navigated the first flat boat that ever descended the Mississippi, should have lived to see a magnificent steamboat ploughing the same watery track, is a truth which affords a subject of much admiration. When he launched his little bark on the Monongahela, what were his anticipations? Such as time has proved? No, he then thought of the wily savage, whose covert was a wide and untrodden wilderness. He proceeded on his precarious voyage. Instead of cheering aspects of busy cities, flourishing villages, and cultivated farms, which now chain the voyager's attention, he saw a range of hills, unshorn of their primeval wilderness, whence the lugubrious howl of the wolf proceeded, the vast wilderness where the foot of civilized man had not trodden, "instinct," 'tis true, "with life," but it was the life of the forest denizen, the trembling fawn, and the myriad songsters of the wild. He reached his destination, but his safety was a marvel to him-

self, and his dangers in after recital, wakened up a fear stricken excitement in the minds of those who listened to his tale of perils "by field and flood."—He lived to see the country change masters, the wilderness blossom as the rose, and human energy achieve a conquest over a thousand obstacles. This is the greatest triumph that man has yet achieved.—History records no parallel. To the future generations of America, it will be what the fabulous age of the Titans was to the ancient Greeks.

The manner of men's dying has often been commented upon, as indicative of individual character under circumstances where dissimulation can no longer avail. The indication is not good for much in our judgment, for there is very frequently as much study of effect, and "hollow show," in the last moments of life, as at any other period of it.

The following extracts from volume II. of a curious and clever book, called *the Doctor*, lately published in England, have some bearing on this point.

[From the Doctor.]

"It is one thing to jest, it is another to be mirthful,—Sir Thomas More jested as he ascended the scaffold. In cases of violent death, and especially upon an unjust sentence, this is not surprising; because the sufferer has not been weakened by a wasting malady, and is in a high state of mental excitement and exertion. But even when dissolution comes in the course of nature, there are instances of men who have died with a jest upon their lips. Garci Sanchez de Badajez, when he was on the point of death, desired that he might be dressed in the habit of St. Francis; this was accordingly done, and over the Franciscan frock they put on the habit of Santiago, for he was a knight of that order. It was a point of devotion with him to wear the one dress, a point of honor to wear the other; but looking at himself in this double attire, he said to those who surrounded his death-bed, 'The Lord will say to me presently, "My friend Garci Sanchez, you come very well wrapt up!" (may arropado) and I shall reply, "Lord, it is no wonder, for it was winter when I set off."'

"The author who relates this anecdote remarks that 'o morrer com gracia he muyto bom, e com gracia he muyto mau:' the observation is good, but untranslatable, because it plays upon the word which means grace as well as wit. The anecdote itself is an example of the ruling humor "strong in death;" perhaps also of that pride or vanity, call it which we will, which so often, when mind and body have not yielded to natural decay, or been broken down by suffering, clings to the last in those whom it has strongly possessed.

"Don Rodrigo Calderon, whose fall and exemplary contrition served as a favorite topic for the poets of his day, wore a Franciscan habit at his execution, as an outward and visible sign of penitence and humiliation: as he ascended the scaffold, he lifted the skirts of the habit with such an air that his attendant confessor thought it necessary to reprove him for such an instance of ill-timed regard to his appearance. Don Rodrigo excused himself by saying that he had all his life carried himself gracefully! The author by whom this is related calls it an instance of illustrious hypocrisy. In my judgment the father confessor who gave occasion for it deserves a censure far more than the penitent sufferer. The movement, beyond all doubt, was purely habitual,—as much so as the act of lifting his feet to ascend the steps of the scaffold; but the undeserved reproof made him feel how curiously whatever he did was remarked: and that consciousness reminded him that he had a part to support, when his whole thoughts would otherwise have been far differently directed.

"A personage in one of Webster's plays says:

"I knew a man that was to lose his head
Feed with an excellent good appetite
To strengthen his heart, scarce half an hour before,
And if he did, it only was to speak."

Anecdote.—In a friend's album, Mr. Smith, keeper of the prints in the British Museum, wrote a playful account of himself, in which is the following paragraph:—"I can boast of seven events, some of which great men might be proud of—I received a kiss when a boy from the beautiful Mrs. Robinson; was patted on the head by Dr. Johnson; have frequently held Sir Joshua Reynolds' spectacles; partook of a pot of porter with an elephant; saved Lady Hamilton from falling when the melancholy news reached her of Lord Nelson's death; three times conversed with King George the Third, and was once shut up in a room with Mr. Kean's lion.—[London Paper.]

The schooner *Mexico*, commanded by Capt. James Almeida, and engaged in the Mexican trade, which disappeared so mysteriously some months since, is thus accounted for by a New Orleans paper: The captain and cabin passengers of that vessel were murdered by three Italians who were on board, and she was afterwards scuttled and abandoned by them somewhere on the Spanish Main.

City of Brooklyn.—The Common Council met on Tuesday, 20th, and elected George Hall, Esq. Mayor, and Cyrus P. Smith, Counsellor and Clerk. The oath of office was administered to the Mayor elect by Judge Morse. The Mayor then addressed the Board in a short speech, in which he congratulated them and his fellow citizens on the successful issue of their application for a city charter; and the more so, as it has been a struggle against the combined and uniring opposition of a portion of their own county, and the great and influential city of New York. But while we rejoice, gentlemen, (said he,) that the legislative wisdom of our State has indignantly frowned down the narrow minded policy which has been arrayed against us by our sister city, and by an almost unanimous vote, secured to us those rights and privileges which our position, our population and wealth had a right to demand; let us not be unmindful of the additional obligations it imposes on every good citizen, and especially upon us, their representatives, to proceed with caution and prudence, in the discharge of the various duties committed to our trust.—[Commercial.]

[From the Keene N. H. Sentinel of May 22.]

The snow storm of Thursday last (15th May!) was very severe on the high lands in this vicinity, the snow drifting as in February. We learn that west of the mountains the snow was a foot deep, and that two of the stages from Middlebury went out on runners. At Haverhill, N. H. the snow fell nearly two feet on a level.

The Rutland Herald says the storm raged with fury from 8 o'clock Wednesday evening, to Thursday afternoon. The snow fell twelve inches. "On Friday, when the sun came to shed its beaming rays on the foliage, it was enough to make a sensitive heart sick at the prospect. All the beauty of Spring had vanished, and every green thing bore the marks of desolation—it looked like the 'gloom of Autumn.'"

GREAT RISE IN THE ALABAMA RIVER.—The Mobile Register of the 8th, states, on information received from passengers by the steamboat Choctaw, from Tuscaloosa, arrived the evening before, that the River at Lempolis had risen twenty-five feet, within a few days, and that it was rising when the boat left that place. Serious apprehensions were entertained for the Cotton and Corn planted on the bottom lands.

All the contents of the number for next month, of the American Quarterly Review, are printed, and the number will be issued without delay. The titles of the several articles are,—Art. 1. Washington and his Writings. 2. Life of Alexander Hamilton. 3. Italian Tragedy. 4. Cox on Quakerism. 5. Life and Writings of Robert C. Sands. 6. Black Hawk. 7. Decline of Poetry. 8. Paris and the Anniversary. 9. The Public Distress.

Colony of Pigeons.—A Susquehanna Pa. Co. paper mentions that immense numbers of Pigeons have taken possession of, and appropriated to their use, a territory said to be nine miles in length, and two miles in width; every foot of which, and almost every tree and branch of a tree upon it, are constantly occupied by them. It is presumable that the beech woods are indebted for this Pigeon visit, to the abundant crop of beech nuts this season.

Appointment.—We understand, says the Commercial, that Eli Moore, of this city, has been appointed by Gov. Marcy, to inspect and make a report to the Executive of the State, of the different prisons, at a per diem allowance of five dollars, and travelling expenses.

DEPARTURE OF MISSIONARIES.—The ship Corvo sailed on Wednesday, from Boston, for Bombay, having on board the Rev. Messrs. Graves and Munger, and Messrs. Hubbard and Abbott, and their wives, and also Miss Graves and Miss Kimball, all destined to the Mahratta Mission. Many persons assembled on the wharf to witness the impressive ceremony of embarkation.

Mr. MADISON.—It will be gratifying to our readers to learn that Professor *Dunglison*, on his return through Washington on Thursday from Montpelier, the seat of Mr. Madison, reported him to be in a rapid state of recovery.

NEW MANUFACTURE.—We have before us two ladies hats called the "White Aspen," and they are very pretty light summer hats, as one would wish to see. The one is plain: the other an open diamond figure; and either is fit to grace the head of beauty. These new articles may be had of Wm. P. Sloan, 29 Stone Street.

BOSTON, May 21.—*The Hardest fend off*.—The ship *Neponset* was yesterday hauled upon the railway, and her cut water exhibits the effects of the tremendous power of the stroke of a whale. Capt. Hunt informs us that on his passage out to Canton on the 19th of last July, when sixty days from Boston, a sudden shock was felt by all on board, and that those who did not see the whale, supposed the vessel had struck a rock. It was in broad day, and the mate, who was steering at the time, saw the whale, and might have avoided it as well as not, but thinking to have a little sport, and not being apprehensive that there could be the least danger in giving him a gentle touch, kept straight on; he soon found out his mistake however, and came off second best, for the whale on being disturbed, gave a sudden turn, bringing his tail directly across the bows of the ship, carrying away a part of the cut-water, a piece of solid timber eight feet long and nearly a foot thick, breaking off a number of copper bolts as short and with as much ease as if they had been pipe stems, and doing some other considerable damage. It was a large right whale, and in all probability if he had got a fair lick, as the boys say, for this was nothing but a gentle touch, he would have sent the vessel to the bottom. Capt. Hunt was obliged to repair as well as he could in Canton, and now the ship is on the rail-way, the effects of the encounter are plainly to be seen.

[From the *Western Carolinian* of May 17.]

HARD TIMES.—Corn is now worth one dollar per bushel in this place, and hard to get at that. It has never, but once, within our memory, been so high here. In 1817 it sold, we believe, as high as \$1.25—but that was hardly as high as 50 cents now, if we take into consideration the redundancy of the circulating medium then, and its extreme scarcity at the present time. Many poor families are in a state of actual suffering, for they have not the "ways and means" of going any distance in search of grain; and those farmers in the country, who had it to spare, have already disposed of their surplus.

It is said that Corn may be had, as yet, in abundance, up the Yadkin. Those who have spare capital, would act, if not prudently, at least generously, by contributing something to collect a supply at this place to be distributed to the poor on such terms as would tend to alleviate distress without encouraging idleness.

The privilege of filling up Coffee House Slip and Old Slip, has been sold for two thousand seven hundred dollars, and the privilege of dumping dirt into them is retailed by the contractor at three cents a load. This at first seems more strange, than that servants should hire the privilege of tending in hotels. But when it is considered how great the quantity of dirt and rubbish is which must be taken away from the buildings which are pulling down, and the cellars which are digging in the lower part of the city, and that there is no other place of deposit for it within the distance of nearly two miles, the thing is accounted for.—[*Jour. of Com.*]

Accident.—The sloop *Rising Sun*, Capt. Bull, of Barnegat, whilst proceeding down the bay in a squall on Saturday afternoon, was struck by a heavy flaw of wind and capsized. Two of the hands were drowned. One of them was in the cabin at the time of the accident, and the Captain hoping to save his life, procured as soon as possible, an axe from a schooner hard by, with which he cut a hole into the cabin, but as soon as the air was admitted the sloop righted, and the poor fellow was irrecoverably lost. The sloop soon after drifted ashore on Robin's Reef, and on Sunday morning, when the Captain boarded her, he found that some rascals had in the night completely stripped her of rigging, blocks, &c.

HUDSON, COLUMBIA COUNTY, MAY 27.—The barque *Washington*, Captain Clark, left our docks on Tuesday afternoon last for the Pacific, in pursuit of the sperm whale. She was manned and furnished for

three years. She sails on her second voyage. Our citizens have now eleven vessels in quest of the oily treasures in the prolific deep.

Criminal Outrage.—The church, called St. Matthews, in Manchester village, on the west side of the Schuylkill, near this city, was entirely destroyed by fire on Saturday evening. There is not the slightest doubt that this conflagration was the work of an incendiary. There had been no fire in or near the building, for a long time.—[*Philadelphia Commercial Intelligencer.*]

The bill concerning gold and silver coins of the United States, and for regulating the value of foreign coins, passed the House of Representatives on Tuesday. The Senate will undoubtedly—supposing the provisions of the bill to be satisfactory, (of which, not having seen it, we have no means of judging)—speedily adopt it.

[From the *Arkansas Gazette*, April 30.]

CHOLERA.—LITTLE ROCK.—Among the passengers who passed up on the steamboat *Gallipolis*, on Friday night last, were Lieuts. Chandler and Taylor, U. S. A., having in charge about 140 recruits for the 7th U. S. Infantry, at Fort Gibson, which have been recently enlisted in New York and other eastern ports. These recruits, we are sorry to say, were in a distressing situation when they passed here, the Cholera having made its appearance among them, and bidding fair to thin their ranks considerably. Six had died since they had left New Orleans—two on the day they arrived here, and upwards of 40 new cases reported same day.

The *Helena Herald*, of 24th instant, states that the steamboat *Warren* passed there on the 22d, bound up, having lost 10 or 12 passengers by cholera, between New Orleans and that place—one of which was Mr. B. Stowell, of Natchez.

The Cholera was still prevailing, with little or no abatement, among the Cherokee emigrants, encamped near the mouth of the Cadron, when we last heard from them. The number of deaths in the party, from all diseases, since they left Waterloc, on the Tennessee river, amounts to about 60—a fearful mortality in a party originally not exceeding 550 souls, in the short space of about two months. Every humane exertion within the control of Lieut. Harris, the conducting agent, has been used to alleviate the sufferings of the emigrants. One of the physicians, Dr. J. C. Roberts, employed by him to attend on the sick, was attacked by the disease, and died on Tuesday last; and Dr. John T. Fulton, the only other attending physician, was also seized with it last week, but, we are happy to learn, was convalescent and out of danger on Friday evening last. Another has since been employed from this county, who, we hope, may be more fortunate.

The disease also appears to be spreading along the river. A citizen of this county, Mr. Madison Taylor, died last week, about 15 or 20 miles above this place, and there was said to have been another in his family and one in the vicinity, both of which are convalescent. There have been several cases of the cholera at or near Pine Bluff, within the last ten or fifteen days, and three or four blacks have died; but the disease had abated when the last steamboats left there.

For the information of our friends abroad, we have the pleasure of assuring them, that we have no case of the Cholera in town, nor in the vicinity, and that our citizens are as healthy as usual at this season of the year.

The Park.—The Corporation, some months since with a view to adorn this beautiful promenade, and to protect the areas from being invaded and trampled upon, made an appropriation for the purpose of purchasing handsomely turned Locust Posts and chains to enclose all the areas in a substantial manner.—The work and the materials were let out on contract to a gentleman who sent over a sample of the kind of chain required to England, and ordered enough to complete the enclosure of all the areas. They arrived a few days since, and a number have been passed through the turned posts, and present a rough, weak, and miserably insufficient appearance for the purpose intended. Some of them have since been broken and others will doubtless soon be broken by the boys and others resting on them, and the post holes will soon become so large as to let the chains down almost to the earth. The whole job, in short is most miserable executed. The reason for sending to England, the contractor says, is because he could, and did purchase these chains at 13 1/2 cents per pound, whereas when made in this country twice as good, they would cost 16 cents a pound and em-

ploy American mechanics. This is favoring American industry with a vengeance and exhibits a disposition to disregard public feeling, which should meet with popular disapprobation.—[*Daily Advertiser.*]

STEAMBOAT UNITED STATES.—This splendid [Boat proved herself an excellent sea vessel, by riding out in safety the tremendous gale that wrecked the Steamboat *Oswego*. Though encountering the full force of that storm, she was perfectly manageable, so much so that the passengers felt entirely safe. On her last trip down the Lake, she run from Niagara to Ogdensburg, (325 miles) including the usual stoppages at seven different ports, in thirty-five and a half hours. The last thirty-six miles was accomplished in two hours and forty-nine minutes. The Ogdensburg paper speaks in high terms of her popular Commander, Capt. R. J. Van Dewater.

P. S.—The United States will hereafter leave Ogdensburg at 9 o'clock, A. M. on Sundays, instead of 5 o'clock, P. M.—[*Alb. Even. Jour.*]

[The previous day's proceedings will be found in the *Extra.*]

A Novel Law Point.—The Supreme Court of Massachusetts, at its law session in Boston in March last, decided, that a grand-child born eight months and a half after the death of his grand-father, is included in a bequest to grand-children "living at his decease."

The London Weekly Despatch, in declining to publish a "Subaltern's Eulogy on a great Captain," takes occasion to remark, that they have but little respect for heroes, in the common acceptance of the term, but there have been great leaders, whose memory will be ever dear to freemen—such were,

"Leonidas and Washington,
Whose every battle-field is holy ground,
Which breathes of nations saved—not worlds undone.
How sweetly on the ear such echoes sound!
While the mere victors may appeal, or stun
The servile or the vain: such names will be
A watchword, till the future shall be free!"

[From the *Journal of Commerce.*]

LATEST FROM RIO JANEIRO.—By a decree of March 6th, government has granted to a company called "Nitheroy," the exclusive privilege, for ten years, of navigating the rivers and bays of the Province of Rio Janeiro by Steam. The Company, on their part, agree to establish steamboats on said bays and rivers, within 15 months from the date of the decree, under penalty of two contos of reis, to be paid to the public Treasury.

The Minister of the Home Department has addressed Circulars to the Presidents of several Provinces, stating that the government had received information of the existence of the Silk-Worm in those Provinces, and requiring them to investigate the matter, and "remit to the Secretary of State's a portion of balls of silk as made by the insect, if such are to be found," and also "every possible information as to where they are to be found, the shrubs or trees on which they feed, and whether they can be propagated with facility in houses." The Silk-Worm of Brazil is not exactly of the same species with that of Asia, being larger and of a more hardy nature. The Silk is said to be of an excellent quality.

Jose Aronche de Toledo Rondon has been commissioned by the government to write a treatise upon the process of manufacturing Tea. It appears that this plant has been propagated to some extent in the Provinces of St. Paul's Nines, &c. and that it flourishes extremely well. It was introduced into St. Paul's by the gentleman above named, whose plantation in 1829 contained upwards of 30,000 plants.

RIO JANEIRO, April 5th.—The horizon of our political world bears a more favorable aspect than it has done for some time past; the reports from the Presidents of the different Provinces to the Regency, and the numerous felicitations received from the several municipalities, all announce that tranquility is firmly restored in all the Provinces, except that the insurrection of Panellas and Jaquipe has not yet been quelled; but as troops from all directions have marched against the insurgents, they cannot stand out long; several persons implicated have been taken and sent to the Island of Fernando Noronha.

The long continuance of dry weather has much injured the crops in the Minas districts generally, and reduced the towns of Diamantina and Principe to absolute starvation; happily the rains which have lately fallen, and the liberal subscription made by the inhabitants of this city, both natives and foreigners, whose names have been published, amounting to near Rs. 30,000,000, and measures adopted by government, have greatly relieved the unfortunate sufferers.

[From the Journal of Commerce.]

A NEW CONTINENT.—It will be recollected that a year or two ago, a paragraph was put forth by the London Literary Gazette, if we recollect right, and extensively copied, stating that a large body of land had been discovered somewhere to the Southward of the Cape of Good Hope. There was however a great lack of details, for want of which, as well as the extraordinary character of the discovery, many were inclined to regard it with incredulity. We now have the long sought details.

INTERESTING TO THE WORLD AT LARGE.

[From the Tasmanian of Hobart Town, dated October 11, 1833.]

Most of our readers will recollect that about 18 months since, Capt. Briscoe, of the brig Tula, brought his vessel to this port for repairs. It will also be fresh in the memory of many, that some of our public writers pretended to doubt the authenticity of Capt. Briscoe's statement—viz., that he was then on an expedition, at the cost of a London mercantile house; indeed, in this very journal, the epithet "piratical" was more than once repeated when referring to the Tula and Lively. At the time Captain Briscoe was with us, it became pretty generally understood that a discovery of land of some importance had been made, but as great pains were taken to keep the situation a secret, the various reports circulated, of course, were only surmises of those who pretended to be more knowing than their neighbors. The following extract, however, will disclose the secret, which was so well kept by the enterprising crews of the two little vessels.

"The discovery of the land towards the South Pole, made by Captain Briscoe, in the brig Tula, accompanied by the cutter Lively, both vessels belonging to Messrs. Enderby, extensive owners of ships in the whale fishing, has been communicated to the Royal Geographical Society.

"It is supposed that this land forms a part of a vast Continent, extending from about longitude 47—31 east, to longitude 69—29 west, or from the longitude of Madagascar round the whole of the Southern or South Pacific Ocean, as far as the longitude of Cape Horn. On the 28th February, 1832, Captain Briscoe discovered land, and during the following month remained in the vicinity; he clearly discovered the black peaks of mountains above the snow, but he was, from the state of the weather, and the ice, unable to approach nearer than about 30 miles. The Stormy Petros was the only bird seen, and no fish. It has been named Enderby's Land, longitude 47 31 E. latitude 66—36 S. An extent of about 300 miles was seen. The range of mountains E. S. E.

"In consequence of the bad state of the health of the crew, Capt. Briscoe was compelled to return into warmer latitudes. He wintered at Van Diemen's Land, and was rejoined by the cutter, from which he was separated by the stormy weather, in the high south latitudes.

"In October, 1831, he proceeded to New Zealand. In the beginning of February, 1832, he was in the immediate neighborhood of an immense iceberg, when it fell to pieces, accompanied by a tremendous noise.

"On the 4th of the same month, land was seen to the S. E. longitude 69—29, latitude 67—15. It was found to be an island, near to the head land, of what may be hereafter called the Southern continent. On the island, about four miles from the shore, was a high peak (and some smaller ones,) about one third of its height was covered with a thin scattering of snow, and two thirds completely with snow and ice. The appearance of the peaks was peculiar; the shape was conical, but with a broad base.

"This island has been named Adelaide Island, in honor of her Majesty. Mountains were seen to the South at a great distance inland, supposed about 90 miles. On 21st February, 1832, Captain Briscoe landed in a spacious Bay on the main land, and took possession in the name of his Majesty William IV. The appearance was one of utter desolation, there being no vestige whatever of animal or vegetable life. In future, this part of the continent, if such it prove, will be known as Graham's Land."—[Sydney Monitor.]

FOREIGN ITEMS.

The Prince de Ligne, the Duke d'Ursel, and others whose houses were sacked by the Brussels mob, had arrived at Paris.

M. Barbé Marbois, at the age of 90, retires from the Presidency of the *Cour des Comptes*, and is succeeded by M. Barthe, created for that purpose a Peer of France.

Mr. Livingston, our Minister to Paris, had interviews with the King on the 3d and 5th ult., both after the rejection of the indemnity.

FRENCH TREATY.—The following article from the National Gazette, shews that we have no reason to expect any reconsideration of the vote in the French Chamber of Deputies, rejecting the American indemnity—no such usage existing in that body. At the next session, we entertain little doubt of a different result.

A French friend has sent us the following note, which possesses interest in regard to the fate of the Treaty with France:

"The answer to your inquiries about the reconsideration of votes, is more easy than I at first supposed. Annexed, you have the text of two articles of the Charter, as revised in 1830, after the Revolution.

"Art. 15. The right of proposing laws belongs to the King, to the Chamber of Deputies, and to the Chamber of Peers. However, all revenue laws must be voted first by the Chamber of Deputies."

"Art. 17. If a proposition of a Law has been rejected by one of the three branches, it cannot be brought up again (représenté) during the same session."

"As for what is called reconsideration of a vote, that is, voting again in the same session, upon a question decided when the proper number of Deputies (the Quorum) has been present at the vote, it is altogether unknown in our legislative assemblies, at least since the famous Convention, who never having consulted anything but their arbitrary and despotic will, often treated their own decrees as they had dealt with most of the sacred laws of humanity."

Population of Great Britain.—There has just been printed in two volumes folio, an "Enumeration Abstract" of the population of Great Britain for 1831, made from the returns and answers forwarded from each parish in England and Scotland, pursuant to an act of Parliament.

Population of England and Wales, from the year 1700 to the year 1830, including the army and navy, and merchant seamen.

1700—5,134,516	1750—6,039,648	1800—9,187,176
1710—5,066,337	1770—7,287,586	1810—10,407,556
1820—5,345,351	1780—7,814,937	1820—11,957,505
1830—5,687,903	1790—8,540,736	1830—13,846,851
1740—5,389,705		

The population of Ireland amounted to 7,767,401. The increase of Great Britain since 1801, has always been about one a half per cent. per annum. The comparative proportion of families stands as follows in centesimal parts.

	Agriculture.	Trade, &c.	Others.	Total.
G. Britain	1811—35	44	21	100
	1821—33	46	21	100
	1831—28	42	30	100

Thus trade and manufactures appear to have somewhat increased between 1811 and 1821, agriculture to have somewhat declined; but between 1821 and 1831, the proportion of families employed in trade receded from 46 to 42 per cent. and the agricultural population from 33 to 28 per cent.

Summary of Great Britain.			
1801	1811	1821	1831
England, 8,331,434	9,551,888	11,261,437	13,191,005
Wales, 541,546	611,788	717,438	806,182
Scotland, 1,569,061	1,695,588	2,053,456	2,365,114
Army, Navy, 479,598	640,530	719,506	877,017
10,942,646	12,609,864	14,391,631	16,539,318

Error Corrected.—In noticing a great assemblage of the Trades Unions in London, who met to petition the King for a commutation of the punishment of some Unionists condemned to transportation, we stated the number of the procession at 200,000, while in fact it did not, we find, exceed 30,000. Our mistake arose from the following paragraph in the Times of the 21st, the day before the meeting:

An absurd notion has got hold of these "Trades' Unionists," that notwithstanding their multitudinous meeting, and their alarming and most inconvenient and troublesome procession, their petition must, as a matter of course, be received at Whitehall, provided only that the entire mass of 200,000 petitioners abstain from breaking bedily into the Home-office, and content themselves with sending a small detachment of their numerous army to present it. Now, we can inform them that so clumsy and wretched an expedient will not serve the purpose.

Steam v. the Turn-outs.—The turn-out of the Lan-

cashire workmen in the building trade has introduced a curious application of the steam-engine. This machine is now employed instead of manual labor, in hoisting building materials to the top of the edifice where they are intended to be used. The Liverpool Custom-house is at the present moment rising into existence by the assistance of a steam-engine, which raises sixteen thousand bricks *per diem*, with seven or eight tons of mortar, and at the same time mixes the mortar below.

ROYAL STATUTE—ESTATUTO REAL, For the Convocation of the General Cortes of the Kingdom of Spain.

Art. I.—In conformity to the provisions of the law 5th, chap. 15th, part 2d, and the law 1st and 2d, chap. 7th, book the 6th of the new Constitution, her Majesty, the Queen Governor, in the name of her august daughter Donna Maria II, has resolved to convocate the General Cortes of the Kingdom.

Art. II.—The General Cortes shall be composed of two *Estamentos* (Estates), viz., of the *Proceres* (Peers) of the Realm, and of the *Recuradores* (Deputies) of the Kingdom.

CHAPTER II.

Of the *Estamento* of the Peers of the Realm.

Art. III.—The *Estamento* of Peers of the Realm shall be composed—

1. Of the Most Reverend Archbishops, and of the Most Reverend Bishops.
2. Of the *Grandees* of Spain.
3. Of the *Titulos* of Castile.
4. Of an undetermined number of Spaniards, elevated in dignity and illustrious by their services in various careers, who shall or may have been Secretaries of State, Ambassadors, or Ministers Plenipotentiary, Generals of the Navy or Army, or Judges of the Supreme Tribunals.
5. Of the territorial proprietors and chief partners in manufacturing companies, or mercantile establishments, which shall be found to unite to personal merit, and other corresponding circumstances, the possession of an annual income of 70,000 reals, and have been previously Deputies of the Kingdom.
6. Of those who as public teachers or cultivators of science and literature, have acquired renown and celebrity, and who also possess an annual income of 70,000 reals, whether derivable from private property or a salary paid by the State.

Art. IV.—It shall be sufficient to be Archbishop, or Bishop Elect, or Bishop Auxiliary, to be eligible in that class, and to take a seat in the *Estamento* of the Peers of the Realm.

Art. V.—All the *Grandees* of Spain belong by birth to the *Estamento* of Peers of the Realm, and shall take their seats accordingly, contingent only upon the following conditions—

1. That they shall be 25 years of age complete.
2. That they be possession of the *Grandeeship*, and hold it in their own right.
3. That they shall have an annual income of 200,000 reals.
4. That their estates shall not be subject to any kind of mortgage.
5. That they are not under criminal process.
6. That they are not the subjects of any other Power.

Art. VI.—The dignity of Peer of the realm is hereditary in the *Grandees* of Spain.

Art. VII.—The Sovereign shall elect and name the other Peers of the realm whose dignity shall be for life.

Art. VIII.—The *Titulos* of Castile, who may be named Peers of the realm, shall prove that they possess the following qualifications:

1. That they are 25 years of age.
2. That they are in possession of the *Titulo* of Castile, and hold it in their own right.
3. That they are in the receipt of an income of 80,000 reals.
4. That their estates are not subject to any kind of mortgage.
5. That they are not under criminal process.
6. That they are not the subjects of any foreign Power.

Art. IX.—The number of Peers of the realm is unlimited.

Art. X.—The dignity of Peer of the realm shall be forfeited only in case of legal incapacity, or in virtue of a sentence by which an infamous punishment may be awarded.

Art. XI.—It is reserved to future regulations to determine all that concerns the interior proceedings and mode of deliberating in the *Estamento* of the Peers of the realm.

Art. XII.—The Sovereign shall elect from the Peers of the realm, whenever the Cortes are convoked, those who are to exercise, during the period of that Session, the offices of President and Vice-President of the said *Estamento*.

CHAPTER III.

Of the *Estamento* or *Procuradores* or *Deputies* of the Kingdom.

Art. XII.—The *Estamento* of the Deputies of the kingdom shall be composed of the persons to be chosen according to the law of elections.

Art. XIV.—To be a Deputy of the kingdom it will be necessary—

1. To be a native of those kingdoms, or the son of Spanish parents.

2. To be of 30 years of age completed.

3. To be in possession of an income of 12,000 reals yearly.

4. To have been born in the province for which the Deputy is named, or to have resided in it for two previous years, or to possess in it some property either in town or country, which shall produce half the rent necessary to be a Deputy of the kingdom. In case any individual should be elected a Deputy to the Cortes for more than one province, he shall have the right to choose between those by whom he shall be named.

Art. XVI.—The following cannot serve as Deputies of the Kingdom—

1. Those who have been proceeded against criminally.

2. Those who have been condemned by a tribunal to an infamous punishment.

3. Those who have any natural physical incapacity, notorious or permanent.

4. Those traders who are declared in a state of insolvency, or who have suspended their payments.

5. Proprietors whose estates are mortgaged.

6. Debtors to the public Treasury, in quality of indirect contributors.

Art. XVI.—The Deputies of the Kingdom shall act in conformity to the powers with which they shall have been invested at the time of their election, as prescribed by the Royal Decree of Convocation.

Art. XVII.—The duration of the powers of the Deputies of the Kingdom shall be for three years, except when the Sovereign shall dissolve the Cortes before the expiration of that time.

Art. XVIII.—When a new election shall be proceeded in, whether in consequence of the powers having expired, or that the Sovereign shall have dissolved the Cortes, those who have been Deputies of the Kingdom may be re-elected, provided they still fulfil the conditions required by the laws.

CHAPTER IV.

Of the Meeting of the *Estamento* of the Deputies of the Kingdom.

Art. XIX.—The Deputies of the kingdom shall meet in the place designated by the Royal Decree of Convocation for the celebration of the Cortes.

Art. XX.—The Cortes themselves shall enact rules for determining the form of verification, of the powers of Members.

Art. XXI.—When the powers of the Deputies of the kingdom shall be determined, they will proceed to elect five from among themselves, from whom the Sovereign will select the two who are to act as President and Vice President.

Art. XXII.—The President and Vice President of the *Estamento* of the Deputies of the kingdom shall cease their functions when the Sovereign shall suspend or dissolve the Cortes.

Art. XXIII.—The regulations shall determine every thing relative to the interior proceeding and the mode of deliberating in the *Estamento* of the Deputies of the kingdom.

CHAPTER V.

General Provisions.

Art. XXIV.—To the Sovereign shall exclusively belong the right of convoking, suspending, and dissolving the Cortes.

Art. XXV.—The Cortes shall be assembled in virtue of the Royal Convocation, in the place, and on the day therein named.

Art. XXVI.—The Sovereign shall open and close the Cortes either in person or by commission.

Art. XXVII.—In observance of the law 5th, chapter 15th, part 2d, the Cortes shall be convoked after the death of the King, in order that his successor shall swear to the observance of the law, and receive from the Cortes the necessary oaths of fidelity and obedience.

Art. XXVIII.—Likewise the general Cortes of the kingdom shall be assembled in virtue of the said law, when the Prince or Princess who may be heir to the Crown shall not be of age.

Art. XXIX.—In the case expressed in the preceding

article, the Guardian of the minor King shall swear in the Cortes loyally to watch over the safe keeping of the Prince, and not to violate the laws of the State, receiving from the Peers of the realm, and the Deputies of the kingdom, the necessary oaths of fidelity and obedience.

Art. XXX.—In observance to law 2d, chap. 7th, book 6th, of the New Compilation, the Cortes of the kingdom shall be convoked when any difficult circumstances occur, the weight of which may require their counsel.

Art. XXXI.—The Cortes shall not have the right to deliberate upon any subject which shall not be submitted expressly to their examination in virtue of a Royal decree.

Art. XXXII.—This article shall be without prejudice to the right which always has been exercised by the Cortes of offering petitions to the Sovereign, making use of the form and mode which shall be prescribed in the decree.

Art. XXXIII.—In order to constitute a law there shall be required the approbation of one and the other *Estamento*, and the sanction of the Sovereign.

Art. XXXIV.—In conformity to the law, 1st, chap. 7th, book 6th of the New Compilation, neither taxes nor contributions of any class whatsoever shall be imposed without having been proposed by the Sovereign and voted by the Cortes.

Art. XXXV.—No taxes shall be imposed for more than the space of two years, before the expiration of which period they should be voted anew by the Cortes.

Art. XXXVI.—Before voting in the Cortes the taxes which are about to be imposed, the respective Secretaries of State shall present a statement, in which shall be set out the condition of the several branches of the public Administration; after which the Minister of Finance shall have to propose to the Cortes an *expose* of the expenditure, and the mode by which it is proposed to be met.

Art. XXXVII.—The Sovereign shall suspend the Cortes by virtue of a decree signed by the President of the Council of Ministers, and immediately upon the reading of said decree, both the *Estamentos* will rise, and not resume their sittings or exercise any further deliberation.

Art. XXXVIII.—In case the Sovereign suspends the Cortes they cannot be reunited, but in virtue of a new Decree of Convocation.

Art. XXXIX.—On the day which shall be appointed for the meeting of the Cortes the said Deputies of the kingdom shall assemble in them, except in such cases where the term of three years, during which their powers are given, shall have expired.

Art. XL.—When the King dissolves the Cortes, it is done either in person or by means of a decree, countersigned by the President of the Council of Ministers.

Art. XLI.—In either one or the other case both *Estamentos* shall separate immediately.

Art. XLII.—The order for the dissolution of the Cortes being announced, the *Estamento* of the Peers of the realm cannot be reunited or enter into any resolutions, except, in virtue of a new Convocation the Cortes shall be reassembled.

Art. XLIII.—When the order of the Sovereign dissolves the Cortes, the powers of the Deputies of the kingdom are annulled by the same act.

Art. XLIV.—All that may be done or determined afterwards is null and void.

Art. XLV.—When the Cortes shall be dissolved others shall be called before the expiration of one year.

Art. XLVI.—When the Cortes are convoked, at the same time are to be convoked both the one and the other *Estamento*.

Art. XLVII.—One *Estamento* cannot be assembled without the other.

Art. XLVIII.—Each *Estamento* shall hold its Sessions in separate Chambers.

Art. XLIX.—The Sessions of both the one and the other Estate shall be public, except in those cases where the regulations shall point out.

Art. L.—The Peers of the realm as well as the Deputies of the kingdom shall not be held responsible for the opinion and votes which they may give in discharge of their duty.

Art. LI.—The regulations of the Cortes shall determine the relations of the one and the other *Estamento* as well as reciprocally between themselves as well as respect to the Government.

[FOR THE NEW YORK AMERICAN.]

MR. EDITOR.—The writer, acting on the suggestion of your Western Correspondent, has attempted to verify what was poetry before. He cannot claim the credit of giving the lines a "happier dress," but, albeit, not a poetical friend of you or any body else, he delights in simple rhyme, and has tried to retain that quality in the following—

INDIAN SERENADE

In imitation of the original prose translation, made by Mr. H.

Bud of the forest, now shut in thy bower,
Rise from the leaves swelling round thee, a flower!
Beautiful bird of the prairie awake!
Powerless the hawk is, and harmless the snake.
Thou with the eyes of the fawn, give to me
Wild, timid glances, and draw me to thee:
Warm are thy looks, and the joy thy disclosure
Gladdens my heart, as the dew drop the rose.
Sweet is thy breath as the sigh of the south;
Sweet as the store of the bee thy mouth:
Sweet is thy voice as the music of rain
That lulls the roving hunter to slumber again!
When the mow me, and the maple trees run
Flow the springs murmur, and swell to the sun
So towards thee swells my blood with delight;
So, too, I murmur to silence, all night.
When with mild passion thy bosom is mov'd,
How my heart sings unto thee my lov'd!
So, in the moon of red berries, awake
Breeze, and sing to the leaves as they shake.
If thou art sad, and art sighing the while,
Dark is my heart and uncertain my smile!
Like the bright river that bears on its breast
Sunset, made dim by a cloud in the west.
Morning's red ray, as it shines on the lake,
Brightens the ripples that night breezes make;
So, when thou smilest, the gloom that before
Clouded my spirit, surrounds me no more.
Wake and behold me, beloved and best!
Blood of my heart! come and live in my breast!
Heaven, earth, water, are smiling around;
I alone sadly look up from the ground.

[FOR THE NEW YORK AMERICAN.]

THE BRIDE MAID'S GRAVE.

Lines suggested by the recent death of Miss M***** C***, of Ulster, N. Y.

"And then I think of one, who in her youthful beauty died,
The fair meek blossom that grew up, and faded by my side."
Where the tender o'er's wave,
And soft winds sweep,
We will make her gentle grave,
And memories keep—
There the stainless virgin Rose,
And Violet,
Will their balmy lids unclose,
With tears wet—
Such as solemn Evening sings
On Lillies fair,
While each bell in fragrance rings
For spirit pray'r.
With the bridal-chapel bound,
Still on her brow,
We will "lay her in the ground,"
Afar from wee.

New York, May 24th.

[From the Youth's Sketch Book.]

THE LITTLE BOAT BUILDERS.

Beside the sea-shore Charles and Ben
Sat down, one summer day,
To build their little boats—and then
To watch them sail away.
"Hurrah!" the boats have left the shore,
And side by side they sail;
And pleasant sunshine all before,
Behind, the summer gale.
But all too rough the sunny sea—
One boat upsets—and then
They clap their hands and shout with glee,
"Hurrah! she's up again."
But on the wave it cannot live;
It sinks—and now the other!
And now a louder shout they give,
"Hurrah! we'll build another!"
"Let's make ourselves a little sea—
The ocean is too large—
This tub will do for you and me
To sail our little barge."
Dear children! thus through life your joys
May vanish! Will you then
Still laugh as o'er your childish toys,
And think they'll rise again?
And when life's ocean seems too wide
Your quiet course to trace,
Say will you wisely turn aside,
And choose a humbler place?
And will you, as your joy's decay,
First one, and then the other,
Shout on, as one hope sink away,
"Hurrah! I'll build another!"

TIME.

On! on; still on! the bell of Time tolls on
Its unregarded tocsin to the ear;
On! on! the stream of Time, that long hath gone
O'er crown and crook, o'er banquet and o'er bier,
Rolls by; whilst on its banks we sport and play,
Reckless of rising floods. Years disappear,
And kindred, vanish; yet the heedless mind
Can note no promise in the buds that find
New thrones in old woods—when the cushat calls
Its spring recitile. Still we chase away
The omen from our breast, and shut our sight
To the hand-writing on the wall, while night
Blots out the idle labors of the day!

Canal Tolls.—The tolls collected upon the New York Canals, for the week ending on the 14th May, amount to the sum of *forty-six thousand five hundred and thirty-three dollars and twenty-eight cents*. The total amount collected during the four weeks ending on the 14th instant, is \$195,018 57.—[Alb. Argus.]

TOWNSEND & DUFFEE, of Palmyra, *Manufacturers of Railroad Rope*, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the U. S. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon date, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York, }
January 29, 1833.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 18, 1833. A29 if RM & F

TO IRON MANUFACTURERS AND OWNERS OF IRON ORE BEDS.

JOSEPH GOULDING, of Keeseville, Essex county, N. Y., has invented and patented a *Magnetic Separating Machine*, for separating Iron Ore from the extraneous matter usually found in connection with it; and he begs leave to recommend it to the especial notice of owners of Ore Beds as possessing qualities of great importance, as by the use of it many ore beds can be made very valuable, it being applicable in all cases when the Ore is magnetic.

The quality of the iron made is much improved by the process of separation, indeed good iron can, after separation, be made from ore which would without it be considered not worth working. There is also found to be a great saving in the transportation of ore, and in time and fuel required to work the same into iron.

Mechanics can be furnished at short notice which will separate from half a ton to twenty tons each in twenty-four hours.

J. Goulding also manufactures to order, *Cylindrical Forge and Blast Furnace Bellows*, of the most improved construction, and which are successfully used in nearly all the Forges and Furnaces in Clinton and all the adjoining counties. M 14tf
January 20th, 1834.

RAILWAY IRON.

Ninety-five tons of 1 inch by 1 inch, Flat Bars in lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.
200 do. 14 do.
40 do. 14 do.
800 do. 2 do.
800 do. 2 1/2 do.
soon expected.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 2 3/4, 3, 3 1/4, and 3 1/2 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON,
9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them. d71mcwv

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,
347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better success can be done in the execution.

* Mr. Thorburn is also Agent for the following publications, to wit—

NEW YORK FARMER and American Gardener's Magazine. MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them by calling at 347 North Market street, Albany.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company, WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 49, page 72 of this Journal. d6

RAILROAD TURNOUTS, REVOLVING PLATFORMS AND SIDELINGS.

The subscriber having been for some years engaged in constructing turnouts, and inserting the necessary switches and fixtures appertaining to the same, on the Baltimore and Ohio Railroad, and as those works on that road will be shortly completed, he is desirous of being employed by any Railroad Company requiring work of the above description.

He will either contract at a fixed price to execute the work, he providing all the necessary materials and fixtures, or otherwise,—or he will engage himself at a stated salary.

In relation to his abilities and general character he begs to refer any Company, disposed to engage him, to the Baltimore and Ohio Railroad Company.

Letters can be addressed to him at the Office of Construction Baltimore and Ohio Railroad, Baltimore.

a26 6t REUBEN ALER.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & G. W. BLUNT, 154 Water street, J31 6t corner of Maidenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.
Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.
Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind now in use, and as such most cheerfully recommend it to Engineers and Surveyors.
E. H. GILL, Civil Engineer.
Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others of that purpose.

HENRY R. CAMPBELL, Eng. Philad., Germant. and Norrist. Railroad
ml 1y

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleeker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J25 tf

RAILROAD CAR WHEELS, BOXES AND AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited. ml8

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTTE, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewin & Heartte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyor's Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewin & Heartte.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warmest encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same. m25

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JUNE 7, 1834.

RAILROADS—WIDTH OF TRACKS—UNIFORMITY OF.—Those of our readers who have taken the Journal from its commencement, will probably recollect a communication published in No. 4, Vol. 1, showing the importance of uniformity in the width of railroad tracks. We have occasionally referred to the subject as one requiring early and particular attention. It will at once be seen that, by a variation of three, or even two inches, in the space between the rails of roads, now distinct, but destined hereafter to be united,—as, for instance, the *South Carolina*, the *Tuscumbia*, and other roads, which, to the extent of many hundred miles, will, within the next ten years, be connected with them,—the engines and cars of one road cannot be used upon the other roads, and therefore a transshipment will be necessary, at the termination of each part of what should be one great whole.

THE SARATOGA AND SCHENECTADY RAILROAD.—The locomotive engine commenced its regular trips on this road on Wednesday the 28th ult.; on which occasion a party of gentlemen from this village and Ballston Spa, were politely invited by John B. Lasala, Esq., one of the directors and a principal stockholder, to join in the festivities of the occasion. They repaired to Schenectady in a railroad barouche, where they were joined by two of the directors. The engine left that place a little before 12,

and reached this village, drawing a train of 12 or 14 carriages and waggons, in one hour and twenty minutes. The party repaired to the Pavilion, where they partook of the hospitality of Mr. Lasala in a rich and sumptuous dinner. After the drinking of several toasts, the party separated at an early hour, happy in the polite attentions they had received, and gratified in having witnessed the good condition of the road, and the increasing and flattering prospects of business thereon. Indeed, the travel is continually augmenting; and it is a source of no small pleasure, that the various estimates of income heretofore given are likely to be more than realized. Though not immediately connected with the work, we cannot but feel a deep and lively interest in its prosperity, and in every thing pertaining to the welfare of its stockholders.

Another engine, we understand, will be placed on the road in a short time.—[Saratoga Sentinel.]

RENSSELAER AND SARATOGA RAILROAD.—This road, from Ballston Spa to Waterford, is under contract, and the work of constructing it in progress. The building of the bridges over the Hudson and Mohawk, and also the road itself from this to Waterford, will be put under contract without delay.

The officers of the company for the present year are as follows—they were chosen at an election held yesterday:

Stephen Warren, President, (Richard P. Hart having declined a re-election.)

Directors—Elisha Tibbitts, George Griswold, John Cramer, John Knickerbacker, Richard P. Hart, Townsend M'Coun, Nathan Warren, Stephen Warren, George Vail Le Grand Cannon, Moses Williams, John P. Cushman, and John Paine.—[Troy Press.]

Extract of a letter dated Boston, May 30, 1834:

"Our Worcester Railroad is doing very well. The cars paid \$900 last week, \$700 of which is clear profit, beyond the expense of their management of \$100 a day, which is an interest on the whole \$600,000 which has been assessed. The weather, besides, has been unusually bad, and so cold, that few persons comparatively have gone out. I think therefore that the stock will eventually be very productive. They now only run seven miles, but will, in a few days, go thirteen miles, which is the first stage towards Worcester. A friend of mine came today from Newton in 19 minutes with a watch in his hand. They have at other times landed in fifteen minutes, which is at the rate of twenty-eight miles an hour. At this rate but few will go in the stage, which, including stops, takes an hour and a half."—[Jour. Com.]

PENNSYLVANIA RAILROAD.—The advantages of this great state work are already becoming developed. On Thursday afternoon, a lot of 80 bbls. superfine flour, from Columbia, was brought to the depot corner of Vine and Broad streets. This is the first flour that has been brought from the Susquehanna by this route. A lot of between 2 and 300 bushels of corn has also been received from Columbia by this road.—[Phil. Com. Her.]

RAPID TRAVELLING.—Yesterday, the passengers by the Railroad line from New-York were landed at ten minutes past one o'clock. Our exchange papers brought by this conveyance were delivered at our office at eighteen minutes after one.—[Ibid]

CANALS.—The Eastern Division of the Pennsylvania Canal, the Lehigh, and the Morris Canals, are now in excellent navigable order, and, we are pleased to learn, are doing a brisk business. An arrangement has been made with the directors of the Morris Canal for transporting a large quantity of coal from the Mauch Chunk mines to Newark, and other points along the line of this work. This arrangement cannot but be highly advantageous to those interested in the mines, as well as to the owners of the canal stock. Paterson and other places will also come in for a share of the benefits of this arrangement.—[Ibid.]

The corner stone of the Cape Fear, Yadkin and Pedee Railroad, was laid with imposing ceremonies at Fayetteville, on the 15th instant, an interesting account of which appears in the last Observer, and shall be transferred to our columns next week.—[Raleigh Register.]

NEW IRON STEAMBOAT, &c.—We recommend to the attention of the public, the advertisement of our late highly enterprising and public spirited townsman, G. B. Lamar, Esq. (now of Savannah,) whose efforts in facilitating the river communication between this city and Savannah—and particularly the present one, now nearly completed, of a new Iron Steamboat—are worthy of the highest praise, and we hope will insure to him the great success they merit. This Iron Boat is the first of the kind ever introduced into this country, and we doubt not will prove to be one of the most valuable commercial facilities it possesses.—[Augusta Chronicle.]

ECONOMY.—He who saves in one way, that he may enjoy his savings in a more rational one, is the true philosopher: he will do good while living, and be remembered with respect when dead.

Specification of a Patent for an Improvement in Wheels for Cars and Locomotive Engines, to be used upon Railroads. Granted to ROSS WINANS, Civil Engineer, city of Baltimore, November 19, 1833.

To all whom it may concern, be it known that I, Ross Winans, of the city of Baltimore, in the state of Maryland, Civil Engineer, have invented an improved mode of constructing wheels for cars and locomotive engines, to be used upon railroads, and that the following is a full and exact description thereof.

The more clearly to exhibit the difference between my improved wheel and those which have been heretofore employed, I will briefly point out the manner in which wheels for this purpose have been most commonly made; not intending, however, as it is not necessary for the purpose in view, to notice all the plans which have been adopted.

1st. Such wheels have been made wholly, or nearly so, of cast iron; the face, or tread of them, being cast within a *chill*, consisting of a thick rim, or hoop, of iron, which forms a part of the mould.

2d. The wheels have been cast without being chilled, and afterwards hooped with wrought iron, which then forms the face and flanch of the wheel.

3d. A cast iron nave, or hub, has been made to receive wooden spokes, inserted in wooden felloes, which were hooped with a tire of wrought iron.

4th. The hubs have been of cast iron, with spokes of wrought iron, and a rim of wrought or of cast iron, hooped with wrought iron.

These plans have each their respective advantages and disadvantages, but neither of them has fully answered the purpose for which it has been adopted; the wrought iron hoop, or tire, upon the cast iron rims have gradually become loosened; the wooden spokes and felloes have pressed the one into the other, and the tire has ceased to bind them, an evil which wedging will not cure. To remedy these defects, and others incident to some of the wheels, is the object of my improvement.

My wheel consists essentially of three parts, namely, an *interior wheel*, the hub, spokes, and rim of which are of cast iron; a *rim of wood*, formed in a way to be presently described, surrounding the cast iron wheel; a *hoop or tire of wrought iron*, surrounding the wood, and forming the face, or tread, of the wheel.

The *inner wheel* is made, in some respects, like those first noticed, but the face is not chilled, nor has it the same form with the chilled face. It should be made of the same width on the rim, with the wrought iron tire which is to surround and form the tread of the wheel, say five inches. The face of the cast rim may be cylindrical for the greater part of its width, but it must in this case have a fillet, or edge, projecting up on each side of it, say to the height, and of the thickness, of half an inch, which will then give to it the appearance of a wheel with a double flanch, having a cylindrical tread of four inches in width. Instead of making the face in this form, I intend sometimes to give to it a regular declination from each edge towards the centre. A section of the rim, transversely, would then be somewhat in the form of the letter V, but with the angle obtuse. The inclination will be sufficient if the diameter at

the centre of the rim is one inch less than that at the sides, or edges. Other forms may be given to the face of the rim, by which the object in view may be attained, namely, that of retaining the wooden rim in its place, without its allowing it to move out on either side.

A *rim of wood* is to be placed around this wheel, which may consist of any convenient number of pieces, fitted to each other, and to the face of the wheel. The grain of the wood is to cross the rim of the wheel, running parallel with its axis. These pieces may be fitted to the face of the wheel with greater facility by driving them into a large hoop, running as a chuck in a lathe, by which means they may be turned to the form required; they may then be fastened on to the rim by wood screws, or otherwise, and turned thereon to receive the iron hoop or tire. The best thickness of this rim will be from two to four inches.

The *hoop, or tire, of wrought iron*, is to be made in the usual form, turned truly, and passed on over the wooden rim when expanded by heating it as highly as may be done without burning the wood. Bolts are then to be passed through the wrought iron, the wood, and the cast iron rims, which are secured by nuts, to confine the whole together.

The hub, or nave, in a wheel thus made, may be cast entire, instead of having those divisions, or openings, which are necessary in the chilled wheel, to allow for contraction. Although I have described the spokes and rim as being of cast iron, either or both of them may be of wrought iron, but it would be more costly, without affording any adequate advantages; those of cast iron being perfectly safe in this mode of construction.

It will be readily perceived that the wood, thus pressed between two hoops of iron, has an extent of bearing surface which will effectually prevent its being condensed by the force to which it is subjected; whilst, by its elasticity, it will tend to preserve both the road and the vehicles passing over it. If perfectly dried when put on, which may be done by artificial heat, the wood will never shrink, but, on the contrary, will expand, and render all the parts the more firm. Such a wheel will have less tendency than any other, where wood is employed, to get out of truth; and should wedging become necessary, it may be done more effectually than with any other.

The dimensions of most of the parts of such a wheel need not differ greatly from those of the cast iron wheels with chilled rims, but, like them, must vary according to their diameter, and the load they are to sustain; the following is a good proportion for wheels of three feet in diameter, intended for cars carrying three tons.

Cast iron interior wheel, twenty-nine inches diameter; hub, seven inches long by six in diameter; spokes, twelve in number, five-eighths of an inch thick, and three and a half or four inches broad; rim, five inches broad by five-eighths of an inch thick; wooden rim, two and five-eighths inches thick, five inches deep, measuring across the rim; wrought iron tire, seven-eighths of an inch thick, five inches broad; flanch, one and one-fourth inch deep, one inch thick.

Although I have described the rim of wood as placed with its grain crossing the rim of the wheel, and am fully convinced

that this is the best manner of placing it, yet it will answer the purpose, to a considerable extent, when running in the direction of the rim, and I do not intend, therefore, to limit myself in this respect, as what I claim as my invention is the interposing a rim or belt of wood between an interior wheel of cast or of wrought iron, and a wrought iron rim or tire, and securing the whole together in the manner and for the purposes hereinbefore set forth.

ROSS WINANS.

Effectual Plan of Heating Factories, &c., by Steam. Communicated by the INVENTOR. To the Editor of the Mechanics' Magazine and Register of Inventions, &c.

[We have much pleasure in inserting the following communication from Mr. SNODGRASS, an eminent engineer of Glasgow, N. Britain, now on a visit to the United States for the purpose of ascertaining the state of manufactures and mechanical inventions here. We hope to be favored with other contributions during his tour through various parts of the country, which, we are persuaded, will be highly interesting to our readers.—ED. M. M.]

SIR,—Having perused your interesting and valuable Magazine, I beg leave to avail myself of the pleasure of contributing in a small degree what appears to me would materially benefit the rising manufactures of this justly far-famed free country, namely, the best plan of heating by steam. Although I am almost a stranger here, I learn there are, and have seen, a number of beautiful factories heated by stoves, while in Great Britain there are none, to my knowledge, otherwise than by steam. It must be evident that this method is incompatible with the American atmosphere, which in particular seasons of the year, I am told, is highly electrical, and destitute of hydrogen. Stove heat must accelerate this evil in a considerable degree, in the apartments of the factories, which are injurious to the staple of the cotton, during the process of roving and spinning, unhealthful to the workers, and a great increase of risk of accident from firing the building.

Having invented and introduced the system of heating by steam pipes, from 1799 to 1807, (see Philosophical Transactions, London, Vol. for March, 1807,) and since then having 27 years' experience, I presume to send you herewith a plain sketch of the simplest and most effectual plan of heating any regular built factory, and with steam of the lowest temperature. REFERENCES—A, the boiler; B, the ash-hole; C, 1st flat; D, 2d flat; E, 3d flat; F, 4th flat; G, garret flat; H, condensed water pipe.

On looking at the plan from right to left, the pipes are inclined according to the length of the factory, so as the air and condensed water may freely recede before the steam, then descend by the perpendicular pipe to next flat, and so on from flat to flat, after sending the steam to the garret flat in the first instance by a large upright, not less than eight or nine inches in diameter, thus allowing as little condensation as possible taking place in that pipe; it ought to be secured from the external air, and made as a reservoir of steam to the boiler. As each range of pipes descends from the garret flat, they ought to increase in diameter about a half inch in each flat, owing to the latent heat of the steam diminishing as the distance increases from the boiler. The small

copper pipe at the end of the cast iron range of pipes in the lowest flat, for the discharge of air and condensed water, may be about three-fourths of an inch in diameter. These pipes should be laid on small rollers, pivots of which to move in a small frame (cast iron) fixed on the floors, and close to the wash-board of the apartment, on any side most convenient for passing them, thus, not almost, appearing in the room, and, in the lowest position, more effectually heating the air.

The data for proportioning the diameter of these pipes to the temperature of the air in the apartments is a square foot of surface of steam pipe for 200 cubic feet of air, to produce about 64 degrees of heat, supposing the steam about 4 lbs. on the square inch of pressure above the atmosphere, and the surface of the pipes black,—160 superficial inches steam pipe for 72 degrees of heat.

I may add: the boiler may be so placed that the condensed water may be returned to the bottom, and save in a small degree the latent heat therein. Where steam engines are employed to drive the machinery, the surplus steam for a great part of the year is sufficient to heat the factory, thus saving the whole expense of fuel nearly. Insurance ought not to be more than the half, compared with the risk of stoves. If any further information is found wanting, your taking the trouble of addressing me, care of Messrs. Thomson & MacFarlane, No. 87 Pearl street, will be duly attended to by,

Sir, yours, most respectfully,

NEIL SNODGRASS,
Civil Engineer, of Glasgow.

New-York, May 5, 1834.

N. B.—In irregular built factories, much is to be attended to in the arrangement of steam apparatus, for the proper charging with steam, and discharging air and water; also, the best plan for joining the pipes to make them permanent and cheap, which I shall be glad to engineer, and insure the result; also, my metallic packings for steam engine pistons, and piston valves, a drawing and de-

scription of which shall be handed you in a short time.

N. S.

STATISTICS OF FRENCH MANUFACTURES.

—The principal manufactures of France may be dated from the reign of Louis XIV., whose minister, the celebrated Colbert, invited foreign artists and artisans of every kind and of distinguished merit into the kingdom, and encouraged them by premiums to fix their establishments in France. But towards the end of his reign, that monarch, by his revocation of the Edicts of Nantes, and his persecution of the Protestants, in a great measure destroyed the advantages arising from the foreign establishments, by forcing thousands of artisans to seek refuge in England, and the Low Countries, into which they introduced those branches of industry, especially silk. Thus France lost the services of some of her most ingenious mechanics through the folly of an infatuated monarch.

To give an idea of the manufactures of France, it is sufficient to cite the draperies of Louviers, Sedan, Elbeuf, Castres; the cambrics of Valenciennes and Cambray; the pier-glasses of St. Gobain, whose dimensions are occasionally ten feet in height by four and five feet broad; the cotton manufactures of St. Quentin, Rouen, &c. &c.; the linens of Brittany, Dauphiny, and the northern provinces; the laces of Lille, A. lencon, Valenciennes, and Puy; the silks of Lyons, Avignon, Nimes, and Tours; the tapestries of the Gobelins, at Paris; the carpets of La Savonnerie and Aubusson, which, in beauty of design and brilliancy of colors, rival those of the east; the porcelain of Sevres, her manufactures of clocks and watches, jewellery, crystal, mock diamonds, bronzes, fire arms, &c. To these might be added an immense number of manufactories which were wholly unknown in France half a century ago, such as files, needles, wool-cards, &c.

We have learned from official sources, that the capital employed in manufactures

amounts to 1,820,105,409 fr., which is applied as follows:

In indigenous materials,	416,000,000 fr.
In materials imported,	186,000,000
In wages,	844,000,000
In general expenses, as wear and tear of machinery and tools, repairs, fuel, lights, interest of money, invested as fixed capital, which being deducted from the gross amount leaves 182,105,409 francs for the profit of the manufacturers,	192,000,000

The annual produce of the principal branches of industry in 1828 has been calculated in round numbers as follows:

Thrown silks, silk stuffs, gauzes and crapes,	160,000,000 fr.
Cloths and woollen stuffs,	250,000,000
Linen drapery and thread lace	210,000,000
Stationary,	25,000,000
Cotton,	200,000,000
Lace,	10,000,000
Hardware,	125,000,000
Coal, and other produce of mines and quarries,	30,000,000
Watches and clocks,	30,000,000
Gold and silver articles,	50,000,000
Jewellery,	40,000,000
Glass, plate glass, china, pottery, bricks,	80,000,000
Lime and plaster,	15,000,000
Salts and acids,	30,000,000
Soap,	30,000,000
Refined sugar,	15,000,000
Hats,	30,000,000
Leather,	160,000,000
Dye and varnish,	50,000,000
Perfumery,	15,000,000
Books,	30,000,000
Beer,	60,000,000
Cider and perry,	50,000,000
Brandy,	75,000,000
Upholstery and musical instruments,	50,000,000

Total, 1,820,000,000 fr.

Having enumerated the principal manufactures in France, we shall state from official information the progress made in the productions of those manufactories from 1812 to 1827. In the first place, we find that under the government of the empire, when Belgium and the left bank of the Rhine were under her dominion, France in 1812 employed in her manufactories 35 millions kilogrammes, or 70 million pounds of native wool. In 1816 the quantity of native wool, with the amount imported of foreign wool, for fine cloths, merinos, and cachemires, &c. was in the whole 80 million French pounds, which, with the difference of nearly ten per cent., is equal to 90 million lbs. English. In 1824 and 1826 the quantity of wool used in the manufactories amounted to 48 millions of kilogrammes, making an increase in the consumption of wool in 14 years of 26 millions of French pounds, or more than one million English tons.

In 1812, the quantity of cotton spun into thread did not exceed 10,362,000 kilogrammes. The consumption in 1816 amounted to 12 millions of kilogrammes; in 1825, the quantity manufactured was 26 millions; in 1826, 32 million kilogrammes of cotton employed in prints, calicoes, tulles, &c.: thus the consumption has been more than tripled in 14 years. The consumption of silk has not

less increased in proportion to wool and cotton. In 1816, France imported 400,000 kilogrammes of silk; in 1824 and 1825, 650,000 kilogrammes; and in 1826, not less than 800,000 kilogrammes, notwithstanding the progress made and encouragement given to breeding of silk worms in the country. In 1816, the quantity of coals extracted from the mines did not exceed 1000 million kilogrammes; in 1826, they furnished 1500 million kilogrammes. In 1814 and 1816, the quantity of iron manufactured amounted to 100 millions, and in 1825 and 1826, it had increased to 160 millions of kilogrammes.—[Goldsmith's Statistics of France, and Rep. Pat. Inv.]

The following letter was read, together with, and formed a part of, the report of a committee of the Pennsylvania Legislature, appointed to inquire and report as to the best method of conducting the business of transportation upon the Pennsylvania Railroads.

It was intended that this should follow the Report, which was published in No. 15 of this volume of the Journal, but was at the time mislaid.

Letter from Moncure, Robinson, Esq., to Wm. H. Keating, Chairman, &c., dated Harrisburgh, February 21, 1833.

Sir,—I have received your letter of yesterday, and with pleasure present the following reply to the questions proposed by the committee.

The first inquiry is, "on roads of the length and undulating character of the Philadelphia and Columbia railroad, or connecting two lines of canal, like the Alleghany portage railroad, what are the relative advantages of transportation by horse power, or by locomotive engines?"

When the profile of a railroad is undulating, unless its grades, or ascents and descents, are very short, the useful effect of a horse is materially impaired. In other words, although in descents the force exerted by him may be but trifling, he cannot, in consequence, draw a proportionably large load on ascents. With locomotive power, the diminution in useful effect is by no means in a corresponding ratio; and provided the graduation of a railroad be not at any point too steep to admit of an engine urging on its load by the adhesion of its wheels, a large proportion of what would be its useful effect on the level may be had. The engine, on ascents, travelling at a slower rate under an increased stress; on levels, or on descents, exerting any disposable force in attaining a higher speed.

When a line of railroad is not only undulating, but a long one, the superiority of locomotive power becomes more decided. The loss of time and waste of steam in starting and stopping, become relatively of less moment, and the saving in time, by the superior velocity which locomotives enable us to attain, becomes more important. In the case of the Columbian and Philadelphia railroad, for example, four days would probably be required, with horse power, for the transportation of merchandise and produce between Columbia and Philadelphia. With locomotive power, the trips may be made with entire ease and safety in six hours, including stoppages. Supposing the cost of transportation to be the same with either power, a large accommodation would be afforded to the public, in the greatly increased speed of transportation. Persons coming to Columbia with their produce would have it in their power to travel with it to Philadelphia, and to attend personally to its disposition, without any sacrifice of time; and to the community generally, facilities in intercourse and travel, and in the transportation of the mail, would be afforded, which can scarcely be appreciated until they have been realized.

There is no peculiar reason for using locomotive power on railroads connecting lines of

canal, except that the trade on such lines is, from many causes, more irregular and uncertain than on continuous railroads, and that the use of locomotive power, so far as the profile of the railroad may justify its introduction, enables us to provide an extra power to meet any exigencies of the trade; without incurring any further expense, when the engines may be unemployed, than the interest on their cost.

The next inquiry of the committee is,—“Would it, in your opinion, be practicable, by a rigid enforcement of by-laws and regulations, to make either of these roads (connected, as they are, with the lines of canal,) valuable as a public highway to the State, and to the districts of country which they are intended to accommodate?”

In reply, I would observe, that I do not think it can often be advisable to make any railroad, however short, a public highway; because, a company possessing an exclusive privilege of transportation, and bound to transport whatever may be offered it, may accommodate any given amount of trade, with a smaller disbursement for power, whether that power be locomotives or horses, and a smaller investment in cars and carriages, than would be required to insure the same amount of accommodation to the public, if transportation be effected by common carriers or individuals. A few considerations will suffice to make this apparent. Suppose the business of transportation placed in the hands of a company, the whole amount of trade on a railroad ascertained, and the maximum transportation required in a given period known. A sufficient amount of power and an adequate number of cars and carriages may be procured, and no more. The necessary shops being erected, and skilful workmen provided for repairs, these last are effected economically, promptly and properly. Presuming the capital invested to be diminished, and the power employed, the number of persons occupied, and the expenditure incurred for repairs, to be lessened, the cost of transportation may obviously be reduced; and a company, although bound to transport, without the least delay, every thing which may be offered it on a railroad, may afford to do so at a lower rate than individuals possibly can.

If, however, locomotive power be looked to on the Philadelphia and Columbia railroad, (and the reasons in its favor appear, from what has been said, to be decisive,) it seems to follow, necessarily, that the railroad cannot be a public highway. Setting aside the difficulties, and, I might add, the impracticability of adopting such a police, and enforcing such by-laws and regulations as would in that case be necessary, other considerations lead to the conclusion that, even were it practicable, there would be no advantage in transportation by locomotives on a public highway.

To make use of locomotives on a line of railroad, it is necessary that an adequate number of engines should be provided, to guard against danger of delay from accidents or other causes; that warehouses, depots, engine-sheds, and water stations, should be erected; that there should be shops with competent workmen, at different points on the line of railroad, to effect repairs without delay, and to keep the engines, cars, and other vehicles used on it, in the most perfect order. It is evident that no individual would be willing to make the permanent disbursement necessary to effect transportation advantageously with this description of a power, on a railroad entirely open; that if attempted at all, it would necessarily be also a charge to the producer, or owner, which would not be necessary under such a system as would afford to an individual or a company, a guarantee of a regular and permanent business, correspondent to the outlay which would be necessary to accommodate it effectually.

Different, but not less forcible reasons, make it, in my opinion, very unadvisable to leave it to private competition to provide the means of transportation on the Alleghany Portage. These reasons are given in some detail,

in a report which I had the honor to make to the board of canal commissioners, in December, 1829, and to which I beg leave to refer the committee. It is true that, on the Portage, the same advantage can scarcely be expected from the use of locomotive power, as on the Philadelphia and Columbia railroad; but, on the other hand, if the views taken in that report be correct, a large diminution may be made in the amount of stationary and locomotive power, and in the number of horses which would be requisite, and an accommodation given to an irregular trade, which could not be effected by leaving it open to the principle of private competition.

A view was taken in the report referred to, which it may be proper to express in more detail—this is, “that should transportation on the proposed railroads be effected by agents or responsible lessees of the Commonwealth, the objections which have been made to the Pennsylvania line of communication, as presenting, in its portage, dangers of delay and uncertainty, may be in a great measure avoided.”

Should the railroads in question be public highways, it is not believed that any competition would insure an adequate amount of power, and a sufficient number of cars for transportation, to avoid delay during those seasons of the year when the trade on the canals would be most active; and if it were otherwise, as there can be no obligation on any particular carrier to transport what might be offered him, it would be necessary for an owner sending produce or merchandize by the canal, to accompany it, or to engage the services of an agent on whom he could depend, at the point of transshipment, to forward it. It would be otherwise, under either of the arrangements which have been suggested; it would be only necessary, in either case, to consign it to the care of the transporting agent at Columbia, or at either of the points of termination of the Alleghany Portage, as the case might be, and the articles consigned would, as a matter of course, be forwarded without delay or risk, to the proper address.

The perfect facility and certainty which may be given to the largest business, under the arrangement proposed, may be judged of from the accommodation afforded by the Manchester and Liverpool railroad. On that railroad, a trade and travel so far unexampled, and certainly beyond what may be anticipated for many years on any line of railroad in this country, are accommodated daily without the least delay, interruption or embarrassment, on two tracks of rails; and the line (to use the expression of the board of directors) appears ordinarily “almost a desert.” Indeed, under proper regulations, there appears to be no limit to the business which a double track of railroad, under proper regulations, can accommodate. In this respect, the most spacious canal cannot compare with it, because the capability of this last is necessarily limited by the number of boats which can be passed through its lock of greatest lift in a given time. It is not, however, hazarding too much to say that, with trade very inconsiderable in comparison with the present trade of the Manchester and Liverpool railroad, the most serious embarrassments might be anticipated on a railroad on which transportation should be effected by individuals.

The third inquiry of the committee is, “would you recommend that the Commonwealth, by its officers, should become the transporter; or that the improvement should be leased for a term of years to a company, that should be bound to transport at certain specified rates of toll and transportation?”

I should think the latter plan the more advisable. I can entertain no doubt that, after a very short period, an estimate, sufficiently accurate, of the amount of trade on each of the two railroads, might be made, to admit of an arrangement between the Commonwealth and a transporting company, which would be fair and equitable; and if certain rates of toll and transportation were fixed on by the proper au-

thority, that proposals would be made by a sufficient number of responsible individuals, or associations, for the privilege of transportation, to insure a fair compensation to the Commonwealth for the use of its railroads, and the most complete accommodation to the public. It would be desirable, that as much time as possible should be afforded to responsible individuals or associations, who might be disposed to submit proposals, to make the necessary inquiry and investigations, and to enable the agents of the Commonwealth to act advisedly in any arrangement which might be entered into. No delay in the use of the railroads, as soon as any considerable portion of either of them was in readiness, need result from this cause. The officers of the Commonwealth might proceed to procure the necessary locomotive engines, cars and carriages, and to make all other arrangements, in the same manner as if the Commonwealth were to be the transporter. If an arrangement was made with a transporting company, the engines and cars, if of suitable construction, would be received of the Commonwealth without loss. If no disposition was made of the railroads, the agents of the Commonwealth would then be prepared to effect the transportation of passengers and merchandise at the earliest moment after the roads, or any productive portion of them, were in readiness.

The fourth inquiry of the committee is, in the event of a lease to a transporting company, "what would be necessary, on the part of the Commonwealth, beyond the completion of the railroads, and what precautions should be taken to insure their preservation?"

This inquiry has been in part answered in what has already been said. In order to accommodate the trade on two important lines of railroad, constructed by the Commonwealth, extensive warehouses would be necessary at the points of termination of the Philadelphia and Columbia, and Allegheny Portage railroads, and probably others of a smaller size at many points on the line of the former. Workshops for the purpose of repairing both engines and cars, and water stations and engine sheds, would be necessary on each line. An adequate provision, in these respects, might be made by the Commonwealth in the first instance, with a view to more extensive arrangements, as the trade might require them.

In order to insure the preservation of the railroads, it might be made the duty of the transporting company on each road, to keep the line of railroad in good order, with permission to make such extensions, in the way of turn-outs, turning platforms, warehouses, and repairing shops, as experience might show to be necessary. Or an officer of the Commonwealth might be kept on each railroad, for the purpose of making such repairs and extensions.

In the former case, a company would, of course, expect any necessary disbursements for repairs of the railroad, or extensions, to be an offset in the payment of its annual dues. It would therefore be proper for the Commonwealth to guard against unnecessary or injudicious expenditure, by providing that no claims for repairs or extensions should be paid, unless the expenditure were made on the authority of some engineer of standing, and except on his certificate that the same had been judiciously made; or, the disbursements made by a company might be submitted annually to such an engineer, and subjected to any deductions which he might deem reasonable.

I believe, sir, that I have now replied to the different queries of the committee. I fear I may not have explained my views as clearly as I would have wished. I must plead, as my apology for the hasty manner in which they are presented, the necessity of leaving Harrisburgh to-morrow morning, and the little time consequently at my disposal. Such as they are, they are with great pleasure submitted; and I shall be gratified if they should prove of use to

the committee in the investigation they are making.

I have the honor to be, very respectfully,
your obedient servant,
M. ROBINSON.

THE IRON STEAMBOAT ALBURKHA.—This vessel is now in the river Niger, with the Quorra steamboat, and seems to have been the favorite of the two vessels since they departed on their interesting expedition. The advantages of iron vessels in warm climates are ably pointed out in a short extract we gave in our last number from Chambers' Journal; and these advantages seem in no wise exaggerated in the instance of the Alburkha, according to reports received from those embarked in her. This vessel was built by Mr. Laird, of Liverpool, for the purpose of navigating the shoal water of the river, and we understand that he has since constructed another for the interior navigation of Ireland. We have no doubt that these vessels, from their vast superiority over those of wood, and their durable quality, will speedily be numerous employed.—[Nautical Magazine.]

THE TROY STEAMBOAT.—By the following extract from the "Annual Register" for 1785—"Occurrences" p. 95—it would appear that this boat is not of a new construction. * The only difference between it and that here described, seems to be in the propelling power, the one being by steam and the other by sails.

"EDINBURGH, Dec. 3.—Yesterday an experiment was made at Leith on a vessel of a new construction, the invention of a gentleman of this city. She consists of a vessel of about sixty feet long and seven broad, cut into lengthways, the sections placed at about seven feet distance, and joined at top by strong beams planked over, so as to represent upon deck a vessel of the ordinary proportions, 60 feet by 15. The experiment fully answered expectation, notwithstanding one of the principal sails was by accident, prevented from being properly set. She was attended by the king's boat at Leith, which is reckoned a fast sailing boat of her size; but the new vessel outsailed her, and when the breeze increased left her about a mile in four. It was found that the above vessel is capable of carrying double the quantity of sail of one of the ordinary construction and of the same length and breadth, and has this peculiar advantage that she only draws two feet and a half of water."

The gain by this construction, as in the Troy boat, is in an increase of speed and a diminution of the draft of water.—[Nat. Gaz.]

* There is this other difference, that Mr. Burden's boat consists of two perfect cylinders.—[Ed. N. Y. Am.]

Internal Improvement.—The good people of the upper part of the State are putting their shoulders to the wheel in the great cause of internal improvement. The contemplated rail road from Athens to Augusta is now employing all their energies. The last Banner says, "our public spirited townsmen, Messrs. Williams, Camak and Shannon, returned a few days since from the counties of Greene and Morgan, where they had been for the purpose of procuring subscriptions to the stock of the Georgia Rail Road Company. Their success in those counties was truly gratifying to the friends of internal improvements, and places the entire success of the project beyond a doubt. We now look upon the matter as entirely settled. A very short time will witness the commencement of a system of internal improvement in Georgia, which must, at no distant day, place her proudly by the side of her most exalted and flourishing sisters."—[Georgian.]

[From the Journal of Commerce.]
SUPERIOR COURT—MAY 27.—JUDGE JONES, presiding. *Miles Burke against the Camden and Amboy Rail Road and Transportation Line.*—Damage laid at \$1000.

This was an action to recover damages for injuries done to plaintiff's goods, whilst being forwarded by defendants from Philadelphia to New York.

From the evidence adduced on the part of the plaintiff, it appeared that his son, Master Joseph Burke, left Philadelphia on the 21st of December last in the defendants' steam boat. On that occasion, Master Burke brought with him his own private wardrobe, a theatrical wardrobe, containing forty or fifty dresses, two violins and a trunk full of music in print and manuscript. The baggage thus designated exceeded in weight what passengers are permitted to carry without paying for it, and \$1 50 charged for the surplus.

The baggage of all the passengers in the steam boat was put in a wooden crate or crib, which remained on the deck of the steam boat until it reached Bordentown. The crate with its contents was then being lifted from the boat by a crane which stood on the wharf, and whilst it was suspended in the air, the strap of the crane broke and the crate fell into the water, where it remained about twenty minutes before it was raised out of it. Master Burke's baggage was in consequence entirely saturated with water. The value of the property before this accident, was estimated at \$200 for the two fiddles, \$300 for the music, and from \$1000 to \$1600 for the dresses, all of which articles were considerably injured, and some of them rendered altogether useless by their immersion in the water.

In bringing the action, the plaintiff regarded the defendants as common Carriers, and on that ground sought to render them responsible. They also endeavored to show that the defendants were guilty of negligence in not having sufficiently manned the rope before the accident, and having used it for too long a period without repair or renewal. The defendants admitted that the rope was not calculated to last more than a year, and it had been nearly eight months in use when the accident occurred. When the rope broke, a thicker one was substituted in its place, which the plaintiff maintained was a tacit admission that the first rope was not sufficiently strong.

On the part of the defence, Master Burke was cross examined as to his age, and how the profits of his profession as an actor were applied by his father.

To these questions he answered that he did not consider himself more than 15 years old, that he had been an actor during the last ten years, and was altogether ignorant how his father applied the profits derived from his [Master Burke's] acting.

The object of the defendants' counsel in putting these questions, was to show that the property on account of which this action was brought, had been purchased with the profits of Master Burke's acting, and also with a design to show that these profits were received and retained by the plaintiff merely in trust for his son;—in which case the present action should have been brought in the name of Master Burke's guardian.

The Court remarked that the father was entitled to his son's earnings, and unless it could be shown that his father had invested those earnings in his son's name, or had made a written agreement on the subject, the counsel's objection would not hold good.

It was then contended that the public notice given by the defendants in their advertisements, &c. that all baggage should be carried at the risk of the traveller, rendered the present case different from that of common carriers, and prevented the defendants being liable unless they had neglected to provide proper and sufficient means of transport. That in the present case, the sufficiency of transport having been provided, depended whether the crane was sufficient for the purpose of raising the crate from on board, and to prove that it was, several witnesses were called, who deposed that the strap attached to the crane was formed of a rope 4 1/2 inches thick, which was sufficient to raise three or four tons; and that the crates of goods in the steamboats never exceeded or perhaps amounted to 3000 lbs. weight, and were more generally about 23 cwt. The strap of the crane was also served or twined over, as ropes are done in ships, and after it broke, no natural defect or injury from time or the weather could be perceived in it, nor could its breaking be in any way accounted for except by attributing it to pure accident.

It was also shown that Master Burke had frequently travelled on this line before, and had been informed that the proprietors would not be answerable for any injuries done to passengers' baggage or losses which they might sustain.

These were the principal points urged on the part of the defence.

The Court summed up the evidence and commented on it, and advised the jury, in order that the law points involved in this case might be considered hereafter, to find for the plaintiff, on the ground that the defendants were common carriers, and therefore liable for the losses sustained by the plaintiff. The jury would also find a special verdict relative to the question of negligence, and if by possibility they found a verdict on both points, it would probably stand good.

The jury returned a verdict of \$500 damages and 6 cents cost.

And that there had been no negligence on the part of the defendants.

Counsel for the plaintiff, Messrs. Graham—for the defendant, Mr. Anthon.

Animal Mechanics, or Proofs of Design in the Animal Frame. [From the Library of Useful Knowledge.]

(Continued from page 337.)

PART II.

Showing the Application of the Living Forces.

Amongst the least informed people, and in remote villages, there are old laws and rules regarding health, sickness, and wounds, which might be thought to come from mere experience; but they are, on the contrary, for the most part, the remains of forgotten theories and opinions, laid down by the learned of former days. Portions of knowledge, it would appear, confined at first to a select part of society, are in the progress of time diffused generally, and may be recognized in the aphorisms of the poor. These are traced to their source only by the curious few, who like to read old books, and to observe how that which is originally right, becomes, through prejudice and ignorance, distorted and fantastical.

If a very little exact knowledge of the structure of our own frames were more generally diffused, charity would be advanced, empirics could hardly maintain their influence, and medical men might have a further motive to desire professional eminence.

Men suppose that the knowledge of their own bodies must be a science locked up from them, because of the language in which it is conveyed; or they take away their thoughts from it, as from the contemplation of danger, unwilling to survey the slight ties by which they hold their lives. They are like persons for the first time at sea, who shudder to calculate how many circumstances must concur to speed the frail vessel on its voyage, and how little is between them and the deep. It is then a mean and timid spirit that shuts out from our contemplation the finest proofs of Divine Providence. Galen's treatise on the uses of the parts of the human body was composed as a hymn to the Creator, and abounds in demonstrations of a Supreme Cause; and when Cicero desires to prove the existence of the Deity from the order and beauty of the universe, he surveys the body of man, deeming nothing more godlike, as marking man's superiority to the brutes, than the privilege of contemplating his own condition, since it teaches him the ways of Providence, from a knowledge of which come piety and all the virtues.

Although we are writing under the title of *Animal Mechanics*, the reader must be aware that we cannot proceed much farther on mechanical principles alone. At least, before we have it in our power to illustrate particular parts of the animal frame by reference to those principles, we must have the proofs before us that we are considering a living body. It is the principle of life which distinguishes the studies of the physiologist from the other branches of natural knowledge. To lose sight of this distinction is to tread back the path, and to engage once more in the vain endeavor to explain the phenomena of life on mechanical principles. We have taken mechanics in their application to mechanical structure in the living body, because they give obvious proofs of design, and in a manner that admits of no cavil. Yet, although those proofs are very clear in themselves, they are not so well calculated to warm and exalt our sentiments

as these which we have now to offer, in taking a wider view of the animal economy.

In entering on the second department of this treatise, the reader may be startled at the subjects of discussion, but this comes also from ignorance of their nature. Much may be learned from the observation of things familiar. Their perpetual recurrence banishes reflection respecting them, but it is the business of philosophy to make us alive to the importance of that which we have been accustomed to from childhood, and have therefore long ceased to observe with attention.

In the first chapter of this second part we shall continue to examine the operations of the animal body, independently of the agency of the living property: we shall consider it as a mere hydraulic machine. Following the blood in its circle through cisterns and conduit pipes, we shall point out the application of the principles of this science, as we formerly did those of mechanics, and so arrive at the like conclusions by a different course. And as we before found every muscular fibre adjusted with mechanical precision, so now we shall find every branch of an artery, or of a vein, taking that precise course and direction which the experience of the engineer shows to be necessary in laying the pipes of an engine.

Having thus surveyed the mechanical operations of the animal body, and the course of the fluids conveyed through it, on hydraulic principles, we shall consider ourselves as having advanced through the meaner to the higher objects of inquiry, and proceed to show how the principle of life bestows different endowments on the frame-work; how motion originates in a manner quite different from that produced by mechanical forces; how the sensibilities animate the living properties of action; how the different endowments of life correspond with each other, and exhibit power and design in a degree far superior to any thing that we observed in the mechanical adjustment of the parts or, the circulation of the fluids.

CHAPTER I.

THE CIRCULATION OF THE BLOOD UPON THE PRINCIPLES OF HYDRAULICS.—In tracing the course of the circulation of the blood, it is natural to inquire how far the system of reservoirs, pipes and valves, which form the apparatus for conveying it, are constructed on the principles of hydraulics.

We find this difficulty in the outset, that the vessels containing the blood are not rigid, like those the engineer employs in erecting hydraulic machinery. Instead of resembling pipes which convey water, and which receive the force of gravitation on them, they have both elasticity and an appropriate living power. The artery, the tube which conveys the blood out from the heart to the body, has a property of action in itself. Its elasticity and muscular power must derange those influences which we study in pure hydraulics.

There is to be found, notwithstanding, a great deal that is common to both, when we compare the tubes of an animal body with the hydraulic engine; the capacity of the vessels; the increase or diminution of their calibres; their curves; the direction of their branches—all these ought still to be on the same principles on which experience has taught men to form conduit pipes. We ought not to be indifferent to these proofs of de-

sign, because we acknowledge that an infinitely superior power is brought into operation in the animal body, and which is necessary to the circulation of the blood. It renders the inquiry more difficult, but it does not obscure the inferences drawn from the consideration of the whole subject.

We shall first present to our readers the simplest form of the heart. It is not necessary to detail the more complicated structure of the human heart, where, in fact, two hearts are combined; the fibres of the one continued into the fibres of the other, and the tubes twisting round one another so as to present the form which is familiar to every body. Although there are four intricate cavities, seven tubes conveying the blood into them, and two conveying it out of them, we shall, for the purpose of considering the forces circulating the blood, and comparing the living vessels with pipes, present the heart and vessels as simple; yet with perfect truth, being, in fact, the heart and vessels of animals of more simple structure.

Fig. 1.

The action of the heart is this: the blood returns from the body by veins into the sinus, or auricle,* A, and distends it; this sinus is surrounded with muscular fibres; by the distention or elongation of these fibres they are excited, and the sinus contracts and propels the blood into the ventricle B. The ventricle is, more muscular; it is, in fact a powerful hollow muscle; it is excited by the distention, and contracts and propels the blood into the artery, C.

We understand, then, that every heart must, at least, consist of two cavities alternating in their action; that the vessel which carries the blood to them is called a vein; and that the vessel which carries the blood out from them is the artery.

The first thing that strikes a person examining the heart is the extraordinary intricacy of the cavities, from the interlacing of its muscular fibres, and he naturally says that they appear ill calculated for conveying a fluid through them. There is an attraction between fluids and solids, he might observe, and this attraction is increased by the extension of the surfaces of the pillars and cords which he sees in the interior of the heart.

We must remind him that the blood is coming back from the body, having performed very different offices, in different parts, and has parted with different properties in the several organs it has supplied. There is, in that stream of blood which enters through the vein, a new supply of fluid,

* Auricle, from *auricula*, the flap of the ear, is a name given to the sinus, because a corner of it hangs over like a dog's ear.

which has come by digestion, the material for making fresh blood, as well as that which has run the circle. These two fluids must be thoroughly mixed together, and no doubt this is one of the offices provided for by the intricacy of the interior of the heart.

Again, looking to the recesses of the cavities formed between the fleshy columns, and behind the valves, we might suppose that the blood would remain there stagnant. There are cavities, or recesses, too, in the remote parts of the circulating vessels, where we might suspect that the influence of the stream would not be felt, and a stagnation might take place. But there is attraction between the particles of fluids, as well as between the fluids and their containing tubes. Let us see then how, in this figure, a stream of

Fig. 2.

water, carried through a cistern of water, will, by its friction, draw after it the water in the cistern, and carry it above its natural level, and over the side of the vessel.

The stream entering the reservoir, A, by the pipe, B, carries with it all the water, C, which stands above the level of its upper surface. By this we see that the stream of blood entering into the heart, even if its cavities were not emptied at each impulse, as some contend they are, would draw out the blood from its recesses, so that no part could remain stagnant, but, on the contrary, all would be carried in eddies round the irregularities, until they took the direction of the great artery, in which they would be perfectly combined.

The next thing to be noticed partakes of the nature of a mechanical provision—we mean the action of the valves.

We must here remark, that the opening into the ventricle is very different from that which leads out of it, the latter being much smaller. Medical writers describe this as if it were nothing to them, and a mere accident. But it must be recollected that a stream of water entering a reservoir is in a very different condition from that which is going out of it; it is on this principle that the mouths (*ostia* is the anatomical term) of the ventricle are differently formed, and it is this difference which makes the structure of the valves which guard those passages so dissimilar and so appropriate. Without attention to this we should follow our medical authorities, and call this variety in the mechanical adaptation a mere playfulness in nature. It is more agreeable to us to see a precision of design visible at the first step of this inquiry.

The valves of the heart are regular flood-gates, which close the openings against the retrograde motions of the blood. They are not all of the same mechanical construction, and their difference deserves the reader's attention as proving design in this hydraulic machinery.

The valve which we have first to describe closes the opening betwixt the auricle, or sinus, and the ventricle, and prevents the

action of the ventricle propelling the blood back again into the auricle.

It is a web, or membrane, resembling a sail when bagged by the wind. The blood catches the margin of this membrane, and distends it as the wind does the stay-sail, or gib, of a vessel, which it much resembles, being triangular and pointed. There are three of these membranes, and the valve is called *tricuspid*, or three-pointed. Three membranes, then, of this kind, combining and being floated back upon the mouth of the opening, effectually close it.

The illustration of the action of these valves by a sail is so perfect, that if the reader will have patience to attend to those little contrivances which the mariner finds necessary for strengthening his canvass, and giving to it the full influence of the wind, he will have an accurate idea of the adjustment of these floating valves.

Fig. 3.

To carry on the comparison: one edge of the stay-sail is extended upon the stay, A A, and tied to it by *hanks*. The edges of the sails, called the *leeches*, have a *bolt-rope* run along them; and on the edge where it is attached, the canvass is strengthened by being hemmed down or tabled. In the same way as the foot of the sail, or lower margin, is strengthened with the bolt-rope, just so are the valves strengthened at their edges and their corners. Where the two ropes join in the loose corner of the sail, they form a clue—a loop to which tackle is attached; the valve has such a corner so strengthened, and has a cord attached. The corners of the sail are strengthened by additional portions of canvass called *patches*; so are the valves strengthened where their tendons are

Fig. 4.

infixd. To the corner or clue, B, ropes are attached which are called the *sheets*, C C. These being drawn tight, spread out the foot of the sail to one side or the other, according to the direction of the wind, and the tack the ship is on; the valves have also their tackle; and, in short, we shall find a resemblance to all the parts of a sail in the valves of the heart.

One edge of the triangular valve is tied to the margin of the opening, as one of the leeches of the sail is attached to the stay; the opposite corner is loose, and floats, as the sail does in tacking, until the blood, bearing against it as the wind bears against the sail, bags and distends it; the corner is then held down by tendons, for there are cords attached to the corner of the valve, as well as to the corner of the sail. These the anatomists call *cordæ tendineæ*, B B, which in their office have an exact resemblance to the ropes called the sheets of the sail. They are delicate tendons attached to the margin of the valve, and they prevent the margin from being carried back into the auricle.

INDIAN RUBBER WATER-PROOF.—This substance is every day becoming of increasing importance. For harness and various other farming and domestic purposes, it will at no distant day be used. The following is from the Ohio State Journal:

Having heard much said of late in favor of Jewitt's water-proof, as rendering leather perfectly tight, I witnessed an experiment on Saturday last, showing the improvement of the leather as to its durability; and were there not a number of the most respectable citizens present, I should hesitate to state the fact and publish it to the world. Two pieces of leather, of equal thickness, were tried upon a grindstone, under a pressure of a weight of 12 lbs. In the first place, the leather in its natural state was placed upon the stone, which was revolved 1500 times; then the piece saturated underwent the same operation 3000 times; and when compared, it was found not to be so much worn as the leather in its original state. From the test made, I have no hesitation in giving it as my opinion, that leather thus prepared will last twice as long as that in its original state. When it is considered that in addition to its rendering leather perfectly impervious to water, it adds 100 per cent. to the wear, its value to the American people is almost incalculable.

P. H. OLMSTED.

Columbus, March 18, 1834.

From the Eclectic Journal we extract the following:

In our former notices of this valuable article, we omitted mentioning particularly its beneficial applicability to all kinds of leather harness. It could not fail to have been observed by every individual who has had the opportunity, that those parts of harness composed of leather are, in general, injured infinitely more by wetting and drying, both by rain and sweating of the horse, than by friction or actual wear. By wetting and drying, the leather becomes hard and unpliant, in which condition it cracks and breaks. But let the harness be saturated with the water-proof, and neither water nor sweat can penetrate it, and the leather must remain as soft and pliable after exposure to wet as before. This will certainly render the harness more durable, as well as less liable to chafe or gall the horse.

In conclusion, we will repeat the suggestions of Col. Jewitt, that his composition will be equally as applicable to wood as leather, and by excluding the water from its pores, vastly increase its durability. If future experiment confirms this suggestion, as we have strong reason to hope it will, the advantages which hydraulics, and particularly the shipping interest, will receive from this discovery, will be incalculable.

THE CHINESE WALL.—According to a statement in the "Morgenblatt," the celebrated Chinese wall was erected 213 years before the birth of Christ, against the Mongolese. It is 714 German miles long, 14 feet thick, and 26 feet high; so that with the same materials, a wall, one foot in thickness and 23 in height, might be carried twice round the whole world.

YEARS.—The word Year is purely Saxon, and is supposed by some to be derived from *æra*: whilst others deduce both words from the Greek *ear*, or Latin *ver* (Spring); because many of the ancients were in the habit of dating the commencement of the year from spring. In the Hebrew, Greek, and Latin languages, the word year is expressive of a ring or circle. The Egyptians also represented it by a snake placed in a circular position, with its tail in its mouth; whence, perhaps the name of the *Zodiac*, or that *imaginary* circle which is made by the sun in the heavens, during the twelve months. The time in which the sun performs its journey through the twelve signs of the Zodiac comprehends 365 days, 5 hours, 48 minutes, and 48 seconds, and is therefore styled the Natural, Solar, or Tropical Year. The Sidereal, or Astral year, is the time which elapses from the sun's passage from any particular fixed star, until its return to it again, and is just twenty minutes and twenty-nine seconds longer than the natural or solar year. The Lunar year consists of twelve lunar months, or that period during which the moon passes twelve times through its various phases, or changes. The common or civil year, in use with us and established by law, contains 365 days during three successive years, but in each fourth year an *intercalary* or additional day is inserted, in order to make up the number 366, such additional day being considered equivalent to the time lost by not counting the five hours and forty-nine minutes at the end of each of the four years, from one Bissextile or Leap year to another. The word *leap* sufficiently explains the act of passing over the hours in question. This plan was invented by Julius Cæsar, or by Sosigenes, the Egyptian mathematician, who assisted him in rectifying the Calendar. The additional or *intercalary* day is with us always placed in the month of February, which consequently in *Leap Year* consists of twenty-nine days, the usual number being twenty-eight. Cæsar placed it in the month of March, by reckoning the sixth day of the calends of that month twice over, hence the term *Bissextile*, from the words *bis* (twice) and *sex* (six), or *sextilis* (sixth day). But by the Gregorian alteration, the fourth year coming at the close of a century is not a leap year, unless the number of hundreds be a multiple of four. Thus 1600 was a leap year, 1700 and 1800 were not, 2000 will be. The reckoning of time by the course of the sun or moon was attempted in various ways by different ancient nations; but they, finding that their minor divisions of time did not correspond with the courses in question, endeavored to prevent confusion by ordaining a certain number of days to be *intercalated*, or inserted, out of the common order, so as to preserve the equation of time. The *Egyptian* year (as used by Ptolemy) consisted of 365 days, which were divided into twelve months of thirty days each, besides five *intercalary* days at the end. The *Egyptian Canicular*, or *natural* year, was computed from one *heliacal* rising of the star Sirius, or *Canicula*, to the next. By the regulation of Solon, the ancient *Greek* year was *lunar*, and consisted of twelve months; each containing thirty and twenty-nine days, alternately; and, in every revolution of nineteen years, the third, fifth, eighth, eleventh, sixteenth, and nineteenth, it had an *intercalary* month, in order to keep the New and Full Moons to the same seasons of the year. The ancient *Jewish* year was the same as the *Greek* one, only that it was made to agree with the Solar year by adding eleven and sometimes twelve days at the end; or an *intercalary* month when necessary. The modern *Jewish* year consists of twelve lunar months generally; but sometimes of thirteen, that is, when an *intercalary* month is inserted. The *Turkish* year consists of twelve lunar months of thirty and twenty-nine days alternately, sometimes of thirteen. The ancient *Roman* year, as settled by Romulus, was *lunar*, but contained only ten months, which were irregular, and comprehended 304 days in all; being a number fifty

days short of the true *lunar* year, and sixty-one days of the *solar*. Romulus added the requisite number of days at the end of the year. Numa Pompilius added two months, making the year to consist of 355 days, thereby exceeding the *lunar* year by one day, but being short of the *solar* one by ten days. Julius Cæsar, during his third consulship, and whilst he was Pontifex Maximus, or high priest of Rome, reformed the calendar by regulating the months according to their present measure, and adding an *intercalary* day every fourth year to the month of February; but he being assassinated before his plan could be fully brought into operation, the Emperor Augustus perfected and established what his kinsman had begun. The *Julian* year, which consisted of 365 days and 6 hours, was, however, still incorrect; for it was found to be too long by about 11 minutes, which in 131 years would be equal to one day; consequently, there was a further reformation of the calendar by Pope Gregory, in the 1582. He cut off eleven days, by calling the fourth of October the fifteenth. This alteration of the style was gradually adopted in the several countries of the European continent; but in Russia, in some of the Swiss cantons, and in the countries of the East, the *old style* is still preserved. The Parliament of England adopted the *Gregorian* plan, in 1752, by enacting that eleven days should be omitted that year, all dates therefore, previous to 1752, are said to be according to the *Old Style*: whilst those since that period are deemed to be according to the *New Style*. In 1800, which was properly a bissextile, or leap year, the *intercalary* day was omitted; hence the difference between the old and new style is now twelve days. The *Gregorian* regulation does not absolutely preclude all error in future; but that is likely to be so trifling, as not to require particular attention. The beginning of the year has by no means been the same in different ages and countries. The Chaldeans, the Egyptians, and the Jews, in all civil affairs, began it at the *autumnal equinox*. The ecclesiastical year among the Jews, the common year of the Persians, and of the Romans under Romulus, commenced in spring: a mode still followed in many of the Italian states. Both the *equinoxes*, as well as the *summer solstice*, were each the commencing date in some of the states of Greece. The *Roman* year, from the time of Numa, began on the calends of January; the Arabs and Turks compute from the 16th of July; the christian clergy formerly commenced the year on the 25th of March—a method observed in Great Britain, generally, in civil affairs, until 1752; from which period our civil year has begun on the 1st of January, except in some few cases, in which it still commences on the “Day of Annunciation,” or the 25th of March. In Scotland, the year was, by a proclamation, bearing date so early as the 27th of November, 1599, ordered thenceforth to commence in that kingdom on the 1st of January, instead of the 25th of March. The English Church, still, in her solemn service, renews the year on the *First Sunday in Advent*, which is always that next to or on *St. Andrew's Day*. Our ancestors, after the establishment of Christianity, usually began their year at *Christmas*, and reckoned the commencement of their *æra* from the incarnation, or birth of Christ. William the Conqueror, however, introduced the method of substituting the first year of his own reign for the Christian *æra*. At subsequent periods, the English reverted to the ancient custom; but all State proclamations, patents, charters, and acts of Parliament, have continued to be dated from the commencement of the reigns of the respective sovereigns, with the addition of the words, “and in the year of our Lord,” &c. The Russian government did not adopt the Christian *æra* until the time of Peter, in 1725; their previous practice had been to reckon from the world's age, or the *year of the creation*.

CREAM OF TARTAR, rubbed upon soiled white kid gloves, cleanses them very much.

AGRICULTURE, &c.

[From the New-York Farmer.]

Cultivation of Grape Vines in Pots. By the EDITOR.

Very considerable attention is now being paid, by gardeners in England, to the cultivation of the vine in pots. In some instances the long cuttings from large vines are curled around the inside of the pot, leaving above the soil but one or two eyes, which, in consequence of the numerous roots that are made, speedily obtain a vigorous growth. By giving the vines a circular training, they will become quite ornamental, and take up but comparatively little space. By putting the pot containing the vine in another, and filling the space between them with soil, a uniform moisture may be easily preserved. To families living in towns and cities, the subject is of much importance; to the ladies in particular we recommend it. Mr. Mearns, gardener to the Duke of Portland, thus expresses himself in the Horticultural Register, on this method of cultivating them in England:

“By my method I shall introduce vines into any farmer's garden in the kingdom, where none had previously been; and at the expense of little besides ten or twelve lights of glass will insure him from 500 to 1000 fine bunches of good grapes the first season! If any one can boast the same, the fact has never been laid before the public, else it is likely I should have seen it. I go thus far, on purpose to raise a curiosity, and to excite every degree of emulation, knowing, that if such can be excited, the system will very soon discover itself to be most important to the country. The successful cultivation of the grape is certainly one of the simplest branches of the art, both in pots and in borders; if a vine be left entirely to itself it will soon become fructiferous, after having been for years under the most rigid discipline to little purpose. A vine, excited to a high degree of luxuriance, is neither the most fruitful nor produces the finest or best grapes. I have seen Hamburgs, from three to six and eight pounds weight each bunch! The vines comparatively *weak*, and vine border very shallow, and by no means rich!

“As curiosity will be created by such a remark, I beg to state that such grapes were repeatedly produced by a Mr. Minnett, formerly gardener to Mrs. Powes, Berwick House, near Shrewsbury.

“I have there seen bunches of Hamburgs from fifteen to sixteen inches long, and from eight to ten inches across the shoulders; the berries all of a perfect black, as close as they could grow together, and the size of a boy's large marbles.

“I have coiled into pots this season upwards of a hundred branches; forty and more of which I have got into action. I shall continue to introduce others till the middle of June; if I can *starve* them into dormancy by cold bleak exposure, or by burying them in clay-cold murk graves or caves! or by being sunk under a wall on a north aspect. I am begging of all my friends the long branches which they cut out in pruning, and as far as Somersetshire, Worcestershire, Staffordshire, &c. &c., so that I expect, in a short time, to have a stock of plants sufficient to produce 1000 bunches the first season.”

"Put in your cuttings of young wood, in coils of three, four, to five feet, blinding all the eyes, except the two uppermost. I choose to leave two eyes till the finest gets the lead, and is safe, for fear of accident to one alone; I then slip the weakest off. If placed into a bottom heat, and the eyes be buried about an inch or two in the pots, in the course of coiling, by the time the best eye appears above the soil, as strong as the bud of a fine asparagus! the whole coils beneath will be completely occupied with young active roots; and by the time the shoots are four feet long, the pot will be a perfect mat of those eager feeders. Then shift and top the shoot and never leave on any laterals; plunge as before into a fine bottom heat and encourage the main top-most eye alone to push; and lead it on, but without laterals, till it is again four feet long; when, if the pot is full of roots, shift, top it as before, and encourage again the uppermost eye only to start; and by the time it is another four feet, if not over-potted before, it will require a third shifting. If required, you may stop at every four feet, five or six times; but three shiftings will be found enough for the season; and you had best not suffer it to reach above from twelve to twenty feet of clear bearing wood. At the end of the season you will have shoots one inch and a half diameter, and with fine bold eyes, and full of fine set bunches for the next season!

"You will readily perceive, that, by such an early and abundant accumulation of young vigorous roots, and by such a top and bottom management, it is no extraordinary miracle to have every cutting a fruit bearing shoot at one season's growth; and by a proportional coil of large older wood, it will be equally obvious to you how readily such will produce a fine crop the first season!"

"The extraordinary progress of my grapes upon the coiled vines, placed in a bottom heat, astonishes every one. In another season, when I have got my wood early ripened, I intend to start some in October, and to have plenty of fine ripe grapes by the middle of February. I have some at this time half grown, the branch being only cut from the vine, and placed in bottom heat 20th of November! 'Can such things be?' Yes, easily and simply so. I intend to keep some coilers as late as the middle or end of July, before they are excited, and then to place them in a bottom heat. The fruit, by doing so, will be perfectly ripe before the dull weather of autumn sets in, but not so with the wood; by which circumstance they will retain the leaves vigorously through the winter, and consequently the fruit will retain its plumpness till April or May!

"You will now say this is going too far, but it undoubtedly may be done. New ripe grapes in February, and plenty of old grapes till the end of June! There is little beyond the power of man, if he will but exert those faculties with which God has endowed him."

Uses and Cultivation of the Pie Plant or Rhubarb. By D. F. AMES. [For the New-York Farmer and American Gardener's Magazine.]

MR. FLEET,—America is blest with a favorable climate, and peopled by natives from all parts of the earth, who variously cultivate our various soil; and yet our markets are not so well supplied with fruit and vegetables as those of less favored lands. This arises, in part, from the very limited demand for any thing out of the common way. Animal food

is of a more heating and irritable nature than vegetable; consequently less adapted for our summer season. Indeed, at any time, the wholesomeness as well as luxuriance of our table is greatly magnified by these salutary additions. Among their number, I wish to call the attention of your readers to the Turkish rhubarb, *rheum raphaniticum*. This is a valuable plant, and only requires to be known to receive general cultivation; it has the important recommendation of presenting itself for the table, when few others for a similar purpose are to be had. The petioles or stems of its large fan-like leaf are the part to be prepared. When the leaf is fully expanded, cut it close to the main stem, remove the green top, then deprive the stalk of its outer skin by stripping it down, and not by cutting with a knife; then cut it in small lumps, not too thin, and either boil it in dumplings made of short paste, or bake it in tarts, using sugar, lemon, &c., to the taste. It is found greatly to improve the flavor of apple tarts or pies, by mixing it in the proportion of one-third to two-thirds of apples. The latter fruit having been kept through the winter generally loses its flavor, and becomes flat and insipid. But the good housewife will soon find a variety of ways to cook this delightful plant. I shall only add that it has the reputation of being very serviceable in aiding the discharge of bile, and conclude with a few remarks on its culture. The medical rhubarb is principally brought from the mountains of Tartary, and is the dried root of this plant. It grows there in great abundance upon the declivities of the mountains, preferring a light sandy soil, on the south side, but in the shade; therefore procure a place in a warm shady border of your garden, loosen the earth, *far and deep*, enrich the spot with some rich light soil, and place the root upon a small quantity of old stable manure, so that its top, before any leaves have started, be six inches below the surface; over the crown of the root, strew a little more manure and cover it with fine mould. In the spring, when the leaves begin to appear above ground, draw the earth round them, and when the stem of the leaf has attained the length of six or eight inches, they may be cut for use. The main stem will attain the height of six or eight feet. The root for planting may be obtained at the seed stores and nurseries.

As early as February or March, some growers of this plant put barrels or large boxes over the plants, and cover the whole with heating manure. Thus treated, they will grow very rapidly. Others let them stand in open warm situations, taking no other pains than keeping the ground free from weeds, and cut the leaves as wanted. They are propagated by separating the suckers or roots from the main stem. In a few years one plant will make a dozen or more.

D. F. AMES.

WASHING AND SHEARING SHEEP.—When we wash sheep in warm weather to cleanse their wool it does not injure them, but if cold, it does, and sometimes introduces the rot.

Washing common sheep's wool on their backs is the best method to prepare it for carding, that I have observed, if it is well done; and the best way to do this is to put the sheep in clean running water (to the number of 50 or 60) before we commence washing; this soaks, and dissolves the dirt in the wool, so that even merino wool is made much cleaner. (This we discovered by a merino sheep jumping out of a boat and going to shore, and when we washed it, the wool that had been

wet was considerably cleaner.) Then carefully wash them the common way.

Wool is much better, when shorn early, both for carding and wearing.

I have shorn my sheep from the 1st of 5th mo. (May,) to the 6th mo., (June,) and by several years' experience in carding wool, have found that the earlier wool is shorn the better it works in carding, even merino as well as common wool; because it is more elastic, and softer: but when wool is shorn late in the season, it becomes dead and harsh, and is subject, when carded, to nap: so that early shearing, keeping sheep in good order, and washing wool suitably, are material objects.

According to my observation, about the latter end of April and the first week in May is mostly warm dry weather; that if sheep were shorn about this time, their wool would card, and wear much better than when shorn late; and they do as well with me as when their wool was taken off late, having a suitable shelter.

The best method that I have observed of washing common wool after shearing is to put 8 or 10 lbs. in a tub of cold, soft water; let it soak 30 or 40 minutes, then rub it slightly and rinse it out; fill the tub with fresh wool as before, in the same water, and when thus done, rinse it in clean water, and shake it out loose for drying. Warm water takes the grease too clean, out of common wool for carding; and it makes it harsh, and is more or less subject to be fulled; soaking the wool dissolves the dirt, and this is all we want out of common wool; to rub it slightly, for wool may be fulled by rubbing it much, and wool should not be fulled, for that will cause it to nap in carding; to shake it out loose, for wool made loose and unconnected cards the best; it is best not to empty the water until done washing, because the oftener we wash in the same water the cleaner wool will be; for the grease in wool acts like soap, in cleansing it; on this account it is preferable to wash the locks first, before we wash that which is for more particular use.

Wool ought to be taken in before rain, for that injures it, by connecting, or interlocking the fibres; it also makes it harsh and compact.—[Ohio Aurora.]

CULTIVATION OF GARDEN SEEDS.—Without great care in raising seeds, many kinds of garden plants will deteriorate or become of mixed varieties. It is not only necessary to make an early selection of the very best plants for seed, but those growing under all the circumstances likely to produce the desirable properties. If planted near each other, particularly if they flower at the same time, they are sure to mix, and, in nine instances out of ten, produce inferior plants. Among the vegetables liable to hybridise are the brassica family, including cauliflowers, broccoli, cabbage, turnips, &c., and different kinds of peas, beans, cucumbers, beets, onions, lettuce, and corn. The latter, in particular, will, by the aid of strong winds, mix at a great distance. Those who grow seed for sale cannot be too careful.

QUICK SILVER IN TREES.—On reading the following paragraph, in the Genesee Farmer, the thought occurred to us that the infusion of mineral or vegetable preparations into the circulation of the sap of peach trees, infected with the yellows, might be attended with good effects.

"Mr. Garrigues states that a plum tree in his vicinity, which had for several years dropped all its fruit prematurely, had, since a hole had been bored into it, and a quantity of quick silver deposited therein, ripened its fruit, which had been so abundant as more than to supply the family of the owner."

NEW-YORK AMERICAN.

MAY 31—JUNE 6, 1834.

LITERARY NOTICES.

No. XXVI.

Peoria, Illinois, March.

I have gone through a variety of amusing and some vexatious adventures in crossing the country from Galena to this central place; but you have now been with me so long upon the prairies that I shall not fatigue you by detailing more of a traveller's passing mishaps and petty encounters. The great melting of the snows that detained me at Galena, was followed by a sharp frost, which, crusting over the swollen streams, made their passage very painful for the horses. In passing through the Winnebago swamp, we drove for the distance of a mile through water up to the chests of our horses, and so heavily coated with ice, that it was as much as the leaders could do to break a way with their fore feet. My fellow traveller, however, for I started with but one from Galena, proved to be an old campaigner and capital travelling companion, and we managed to extract some amusement from every occurrence, however annoying; and whether we were jolting over the frozen ground in an open wagon without springs or seats, or keeping the freezing night-wind away by stuffing our bed clothes in the crevices, as we shared a pallet together in some half constructed log edifice, the spirit of fun and good humor has been sympathetic between us.

About a day's journey from Galena, we passed over a reach of prairie, some 12 or 14 miles in extent, where my companion, who is a middle-aged man, was fortunate enough, a few winters ago, to be the cause of saving a great many lives. A rain of sleighs, holding more than a dozen people, among whom were several females, started immediately after breakfast to cross this narrow arm of the prairie; and though the distance was only as I have stated it, they contrived somehow to lose their way in the snow, and night closing in found them apparently as far from the house they were seeking, as when they started in the morning. They had, in fact, during a sudden flurry of snow, turned completely round, and, as my companion was the first to discover, were actually going backwards instead of advancing on their route. A council was at once held, and all except my friend were for still pushing forward, though the horses were worn down with fatigue, and several of the travellers already frost bitten or becoming torpid with cold. But my companion, who probably had more experience in such scenes than any of the company, immediately took command and ordered a halt, declaring that he would not move a step further, and warning them that they would perish should they not make use of the few moments of light that were left them to secure themselves for the night. Providentially every one yielded to him. The horses were turned loose, and the snow having been removed from a large space of ground, it was forthwith covered with buffalo skins, and the largest sleigh in the train placed inverted upon them. The whole company then, with the exception of my friend, crawled beneath the impending structure, while he remained outside and covered up the box with snow, shovelling it on with a piece of board. This exercise—which alone saved his life, while it ensured the safety of theirs—he continued till morning, when some of the horses having found their way into the settlements, the people came out and led the company to their homes. During the same spell of weather, if not on the same night, two waggoners and some oxen were frozen on the prairie, farther down the country, on a route which I have since passed. There were three of them in company, each with a team, hauling goods to some point on the Illinois. Finding their oxen gradually becoming stiff with cold, they determined to leave them and hurry on to a house. One of the three gave out before they had gone many miles, and his companions buried him in a snow bank; the second sank down on the road; and the third only succeeded in reaching a house and saving his life.—Part of the load of these poor fellows consisted

of blankets, which, had they known, it might have saved them. The incident struck me when told near the spot on a cold day, though not so much as a similar story which I heard when I first came upon the grand prairie in Indiana. It related to the fate of an emigrant who attempted to cross a broad arm of the prairie with his family, in an open wagon, on a very cold day. They were found stiff in the road, the horses frozen in their traces, and standing upright, as if petrified by some sudden influence, and the man leaning against the wagon, with a fragment torn from it in his hands, as if in the act of trying to make a fire. The mother sat upright, with an infant in her arms, but the children were curled about her feet in every position that an attempt to screen themselves from the cruel exposure could suggest. But these stories, of which I could tell you a hundred, begin now to lose their effect, as, with the gradual opening of spring I find myself approaching a milder region. The last day's travel has led along those sunny bottoms of the Illinois, where, even at this early season, the chattering of the parrot may be heard upon every side; and here and there I have delighted to observe a tender green stealing over those sheltered meadows beneath the retreating banks of the river, whose narrow limits and basin-like appearance answer so completely to my preconceived ideas of a prairie. The Illinois about 30 miles above this point expands into a fine lake, upon the banks of which Peoria is situated. The site is one of the prettiest for a town that I ever saw, and the approach to it, through alternate prairies and richly wooded bottoms, that fringe the lake with a vegetation of stupendous growth, and give glimpses of its sparkling waters and blue islets through festoons of vines that overhang the road for miles continuously, must in summer be like a scene of fairy land.

Peoria is about the geographical centre of Illinois, though by no means as yet the centre of population, which is still far to the southeast. This place is rapidly improving, and may very possibly become the future seat of Government. It has inexhaustible quantities of bituminous coal in its vicinity and commands an unbroken steamboat navigation with St. Louis. The adjacent country is very fertile. The soil, like that of Illinois generally, is better suited to the grazier than the agriculturist. It is composed of a black and rich mould, with a small admixture of fine silicious sand, and rests on soft and permeable clay without being interspersed with stone or gravel.—This formation, as is observed by Governor Coles in an excellent address before a scientific body in Illinois, whilst it is unfavorable to the existence of perennial streams and fountains, and impedes the plough of the agriculturist, and endangers his health by the creation of miasma, in the vicinity of the middle lands furnishes inexhaustible meadows to the grazier, and every facility for canals and railroads. The Illinois river was described by Gen. G. B. Clark so long ago as 1777, as "a natural canal passing through natural meadows;" and the facility with which branches might be made as the country requires them, is now very apparent. The route of the proposed canal (of which I have before spoken) to connect the waters of Lake Superior with those of the Gulf of Mexico, by a communication of only one hundred miles, commences at a point on the Chicago river, five miles above its mouth, where the water is 12 feet deep, and on a level with Lake Michigan: thence seven miles and a half to the summit level, which is 17 feet above the surface of lake Michigan, and five feet nine inches above the Deplaine: thence (for a ship canal,) down the valley of the Deplaine and Illinois, about 90 miles, with 175 feet descent to the mouth of the little Vermilion, four miles below the rapids of the Illinois river; at which point that stream is navigable for steamboats at all seasons.

Ten years, and \$40,000 have now been spent upon this work, and not a shovelful of earth, so far as I can learn, is yet removed from the soil. Let the New York merchants step in and make it, and the warehouses of Buffalo will be to St. Louis what those of New Orleans are at present. New York will have the whole trade of the Mississippi valley, and the vast regions of the Missouri will be tributary to her market. A canal boat that can navigate the lakes may then clear at Coenties slip and discharge her cargo at a trading post on the Yellow Stone. Such a canal would be to this Union what a cut through the Isthmus of Darien would be to the world. The one would draw St. Louis as near to New York as the other would India to Europe. It would be well indeed that Government should make it; but the means required are so slight in comparison with those invested in a hundred similar works

in different parts of the country, as to bring it easily within the limits of individual enterprise. The State of Illinois, judging from the progress already made, will not complete the canal for half a century to come. The want of capital is here so great as almost to seal up each outlet for enterprise, though they present themselves on every side; and our eastern capitalists are so completely ignorant of the prodigious resources of this region, that it may be long before the defect is supplied. Were the people in our rich eastern cities more familiar with even the geographical relations of this extraordinary region, I am convinced that more than one company would be formed, that would be eager to purchase from the State of Illinois, at a handsome premium, the right of making the canal and holding it in joint stock for a term of years. When people of capital and enterprise open their eyes to this matter, the work will be accomplished in three seasons, and as you may then take a steamboat at Buffalo and check a berth for St. Peters, a trip to the Falls of St. Anthony will soon be thought no more of, than is now an excursion to Niagara. Fishing parties will be made up at Islip for lake Pepin; and Hewitt will furnish port folios to tourists that wander away to sketch the awful scenery of the (now) remote "Thunder's Nest,"* while "the Teton of the burnt wood" will supply Jennings's larder with game, and Paulding's best Madeira be drank by gentlemen that shoot elk among the Dacotahs.

St. Louis, March, 1834.

Here I am, safely at last in the renowned city of San' Louis. Our route from Peoria, by the way of the flourishing towns of Springfield, Jacksonville, and Alton, through the small meadow-like and half cultivated prairies of Lower Illinois, was very agreeable; and in crossing one prairie of considerable extent, I had the pleasure of seeing it on fire on every side around me. The hour was near midnight, and the spectacle was magnificent beyond description. An illustration by Westall's pencil of The Rich Man in the Burning Lake, which I have seen somewhere, would give as near an idea of the scene as the painter's art could convey. In one place the prairie presented exactly the appearance of a broad burning pool, in others the flames swelled up like seas of fire, rolling the liquid element in solid columns over the land; and then, like the waves of the sea itself, when they break upon the shore, a thousand forked tongues of flame would project themselves far beyond the broken mass, and greedily lick up the dry aliment that lay before them. Our horses did not seem to mind the phenomenon at all, and we drove so near to the fire as to feel the heat very sensibly. But though we probably incurred no danger, it was almost startling at times to see a wall of fire as high as our horses' ears, in some places stretching along the roadside, while the flames would shoot to the height of twenty feet or more, when a gust of wind would sweep the prairie.

We had an accession of four or five passengers at Jacksonville, and I was not a little amused to find that out of six persons in the stage, we had four colonels; and when we chanced to stop at a tavern, where I saw a cartridge box and a musket, over the mantelpiece, I could not help remarking aloud, that it was the first symptom of the existence of a private, I had seen in the country. Some of the colonels looked a little sour, and the jest might not have passed off as easily as I could have wished it, had not my friend, who was also a colonel, entered my name on the tavern register by the same distinguished title, which, I presume, qualified me to speak a little *ad libitum* of militia deeds of arms.

The population seen in the last few days, seemed to be of a very mixed character: some were quakers, from Pennsylvania, and they had every necessary and comfort of life; others again, were miserable looking creatures, from North Carolina and parts of Tennessee, who lived with scarcely any labor, and kept a blanket suspended over their porch instead of a door—in log huts, that had been built for several seasons. At Alton, again I saw in their neat white houses, with their green venetian blinds—their tasteful piazzas and pretty enclosures, with newly planted shrubbery—sure indications of a New England population. The same, or even greater marks of improvement and superiority in their style of living, over the mass of emigrants hither, are manifest, I am told, wherever the English have established themselves in

* Pronounced *hauling*: a term universally used at the West instead of its northern synonyme "drawing." They have Shakespeare's authority for it—"I think oxen and wain ropes cannot *hale* them together."—TWELFTH NIGHT.

* A young officer of the first Infantry, who commanded an exploring party into this savage region, so called by the Indians, arrived from his tour while I was at Prairie du Chien. He described the scenery as possessing a desolate grandeur which words could not paint.

Illinois. I have missed all their settlements, by passing to the westward of them. But both here and in Michigan, I have always heard the English residents spoken of with respect and affection.

A few miles below Alton, on the Mississippi, I passed a deserted village, the whole population of which had been destroyed by the "Milk sickness." The hamlet consisted of a couple of mills and a number of frame houses, not one of which were now tenanted; but the dried weeds of last year choked the threshold of the latter, and the raceways of the mills were cumbered up with floating timber, while the green slime of two summers hung heavy upon their motionless wheels. Not an object but ourselves moved through the silent town; and the very crows themselves seemed to make a circuit around the fated place when they came in view of the thickly-sown burial ground on the skirts of the deserted village.

We were now on the famous "American bottom;" and I was really astonished at the prodigious size of the trees, and the magnificent vegetation which this region displays, but the scattered inhabitants looked far from healthy. At Alton we struck the Mississippi, and a few miles below we passed the mouth of the Missouri, where its white and turbid current could be seen rushing in among the Islands and staining the limpid tide of the Father of rivers far down the western shore, while for twenty miles below that clear stream still preserved its purity on the eastern side. Surely Father Hennepin was mistaken, when he called the streams above and below the Missouri by the same name! For the Upper Mississippi, except in its breadth and volume of water, bears but little resemblance to the Lower river; while the Missouri, as it tears through its muddy banks to drink that beautiful tide, soon gives its own turbulent character to the whole stream below, and even impresses its peculiar features upon the gulf in which it at last loses itself.

It was too late in the evening to cross when we arrived opposite to St. Louis, and I amused myself before retiring for the night, in listening to the sound of the church bells—the first I had heard in many a month—and watching the lights as they danced along the lines of the dusky city, and were reflected in the dark rolling river. We crossed in time for breakfast, and I am now tolerably established at the best hotel in the place.

THE WORKS OF MRS. SHERWOOD.—New York.—HARPER & BROTHERS.—Vol. 1.—Comprising the history of Henry Milner, a little boy, who was not brought up according to the fashions of this world.

The deserved success which attended the publication of a uniform edition of Miss Edgeworth's works; now so recently completed by her last admirable, every way admirable tale of *Helen*, has induced, we may presume, the same enterprising publishers to undertake a similar edition of the works of Mrs. Sherwood; devoted like those of Miss Edgeworth, to the improvement of her fellow creatures—tho' by the more immediate and direct intervention of religion.

Miss Edgeworth, without omitting the occasional introduction of religious sanctions to enforce moral precepts, mainly relies on the present and immediate advantage and happiness which flow from an observance of, and strict adherence to, truth and duty.

Mrs. Sherwood, on the other hand, constantly presents obedience to the will of God as the rule of action, which, from its superior sanctity and obligation, supersedes any appeal to, or reliance on, less exalted motives of action.

Together, these two writers—dissimilar in quality and yet both of great ability—have furnished materials of rare excellence for conducting moral and religious education.

Henry Milner has never before been republished complete in this country. It is not perhaps as attractive, upon the whole, as the *Lady of the Manor*, or *Rosabel*, yet it is attractive notwithstanding.

The number of volumes to which this edition will extend is not ascertained. Meanwhile, we hazard nothing, we are sure, in predicting ample encouragement to this new and meritorious enterprise of the Harpers.

A fatal spasmodic disease peculiar, I believe, to the Valley of the Mississippi. It first attacks the cattle, and then those who eat beef or drink milk.

THE LADIES COMPANION, No. 1.—New York: W. W. SNOWDEN.—Another monthly Magazine, "devoted to Literature and the Fine Arts." Truly, we are abundantly supplied with light reading, but whether, it is as advantageous as it is abundant, "may be well questioned." This is a well printed miscellany, of about 50 pages—double columns; and with a great variety of stories, tales, and anecdotes, selected and original.

A SYSTEM OF MODERN GEOGRAPHY, with an Atlas, by G. M. HUNTINGTON. Hartford: E. HUNTINGTON & Co. New York: R. B. HOLMES.—This is designed for schools and academies, and as a general geographical reading book. It is a general and rapid view of the outlines geographically, and historically, of marking incidents in each country. The United States of course occupy a large space in a book designed for American schools, but it does not exclude from notice any other country. There are wood cuts, representing peculiarities of different people, public edifices, &c. The maps in the accompanying Atlas are colored, and apparently accurate. The whole seems carefully and skilfully prepared.

CONVERSATIONS OF A FATHER WITH HIS SON, ON SOME LEADING POINTS IN NATURAL PHILOSOPHY, by the Rev. B. H. DRAPER. New York, N. B. HOLMES.—There is no excuse for ignorance now a days, though possibly the very facilities which exist for acquiring elementary knowledge on all subjects, may lead to a neglect of that arduous, systematic, and persevering study which alone can make really learned men. Meanwhile let us welcome all of good we can—and as such we consider this little volume—which explains practically and intelligibly the phenomena of matter, of the solar system, of colors, and other analogous wonders, for such indeed they never cease to be even to those who thoroughly understand all about their laws. This little book is, too, very well printed.

FRENCH READER, OR A STEP TO TRANSLATION, &c., by Jos. F. A. BRUF: New York—Sold by the publisher, 28 Murray street, and by the booksellers generally.—This is a second edition of a work, prepared by a practical man, whose wide and intelligent experience as a teacher, has taught him the difficulties most obvious and common among learners, and who in these pages, has applied himself to diminish or overcome them. There is also a treatise, well executed, on pronunciation, the accents, &c.

LAW OF REAL PROPERTY.—An Essay on the law of real property in New Jersey, by William M. Scudder, Esq., will, as we learn, be issued from one of the New Jersey presses, sometime during the summer. It is recommended by Chief Justice Horblower, of that State.

THE NEW ENGLAND MAGAZINE for June.—Boston J. T. BUCKINGHAM—clever as usual—and varied.—It flags not in spirit or in interest. We extract a short passage, on a familiar subject.

DUNNING.
"Shut, shut the door, good John, fatigued, I said;
"Tie up the knocker, say I'm sick, I'm dead."

Misery, they say, acquaints a man with strange bed-fellows; and poverty acquaints him with unwelcome followers. The word dun—what the thing is, we need not in these times define—is derived from a troublesome fellow, a collector of bills, named John Dun. Happy mortal, he has gained immortality, like McAdam, by giving his name to a science.—John Doe and Richard Roe have not such general celebrity. I detest the name, and I love not the thing,—though it is principally for my friends that my sympathies are awakened. The last case in which I had a personal interest,—and though I write for Magazines, be it promulgated that I expect no other,—is a present call from the printer's demon for copy. Take it, and away. "So, being gone, I am myself, again."

The Chinese are a wise people; their institutions are perfect,—the paternal government is better than the presidential. They have one law, by the adoption of which, we should be more relieved than by the restoration of the deposits, the re-charter of the

Bank, or [even] the abdication of the President. It would be a great benefit to the public, and the very thing for me. In China, there are three hundred and sixty-four days of rest,—days wherein no one carries to another bill or note,—days on which, protests are inoperative, and duns illegal.

There are, however, countries in the East less enlightened than China, and also in the West. In "Merry England," what are the records of the Fleet, especially in the last century, but a book upon the misfortunes and imprudencies of genius. Fielding was almost at home in it; descriptions of a prison, are his most familiar and graphic chapter. He describes like a man who was confined to his subject; like a wight who has no view of the world but what comes through a grated lattice. The very light of the sun on his cold floor, was chequered with bars. Debt, in England, is criminal, and poverty the heaviest of misfortunes. There are two great principles that sway the nation, which thinks it sways the earth, and which possesses but too much of this planet. These are Wealth and Fashion,—fashion is the strongest, from the deep-rooted aristocracy. The cousin of a Duke, or the flatterer of a Dutchess, may be poor in all pride, and claim the precedence of fashion over mere opulence. This is the reason why the English are so shocked in America at our disregard, or happy ignorance of the local, conventional, fashionable modes of England, which, in England, were invented and are kept up with great care, to restrain the irruptions of the vulgar, for such, ninety-nine in the hundred are esteemed,—as the Romans built a wall across the island, to repress the incursions of the barbarians.

This may seem discursive,—but from Fashion to Duns, is but one step. In France, the wight subject to the latter, has less to endure than his contemporaries in England. A foreigner, however, is not favorably or hospitably distinguished by the law. He may be incarcerated for debt till death comes to release him.

It is evident, that in most nations, the rich make the laws,—for poverty is generally harshly treated. The debtor, in ancient Rome, might be sold to captivity across the Tiber. In some of the less enlightened countries, he is, at this day, a slave and may be sold like any other cattle. In China, there are laws that the creditor shall not seize for debt, the debtor or his wife, which shows that such a custom existed.

In this country, where every body is rich and thriving, debtors are hardly within the protection of the law; the legislation respecting them is of course different in various states. The slavery has been lightened in our own State, and the limits of the captive have been enlarged. In the times of the pious founders of our commonwealth the following lesson would have had its influence. It relates to a certain king who was not above overlooking his own treasure:

"And when he had begun to reckon, one was brought unto him which owed him ten thousand talents; but forasmuch as he had not to pay, his lord commanded him to be sold, and his wife and children, and all that he had, and payment to be made.—The servant therefore fell down and worshipped him, saying, Lord, have patience with me, and I will pay you all. Then the lord of that servant was moved with compassion, and loosed him and forgave him the debt. But the same servant went out, and found one of his fellow-servants, which owed him an hundred pence: and he laid hands on him, and took him by the throat, saying, Pay me that thou owest. And his fellow-servant fell down at his feet, and besought him, saying, Have patience with me, and I will pay thee all. And he would not; but went and cast him into prison, till he should pay the debt. So when his fellow-servants saw what was done, they were very sorry, and came and told unto their lord all that was done. Then his lord, after that he had called him, and said unto him, O thou wicked servant, I forgave thee all that debt, because thou desiredst me: shouldst not thou also have had compassion on thy fellow-servant, even as I had pity on thee? And his lord was wroth, and delivered him to the tormentors, till he should pay all that was due unto him."

The facilities of credit have sometimes been too great; dealers have been too ready to trust—that ill-omened word to both buyer and seller. When there is no security but in the character, or punctuality of the purchaser, this facility of credit will be much diminished. It has already had a bad effect on the public morals,—the younger class of dealers are more adventurous more enterprising, than the old.—Their word is not so good and their bond requires more sureties. The distinctions of *meum* and *tuum* have been shaken, and it is the duty of every good citizen and moralist to restore them to their original strength.

The first lesson to be planted and rooted in the

mind of a child is to love God, and never tell a lie. The second should be to shun debt, and respect the most trifling rights of property in others. To shun debt is, however, a sort of corollary to the lesson on truth; for he who has no debts, avoids the strongest temptation to tell a lie. Our veracity—all our virtues—the respect of the world—the respect of ourselves, depend upon independence. R. C.

SUMMARY.

THE COIN BILL.—We were in error yesterday, in our supposition that the bill which passed the House of Representatives on Tuesday, referred to our own gold and silver coins, as well as to foreign silver coins. It regulates the value of the latter only, at will be seen by the bill annexed, in the amended shape, in which it passed.

A Bill regulating the value of certain Foreign Silver Coins within the United States.

Be it enacted, &c. That from and after the passage of this act the following silver coins shall be of the legal value and shall pass current as money within the United States, *by tale*, for the payment of all debts and demands at the rate of one hundred cents the dollar; that is to say, the dollars of Mexico, Peru, Chili, and Central America, of not less weight than as now coined, and those restamped in Brazil of the like weight, when of not less fineness than ten ounces, fifteen pennyweights, and twelve grains of pure silver, in the troy pound of twelve ounces of standard silver; and the five-franc pieces of France, when of not less fineness than ten ounces and sixteen pennyweights in twelve ounces troy weight of standard silver, at the rate of ninety-three cents each.

Sec. 2. And be it further enacted, That it shall be the duty of the Secretary of the Treasury to cause assays of the aforesaid silver coins, made current by this act, to be had at the Mint of the United States at least once in every year, and to make report of the result thereof to Congress.

PHENIX BANK, New York, May 24. 1834.

Dear Sir—At a late meeting of the President and Directors of the Phenix Bank, the subject of redeeming the notes of all the banks in this State, *at par*, in the city of New York, was discussed.

The board has long been anxious to meet the often expressed wishes of the merchants, dealers and traders, and in the belief that no time can be more opportune than the present, I am instructed to communicate to you the intention of the Phenix Bank to receive in their daily exchanges from your bank, all notes issued by any or all of the Banks in the State of New York, at the par value thereof; provided the Banks in the city of New York will respectively keep a special deposit in the Phenix Bank, to cover the probable amount employed and the expenses incurred.

The advantages of this system to the citizens of our State—to all who are engaged in exchanging the products of her soil, or other commodities—are too apparent to need illustration.

Our banks will severally partake of the benefits to be derived from an improved currency, and an increased credit necessarily flowing from a system of greater security.

It is believed that the banks in the several counties of the State, will generally approve the contemplated measure, and by degrees will adopt it. Many have anticipated the change, well assured of advantage when the system shall be applied to the entire State.

Desirous to promote and effectively aid the above object, the President and Directors of the Phenix Bank solicit your attention thereto, and ask your co-operation. I am, respectfully, yours,

J. DELAFIELD, *Cashier*.

Dividend.—The Merchants' Bank have declared a dividend of three per cent, for the last six months, payable on the 2d June.

In Vermont, at half past five o'clock in the morning, of the 19th inst., a shock of earthquake was felt in several places.

[From the Globe of yesterday.]

We are happy to be able to contradict the report of the ravages of the Cholera among the troops at Fort Mitchell, Alabama. We learn from the Adjutant General, that an official report, dated the 22d of May, was received on the 2d inst. from Captain Fraser, the commanding officer of Fort Mitchell, in which he says not a word of sickness of any kind whatever.—If the Cholera had been among the troops, or even prevalent at or near Fort Mitchell, it is believed that Captain Fraser would certainly have reported the circumstance.

Africa, fatal Africa, has added another to the long list of those who, seeking to explore her unknown regions, have found in them only a grave. Lander, the real discoverer of the course of the Niger, has perished—as we learn by the Canada—having been murdered 200 or 300 miles up that river. Others, however, will succeed to the place thus made vacant by death, for nothing can daunt the indomitable spirit of human enterprise.

[From a Philadelphia paper.]

TEMPERANCE ANNIVERSARY.—The Anniversary of the Pennsylvania Temperance Society was celebrated on Friday, the 24th inst., at the Central Church, in this city. MATTHEW NEWKIRK, Esq. the first Vice President, took the Chair. The meeting was opened with prayer, by Dr. Beman. A letter from Dr. P. S. Physick, the President of the Society, was read, apologizing for absence. Extracts from the seventh annual report were read by the Rev. John Marsh, Secretary of the Society. They represented the cause as in a very progressive state in many parts of Pennsylvania, and gave a highly gratifying picture of the good already effected through the exertions of the Society. The Rev. Dr. Tucker, of Troy, moved that the report be accepted and printed, which motion was carried. An appropriate Temperance Hymn was then sung.

The Rev. Dr. White, of South Carolina, made a handsome speech in support of the following:

Resolved, That the influence of the female sex, always powerful for good or evil, has been such in the benevolent institutions of the age, as to cause Christians to appreciate more highly than ever their intellectual and moral elevation in Christian countries; and that the friends of Temperance, grateful for the past, look with deep interest at their co-operation in their great and delightful work of reform.

The Rev. Dr. Mason, of New York, introduced the following:

Resolved, That while the Church of Christ is, and must continue to be, the standard and the means of a pure morality in our land, it is our urgent and imperative duty, in view of the light disclosed by the Temperance Reformation, to declare in her sanctuaries and court, how far she desires this reformation to proceed in its influence on herself, and how soon she desires to reach that point.

Dr. Mason took a deep view of the connexion between the Temperance Reform, and the interests of religion, and showed clearly what may well excite admiration and wonder, that the backwardness and opposition of many ministers and churches had been such as to make it questionable, whether professedly religious men had been most for it or against it. The church, however, of all denominations, are waking up, and he supported the sentiment of his resolutions, in a manner to make ministers and Christians in the house feel deeply on the subject.

Rev. Dr. Beman, of Troy, introduced the following resolution, and closed the meeting with much wit, pungency and eloquence:

Resolved, That the abandonment of more than 3000 distilleries in the United States, and the cessation from the traffic in ardent spirits of more than 7000 venders under the light of Temperance, shows that there is a moral power in the earth, (public sentiment) which may yet expel that traffic, the great source and support of intemperance, from the abodes of civilized man.

Military.—Major M. M. PAYNE of the United States Army arrived in this city from Fort Gratiot on Saturday with two companies of Artillery; one of which is to be stationed at Fort Hamilton, and the other with the Major at New London. This is the same prompt and efficient officer, who at the time of the *Black Hawk* expedition, received an order to repair to the frontiers with his Company at 10 o'clock in the morning, and at five in the afternoon was on the way from Baltimore to this city with his entire command. He has been kept since that period at Fort Gratiot at the foot of Lake Huron, whence he now returns with his Company, after a two year's absence on seven hours notice.—[Courier and Enquirer.]

DONATION TO THE POLISH EXILES.—We have received seventeen shirts, made by the young ladies belonging to the "Young Ladies' Sewing Association of the Reformed Dutch Church in Exchange place," which have been sent, according to direction, to the Executive Committee, "to be distributed among the exiled Poles lately arrived on our shores."

ANOTHER BANK STOPPED.—The Mechanics' Bank of Patterson, N. J. closed its doors last week. It has not been, for some time, in repute; therefore there are not a great many of its notes in circulation.

[From the Batavia Times, Extra, May 31.]

GREAT FIRE AT BATAVIA.—Our village is again a heap of ruins. A fire broke out yesterday, (Friday) about 5 o'clock, P. M. between two barns in the rear of the Eagle Tavern and the stand kept by Harvey Rowe. It was discovered at a very early stage of its progress—but it almost immediately communicated to the hay, some of which projected through the cracks of the adjoining barn. Then all hopes of extinguishing it were at an end. The attention of the citizens was directed to the preservation of what property contained in the houses could be got out.—It is impossible this time, to estimate the loss which has been sustained. The following is a list of the sufferers, as far as we have been able to ascertain them:

1. The Eagle Tavern, a large three story brick building, owned and occupied by B. Humphrey—together with the brick building which was attached to and formed a part of the tavern, except the first story, which was occupied by E. C. Dibble, Esq., and Judge Cumings, as offices. Mr. H. was insured on the building and furniture, \$6,700—Buffalo office.
2. The three story wooden building, occupied by Harvey Rowe, and owned by A. Champion, of Rochester. A part of the furniture was saved.
3. The Law Office, owned and occupied by Mess. Taggart & Smith.
4. The tailor shop occupied by Leach & Jones.
5. An office occupied by Wm. H. Webster and Horace U. Soper, Esq., with a family above.
6. The dwelling occupied by Mr. Thomas Cole.
7. A dwelling in the rear of the one last named, occupied by Richard Smith, Esq.
8. A building owned by Erastus B. Seymour, and occupied by Chas. T. Buxton as a cabinet shop—by Gilbert & Seward as a tin shop. Mr. Seymour was insured \$300 at the Buffalo office.
9. A dwelling house owned by the widow Hewett, and occupied by John Putnam.
10. A law office owned by Ethan B. Allen, Esq., and occupied by Allen & Chandler.
11. A building owned by Ethan B. Allen, Esq., and occupied by Mr. Ottaway as a tailor shop and dwelling.
12. A building owned by Ebenezer Mix, Esq., and occupied by Mr. Putnam as a grocery.
13. A building in the rear of last named, owned by the same, and occupied by Mr. Leonard as a dwelling.

Both of the last named buildings were pulled down, and all of them was situated on Genesee street.

14. On Court street, a building occupied by James M'Allister.

15. A building owned by Cary & Grant, and occupied by James Harrington.

16. On Big tree street, a building owned by Cary & Grant. Messrs Cary & Grant were insured on the two last named buildings, \$500, at the Buffalo office.

17. Another building on Big tree street, but by whom it was owned or occupied we have not been able to learn.

Besides what has been enumerated, the extensive barns, shed and stables of Messrs. Humphrey, Homer, Rowe & Putnam, were entirely consumed with their contents, hay and oats. Horses, carriages, &c. all saved.

At one time our whole village was threatened with total destruction. The buildings on the north side of the street were on fire a number of times.

EXTRAORDINARY ARRIVAL.—At 1:2 past 11 o'clock, A. M., we received the United States (Phil.) Gazette of this morning, June 3d, (by the Rail Road Line,) from which we make the following extracts.

"We had a pleasant exhibition of the 'ABRORA BORRALES' last evening."

Superfine flour continues steady at \$5.50. Some demand exists for Rye Flour, and sales have been made at \$3.50, which is a trifling advance. Corn Meal in brls. is selling at \$3. 5000 bushels Genesee Wheat was yesterday sold at \$1.15, to arrive.

The morning steamboat for New York of the Railroad Line, will leave Chesnut street wharf this morning, and the succeeding mornings of this week, at three instead of seven o'clock, as heretofore, and will arrive in New York at 11 o'clock, A. M. in time for morning travellers to reach the race ground before the races commence.

This arrangement will enable our neighbors of

Philadelphia to take an early dinner in New York and return home to tea, when there shall be a 12 o'clock line from New York.

Foot Race.—Yesterday afternoon, at 5 o'clock, Mr. C. W. Clauser, according to previous notice, commenced the undertaking of performing on foot the distance of twelve miles in eighty minutes, which he performed, as we understand, with ease in seventy-eight minutes. The ground over which he passed was from the corner of Fourteenth-st. and the Bowery to Harlem bridge and back.

SAILORS' FREAK.—At the Tremont Theatre in Boston on Monday evening, a party of sailors from the Frigate Potomac, amused themselves by drawing into the second tier of boxes a part of their companions who had taken their seats in the pit. This was done by means of handkerchiefs tied together. One of the tars thus promoted, weighed near 200 pounds.

It is stated that the body, to which we referred a day or two since, as having been taken from the Schuylkill, was that of J. AUGUSTUS STONE, Esq. the author of *Metamora* and several other dramatic pieces. We learn this with deep regret. Mr. Stone possessed many qualities calculated to endear him to a numerous circle of friends. He was, we learn, subject to fits of insanity.—[Philad. Inq.]

Extraordinary Trotting Match.—A bet of fifteen hundred dollars was made some time since, by Mr. B. R. TWEED, of this city, that his two horses would trot in harness one hundred miles in ten hours, over the Centreville Trotting Course. This match against time came off on Saturday. The weather was propitious, there being so sun and the course in fine order. The horses, which are not thoroughbred, but ordinary road horses, started at 20 minutes past 9 o'clock, and performed their task in two minutes and twenty-five seconds less than the time allotted them. At starting the bets were two to one against the horses. After they had gone the first fifty miles however, opinions changed, and bets were freely offered in their favor. At eighty miles, the horses appeared a good deal distressed, and their backers seemed anxious to back out. A feeling that the horses would give in seemed indeed pretty generally to prevail during the last 20 miles, until the last half mile. But they got through their unprecedented task, and won the match for their owner in 9 hours, 57 minutes and 35 seconds. The crowd on the course was immense, and large sums of money were bet during the day. The horses were driven in a light waggon, and Mr. GEORGE SPICER was the reins-man.

Nothing equal to this has ever been done in any country before. Tom Thumb trotted in England 100 miles in 10 hours and 7 minutes, but it was in single harness.—[Courier.]

The last Galenian furnishes a table of the quantity of lead annually made at the lead mines in the United States, from their first opening in 1821 to 1833, inclusive. The statement contains a remark that the lead is less abundant this spring than at any preceding time, and that comparatively speaking, little will be made this year. The whole quantity made during the twelve years mentioned, is set down at 63,845,740 lbs., of which 7,941,792 lbs. were made during the year 1833. The mining business during that time seems by the table to have fluctuated without any perceptible law of increase. The quantity of lead raised in 1823, was more than twelve millions of pounds, and the next year more than fourteen millions and a half. It fell in 1832 to little more than four millions. This variation arises, we suppose, from the want of a regular plan of operations, a deficiency of capital, and the uncertain tenure by which the lead mine lands are held.

We find in the Gazette of Thursday the following postscript:

Postscript.—The British cutter *Post-Boy*, Captain Toogood, arrived here last evening from Falmouth, England, whence she sailed on the 5th of May. The vessel has no cargo, and only a single letter to a mercantile house in this city. The public, of course, is left to conjecture the object of an arrival under circumstances so unusual. Judging from our own feelings, we can easily imagine how anxious our readers will be for more important information on the subject.

We learn that the above vessel belongs to the Messrs. Rothschilds, bankers, and has brought out a large amount of specie.—[Lancaster says, one million of dollars!!!]

We regret to learn, that the house of the Rev. Mr. Davis, of Ballston, was burnt on Wednesday

last. A part of the furniture was saved; but the loss of Mr. D. over and above an insurance on the building, is said to be nearly \$3000.—[Saratoga Sentinel.]

[From the Baltimore American of Tuesday.]

Our highly esteemed fellow-townsmen, CHRISTOPHER HUGHES, took his departure for the Eastward this morning, to embark at New York in the 8th packet for England, and thence to resume, at the capital of Sweden, his duties as the representative of the United States. He carries with him the warmest wishes of his numerous friends for a safe and pleasant voyage, and for the continued success of his efforts in the discharge of the responsible duties of his elevated station. The occasion of his departure has elicited from him the following Address, which it affords us pleasure to be the medium of communicating to his fellow-citizens:

TO MY FELLOW-CITIZENS OF BALTIMORE.

133 South Charles street, }
1st June, 1834. }

I have been twenty years in the foreign Diplomatic Service of my country. During that time, I have been at home but four times, to re-visit my country; to see to my private affairs; and to nationalize my European-born children. I may say, that with the exception of the years 1815—16, passed in the State Legislature, I have been abroad since 1813. My three first diplomatic appointments—and I say it with pride—were conferred upon me by Mr. Madison; partly from his personal knowledge of me, and partly at the suggestion of Mr. Monroe, then Secretary of State. This last named eminent, virtuous and admirable man and patriot, when himself President of the United States, stated to me his regret, and his inability, (from the habit of the Government, and he believed, the expectation of the people, that high diplomatic rank could, and *should*, only be conferred upon those who had made themselves known to the Nation, by their services in the national Councils) to promote me to higher rank. He added—“Mr. Hughes, I dare not elevate you, to place and rank, for which I think you fit; it would be attributed to personal favoritism; for, though you are known, and advantageously known to the Administration, you are not known to the Nation. This is a pernicious usage and prejudice, of giving diplomatic missions only to prominent members, and party men, in the National Legislature; but, it is *stronger than I am!* Diplomatic fitness often turns upon other qualities; but, I repeat, I dare not do for you that which I wish, and you deserve, yet I will do something, that may be grateful to you—honorable and useful to you, hereafter—and proving my opinion and respect for you.—I will, if you will allow me, write you a letter—it may be a gratifying family archive—expressing my high value and opinion of your services; for no man has served his country with more zeal, fidelity, honor, and success, than you have done, during the ten years that you have been employed.” This was in 1823. The conversation took place at midnight, and in the President's House. It was the last time I saw my venerable and venerated friend and patron. This, (nor any other) country, never produced, nor possessed a more faithful servant, a purer patriot, or a better man, than James Monroe. I knew him from my youth: I venerated and I loved him. And among the testimonials of character and success, in my modest career, I hold his private letters to me, to be the most precious documents. My son shall inherit them, and his father's respect for the character of James Monroe.

I explained to Mr. Monroe “how happy I should have been to receive such a testimonial, if he had not previously consulted me on it, but after consultation, I begged respectfully to decline it.” I was wrong.

I have been continued, as you know, by the succeeding Administrations, in diplomatic employment; true, under some, and heavy disappointments; but, a public man may not always choose.

I arrived at New York, in September last year, after an absence from my country of eight years. My object was to plant my children in the American soil. I am now about to return to my post, in Sweden. I will not say, my humble post—for humility may not be associated with the representation of this great and happy Republic.

I embark on the 8th of June. I leave my children in America. Children should be reared in the country in which they are to live. They should be reared in its habits, its customs, its feelings, its doctrines, its sentiments—aye, even and better, in its national prejudices, (for national prejudices are always excusable—sometimes respectable,) rather than be brought

up in a foreign land. If this be true,—and I believe it,—it is especially true of Americans. Europe is a bad school for the education and rearing of Americans. I understand the word American as convertible with Republican. May they ever be *synonyms*. This is the principle of our political life—of our national and individual independence—happiness—peace—and importance, at home and abroad. Disturb—destroy this principle, admit, among you, any other distinction, than that which superior talents and superior virtue establish and command, and then only, “during good behavior,” on which you are to pass, and for limited terms, which you are to renew,—admit among you any other, than the principle of political and social equality, and rottenness will creep into your foundations,—and your fabric must fall; your blessed and beautiful Union—(in whose duration I conscientiously believe, notwithstanding the recent throes and menaces, and for whose duration I will devote, as I am ready to stake, my life!)—your glorious Union must, and will split, into degraded, powerless, unhonored fragments! You will add another to the many memorable and mournful monuments of human weakness and folly; you will furnish another argument to the logic of the foul and pernicious foes of your institutions! You will strengthen the cause of tyrants and of aristocrats, who insolently maintain, that they, and only they, are fit to govern; for “that man is incapable of self-government.”

Upon yourselves, my fellow-citizens, depend your national honor, happiness, and Liberty. Your national honor, happiness, and Liberty depend upon your Union, and your Union depends upon equality.

I am not more convinced of my Religion, than I am convinced of these truths. They have been the guides of my public and private life; they are engraven on my heart, and my heart has ever been, and ever will be, my Country's.

But, my fellow townsmen, it is not my object to address to you a political homily. You can have nothing to learn from me, in the value of your unsurpassed political and social advantages, nor the means to preserve and to perpetuate them. You know your privileges; you know their value. I know you; and knowing, I esteem and value you; and I should be unworthy of the constant and gratifying evidences of attachment, of kindness and of personal consideration, which since my boyhood I have received from you, in this my native town, if I did not beg leave to offer you my grateful and affectionate acknowledgements. I trust I am not pampering myself into the delusion of self-importance, if in my inability to call and take personal leave of the many I know and love—the companions of my boyish sports, and the esteemed associates of my riper years—if I respectfully ask to be permitted to take leave of you in this public manner; besides, it will be recollected, that though one man may receive three hundred visits in one day, it would be the work of many days for him, to return them in person.

As far as one, situated as I am, may speak of his movements, my notion is, that my absence from the United States will not be long.

“This is my own, my native Land.”

I leave it with augmented attachment; I leave it, with increased knowledge of its resources, with a deeper conviction of its unequalled blessings; I leave it, with elevated sentiments of its grandeur and its destinies. May my countrymen watch over—preserve—and promote them!

I leave my country; and I leave my children. I will not remain long from either. To return to both, will be to me an elevated joy! and I shall then, whatever I may be worth, hold myself ready, as one of the People, to obey the call of the People, and to serve them as they may think me competent to serve my country.

Nothing but poverty could induce me to accept a paid office, at home. I say this, as man should say every thing, subject to circumstances and reflection. To represent one's fellow-citizens and neighbors—and at their call—is not an office in the ordinary sense of the word. It is the only place, in my present notions, that I would consent to fill; and only then, if called to it. When called to it, an American has no right to refuse; and this is the only right an American has not. This has ever been my opinion, on this first and most important of patriotic duties; and there is one other point, on which I have ever entertained and ever shall entertain, a fixed opinion, to wit—that it is the sacred duty of every American to vote at every election. If he omit to vote, he fails in one, perhaps the chief one, of his duties to his country.

My Fellow Townsmen, I bid you an affectionate, and a respectful farewell.

CHRISTOPHER HUGHES

[From the Detroit Courier, May 21.]

IMMIGRATION.—Our streets are again thronging with life, and crowds of emigrants are daily arriving, filling all our hotels and places of public resort to overflowing. It is computed that on Friday and Saturday of the past week alone, not less than two thousand strangers arrived in the different boats at our wharves. Some are reloading their furniture and starting at once in caravans for the interior with their families; while others who are more at leisure, or are awaiting public conveyances, are grouped around with pocket map of the interior in their hands, tracing their separate routes from this great rendezvous of western adventurers. There are expressions of satisfaction and cheerfulness in these strange faces which argue any thing but disappointment or discontent at the aspect of Michigan on t'le introduction. We are happy also to observe the appearance of robustness and health which these new comers present, in whom we seem already to recognize the hardy and enterprising materials for many new and flourishing settlements. This tide, which is constantly pouring onward along the great thoroughfare of waters, seems speedily to promise to Michigan her complete quota of inhabitants requisite for admission into the Union.

It is a fact which we presume none will venture to controvert, that our population both for integrity and intelligence, will sustain a most honorable comparison with that of our neighboring sisters of the States. A prominent cause of this may undoubtedly be traced to the fact that settlers here are invariably required to pay the amount of their purchases on occupation thereof; a requisition with which the better and more able class of emigrants alone can comply. We cannot but congratulate our new friends on their choice of a location in a land so full of fatness and of promise.

[From the Quebec Gazette 23d May.]

TOTAL LOSS OF THE JAMES OF LIMERICK, WITH 11 OF THE CREW AND 247 EMIGRANTS.

We have had a conversation with Mr. Downes, the Surgeon of the *James*, one of those saved from the vessel, and who signs the statement subjoined. There is no doubt on his mind that the vessel went down with all on board. The *Margaret*, which he was fortunate enough in gaining, after receiving very serious bodily injury while embarking in the boat, came to the spot where the *James* ought to have been, in an hour or two after he had left her, and she had then disappeared. From the condition in which she was left, there can be little doubt on his mind, that she must have foundered with all on board, or, at least, by far the greater number. Some chance of a portion being saved in the boats may exist; but as the *Margaret* had a light out, they very probably would have been enabled to have boarded her. No list of passengers has been saved, the Captain's having been left on board. Their names can now only be exactly ascertained by reference to the Custom House books at Limerick. Several of the families had been well to do in Ireland, and they had with them between £2,000 and £3,000 in gold; being in most part from Rathkeale and its neighbourhood, about fourteen miles from Limerick.—When the *James* left that port, deaths by cholera were daily occurring; but although several suspicious cases appeared, none had proved fatal on the passage.

To the Editor of the Quebec Gazette:

SIR: Allow me the liberty of intruding on your space with a more accurate detail of the circumstances connected with the loss of the *James*, which was rather imperfectly given in yesterday's *Mercury*.

We sailed from Limerick on the 8th April, with 251 passengers and a crew of 16. On Friday, the 11th, we put out to sea, where, after a few days, from heavy gales, &c. we experienced nothing but a series of mishaps, having carried away our topmast, studding-sail-boom, jib boom, main-sail, fore-sail, and yard. On Sunday, the 25th, at six A. M. they set about pumping the ship out, but were not long thus engaged before the pumps were found to be choked by the passengers' potatoes, which, from the rotten description of bags in which they were kept, went adrift about the hold, filling the pump wells, and preventing the possibility of working the pumps, which were hoisted on deck, and a great quantity of potatoes brought away from them; and to prevent a recurrence of this, tin kettles, with holes made in them, were laid on the heels, which proved ineffectual; after which, baskets were substituted, with as little success. Finding the water to increase to an alarming extent, and a gale from the N. W. springing up, with a heavy sea, the ship straining very much, we had recourse to the expedient of baling her out from the fore hatch with buckets

and a provision cask made fast to a tackle; but the water casks which were floating about there, excited the apprehensions of the people, and one passenger, Henry Morgan, getting three of his fingers broken between two of them, the attempt was abandoned. About 4 o'clock P. M. she shipped a sea which carried away the lee bulwarks, and was soon after struck by a second still heavier, with the force of which she listed, canting her ballast, and never returned to an erect position. The water having reached the between-decks, and no chance of saving her presenting itself, the Captain, at five o'clock, ordered the long-boat and skiff to be lowered, as a sail tacking to the southward made its appearance. The passengers crowded into the skiff while she was within the long-boat, and by this means made it difficult to lower the latter, which, when drawn from the after chock, came against the stanchions; after which, they did not seem inclined to take further trouble with her. At half-past six we lowered the jolly-boat, in which eleven of us were picked up by the *Margaret*, of Newcastle, Capt. Wake, to whose kindness and humanity since we are indebted for our preservation.

The persons saved are—Captain Laidler; Robert S. Laidler, his brother; Henry Downes, surgeon; Thomas Enwright, carpenter; James Cook, seaman; Peter Lilly Wall and James Clark, apprentices; with Mary Hastings, Andrew Young, James Shehan, and Edmund Curry or Cedy, passengers.

Your obedient servant,

HENRY DOWNES, Surgeon of the *James*.

Still more distressing Intelligence.—Confirmation of the loss of the *James*, with upwards of 252 persons.—Loss of the bark *Astrea*, with 228 persons.

—Loss of brig *Edward*.—Loss of brig *Fidelity*.—Loss of brig *Columbus*: all bound to Quebec.—Loss of bark *Charlotte Langin*, from Liverpool for Philadelphia.—Loss of ship *Marchioness of Queensbury*.—Loss of bark *John Atkins*, from Halifax for Richmond.—Loss of brig *Margaret*, from Belfast, and four lives.

Never, within our recollection, have we had to record such a list of disasters among shipping, and loss of lives, as has fallen to our lot this day. It will be seen from the following account, copied from the Halifax Gazette of the 21st instant, that the loss of the *James* is confirmed, together with numerous other vessels.

[From the Halifax Gazette of May 21.]

Our paper of today contains melancholy accounts of shipwrecks and the loss of human life. We saw a person yesterday who was at Louisburg when the *Astrea* was lost. The survivors had reached that place. They informed him that that vessel struck on the morning of the 7th instant, against some high cliffs at Little Lorain Head, about five miles from Louisburg and almost instantly went to pieces: that she had studding sails set at the time, and up to the fatal moment of striking had gone at the rate of ten knots. The only individuals saved were the surgeon, carpenter and one seaman, who were thrown almost insensible on some of the cliffs.

SYDNEY, MAY 14.—Bark *Astrea*, William Ridley, master, with two hundred and eleven passengers and crew, went ashore at Loran, near Louisburg, morning of 7th inst., and only the surgeon and two of the crew saved! Same day, brig *Edward* struck a piece of ice near Port Nova, and sunk immediately—crew saved. On the 11th, brig *Fidelity*, Clarke, from Dublin, for Quebec, went ashore on Scattari and was lost; passengers and crew, 15 in number, saved. Same day, brig *Columbus*, Russell, from Newcastle for Quebec, was lost three miles East of Louisburg, crew saved. On the 27th ult., lat. 45 20, lon. 48 53, the *Margaret*, Walsh, from Newcastle, picked up the captain of bark *James*, from Ireland for Quebec, with ten others, only survivors of two hundred and sixty-five persons on board the *James* when she sprung a leak and sunk.

The crew of bark *Charlotte Langin*, of New Brunswick, from Liverpool for Philadelphia, has been landed here from an American fishing vessel. The ship had sprung a leak and they had abandoned her. They were three days in their boats.

Ship *Marchioness of Queensbury*, from Liverpool for Miramachi, went ashore on Cape Tormentine, night of 16th inst. but will be got off if the weather continues moderate.

Bark *John Atkins*, from Halifax for Richmond, went ashore three miles from that place, and was totally lost.

On the night of the 15th inst. brig *Margaret*, from Belfast for St. John, N. B. went ashore at Barrington, and was totally lost—crew saved. The mate's wife and four children were drowned.

[From the Journal of Commerce.]

LOCUSTS.

This year being the regular septemdecennial period for the re-appearance of locusts in our country, and these insects having already made their debut in some places, we cannot do less than devote a brief space to their history and habits. Whether the locust of the United States is of a different species from those which, at various intervals, have carried terror and desolation over large portions of the Eastern world, we cannot positively say; though it is certain that their visits have proved comparatively harmless. The history of the immense multiplication of locusts in some cases, and of the damage done by them, if it were not well authenticated, would be wholly incredible.

This has been chiefly in Oriental countries, where the insect has accordingly a proverbial reputation. "The land," says the Prophet Joel, "is as the garden of Eden before them, and behind them a desolate wilderness; yea, and nothing shall escape them." Again: "They shall run like mighty men; they shall climb the wall like men of war; and they shall walk every one in his own ways, and they shall not break their ranks; neither shall one thrust another."

This graphic description might by some be mistaken for a poetical exaggeration; but let us observe for a moment how remarkably it is accredited by the account the well known Dr. Shaw gives in his *Travels*, of the ravages of these animals in Barbary, in the spring of 1724, when they appeared in such numbers as absolutely to darken the air. After a while they retired into the plains to lay their eggs.—"These," says the traveller, "were no sooner hatched, than each of the broods collected itself into a compact body of a furlong or more square, and marching afterwards directly towards the sea, they let nothing escape them. They kept their ranks like men of war, climbing over, as they advanced, every tree or wall that was in their way; nay, they entered into our very houses and bed chambers, like so many thieves." He then goes on to state that attempts were made to stop their progress by fires of stubble and heath, but all to no purpose, so numerous were the swarms.

In 1797, Southern Africa was overrun in like manner, the traveller Barrow being there at the time; and he states that the whole surface of the ground, for an area of nearly two thousand miles, was literally almost covered with them, while the water of a wide river was scarcely visible on account of the carcasses of these drowned in endeavoring to come at the reeds on the banks. This was the third year of their continuance, and their increase from year to year was estimated at over a million fold. The year before, they had made great ravages, but were finally driven into the sea, which is their common fate, by a tempestuous north wind, and when they were afterwards cast upon the shore, Barrow says they made a bank three or four feet high, extending fifty miles in length, the taint of which was plainly perceptible at the distance of one hundred and fifty miles. It seems that during the night these insects discontinued their march and clustered together in large heaps; and at this time the farmers sometimes destroyed vast multitudes of them by driving among them a flock of several thousand sheep.

Pallas, in his *Travels in Russia*, gives a more minute description of their mode of march. After getting started in the morning, he says, they resemble a swarm of ants, all taking the same course, but without touching each other ["neither shall one thrust another."] They uniformly travel toward a certain region as fast as a fly can run, and without leaping, unless pursued. In their course, they advance from morning to evening without halting, frequently at the rate of a hundred fathoms and upwards a day.—"When their progress is opposed by ditches, they penetrate through them; their way can only be impeded by water, as they are apparently terrified by every kind of moisture. Often, however, they endeavor to gain the opposite bank, with the aid of overhanging boughs; and if the stalks of plants or shrubs be laid across the water, they pass in close columns over these temporary bridges, on which they even seem to rest, and enjoy the refreshing coolness. As soon as they acquire wings, they progressively disperse, but still fly about in large swarms."

As long since as 1650, mention is made of a cloud of locusts in Russia, which entered the country in three different places; and it is stated in a volume of the English Library of Entertaining Knowledge, and elsewhere, that they afterwards spread themselves over Poland and Lithuania in such numbers, that the earth was covered and the air darkened with them. The trees bent with their weight in

some instances, and in others they were seen lying on the ground dead, to the depth of four feet.

In some regions of the world they populate and migrate almost as regularly as certain species of birds. Irby and Mangles, in their Travels in Egypt and Syria, speak of seeing at the southern extremity of the Dead Sea, one morning, a swarm resting in a gully, in sufficient numbers to alter the color of the rocks they alighted on. The guides stated that they were on their way to Gaza, and that they passed almost annually. Volney also describes the movements of swarms which came under his own observation.

From Africa, which would appear to be the home of the animal, they have frequently come, in former times especially, into Italy and Spain. In the year '59, a vast phalanx of very large ones ravaged the former country far and wide, until they were at length driven into the sea; and it is recorded that a terrible pestilence arose from their stench, which carried off an incredible number of both men and beasts. Their depredations are said to have been such in the Venetian territory, in the year 1748, as to have occasioned a famine, in which 30,000 persons perished. There is certainly nothing improbable in this statement.

We cannot ascertain from the sources of information within our reach, that Great Britain has been infested by these insects to any considerable extent.—They appeared in England, it is stated, in 1798, but fortunately disappeared without propagating.

We shall add to these notices of the locust, as some of them may be considered apocryphal, or insufficiently authenticated, a reference to the ablest and minutest description of the same kind we have met with, and this is to be found in the missionary Kay's *Cyfrarian Researches*, published last year in London, and republished here recently by the Harpers. The year 1828 was, in the Cape of Good Hope Colony, ushered in, it seems, by "immense swarms" of these insects, which "literally darkened the Heavens for several days." On the wing, he says, they appear like a black cloud at a distance, but when they arrived at hand, their density intercepts the solar rays in such a manner as to cause an awful gloom, like an eclipse, and a noise like that of a torrent.—In some of the villages, they were spread on the ground so thickly that it was with the utmost difficulty the inhabitants could keep them out of their houses. The water conduits were filled; the rivers so contaminated that the waters were offensive to the smell: the herbage generally destroyed, the trees weighed down with them, and the vineyards laid waste. "Fields which the rising sun beheld covered with luxuries, are, before evening, a desert, for wherever they alight, not a leaf is left upon the trees, a blade of grass upon the pasture, nor an ear of corn in the field."

Mr. Kay speaks of the "frequent visits" of the locust as rendering the prospects of the *agriculturists* in that region extremely precarious. The antidote to the bane is found, to some extent, in the locust bird, which, according to a benevolent regulation of Providence, appears in myriads corresponding to the enemy it has to deal with, and makes great havoc among them. In 1332 their ravages were mostly prevented in this way.

Observations in that quarter of the world of which we have but spoken, add new illustrations to the reference made in Scripture to the ancient use of this insect for human food. In South Africa, not only do the cattle eat the locusts with avidity—perhaps, however, partly owing to the scarcity of better food which they occasion—but the Bushmen also, and other of the desert tribes, often gather them and lay them up for a winter store. The mode of curing and cooking is, to take off the wings and legs, then roast, then reduce the bodies to dust, and this is put up in bags like flour.

THE SERPENTS' BATH.—In the Bubbles from the Brunnens of Nassau, is the following account of the baths in that vicinity, said to be very efficacious in many diseases, and called the Schlangen-bad or Serpents' Bath:

"Once upon a time, it seems there was a heifer, with which every thing in nature seemed to disagree. The more she ate the thinner she grew—the more her mother licked her hide, the rougher and the more staring was her coat—not a fly in the forest would bite her—never was she seen to chew her cud—but, hide-bound and melancholy, her hips seemed actually to be protruding from her skin.—What was the matter with her no one knew—what could cure her no one could divine—in short, deserted by her master and her species, she was, as the faculty would term it, given up.

In a few weeks, however, she suddenly re-appeared among the herd, with ribs covered with flesh—

eyes like a deer—skin sleek as a mole's—breath sweetly smelling of milk—saliva hanging in ringlets from her jaws! Every day seemed to confirm her health, and the phenomenon was so striking, that the herdsmen, having watched her, discovered that regularly every evening, she wormed her way in secret into the forest, until she reached and refreshed herself at a spring of water—haunted by harmless "serpents," when full grown, about four feet in length.

The circumstance, it seems, had been almost forgotten by the peasant, when a young Nassau lady began early to show exactly the symptoms of the heifer. Mother, sisters, father, friends, all tried to cure her—but in vain: and the physician actually

"Had taken his leave with sighs and sorrow,
Despairing of his fees tomorrow!"

When the herdsman happening to hear of her case, prevailed upon her at last to try the heifer's secret remedy; she did so, and in a very short time, to the utter astonishment of her friends, she became one of the stoutest young women in the duchy. What had suddenly cured one sick lady, was soon deemed a proper prescription for others, and all cases meeting with success, the spring gradually rose into notice and repute."

Lieut. Drummond's Artificial Lights. *National Gallery of Practical Science.*—There was on Wednesday evening literally a most brilliant exhibition of Lieut. Drummond's intense lights, applicable to light-houses, telegraphic signals, geodetical operations, and all purposes which require such light to be visible at great distances. Many hundreds of the most distinguished patrons of science and eminent practical scientific men were present on this interesting occasion; and the series of experiments were conducted with extraordinary effect; Mr. Payne, the manager of the gallery, having made all the previous arrangements which were requisite with great skill and judgment.

About two years ago we gave an account of Lieut. Drummond's method of producing this powerful glare of light, by the action of oxygen and hydrogen gas in a state of combustion on a ball of lime. We now saw an Argand lamp, with parabolic reflectors of such prodigious splendour that, as it revolved, it has been visible forty-four miles off; but even this was incomparably excelled by one of the new combinations, so dazzling that no eye could bear to gaze upon it in the line of reflection; and it was stated to be visible at the distance of sixty-six miles!! The next experiment was, we rather think, made for the first time in public, and consisted of the emission of the electric spark, with a parabolic reflector, and so rapidly continued as to form a perfectly continuous light. This was beautiful; and a magneto-electric light, demonstrating the efficacy of galvanism in producing intensity, was not less so. Colored lights were also exhibited; and, altogether, a more gratifying display of admirable and useful science never came under our cognizance. The noble gallery was crowded; and every visitor expressed delight and astonishment at the splendid varieties presented to their view.

Crocodile Bird—Translated from Herodotus.—"Now as the crocodile lives much in the water, he has his mouth within quite covered with leeches.—All other birds and beasts shun the crocodile; but there is peace between him and the trochilus, inasmuch as he is benefited by that bird; for when the crocodile goes out from the water upon the land and opens his jaws, which he is wont to do, in order to receive the cool breeze, the trochilus then entering his mouth, devours the leeches; and he, delighted at the advantage he thus receives, never injures the trochilus."

Dromedaries.—The French are, it is stated, endeavoring to introduce dromedaries from Algiers into the *Landes* about Toulouse, where it is thought they may be very usefully employed.

THEY TELL ME LIFE, &c.

BY H. C. DEAKIN, ESQ.

They tell me life is like a dream, a bright, brief dream and o'er;
They tell me life is like a stream that seeks the ocean shore;
They tell me life is like a flower, that blooms but to decay;
If so, then life is only death, in holiday array!

But ah! I cannot think thy brow, my beautiful and bright,
Is but the seat where death enthroned feeds on thine eye of light;
Nor can I think that thy dear cheek, so redolent of bloom,
Is damasked only to attract the despot of the tomb.

For have not on thy brow, my love, my fond lips oft been prest?
And have I not in rapture oft, reclined upon thy breast?
And ah! how often have thy lips to thy betrothed's frown!
They tasted not of death, my love, I felt them but mine own!

Out on the withering thought that dooms such lustre to the grave!
I say 'tis false, for unto me, Heaven all thy beauty gave;
Away! away! I give to Death, to despot Death, the lie,
For God himself in love has said, "the virtuous never die."

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabethstreet, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.

RAILROAD CAR WHEELS, BOXES AND AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude. For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing and Heartt.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.

LATER FROM EUROPE.—By the packet ship *Canada*, Capt. Britten, from London, we have dates of the 1st of May, for which we are indebted to Messrs. Grinnell & Minturn. They came late to hand, and we are able only to give a few short extracts.

Mr. O'Connell's motion on the repeal of the Union was negatived, April 29, and Mr. Rice's Address to his Majesty, pledging opposition to the project, agreed to by a majority of 485 votes! the noes being 38.

The Debate on the repeal of the Union still continued.

The Lord Chancellor has made an earnest appeal in the House of Lords, to the better feelings of the Trade's Unions, with what effect we shall see.

The sum of 400,000*l.* in silver, had been shipped by one capitalist to Calais in one week, and great quantities to other parts of the continent.

At Berlin a change of the ministry had taken place, which had give much offence to the liberals. The investigation of the late seditious movements were still being carried on, and several persons arrested.

The Journal des Debats of Tuesday, May 28th, says, intelligence has reached government of the taking of Almeida, an important place on the frontier of Portugal, by the troops of Donna Maria.—This news created no sensation at Paris, though it is generally allowed that the affairs of the Peninsula are fast approaching a crisis.

M. De Chateaubriand has announced his intention to offer himself as a candidate to the electors of Lille. He resigned his seat in the peerage on the accession of Louis Philippe.

Some officers of the 36th regiment of the line, and others of the 4th and 9th cuirassiers have been arrested on suspicion of being connected with the republican associations.

The Spanish funds have arisen at Paris, in consequence of the convocation of the Cortez.

The city of Paris has been condemned to pay the damages and loss in several cases where gunsmiths and sword cutlers had sustained any, during the late revolutionary movements. Arrests are going on in France, and every means resorted to that can strengthen Louis Philippe on his throne. M. de S. Romain, a legitimist, has been arrested, and also one M. Mathew, an advocate, in whose possession a number of papers were found. A debate had occurred in the Chamber respecting the relinquishment of Algiers. Several fine speeches. No decision.

Portugal.—The cause of Miguel was suffering severely by desertion, 1300 men having deserted since the 1st of March.

Pedro, together with his ministers, has been excommunicated by the Pope.

Admiral Napier has been created a Count.

General Cardozo has been so hotly pursued by the Duke de Terceira, that it was supposed he would be obliged to take refuge in Spain, where he would give up his arms.

The entire country to the northward of the Douro has been cleared of the Miguelites.

SPAIN.—Quesada is in Vittoria, his corps encamped in the environs. El Pastor is at Tolosa. Butron in command of St. Sebastian. Zicmallacarregery with his brigade, the best in the service, is between Urdech and Elisondo. Merino, with a troop of horse, was attempting to revolutionize old Castile, but met with no success. The Sentinelle of the Pyrenees speaks of a conspiracy to deliver up Tarragona to the Carlists.

The town of Almirda in Portugal, had declared for the Queen. Don Carlos was there and had to fly—public feeling having manifested itself against him—some of his baggage was interrupted containing letters, which are exhibited as specimens of ignorance, being incorrectly spelt, and in bad style. It was expected he had doubled on his pursuers and entered Spain, which has induced his partisans to raise the standard of revolt in Arrogan and Castile.

The Miguelites seem to be in bad plight in Portugal; and Don Carlos has been routed from his hiding place, by General Rodil and his command, who marched into Portugal in search of him. He is supposed to have gone into Spain.

The acknowledgment of Donna Maria by Spain, and the alliance offensive and defensive brought by last arrivals, is confirmed.

In consequence of the success of the Spanish troops in Portugal, under General Rodil, and the flight of Don Carlos, the Spanish funds at Madrid experienced a very great and sudden rise, which of course elevated them also at Paris.

The Ottoman fleet has arrived at Tripoli, and it is hoped will put an end to the civil war in that regency.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary

December 2d, 1833.

For further information on this subject see No 49 772, Vol. 2, of Railroad Journal.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.

Leveling Instruments, large and small sizes, with high magnifying power with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by E. & G. W. BLUNT, 154 Water street, corner of Maldenlane.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG.

Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying off rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad. Philadelphia, February, 1832.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

For a year past I have used instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,

German and Norristown Railroad

TOWNSEND & DUFFEE, of Palmyra, *Manufacturers of Railroad Rope*, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbondale, Luzerne county, Pennsylvania.

Hudson, Columbia county, New-York, {
Janu'y 29, 1833.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A29 if R M & F

PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 10 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory,—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831.

Spikes are kept for sale, at factory prices, by I. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy; J. I. Brower, 229 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrand & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practical, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

J28 1am

H. BURDEN.

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch.		Flat Bars in
200	do. 1 1/2 do.	lengths of 14 to 15
40	do. 1 1/4 do.	feet counter sunk
800	do. 3 do.	holes, ends cut at
800	do. 2 1/2 do.	an angle of 45 de-
	soon expected.	grees with spli-
		cings plates, nails
		to suit.

250 dn. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 2 3/4, 3, 3 1/4, 3 1/2, and 3 3/4 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

dilmsowr

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN.

347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better success can be done in the execution.

* Mr. Thorburn is also Agent for the following publications,

to wit:—New York Farmer and American Gardener's Magazine. Mechanics' Magazine and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

New-York American, Daily, Tri-Weekly, and Semi-Weekly; either of all of which may be seen and obtained by those who wish them by calling at 347 North Market street, Albany.

AMERICAN RAILROAD JOURNAL, AND ADVOCATE OF INTERNAL IMPROVEMENTS.

PUBLISHED WEEKLY, AT No. 35 WALL STREET, NEW-YORK, AT THREE DOLLARS PER ANNUM, PAYABLE IN ADVANCE.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JUNE 14, 1834.

Those subscribers who have paid in advance for the Journal, will please excuse any apparent want of attention in its selections for a few weeks past, as the deficiency, if any, arises from having had to devote the time which ought to be given to its columns to borrowing money, to pay its current expenses.

Those who have not paid for the current, but more especially for the previous years, will excuse us, we trust, for saying that unless they pay the amount due soon, we shall be compelled to strike their names from the list. It can no more be published without prompt pay, than a locomotive engine will ascend an inclined plane without steam. We shall forward their bills by mail, and desire them to remit by the same channel.

At a meeting of the stockholders of the Boston and Providence Railroad Corporation in Boston, on Wednesday the 4th instant, the following gentlemen were elected Directors for the ensuing year, viz.: Thomas B. Wales, Patrick T. Jackson, Joseph W. Revere, John F. Loring, of Boston; William W. Woolsey, Charles H. Russell, of New-York; Charles Potter, of Providence.

And subsequently the Board elected Thomas B. Wales, President; John F. Loring, Treasurer; Benjamin R. Nichols, Clerk.

In our Journal of the 31st ult. we briefly alluded to the charter which had been granted by the Rhode-Island Legislature for continuing this very important railroad from Massachusetts into the city of Providence, and the contemplated opening of that part of it which had been finished, for immediate use. We had not the pleasure of being present on that occasion, engagements having prevented our acceptance of the agent and engineer's invitation; but from some of the stockholders who went on from this city, we learn that they were met at Providence by the directors of the Company,

agreeably to appointment, and, together with a party of gentlemen from Providence, went over and examined the line of the road from the vicinity of India Point, near Providence, to its termination in Boston, and were highly satisfied with the whole appearance of the work. The Company's depot in Boston appears to have been very judiciously located near the foot of the Common, which is a central and convenient point for travellers, and the large building already erected, with its inclosure, affords ample accommodation for the purposes of the Company at that end of the road. The annual report of the directors, of which we expect shortly to obtain a printed copy, shows the whole work in a very favorable light, and there is every prospect that the entire route from Providence to Boston will be ready within twelve months from this time, for the transportation of passengers and goods. On Wednesday the 4th inst. the road was opened for about ten miles towards Dedham, and the directors, with their friends, in the handsome new cars belonging to the Company, were drawn over this part of the road by a locomotive engine, at the rate of more than twenty miles an hour, with apparent ease, and their return to Boston, after a collation at the Sprague Railroad House, politely tendered by the agent and engineers, was effected at a still more rapid rate, the company highly gratified by their excursion.

The following named gentlemen were, on the 2d inst., elected directors of the Utica and Schenectady Railroad Company:

Ernstus Corning, Nicholas Devereaux, Alfred Munson, Henry Seymour, Nathaniel S. Benton, Tobias A. Stoutenburgh, Alonzo C. Paige, John Townsend, Lewis Benedict, James Porter, James Hooker, John L. Graham, Thomas W. Olcott.—[Albany Even. Jour.]

SCHENECTADY AND SARATOGA RAILROAD.—At an election for directors of the Saratoga and Schenectady Railroad Company, held on the 5th instant, the following gentlemen were chosen for the ensuing year: John Townsend, of Albany; John I. De Graff, of Schenectady; John Clarke, of Saratoga Springs; George W. Giles, Henry H. Lawrence, John B. Lasala, Bernard Graham, William Wright, John Ferguson, of New-York.

At a subsequent meeting of the directors, the following officers were elected for the ensuing year: Henry H. Lawrence, President; John Townsend, Vice President; John Ferguson, Secretary.

The following gentlemen were appointed Inspectors for the next annual election: Moses

Henriques, David Augustus Clarkson, Richard Lawrence.—[Albany Evening Journal.]

We trust our correspondent, C. O., will not suspect us of a design to suppress his communication, in consequence of his prediction that a neighboring city will ultimately take the lead of the "City of the Island," or of Gotham. Accident, not design, has had a hand in it.

We now give it a place with pleasure—and, in reply to his query at its commencement, will say that there is reason to apprehend that railroads will be, as certain as that canals have been, made where they will not be profitable to stockholders.

It is, as he says, desirable that the location of important lines of railroad should be made with great care, and with an eye to future, as well as to present, usefulness.

To the Editor of the Railroad Journal.

SIR,—Has it never occurred to you that the capital vested in many railroads and canals is likely, if not exceedingly profitable at the commencement, to be eventually lost, from the roads and canals being superseded by others which may be made afterwards. The great and ultimate object of these improvements is to facilitate exchanges—to cheapen and expedite transportation to and from market—as, between the great coal region, or between the great agricultural west and the best market, whether Philadelphia, New-York, or Boston. Now, if it be assumed that transportation by railroads, or by some better roads, steam being the impelling power, shall supersede, where practicable, all other modes of locomotion,—and I do not suspect myself of being alone in the opinion that there is no extravagance in such an assumption, particularly when we notice the progress of things in Europe—it is no more than reasonable to begin to contemplate, and try to foresee and act upon the natural and inevitable results which must follow, and to lay them before the public, that they may be fairly in view, and have proper consideration in the mind of every man, or company, when coming to a determination in regard to any proposed improvement, both as respects its location and the manner in which it shall be completed, or the amount of capital which may be safely invested in it.

The climate and productions of Europe and North America are so nearly alike, that as the state of science and the arts in these quarters of the world continues to come nearer to an equality, it is fair to conclude that the exchanges of merchandize will hardly keep pace with the increasing population of America. Still, as the condition of men is improving, and society

and nations are becoming more intimate and friendly in their relations, and curious in their inquiries, we may suppose that travel for gratification will greatly increase between the two—this is proved by the number and constant increase of fine ships as packets; and it fairly indicates, in connection with the extent to which steamboats are coming into use, and the long voyages which they occasionally make, that the time is not distant when the packet ships will be propelled by steam. No railroad can be laid across the Atlantic. It will be an object to have each of the two ports in Europe and America, for whence most of these ships may be expected to depart for the other, situated conveniently as it respects the interior parts of the country, and as near together as may be. The wearisomeness of a long sea voyage will render these considerations indispensable, and may lead to some changes not now much thought of.

But to leave this part of the subject for a while, and dwell more particularly on our own United States.

To attain the greatest rapidity of motion will always be an object of controlling importance, and therefore level regions will be greatly desirable for the location of the principal thoroughfares. The intercourse and exchanges between the north and the south must increase vastly beyond all precedent, and probably beyond all present anticipation of the most enthusiastic, for as speed of transportation increases, and the cost is reduced, the productions of each of the various climates will be vastly more consumed in the other climates; and the assumption is, that transportation by land will gradually take the place of water navigation, first, for persons travelling, and then for merchandise, and particularly on account of its expedition, safety, and regularity. This consideration is made stronger, from the fact that much of the interior, and the finest portion of North America, and that which will soon be the most productive and most densely settled, and of course require the greatest exchanges of this character, is already as near by land to the most important productions of southern climates, as it is to our eastern commercial ports. It is not too early, then, to begin the inquiry, where shall be our principal and leading roads? for it is plain that they are not yet located, and that they cannot be determined on judiciously without the most grand and enlarged views, and the most extensive and accurate surveys.

Without attempting to speak of details, which can of course be only determined by such surveys, it is pertinent, and may be profitable to notice, that the formation of the country and the condition and wants of the citizens, present and future, clearly indicate that the road already commenced at Albany must be continued without any regard to navigable waters, on the best and most level ground westward, indefinitely; That another road from Norfolk, or perhaps from Boston, must proceed southwardly over the level region, near the coast all the way, to some harbor where a town is yet to spring up near the south cape of East Florida, from whence there will be a busy steamboat intercourse with Havana; That a branch of this road will proceed, say from Savannah, to New-Orleans, and thence into Texas, and onward, onward; That another principal road will be from this new city on the Cape of Florida, into the great valley of the Mississippi. This brings me back to the thoughts which put me upon this essay, the errors likely to be made in the location of railroads. I perceive some are designed to communicate only between one inland water navigation and another. These may prosper long enough to refund their cost; but the day is not distant when they will have comparatively little value.

Finally, as your journal is likely to be extensively preserved for future reading and reference, and as I am an old man, and shall hardly trouble you many times more, I ask of you the further favor to record a few prophecies.

First, fresh water navigation, including that

of the Mississippi and all its tributaries, will be discontinued, probably within twenty years.

Secondly, New-Orleans, and all cities in unhealthy situations, will greatly decline, and new cities and towns spring up in more healthful and advantageous situations, and that the queen of these will be somewhere at a point not yet thought of in the great valley.

And thirdly, that either Boston or Halifax is destined to take the sceptre from the highly favored city of the island.

And, to conclude, again I would most respectfully hint to the men of Boston (and for this I hope they will remember my children) two things—first, to spare no pains, nor grudge any capital, either in the location or construction of their westward and southward railroads; and secondly, to turn their attention to European steam packets on a large scale. I beg pardon: Boston folks need no hint from me on their own affairs. C. O.

Deep Creek, Sept. 5, 1833.

On a General Mean of computing Descriptive Data of Ellipsoidal Arches, with a new Theorem, and Mechanical Description of their Working Drafts. By Wm. M. CUSHMAN, C. E. To the Editor of the American Railroad Journal, &c.

SIR,—I am induced to send for the Journal the following theorem, and incidental observations, relating to the means of describing the working drafts of ellipsoidal arches, in consequence of the solution of that problem having frequently occupied the attention of the scientific engineer; and still being, I conceive, a desideratum: at least, general expressions possessing the simplicity desirable and even requisite for practical purposes, and furnishing rigorous results, have not yet been investigated for obtaining the pre-requisites to the description of this curve—which is perhaps the most useful and important of any which are used in the whole range of arcuation.

Although the problem is well known to be susceptible of rigorous solution, the length of the process of computation has been deemed so formidable, as to induce its supercedure by mechanical processes: the distinguished Corps de Ponts et Chaussées recommend a graphic solution. This solution is objectionable from its obvious want of rigor—a sufficient objection, I apprehend, when it is considered that, in far the greater number of instances, does this curve find its application to structures involving an expenditure of thousands, and having their elegance and stability materially affected thereby. The process which they would have chosen in the computation, it would seem, was, and must have been, quite formidable, to have induced this justly eminent Corps to recommend this course; but with the assistance of the theorem I am about to advance, a perfect estimation of all the pre-requisites for the description of this curve, for the greatest number of centres desirable in practice, and for arches of the largest dimensions, may be achieved in a lapse of an hour or two—an interval of time which I fancy the practical engineer will admit it is often necessary to exceed in the adjustment of much more trivial matters.

The peculiar appositeness of the semi-ellipsoid, both in regard to equilibration and feasibility, when compared with the full centre, or its segment, or that of the ellipsis, as well as its elegance, will secure its adoption in preference in arches of considerable span, which are not liable to the condition of sustaining much pressure at the crown, or whose situation is not peculiarly favored by nature, at most of the localities which fall within the province of the civil engineer; for, in many places, the full centre, apart from its weakness, is absolutely inadmissible; and the segment of a circle can seldom be fortified with abutments sufficiently strong and massive to resist its stupendous thrust.

The ellipsoidal arch, or l'anse de panier, which answers the conditions of the ellipsis, has superseded it, and derives its importance chiefly from the fact of its mechanical description being

executed with great ease, and because it presents a ready mode of making the drafts for the voussures—of which it is a rigorous condition that the joints be normal to the curve.

It may perhaps be unnecessary to give a demonstration in detail: the mathematical reader, with the aid of a diagram, will readily comprehend and trace its successive steps. To avoid indetermination, it is however a necessary condition, that the transverse axis be the locus of the centre of the least arc, and the prolongation of the semi-conjugate be the locus of the centre of the greatest arc; that the distances from these two centres to the common centre bear a given ratio, as $\frac{m}{n}$; that the subdivisions

of these two lines, made by the intersections of the radii and their prolongations, bear, among themselves, a given ratio. It has further been conventionally determined that, in general, the subdivisions of m be in the ratio of the natural numbers 1, 2, 3, 4, &c., commencing at the least arc, and those of n be equal among themselves.

Let the subdivisions, or rather intersections, of m , by the radii, commencing with the least arc, be designated by b, c, d , &c., then the proposition is,—to find upon the transverse axis the position of the point b .

If the vertex be taken as the origin, the general equation of the abscissa for b will be

$$x = \frac{\lambda \cdot m - \gamma \cdot (S - n)}{\gamma - \lambda} \quad (1.)$$

in which, x = abscissa; λ = semi-minor axis; γ = semi-major axis; and S = sum of the sides of the polygon formed by lines joining the centres, b, c, d, e , &c.

It is plain, from inspection, that when S is known, the whole may be considered as known. The quantity S is that which it has been proposed to eliminate by construction, on account of the length and tedium of the process of computation.

If, however, b', c', d', e' , &c., represent the lesser angles formed at b, c, d, e , &c., by the radii of curvature with m , and C', D', E', F' , &c., be the angular values of each sector at C, D, E, F , &c., which are equal to the differences of the former set of angles, taken in order, then I affirm that, in general, the subsequent theorem is true, viz.

$$S = \frac{1 \cdot \sin. c'}{\sin. C'} - \frac{1 \cdot \sin. b'}{\sin. C'} + \frac{2 \cdot \sin. d'}{\sin. D'} - \frac{2 \cdot \sin. c'}{\sin. D'} + \frac{3 \cdot \sin. e'}{\sin. E'} - \frac{3 \cdot \sin. d'}{\sin. E'} + \frac{4 \cdot \sin. f'}{\sin. F'} - \frac{4 \cdot \sin. e'}{\sin. F'} + \frac{5 \cdot \sin. g'}{\sin. G'} \text{, \&c.} \quad (2.)$$

an expression which, following a plain mathematical law, might obviously be extended, by inspection, to resolve S for an indefinite number of centres. It is a remarkable feature of this expression, that the law which it obeys is so simple and obvious as to be easily retained by the memory, and consequently the operator has only to write it out and apply the tables at any time occasion may require its application.

It is thus observable that the 1st term = S , for 3 centres; the algebraic sum of the 3 first terms = S , for 5 centres; of the 5 first terms = S , for 7 centres; and, in general, if v = number of centres, $(v-2)$ terms = S .

Also, if R_1, R_2, R_3 , &c. be the radii of each sector respectively, then $x = R_1$, = least radius; $x + 1$ term = R_2 ; $x + 3$ terms = R_3 ; $x + (v-2)$ terms = $x + S = R \frac{(v+1)}{2}$ = greatest radius of curvature. It is

possible to construct the curve without knowing any radius but the greatest; but they, as well as the negative terms taken separately, will be found serviceable, as checks, in fixing the position of the centres, and are estimated

without any additional trouble; since being parts of S , it is only necessary to preserve the results of the separate terms in order to obtain them. Thus does a single simple expression afford all the data for tracing this important curve.

Although *speculatively* the expression might be simplified, in bringing the pairs of adjacent terms affected by contrary signs, to a common denominator, yet it would not be *practically* so, for it would not then be united to logarithmic computation, for which operation it has now the most convenient form. If the calculation be skillfully conducted, its valuation will be found brief and comprehensive. For eleven centres, the logs. of all the angles may be found by 10 references to the tables; and if the arithmetic complements of the logs. of their differences be taken, as also the logs. of 1, 2, . . . 5, the simple addition of these logs. agreeably to the prescribed formula, with the summing of the natural numbers answering thereto, will be the only subsequent operations.

Thus, if the span of arch be 120 feet, its rise 40 feet, the numbers of centres 11, and it be determined that the ratio $\frac{m}{n} = \frac{1}{3}$, then will the position of b be indicated by the division of the semi-span in the ratio 15: 18.71, or at 26.7 feet from the common centre; and $R \frac{(v+1)}{2} = 120$ feet = span.

Whence it is inferable, that the anse de panier of 11 centres, having the ratios $\frac{m}{n}$ & $\frac{\lambda}{2\gamma}$ each $= \frac{1}{3}$, has its greatest radius equal to the span, or that $R \frac{(v-1)}{2} = 2\lambda$; and thence may it be constructed without any calculation, simply from the known span and rise.

Its Mechanical Description.—It has not, hitherto, I believe, been remarked that the anse de panier is an *involute*, the evolute of which and locus of the centres of curvature is the polygon b, C, D, E , &c., and x the radius of curvature for the vertex. Hence, the most elegant, ready, and perhaps the best, mode of describing it mechanically, after the requisite lines have been obtained as above, is,—to fix firmly, in the plane of the draft, pins at the vertices, and at each of the central points, upon either side of n , to attach a small but firm flexible wire to the centre lying upon the conjugate produced. After plying it about the polygon to b , and increasing its length by x , which will extend it to the vertex—its evolvment will trace one half. In plying the wire upon the polygon lying upon the other side of n , the other half may be traced.

Or, take the wire $= R \frac{(v+1)}{2}$, and sweeping from the crown, ply the wire about the polygon as before, for one half; returning to the crown, ply it about the symmetrical polygon on the other side of n , for the other half.

As the wire in these movements is always in the direction of the radius of curvature, or the normal, the joints are readily constructed in this mode of description.

Very respectfully,

W. M. CUSHMAN, C. E.

Albany, May 29, 1834.

RAILROAD ON THE BANKS OF THE RHINE.—By the Hague Journal, we learn that the Prince of Orange had returned on the 27th from the head-quarters of the army to the Hague, and thus, we believe, has put an end to the apprehensions which had been entertained by the Belgians that his presence there was the forerunner of an attack. M. Dedel, also, had arrived from London at the Hague. We see that the Dutch are making a rapid progress with steam-carriages, and railroads. Messrs. Stratingh and Becker have tried a steam-carriage on the common road at Groningen, and it has run through the town without inconvenience. This was the first experiment. It is expected that the machine will be improved. A railroad

is to be laid down from Amsterdam, on the right bank of the Rhine, passing through Dusseldorf and Elberfeld to Duis, opposite to the harbor of Cologne, and preparations are making for carrying it into effect. The line is marked out, and Prussia is disposed to agree to the undertaking, the principal author of which is Lieutenant Colonel Bake. The capital necessary is estimated at eleven million florins, the annual expense at 70,000 florins, and the receipt at 1,300,000 florins. Such prospects are far more useful than those marchings and counter-marchings of troops of which we have of late heard so much.—[London paper.]

THE NEW SCOTCH STEAM SHIP.—Yesterday considerable interest was created on the river by the arrival of the new and splendid steamship Dundee, from Scotland. She entered the pool with the colors of all nations flying from her rigging, about half-past ten o'clock, and at 11 o'clock was safely moored at the London Dock buoy, opposite the Wapping entrance. Three cheers greeted her first arrival in the Thames from the people in waiting. This large steamer measures 180 feet in length on the deck, and 51 feet in breadth over the paddles, makes up 107 berths for passengers, and her chief cabin, which is fitted up in a most splendid style, contains a library of books, and is capable of conveniently accommodating 100 passengers at dinner. Her engines are of 300 horse power, and are from the manufactory of Mr. Robert Napier. The Dundee was built at Port Glasgow, under the superintendence of Mr. John Wood, and made her first passage to London in 38 hours and a half, with a strong head wind against her more than two thirds of the voyage. With the exception of the Monarch, Edinburgh steamship, launched last summer, she is said to be the largest steamer yet built, and she will shortly be followed by the Perth, a twin vessel of the same size, belonging to the same Company.—[Engl. pap.]

MR. BETHUNE'S STEAMER.—We have examined the model of the boat now placed at the Exchange. It resembles, in the build of its hull, Mr. Burden's boat: but instead of two barrels, it has three, and the wheels revolve on each side of the middle barrel. The draft of water is very little, and undoubtedly the speed of the boat would be great. It has also some advantages over the other boats, in the arrangements above deck, offering a covered walk of 412 feet, &c. Upon the whole, Mr. Bethune's exertions deserve encouragement, and may lead to some real improvements. With the present overdone business in steamers, and the general depression of trade, it could hardly be expected that large investments would be made in a new scheme of this kind. What we want most, and what might afford some prospect of success, would be small boats, built as cheaply as possible, for passengers alone, and having great speed. Such improved boats run in several parts of Great Britain, and particularly on the Clyde in Scotland. Under present circumstances, such a speculation would also be very uncertain. But ultimately, our freight and passage steamers must be replaced by those for passage only; without, indeed, railroads take the place of all descriptions of water carriage, the latter being certainly less rapid and more expensive.

We copy Mr. Bethune's own statement of the dimensions and properties of his model:

Dimensions of the Model.—(Scale, $\frac{1}{2}$ inch to a foot.)—Centre tube, length 220 feet, side tubes, ed. 190, diameter 12 feet ed. at centre, and 2 feet at the ends; extreme length on deck, 244 feet; extreme breadth in centre, 72 feet; lower cabin, length 192 feet, centre breadth of the same 52, stern breadth 37; upper cabin, length 182, centre breadth 40, stern do. 29; height of both cabins, $7\frac{1}{2}$ feet; lower wings on deck, 10 feet, outside of cabin; fender outside of tubes, 5 feet on each side; upper piazza, breadth 8 feet, circumference or length of walk round which is 412 feet; promenade deck,

length 194 feet; spaces between the tubes, 13 feet; proposed diameter of two water wheels, 27 feet; total weight of the three tubes, superstructure, and two engines of 50 horse power each, on board, 275 $\frac{1}{2}$ tons, which will displace 9875 cubic feet of water. Draught of water, when light, 3 feet 9 inches; do. with 1500 passengers on board, 4 feet 6 inches. Cargo required to sink the tubes to their centre, or to six feet draught of water, 336 tons.—[Quebec Gazette.]

We extract the following interesting account of the first application of steam to vessels, from the April number of the Military and Naval Magazine. The statement appears to be well vouched for, and there is little doubt of its correctness.

STEAM NAVIGATION.—It appears from a late publication, a very valuable one by the by, "Navarette's Collection of Spanish Voyages and Discoveries," that the first known experiment of propelling a vessel by steam was made at Barcelona, more than eighty-five years before the idea of procuring motion by it was first promulgated by Brancas, in Italy—more than a century before this agent was applied to any useful purpose by the Marquis of Worcester, in England—and nearly three centuries before our own Fulton, adapting and combining the invention of a number of contemporary mechanics, successfully solved the same wonderful problem. Curious as this fact may appear, it is completely established by various documents lately found in the archives of Salamancas; and is so circumstantially stated as to be incontrovertible. From these it appears that, in 1543, Blasco de Garay, a sea officer, offered to exhibit before the emperor Charles V., a machine by means of which a vessel should be made to move without the assistance of sail or oars. Though the proposal seemed extravagant, yet the man appeared to be so confident of success that the emperor ordered a commission to witness and report upon the experiment. It consisted of Don Eurique de Toledo, Don Pedro Cardona, the Treasurer Ravago, the Vice Chancellor Gralla, and many experienced seamen. The experiment was made on the 17th day of June, 1543, on board a vessel called "Trinidad," of two hundred barrels burden, which had lately arrived, laden with wheat, from Colibre. At a given moment this vessel was seen to move forward and turn about at pleasure, without sail or oar, or human agency, and without any visible mechanism *except a huge boiler of hot water, and a complicated combination of wheels and paddles.* The harbor of Barcelona resounded with plaudits, and the commissioners, who shared in the general enthusiasm, all made favorable reports to the emperor, except the treasurer Ravago. This man, from some unknown cause, was prejudiced against the inventor and his machine. He took great pains to undervalue it, stating, amongst other objections, that it could be of little use, since it only propelled a vessel *two leagues in two hours*—that it must be vastly expensive, as it was very complicated, and that there was great danger of the boiler's bursting frequently. The experiment over, Garay collected his machinery, and having deposited the wooden part in the royal arsenal, carried the remainder to his own house. In my reading I have somewhere met with the above, which you may deem worthy of a place in your Magazine. The details may be relied on, as I made a note of them at the time in the JOURNAL OF A REEFER.

METEOROLOGICAL RECORD, KEPT AT AVOYLLE FERRY, RED RIVER, LOU.

For the month of April, 1834—(Lat. 31.10 N., Long. 91.59 W., nearly.)

Date.		Thermometer.			Wind.	Weather, Remarks, &c.
1834.	Morn'g.	Noon.	Night.

Red River fell this month 1 foot 2 inches—below high water, 3 feet 11 inches.

AVOYLLÉ FERRY, on Red River, La. }
May 7, 1834. }

To the Editor of the American Railroad Journal.

SIR,—You herewith receive the meteorological table for the month of April, 1834, regularly entered. I regret to see in the Railroad Journal, vol. 3, No. 12, that you have not received my letter of 3d January last. I now inclose you a copy of that; also, extracts from 6th December last: as they were both sent by the same mail I presume they shared the same fate. Copies of the meteorological tables for November and December are also inclosed.

Most respectfully, your obedient servant,

P. G. V.

On the Dip and Declination of the Needle. By
P. G. V. To the Editor of the Railroad
Journal.

Avoylle Ferry, May 7, 1834.

DEAR SIR,—The application of a manufacturer of compasses, in Birmingham, (Railroad Journal, Vol. III, No. 11, calling for information of the dip and declination of the needle, and its *variations*, I think a very important inquiry. In my letter to you, (I think in November, 1832, no copy before me,) I made a similar request, which was, no doubt, overlooked, or thought chimerical. I now wish to add to the manufacturer's inquiry, that the latitude and longitude of the different places be given, and say take the variation from June to December in each year, throughout America, and bring them together : in a few years that long sought problem will be settled. With the observations and actual experiments of Capt. Ross, of the *variation of the Magnetic Needle*, every practical surveyor in the United States can, at any time, give the variation of the needle, and mariners at all times and places wherever they may happen to be.

I have made these hasty remarks since closing my letter of to-day, to give you some idea of my opinions, that you may, if you choose, make some remarks from them.

Your friend and servant.

P. G. V.

We ask the attention of those of our readers who have the means and the inclination to investigate the subject of the above communication. The result of their inquiries, when attained, will always find a place in the Journal and Mechanics' Magazine. P. G. V. will please accept our thanks especially for his duplicates.

We are informed that the speed of the locomotive, on several trips during the present week, has been a mile in two minutes. The distance on which the cars are now running is about 20 miles, and is traversed by the locomotive both ways, including all stoppages, in three hours and a half.

The responsible department of engineer is ably sustained by Mr. Lawson, an English gentleman, under whose superintendence the locomotive has been put in operation, and by whom it is now conducted. It may be deemed fortunate that the Company were able to procure the services of a gentleman to fill this essential station, who combines both the mechanical and practical knowledge of the art.

It has been suggested to us that persons should be cautioned from travelling on the track of the railroad. Indeed, from personal observation, we are convinced that such travelling is attended with considerable inconvenience, if not actual danger; horses become frightened when passing the locomotive, and sometimes quite unmanageable.—[North Alabama.]

Delaware and Raritan Canal.—We learn that the water has been let into the Delaware and Raritan Canal, and that in a few weeks it will be in full operation. On Tuesday evening last, the Directors made up a party, and took an excursion a few miles upon its waters. The Canal commences in front of the town of New Brunswick, and communicates with the Delaware at Bordentown. It is about 43 miles long, 75 feet wide, and 7 feet deep. It has two tow paths, and is so constructed as to admit the passage of sloops of 50 to 100 tons burden, affording a complete and safe water communication between the two cities of New York and Philadelphia, greatly facilitating the conveyance of merchandize, and producing a very considerable saving in the amount of insurance.

By an inscription on a marble tablet which is inserted in the stone work of the lock at the city of New Brunswick, it appears that the Canal was commenced in January, 1831, and completed in May, 1834. It has 14 locks—13 are 24 by 110 feet,—the other is still larger. The feeder which supplies the Western division, is 24 miles long.—[Jour. Com.]

*Proceedings of the Royal Institution, London,
Feb. 14, 1834—Evening Meeting. [From
the London Repertory of Arts, &c.]*

Dr. Faraday gave a conversation on Ericsson's Caloric Engine. He commenced by stating that he felt himself placed in a position of considerable difficulty, in bringing forward a subject on which such difference of opinion existed; yet the object of this institution was

the philosophy of a question, not to decide on the probable result in a mercantile point of view, of any invention or engine which might be brought forward, and in explaining the principles of Captain Ericsson's invention, he trusted that he should not be held responsible for the correctness of the various propositions which he would have to make ; at the same time, he was bound to state that, prior to the construction of the engine, one part of the invention was submitted to his opinion, and he had reported favorably ; and this was the possibility of transferring the heat contained in a current of air passing in one direction to another current of air passing in an opposite direction (separated only by metallic surfaces) ; but how far this might be usefully and economically employed in obtaining an engine of power, it was not for him to determine ; this question would be brought to a fair test when an engine of 50 horse power, now constructing, shall be set to work. Dr. Faraday then described the manner of transferring heat from one current of air to another by working models, and afterwards, by the aid of working diagrams, he explained the construction of Captain Ericsson's engine. Our having given a full account of this engine at page 42 of the present volume,* will render it unnecessary again to describe the principles on which this invention is proposed to work. Dr. Faraday having explained the various bearings of the question, concluded by observing that he was bound, in justice to his own character, to make a remark, which he regretted the more that it was possible and probable, had he been able to see Captain Ericsson prior to his entering into this explanation, he would have been able to remove a doubt and difficulty which he (Dr. Faraday) must confess he could not clear up to his satisfaction ; this had been prevented by the serious illness of Capt. Ericsson. What he referred to was, that he could not clearly see how the difference of pressure, stated by the inventor to exist, could be maintained in the different parts of the apparatus.

INSTITUTION OF CIVIL ENGINEERS.—The following are the subjects which have been under discussion at the Tuesday evening meetings :

"What are the advantages to be derived from the application of undulating railroads?"

After a full discussion (lasting two evenings), in which many of our best and most talented men took part, this question was dismissed with a general expression, that there were no advantages to be derived, but, on the contrary, a decided loss.

"Heating power of coal and other kinds of fuel: Have any experiments been made, or data collected, from which can be calculated the number of cubic feet of atmospheric air which one pound of good Newcastle coal will raise 1° of Fahrenheit?"

This subject has called forward considerable information, but nothing final has been determined on; but so far as we are able to judge, Tredgold's calculations may be depended on for their correctness.

"Velocity of currents of air: Is there any instrument for measuring correctly the velocity of air in motion; and if so, upon what principle does its action depend?"

Mr. Barwise explained an instrument constructed by him for this purpose, and promised to construct one for the institution.

The following are the subjects which stand next for discussion:

"Grouting masonry and brickwork: The application of it—how and when it ought to be used—the materials for it."

"The worm in the timber of piles, &c.: Driven in salt water, and the means of preventing it."

"Lock gates and sluices: With any late improvements in the materials or construction."

"Steam: Any substitute for it—Ericsson's caloric engine."

* For notices of this engine, see pages 147 and 194, vol iii., of this Journal.

View of a Cotton Scutching and Lapping Engine, on the most improved plan, the first one invented, by N. SNODGRASS, of Glasgow, in 1806. [Communicated by the Inventor for the Mechanics' Magazine and Register of Inventions and Improvements.];

EXPLANATION.

- 1, 1, Feeding table, with cotton weighed and spread upon it.
- 2, 2, Scutcher cylinders, 11 inches diameter, to run 1500 revolutions per minute, with covers of iron.
- 3, 3, Wire gauze cylinders, with covers, to spread the cotton, and let off the air generated by the scutcher cylinders.
- 4, 4, Feeding cloths and moving wooden rollers, to carry the cotton under the wire cylinders from scutcher to scutcher.
- 5, 5, Two cast iron rollers, 4 inches diameter, to compress the cotton before it is lapped up on roller No. 6, for the cards.
- 6, Cotton roller, for the carding engine.
- 7, An iron or wooden cylinder, about 15 inches diameter, under cotton roller, for winding up the same.
- 10, 10, A view of one side of the cast iron framing.
- 11, 11, Triangle ribbed hecke, for extracting the gins, &c. from the cotton, and allowed in Europe to be an important part of the scutching engine.
- 12, 12, Air apertures, for letting the generated air escape through the gauze wire covered cylinders.

..... This represents the cotton in process.

New-York, May 14, 1834.

TO THE EDITOR :

Sir,—A few weeks ago I took the liberty of sending you a plan (not mine) for blasting iron ore furnaces with hot air,* successfully in use in Scotland, whereby thirty-three per cent. of fuel is said to be saved; also, a plan of mine for heating factories on the best principles, by steam: in hopes these might benefit this rising country. From the same motive, I again send you another plan of a scutching (batting) machine, for opening, cleaning, and, in one operation, preparing it to be applied to the carding engines; the first one invented by me, in Messrs. G. Houston & Co.'s large spinning factories in the town of Johnstone, Scotland, in 1806, and successfully introduced to the spinning trade in Britain, and, *I believe*, never before in any publication.

The section plan annexed is drawn on a necessarily small scale, to suit the limits of magazines, and is only calculated to suit the understanding of the first rate cotton machine makers, such as Mr. Rodgers, &c. at Paterson. The plan shows all the essential working parts: the various complicated movements, &c. will be easily arranged by these gentlemen, and almost impossible to be exhibited in yours, or any other similar publication. All that I have to observe, in addition to the explanation accompanying the drawing, for the practical working of the machine, in cotton factories, is, that this machine should be made the same breadth of the carding engines, so that the finished lap, No. 6, would suit on applying it. Also, the first feeding cloth, Nos. 1, 1, should be divided into such parts as the manager of the work may think proper, then causing the person that attends the machine to weigh a certain weight of cotton, and carefully spread that weight on each of these parts, which has the effect of enabling the small scutching cylinders to open the cotton more regularly; and, finally, finish the lap, for carding, in the

* Which will be inserted shortly.—[Ed. M. M.]

most perfect manner, doing as much work, and better, with one person, than if more were employed, which is the case with those cotton factories I have been permitted to examine in this country. Also, from twenty-eight years' experience, I decidedly recommend, in no case, to make the scutcher cylinders more than *twelve* inches in diameter, and only with two blades. In the mean time, I am, Sir, yours, &c.,

NEIL SNODGRASS, 87 Pearl st.

THE NEW PIN.—There are few things which more strikingly exemplify the high point of civilization to which this country has attained than the amount of capital continually expended, the inventive talent exercised, and the powerful agencies employed, as the remedy of exceedingly small evils, and the attainment of equally minute objects of convenience. This remark cannot perhaps find a better illustration than in "The New Pin with an Immoveable Solid Head." The defect in the old pin, which it is the object of the present improvement to remedy, is that the head of the pin being separately spun and then put on, was liable to be detached by the pressure of the thumb. The principle of the improvement consists in this: that the head being formed of the

same piece with the body of the pin, the inconvenience attending its slipping is effectually prevented. This is the minute improvement in a minute article, the accomplishment of which has cost the patentees several years of attentive application, and the expenditure of a large capital, according to their own statement, which, when the extent and character of the machinery employed are considered, there can be no reason to doubt. At the same time, it must be taken in connection with this improvement, that the patent pin is altogether produced by machinery, instead of partly by hand processes. "The Patent Solid-headed Pin Works" are situated about a mile from Stroud, on the Bath and Birmingham road. The principal building consists of five floors, each of them one hundred feet in length, and completely filled with machinery. A large iron water-wheel, on which a stream acts with a power equal to that of forty horses, gives motion to all the mechanical apparatus, which is so ingeniously constructed as to perform every essential operation for converting a coil of wire into the perfect pin with scarcely any noise and little apparent effort. Upon the old system, this comparatively insignificant article had to go through fifteen or sixteen hands before it was finished; but this curious machine effects the whole without manual assistance, or any extraneous aid whatever; for the wire being placed on a reel, and the machine set in motion, all the mechanical combinations, so numerous and dissimilar in their movements, are simultaneously performing their various functions with a rapidity and precision truly surprising. While one portion of the apparatus is drawing out and straightening the wire, and cutting it off at the required length, another combination is pointing and polishing the pin, and another compressing a portion of the wire into dies to form a perfect and neat round solid head. The various movements are completely at command, and susceptible of instant alteration and adjustment to pins of any length, and heads of any form, while the machine is working at its ordinary speed. Each machine operates on four wires at once, and from forty to fifty pins are with facility produced in a minute by each of the 100 machines which are completed, and in constant operation at the works. As a more particular detail of the process would not be well understood without engravings, we shall only further state that the works, with the present number of machines, are capable of producing upwards of two tons of pins weekly, or, stating the amount numerically, 3,240,000 pins daily, 19,440,000 weekly, supposing all the machines to be in operation twelve hours daily. It is stated that altogether twenty millions of pins are daily manufactured in this country for home consumption and for the foreign market.—[Penny Magazine.]

A new locomotive of great power and masterly machinery has been constructed for the Newcastle and Fenchtown Railroad, by Mr. E. A. G. Young, of Norfolk. The Beacon states that on the first trial of the engine, notwithstanding the stiffness of the machinery, and without any headway being given to it, it ascended the inclined plane at Fenchtown, (the grade of which is 42 feet to the mile,) with a load of 55½ tons, at the rate of 12 miles per hour.—[Balt. American.]

The receipts of the Charleston railroad for the month of May amounted to \$18,300—passage money \$10,070—freight \$8230.

ILLUMINATED PRINTING.—In many of the old printed books, the initial letters, and occasionally other parts, were printed in red. This was done by two workings at press, and was an imitation of the earlier fashion of *illuminating* manuscripts. The practice is still followed in some almanacs, the saints' days and holy-days being "red-letter days." Some ingenious contrivances have been devised for working in various colors; and a few years since, a curious book was written and published on the subject by Mr. Savage. Still more recently, printing in gold and other metals has been practised. This is done by printing with a sort of size, and afterwards applying the metal leaf. Some very handsome specimens of this have been produced by Messrs. Howlett and Brimmer, of London; but, of course, the process is too costly and too tedious ever to enter into competition with common printing, or to be used for other than purposes of luxury.

VALUABLE DISCOVERY IN THE FINE ARTS.—Mr. Mudie, well known as an able literary compiler, has brought out a popular work on "the feathered tribes of the British Island," in which, amongst other attractive features, the vignettes on the title pages are novelties, being the first successful specimen (says Mr. Mudie) of what may be called Polychromatic printing, or printing in many colors from wooden blocks.

"By this method," he adds, "every shade of color, every breath of tint, every delicacy of hatching, and every degree of evanescence in the outline, can be obtained"; and fifty thousand fac similes of a painting may be produced with perfect uniformity and at moderate expense. The advantages to books, of which a large number is to be sold, will be very great, not only as removing the cost of tinging by hand, which is the same for the last thousand as the first, but by making the copies more alike and more durable, and rising more above the reach of the ignoble pecus of imitators. In these vignettes, Mr. Baxter had no colored copy but the birds, which are from nature. I made him work from mere scratches in outline, in order to test his metal; and I feel confident that the public will agree with me in thinking it sterling. In carrying this very beautiful branch of the typographical art successfully into effect, Mr. B. has, I believe, completed what was the last project of the great Bewick, but which that truly original and admirable genius did not live to accomplish."

THE PULSE.—Every one knows that among the numerous inquiries and examinations which precede the prescription of a careful physician, the state of the pulse is never omitted; yet, as it is probable that few of our readers are acquainted with the reasons for this inquiry, or, what is the same thing, with the facts to be learned from it, we think it may not be uninteresting if we enumerate some of the more prominent ones.

It is almost unnecessary to premise that by the pulse is meant the beat of an artery, and that the one commonly chosen for examination is the radial artery, which beats at the wrist. The first point generally attended to is the number of the beats; and since in this, as in all other medical questions, it is necessary to be acquainted with the state of health, in order to recognize any deviation from it, we must mention the ordinary frequency of the pulse at different ages. In the new-born infant, it is from 130 to 140 in a minute; but decreases in frequency as life advances; so that, in a middle-aged adult in perfect health, it is from 72 to 75. In the decline of life, it is slower than this, and falls to about 60. It is obvious that if we could suppose a practitioner ignorant of these plain facts, he would be liable to make the most absurd blunders, and might imagine a boy of ten to be laboring under some grievous disease, because his pulse had not the slow sobriety of his grandfather's. A more likely error is to mistake the influence of some temporary cause for the effect of a more permanent disease: thus,

in a nervous patient, the doctor's knock at the door will quicken the pulse some 15 or 20 beats in a minute. This fact did not escape the notice of the sagacious Celsus, who says, "The pulse will be altered by the approach of the physician, and the anxiety of the patient doubting what his opinion of the case may be. For this reason, a skilful physician will not feel the pulse as soon as he comes; but he will first sit down with a cheerful countenance, and ask how the patient is,—soothing him, if he be timorous, by the kindness of his conversation, and afterwards applying his hand to the patient's arm."—(De Medica, lib. iii. cap. 7.)*

Granting, however, that these sources of error are avoided, the quickness of the pulse will afford most important information. If in a person, for example, whose pulse is usually 72, the beats rise in number to 96, some alarming disease is certainly present; or, on the other hand, should it have permanently sunk to 50, it is but too probable that the source of the circulation, the heart itself, is laboring under incurable disease, or that some other of the great springs of life is irremediably injured.

Supposing, again, the pulse to be 72, each beat ought to occur at an interval of five-sixths of a second; but should any deviation from this rhythm be perceived, the pulse is then said to be irregular. The varieties of irregularity are infinite; but there is one so remarkable as to deserve particular mention. It will happen sometimes that the interval between the two beats is so much longer than was expected, that it would seem that one beat had been omitted: in this case the pulse is said to be an intermittent one. When the action of the heart is irregular, the beat of the pulse is so likewise; but it will occasionally happen that the latter irregularity takes place without the former one, from some morbid cause existing between the heart and the wrist. It is hardly necessary to observe, that, in all doubtful cases, the physician examines the pulsation of the heart as well as that of the wrist,—just as the diligent student, discontented with the narrow limits of provincial information, repairs to the metropolis to pursue his scientific inquiries.

The strength or feebleness of the pulse, its hardness or softness, and innumerable other qualities, might be discussed here; but, from the great difficulty attending any examination of these points, and the technical niceties involved in any thing more than a bare mention of them, we omit them. There is one point, however, which it would be unpardonable to pass over in silence: sometimes no pulsation can be felt at the usual part of the wrist. This may proceed from so great a languor of the circulation, that it is imperceptible at the extremities; or from the radial artery (the one usually felt) being ossified; or from an irregular distribution of the arteries of the fore-arm.

TO INCREASE THE STRENGTH AND FIRMNESS OF THREAD AND COARSE CLOTH.—The lixivium of oak has been employed for scarcely any other purpose than that of the tanner, and yet it is applicable to a great variety of uses. If thread, cords, nets, coarse linen, &c. be steeped in it, they acquire greater firmness and durability. Fishermen have long resorted to this. Nothing is more apt to spoil than skins, and yet this preserves them. It is the same with hempen and linen cloth: they contain much gummy and resinous matter, which, with tannin, forms an envelope, and thus adds to their durability. Linen ought not to steep more than eight or ten days in this solution: it acquires a very brown color. When this color fades, the operation may be repeated.

The best method of preserving nets and cordage is the following: Dissolve two pounds of Flemish glue in fifteen gallons of water, dip the nets, &c. into this solution, and then

* The lapse of eighteen centuries has not destroyed the utility, much less the beauty, of the eight books on Medicine bequeathed by Celsus to posterity; they are unrivalled for perspicuous elegance and laconic good sense. Celsus is one of the writers of the Augustan age, and is worthy of the times in which he flourished.

steep them in a strong solution of oak or chestnut bark,—the tannin combines with the gelatine, and forms, between the fibres of the hemp, a solid net work, which adds great strength to the cords. Any bark which contains tannin may be employed in making a decoction; so bones, parings of skin, remains of fish, &c. and generally all substances containing gelatine, may be used in making a gelatinous solution. Fishermen, who often throw away on the shore gelatinous fish, may use them for this purpose.—[Jour. des Connais. Usuelles.]

EFFECT OF OIL ON WATER.—The following is a secret worth knowing: In rough weather they (the fishermen of the Bosphorus) spread a few drops of oil on the surface, which permits them to see clearly to a great depth. I was aware that oil would calm the surface of the sea; but until recently I did not know that it rendered objects more distinct beneath the surface. A trinket of some value had been dropped out of one of the upper windows of our palace into the Bosphorus, which at this place was 10 or 12 feet deep. It was so small that dragging for it would have been perfectly useless, and it was accordingly given up for lost, when one of the servants proposed to drop a little oil on the surface. This was acceded to, with, however, but faint hopes of success. To our astonishment, the trinket immediately appeared in sight, and was eventually recovered.—[Dr. Dekay.]

SPONGE.—This well known marine production has been in use from very early times, and naturalists were long embarrassed whether to assign it a place in the animal or vegetable kingdom. Most authorities now agree in putting the sponges in the lowest scale of animal life. There are about fifty different species of sponges, of which nine or ten belong to this country. They are found in the Mediterranean and those seas in warm and temperate latitudes, diminishing in number and becoming of inferior quality on the approach to cold regions. They adhere to rocks in places the least exposed to the action of currents and waves, which the ebbing tide does not leave uncovered. The best sponges known to us are those which come from the Archipelago, where they abound near many of the islands, whose inhabitants may be said to subsist by the sponge-fishery, if we may so call it. At the Cyclades, for instance, sponge-diving forms the chief employment of the population. The sea is at all times extremely clear, and the experienced divers are capable of distinguishing from the surface the points to which the sponge is attached below, when an unpractised eye could but dimly discern the bottom. Each boat is furnished with a large stone attached to a rope, and this the diver seizes in his hand on plunging head foremost from the stern. He does this in order to increase the velocity of his descent; thus economizing his stock of breath, as well as to facilitate his ascent when exhausted at the bottom, being then quickly hauled up by his companions. Few men can remain longer than about two minutes below; and, as the process of detaching the sponge is very tedious, three, and sometimes four divers descend successively to secure a particularly fine specimen.

The best sponge is that which is the palest and lightest, has small holes, and is soft to the touch. By the old physicians, sponge was regarded as a cure for a long list of maladies; this last is now much abridged, though burned sponge, in which form only it is used, still has a place in the materia medica.—[Penny Magazine.]

PRESERVATION OF SKINS.—J. Stegard, tanner at Tyman, in Hungary, completely preserves raw hides from putrefaction, and restores those that are tainted, by applying to them, with a brush, a layer of pyroligneous acid. They absorb it very speedily, and it occasions no injury nor diminution of their value.—[Receuil Industrielle.]

AGRICULTURE, &c.

NOTHING MADE IN VAIN.—We have this week received the following communication, accompanied with a quantity of seeds, as referred to, for which we return the donor our thanks. From the date, we have no doubt but they were intended to have reached us earlier. The discovery of this way of procuring maple seeds is not only a matter of curiosity, but of economy; as we venture to say that it would have required the labor of one man at least one week, to have taken the shells from a quantity of seeds equal to those sent to us. We shall endeavor to have them planted, and will hereafter give the result.—[Goodsell's Genesee Farmer.]

Cultivation of the Sugar Maple and manner of procuring the Seed.

Mr. Goodsell,—Every one is delighted to see our native forests thickly planted by the hand of nature with this valuable and beautiful tree; valuable, because for cabinet work some varieties of this wood are superior to that brought from distant climes; first rate for fire wood, and as good for the manufacture of sugar as the cane plant. And who does not regret the destruction of the ax-man amongst them. Occupying the best soil, they are usually the first victims. But he who destroys should endeavor to produce anew. No native tree can be more easily cultivated than this, the seed being abundant and easily procured. It grows rapidly from the seed in open cultivated grounds, attaining the height of six feet in three years, and in twelve years the stems will measure from six to nine inches diameter. I send you a quantity of seed as a specimen; they are ready prepared for sowing, and are divested of the shell and wings; in their natural state, being connected together in pairs, they are usually called maple keys. About a peck is sufficient for seeding three acres of ground. Nature would seem to dictate the fall of the year to be the proper time for sowing the seed in their natural form, as the effects of the frost would be to soften the shell. At this season they are scattered abroad by the winds in infinite profusion. But divested of the shell and sown in the spring they will grow as surely as peas, and make their appearance at the time the forest trees put forth. They should be sown, or rather scattered upon the furrows of dry land, and harrowed in, and grass seed should be sown for future pasture. Hogs, calves, sheep, horses, &c., may be pastured among them, but no cattle, till they are out of danger. The third year, either fall or spring, they should be taken up, where too thick, and transplanted in vacancies. One thousand may commence growing upon an acre. In twelve years, an enterprising farmer, who wishes for the future prosperity of our country, as well as to enhance the present value of his lands, would walk five miles barefooted before sunrise in the month of June, to view the "sugar bush" of our climate, in full foliage, situated near the residence of the owner, sheltering his fruit trees and habitation from storms, and the resort of the songsters of the air. The leaves of the grove might be collected for the barn-yard. At the age of twenty-five years, the trees might be tapped. I was bred upon a farm, in a deep valley of the mountains, on the eastern border of this state, and have witnessed the growth of the sugar maple in groves from the seed, and also standing singly in fields, where they have stood for more than half a century, presenting a more beautiful appearance than the trees of

any land or clime. My occupation now is farming. As to the manner of procuring seed: I send you about one-fourth part of the winter store of a buck or wood-land mouse, which was deposited in a living hollow beach tree, 15 inches diameter; the whole of his store, being about one bushel, one half beach nuts, with a few other seeds, all shelled, and neatly put up for winter provision, and a nest within, lined with down, the residence of the family. A boy found another store-house the same day, which was 25th of December last, containing half a bushel of maple seeds, with others. Boys are skillful in such kind of hunting. In this way seed stores might be furnished with them from the maple forests of the west, in quantities sufficient to plant out territories and kingdoms. The buck mouse enters his habitation through a smooth hole an inch or less in diameter, into the hollow of the tree, sometimes nearer and sometimes further from the ground. At the commencement of cold weather and snow, the red squirrel visits the place daily, and endeavors with much chattering to gnaw through, to rob the mouse of his store. By this recent gnawing around the hole, and by tracking in the snow, the habitation of the mouse may be discovered. This little animal, also deposits vast quantities of elm seeds, in hollows of the branches and trunks of that stately tree. In the night season, when all his enemies sleep, except the owl, he is busily employed during the fall months, in running up and down the tree, and laying up his winter store. The habitation of the mouse is frequently occupied afterwards by the honey bee. Whenever the maple bears seeds, the mouse, in maple forests, is sure to have a proportion of them for his food. S. H. Clarendon, Jan. 25th, 1834.

CAPITAL REQUISITE IN FARMING.—Mr. Editor: Among the many causes assigned for ill success in agricultural pursuits, of which farmers are often reminded, there is one but rarely adverted to, and I suspect by many farmers has never been considered at all. And that is the absolute necessity of a loose capital to enable a farmer to cultivate his farm to any advantage. The amount of this capital should be nearly equal to the entire annual product of his farm, after deducting his annual gain, if there be any.

Suppose the entire annual product of a farm to be	\$1000
Deduct suppose annual profit	\$150
Deduct also such portion of the milk, butter, grain, potatoes, and sauce generally, as is used in the family during the same season of their production,	80
Leaving to be expended in living and working farm before receiving returns of produce of farm,	230
Now if the farmer himself is both able and willing to perform the labor of one good hired hand, it will be equal to about 200 dollars of this sum, leaving 570 dollars the least amount of loose capital that will suffice to carry him through the year, without being pinched or obliged to slight his work. The amount of wool, flax and provisions, reserved for the consumption of the family from year to year, is included in this sum.	\$770

As this is a subject of importance, and as I wish to be clearly understood, I will proceed a little further. Farmers who live so far from market as to find it impossible, or inconvenient to get the produce of their farms to market before winter (and these constitute a very large majority), it will be seen at once, must incur the entire expense of working their farms and providing for their families for the year, before they realize any thing worth naming from the produce of their farms. Their hired hands must be paid in autumn, if not sooner, and if they expect to get store goods and mechanics'

work at reasonable rate, they must pay as they go along. A farmer sells his pork, butter, cheese, grain, &c. from January to April. The cost of producing all these was paid, (or ought to have been,) the summer and autumn before. His sheep are sheared in May, and should he be able to convert their fleeces immediately into money, (which he cannot always do,) still the whole expense of producing this wool, excepting about two months spring pasturing, was paid the year before, a considerable portion of it the August before.

It cannot be denied that a farmer can get along after a fashion, with little or no capital, because it is done by thousands every year. Some may inquire how this can be possible if the foregoing statement be correct. A farmer without capital, in the first place, will not perhaps hire more than half as much labor as his farm requires; of course all his work is slighted, and all done out of season, and half crops is the consequence. When the time arrives for paying his laborers, perhaps he will get some things out of the store for them on trust, or borrow a little money to pay them in part, and put off paying the remainder until winter or spring, to the no small injury of his credit, otherwise he must force the sale of some of his scanty produce at a reduced price, to make out the pay. In the next place he buys of the store-keeper wholly on a long credit, and pays a price accordingly, say twenty to thirty per cent. more than the cash price. His dealings with the blacksmith, shoemaker, and mechanics in general, are after the same fashion. And thus he passes his life continually pinched for the want of a little money, incessantly harassed by duns, and once in a while is appalled by a tap upon the shoulder, though gentle it may be, of the practised hand of a constable. And for this he must pay the latter, and his co-worker the lawyer, a sum of money for which he has never received any equivalent. And thus he brings the year about—no, properly speaking, he never brings the year about. He is forever toiling to bring up the arrangements of the last year. Time has got the start of him by one year, and he in vain attempts to overtake it.

It is a common remark that small farms are more profitable than large ones; this in the abstract is not true. Though it is doubtless true that multitudes of farmers greatly injure themselves by enlarging their farms *without an adequate increase of capital*. How often do we see farmers who have in the course of years accumulated a little money from small farms, barely enough to enable them to cultivate their present farms to the best advantage, invest the whole of this very capital in more land. Thus making an increase of capital necessary by the very act which deprives them of the little they already possessed. Could farmers who are without a loose capital be persuaded to pursue a precisely contrary course to this, to wit, sell off so much of the land they already possess as will raise a sufficient loose capital to enable them to cultivate the remainder in a proper manner, it would increase both their profits and comfort.

If any thing will excuse a farmer for mortgaging his farm, it is the hiring of money to work that farm. Though he ought in this case to be very certain that he is possessed of so much resolution and discretion, as to be in no danger of ever appropriating money so raised to any other use; so long as it is applied to this use only, it is not so very hazardous a plan. Before a mortgage can press heavily upon his farm, the money can be repaid, and at the worst he has only to return to his former method of farming by the halves, and without either satisfaction or profit. I do not wish to be understood as recommending to farmers the practice of raising money on mortgage. It is better with rare exceptions, where money must be raised, to sell off a portion of the farm, and preserve the remainder free from incumbrance.—H. W.—[N. England Farmer.]

A Cheap Method of making Fence of a Durable Character. By L. M. T. [From the New-York Farmer.]

If the ground be inclined in a direction opposite to that of the fence, begin by turning three or four furrows with a side-hill plough down hill; let them be thrown by the spade up the hill; plough three or four more on the same ground, and let them be thrown above the others; the ground will then present this shape—

Pick up your paving stones, if you have no better, or quarry about half as many as are requisite to make an ordinary $3\frac{1}{2}$ feet wall, and place them against the bank formed until you have a fence four feet high, and from nine to fifteen inches thick, and what is better, one which will not fall down, and which has been tested by the writer of this article to resist the frost, when all other methods of making stone walls have failed. The bank must incline one foot in the four, or four and a half, of height. This fence is made at less expense by one-half of stone, and one-third of ordinary wall in the price of laying. If designed to stop sheep, it must be staked and sided in this shape—

The same fence can be made on level ground, and has been by myself, when it will present nearly the above profile, staked and sided, and is effective against both sheep and cattle.

L. M. T.

Hoosick, Rensselaer co., March 21, 1834.

TESTS OF THE TEXTURE OF SOILS.—One of the best methods of ascertaining the capability of any soil to take up and retain moisture is that described by Mr. C. Johnson, for which purpose he employs the following apparatus.

a, is a small lamp; b, a stool, with a hole in the seat for receiving c, a shallow tin vessel, closely covered, but having a pipe, d, for the escape of steam; h is a pair of accurate scales, such as are used by apothecaries and goldsmiths. In order to employ this apparatus, put a small quantity of the soil to be tried upon the top of the tin vessel, in which water is kept briskly boiling for about half an hour, so as to thoroughly dry the soil by expelling its moisture. Take ten grains accurately weighed of this dried soil,

and add to it, by means of a quill, a drop or two of pure water; if distilled water can be had, so much the better. Weigh the whole a second time, which will now be a few grains above ten. Take out the weight of the water from the scale, leaving in the weights of the dried soil, and suspend the beam, so that the scale may rest on the lid of the tin vessel, the water in which it is still kept boiling; then with a stop-watch note the exact time which the added water takes to evaporate, as will be shown by the beam of the balance becoming level. Mr. Johnson found, that soils requiring less than twenty-five, or more than fifty minutes, to evaporate the added water, and bring the balance to a level, were always proportionally unproductive; the first, from having too much flinty sand, and consequently too few interstices to allow the water to escape.

Rich soil, treated in this way, required thirty-two minutes to bring the beam to a level; chalk, twenty-nine minutes; poor flinty soil, twenty-three minutes; and gypsum, only eighteen minutes.

A very fertile soil from Ormiston, Haddingtonshire, containing, in 1000 parts, more than half of finely-divided materials, among which were eleven parts of limestone soil, and nine parts of vegetable principles, when dried in a similar way, gained eighteen grains in an hour, by exposure to moist air, at the heat of sixty-eight degrees Fahrenheit; while 1000 parts of a barren soil, from Bagshot Heath, gained only three grains in the same time.

Mr. Johnson farther found that one hundred parts of burnt clay, when exposed in a dry state for three hours to air saturated with moisture at sixty-eight degrees, took up twenty-nine parts of water; that gypsum, in similar circumstances, took up only nine parts, and chalk only four parts.

Another method of testing the texture of soils is by taking what is termed their specific gravity; that is, comparing what they weigh in air with what they weigh in water. Sufficient accuracy for practical purposes may be obtained by drying two different soils, at an equal distance from a fire, or in an oven, at the same time, and then weighing in the air a pound of each in a thin bladder with a few holes near its top, or neck. When the weight has thus been obtained in the air, the bladder may be put into water, letting it sink low enough to permit the water to enter through the holes in the neck, in order to mix with the dried specimen of the soil. The weight in water, divided by the difference of the two weights, will be the specific gravity, and the less this is, the greater will be the capacity of the soil to take up and retain water. Muschenbroek thus found rich garden mould to be 1630 compared to 1000 of water, and Fabroni found a barren sand to be 2210 compared to 1000 of water.

Or fill a wide necked pint or quart bottle half full with water, and add the soil to be tried till the water rises to the brim. Then if the bottle can contain one pound of water, and gains half a pound additional when filled in this way, half with water and half with soil, the soil thus tried will be twice as heavy as water, and its specific gravity will be two. If it only gain a quarter of a pound, its specific gravity will only be one.

M. Giobert ascertained that a pound of fertile soil contained, of flinty sand, about 4,400 grains, of clay about 600 grains, of lime about 400, besides seventy of water, and about twenty-five grains of inflammable materials, chiefly carbon. On a comparative trial of a barren soil, M. Giobert found that a pound weight contained about 600 grains of clay, about 400 grains of lime, and little or no inflammable materials. Mr. Griesthwaite directs an equal portion of two soils, perfectly dry, to be introduced into two tall glasses, in the midst of each of which a glass funnel has been previously placed. The soils are to be put in so as to retain, as nearly as possible, their natural state when in the ground, and are consequently not to be too much pressed down. When this has been done, water is to be poured very gradually into each of the

funnels, and it will rise up as it does in a piece of lump sugar into the dry soil, as may be seen through the glass. The more rapidly the water is seen to rise, the better will be the texture of the soils.—[Professor Rennie.]

WHITE MULBERRY.—Experience and observation have demonstrated that the shade of mulberry trees is not injurious to the growth of grass, grain, or any other vegetable. This is an important discovery, and argues powerfully in favor of the means of raising silk.

I would advise, with humble deference, that every farmer procure mulberry seed, form a nursery, transform all his fences into mulberry hedges, and plant standard mulberry trees along all those hedges half a rod distant from each other. A farm of a hundred acres, fenced as above advised, would in a few years yield from the fences a crop worth several hundred dollars! These fences would be as cheap as any other a farmer could erect, would require no repairs, no renewal, so that all the produce arising from the leaves would be a clear profit. One hundred pounds of leaves would produce, in this country, one pound of reeled silk, judiciously fed, worth from four to seven dollars—the price being governed by the good or bad reeling. A single tree will produce from thirty to sixty pounds of leaves, depending on the growth of the tree, soil, &c.—[Village Record.]

On Hussey's Reaping Machine. By CYRUS H. M'CORMICK. To the Editor of the Mechanics' Magazine, and Register of Inventions and Improvements.

ROCKBRIDGE, Va., May 20, 1834.

DEAR SIR,—Having seen in the April number of your "Mechanics' Magazine," a cut and description of a reaping machine, said to have been invented by Mr. Obed Hussey, of Ohio, last summer, I would ask the favor of you to inform Mr. Hussey, and the public, through your columns, that that principle, viz., cutting grain by means of a toothed instrument, receiving a rotatory motion from a crank, with the iron teeth projecting before the edge of the cutter for the purpose of preventing the grain from partaking of its motion, is a part of the principle of my machine, and was invented by me, and operated on wheat and oats in July, 1831. This can be attested to the entire satisfaction of the public and Mr. Hussey, as it was witnessed by many persons: consequently, I would warn all persons against the use of the aforesaid principle, as I regard and treat the use of it, in any way, as an infringement of my right.

Since the first experiment was made of the performance of my machine, I have, for the mutual interests of the public and myself, been laboring to bring it to as much perfection as the principle admitted of, before offering it to the public. I now expect to be able, in a very short time, to give such an account of its simplicity, utility and durability, as will give general, if not universal satisfaction. The revolving reel, as I conceive, constitutes a very important, in fact, indispensable part of my machine, which has the effect, in all cases, whether the grain be tangled or leaning, unless below an angle of 45° to the ground, to bring it back to the cutter, and deliver it on the apron when cut. Very respectfully, yours, &c.,

CYRUS H. M'CORMICK.

* For description and cut of this machine, see page 228 of this Journal.

EXPORTS FROM NEW-ORLEANS.—The Governor of Louisiana, in his late message to the Legislature, estimates the exports of New-Orleans for the year 1831, at \$31,700,000, as follows: Cotton 450,000 bales at \$55 . . . \$31,640,000 Tobacco 30,000 hhdts. at \$10 . . . 1,200,000 Sugar 70,000 hhdts. at \$65 . . . 4,550,000 Molasses 3,500,000 gallons at 20 cts. . . 700,000 And for western produce . . . 5,500,000 from the sum of which he deducts \$22,000,000 for home consumption—leaving the aggregate as above.

[From the Mechanics' Magazine.]

CHUBB'S PATENT LOCK.—The lock made by C. J. Gayler, of 102 Water street, New-York, of which a drawing is annexed, affords more security than any other yet invented, as it cannot be picked or opened with any false instrument; and its combinations are so extensive that tens of thousands may be made without making two alike.

Description—A A a, the bolt; b, the square pin of the bolt; c c, the detector, moving on the centre d; f, the detector spring; g, four tumblers, moving separately on the centre h, shown lifted by the key to the exact position for the square pin b of the bolt to pass, in unlocking. Should one or more of the tumblers be lifted by a pick or false key, in the least degree beyond their present position, the detector, c c, being thus overlifted, will, by the angle of the spring, f, pressing on the opposite side of the angle of the detector, force its hook into the notch a of the bolt, and be firmly held so, until disengaged by the regulating slide K k; in which case, by the introduction of the key, the tumblers are lifted to the regulating combination, and admit the stud n, affixed to the regulating slide, to enter the several grooves, o, in them; the bevelled end k of this slide, by the same movement, pressing against the hook of the detector, disengages it from the notch a of the bolt.

It possesses the four principal requisites of a good lock, namely, security, simplicity, strength, and durability; its security, particularly, is increased beyond calculation, by an improvement (the detector) which not only renders it impossible to be picked, but also detects the first attempt to do so, thereby preventing those repeated efforts to which all other locks are exposed: at the same time it will be noticed that the thief, in making the attempt, renders the lock more secure, for if the detector is (as it must be in such cases) overlifted, it will force its hook into the bolt, and will there remain until it is disengaged, which can only be done with the true key, in the following manner: the key must be turned half way round in the lock in the same way as in locking; then turn back again, and then turn round in the usual way to unlock. If an attempt has been made to pick the lock, the detector will be overlifted, and catch in the bolt; this circumstance will at once be known, when the true key will not open the lock until the detector is disengaged in the way above

mentioned. As to its durability, it is not liable to be injured by constant use; this has been fully ascertained by a lock having been locked and unlocked by steam power four hundred and sixty thousand times without receiving the least injury.

Mr. Gayler makes use of this lock in all his Double Fire Proof Chests, of which the annexed engraving is a correct representa-

tion. They have been several times tested by fire, and have afforded perfect security to valuable books and papers. They are now in use in upwards of fifty banks in the United States, as well as in record and other public offices, and for such purposes are preferred to vaults, as they are equally safe against fire, are free from damp, and can be removed from one building to another with little trouble or expense.

NEW-YORK AMERICAN.

JUNE 7-13, 1834.

LITERARY NOTICES.

THE FROLICS OF PUCK, 2 vols. N. Y.—Harper & Brothers.—A re-publication from an English work. There is much cleverness in these tales; and the evidence, both of good writing and considerable powers of invention—all which, in our judgment, would have told better, and been more consonant with the taste of this matter of fact age, by the omission of the goblin machinery altogether.

Puck, having offended Queen Titania, is banished from fairy land till he should be able to solve the riddle "what pleases woman most." The answer, according to Frolic the First is, that "it is her lover." This answer, the termination of Frolic the Second, renders rather doubtful in Puck's eyes. The third implies love for her husband to be the chief passion; but the riddle in the fourth, is finally thus solved by Puck:

Be she young or be she old,
Warped, or formed in beauty's mould;
Be she widow, wife or maid,

By whatever temper swayed,
Woman's master passion still
Is—to have her sovereign will.

PAPER AGAINST GOLD, or the history and mystery of the Bank of England—by WM. COBBETT. 1 vol. N. Y.: JOHN DOYLE.—There is no living writer of more power than Wm. Cobbett, whatever be the subject he handles. In the papers embodied in this vol.,—and which were written 20 years ago when he was a State prisoner in Newgate, for having attempted to excite the hatred of the British nation against the German soldiers, then incorporated with the British army, and a portion of whom had been just employed in putting down a mutiny in a British regiment—the danger, and fraud indeed, of a paper circulation irredeemable in specie, are set forth with admirable clearness and effect. In this country, where the tendency—by multiplying banks and straining to their utmost their issues—is to induce many of the evils of a paper circulation unsustained by a specie basis, these essays should be read, and may be productive of good—though as long as the restraining law of this State exists, and the right to grant bank monopolies is held and exercised as a political instrument, there will be little room for the operation of mere reason.

THIRTEEN SERMONS, by Wm. Cobbett, M. P.; 1 vol: New York, John Doyle.—We have here the same vigorous and lucid pen applied to various subjects, and in the guise of a teacher of morals and religion. A single extract upon Gambling will exemplify the style and manner of these sermons, so called:

Gaming is sometimes called play; but, what is it in reality? What is the object of every gamester? It is to gain by the loss of another. The object is not to effect an exchange of one thing for another. It is not to render value for value, in any way or under any form. The object of every gamester is, to get by doing injury to his neighbor. It is to get his money or his goods from him without yielding him any thing in return; and this, disguise it under what name we may, is extortion and fraud.

This is not less its character because it as often fails of success as it succeeds in its purpose. The thief is not less a thief when he fails than when he succeeds. It is the intention in both cases that constitutes the crime; and, as to the chance that you give your neighbor, you think that it is not so good as your chance; for, this is the very principle upon which you proceed. This thought must necessarily exist in your mind, or you are destitute of motive altogether. You conceal from your neighbor the fact, that you have reason for expecting to get his money from him. You practice deceit from the first to the last; and your sole object is your own private gain to be effected by his loss.

Pretenders to religion, who are at the same time gamesters, are by no means few in number. If, instead of persecuting their neighbors for difference of opinion on points of doctrine, they were themselves to pay attention to the uniform language of Scripture on the subject of deceit, and especially of deceit practised for the purpose of unjustly extorting from our neighbor his money or goods, they would, perhaps, cease both to game and persecute. In Leviticus, ch. iv. the law is clearly laid down.—We are in no case to deceive our neighbor; and, if we have gotten any thing from him deceitfully, we are to restore it with the fifth part in addition; and then, atonement being made, forgiveness is to be obtained.

Now, the very essence of gaming is deceit. It is impossible to gain, except deceitfully; for there is deceit in the motive. And, as to the manner of accomplishing the end, it presents, perhaps, the strongest possible proof of meanness and baseness of mind. Feigned pleasure, feigned sorrow, feigned applause and feigned reproof: all is false: looks that lie, the lies being too refined to be trusted to the tongue. And all this for the base purpose of gain at your neighbor's expense, and possibly by means of his ruin! From such a school, who is to expect sincerity, uprightness, or even common humanity? Accordingly, it is invariably found, that gamesters are amongst the most unfeeling as well as the most fraudulent of mankind. In Virginia and the slave-states of America, nothing is more common than to see the gamester whose purse has been emptied, call in a domestic slave, man,

woman, or child, as a stake to be played for against a sum of money. Thus the drawing of a card, or the turning of a die, may, and frequently does, separate instantly, and for ever, wife from husband, and child from parents! Look at the poor creature that stands trembling by, awaiting the result of the game; and then find, if you can, words to express your abhorrence of those who can give to a deed like this the appellation of *play*!

LA REVUE FRANÇAISE for May. New York: HOSKIN & SNOWDEN.

THE KNICKERBOCKER for June. New York, J. Disternell.

THE UNITED STATES MILITARY AND NAVAL MAGAZINE for June. Washington, D. C.: BENJAMIN HOMANS.

MECHANICS' MAGAZINE AND REGISTER OF INVENTIONS AND IMPROVEMENTS, for May. Edited by JOHN KNIGHT. N. York: D. K. MINOR & J. E. CHALLIS.

These are the only periodicals on our table at present. The first named is a good number. Its leading article, upon the financial administration of this country, though written by a *Frenchman*, will, we suspect, impart information to a great many *Americans*, well-informed though they be. It reproduces and re-examines the statements of the controversy respecting the relative expenses of the French and American governments, between M. Saulnier on the one side, and Gen. Lafayette, Gen. Bernard, and J. Fenimore Cooper on the other.

The *Knickerböcker* for this month is good merely. The conclusion of the paper on *Talleyran*, if authentic, is very interesting. From the article on Peace Societies, we make an extract, exemplifying the contradiction and inconsistencies of war by a striking incident connected with the battle of Navarino.

Another trait of mad incongruity, and, seen its true light, of disgusting contradiction, ensues. While the fight lasted, mercy and humanity would have been crimes. The only duty, the only heroism and perfection of military attainment, is to kill. But the moment the battle is over, the point of honor is reversed; and the perfection of bravery and honor is to expose life, and manifest an intrepid recklessness to danger to save the very victims, which, but a few moments before, it was duty in every possible way to attempt to destroy. A recorded incident, after the battle of Navarino, will show how this incongruity impressed a race whom we are accustomed to consider as barbarians. After the firing had ceased, Sir Edward Codrington, the English admiral, sent a lieutenant on board Moharem Bey's ship, to offer any medical or other assistance they might want. This vessel, probably with a crew of more than a thousand men, had but one medical officer on board, and he, unfortunately, had been killed among the first in the action. Her loss had been immense, and they had not thrown the dead overboard, nor removed their wounded to the cockpit; and the deck presented a most horrible scene of gore and mangled bodies. Amidst this frightful spectacle, about a dozen of the Turkish officers, superbly dressed, sat in the cabin upon crimson ottomans, smoking with inconceivable apathy, while slaves were handing them their coffee. The English officers presented their Admiral's compliments, and offered any assistance. The chief Turkish officer replied with frigid composure, 'that they stood in no need of any assistance whatever.' 'Shall not our surgeon attend to your wounded?' 'No,' gravely replied the Turk. 'Wounded men need no assistance. They soon die.' Returning to the *Asia*, Sir Edward Codrington's ship, and communicating the result of their mission, they were ordered back to bring with them the Turkish admiral's secretary, and some other officers, with whom the English Admiral held a long conference. When it was closed, the English lieutenant was ordered to land the Turks wherever they chose. Rowing them ashore about day-break, they saw the wreck of a mast, on which a score of wounded or exhausted Turks were endeavoring to save themselves. 'I must rescue these poor fellows,' anxiously exclaimed the lieutenant. 'They are only common soldiers, and will soon die. Never mind them,' said the Turkish secretary, with the utmost composure. 'But it is my duty to mind them; and should I not attempt to relieve them, the Admiral would reprove me and I should disgrace the service.' Having said this, the boat was ordered to pull towards the mast, and the lieutenant succeeded in saving about a dozen of these unhappy wretches. As soon as they were stowed in the bottom of the boat, the Turkish

officer, after a short but apparently profound meditation, burst into an immoderate fit of laughter. 'What is the matter?' exclaimed the astonished lieutenant. 'What, in the name of heaven, is there to laugh at in saving these poor fellows?' 'What to laugh at?' replied the Turk in a tone of the bitterest sarcasm.—'Laugh! by Allah! Are not you English a consistent people? Yesterday, while we were quietly taking our coffee, you opened upon us your cannon, and knocked our ships to pieces, and killed or mangled our men, until the fleet is one vast slaughter-house; and this morning you have suddenly become so humane, that you cannot pass a score of wounded soldiers without putting yourself out of the way to save them?'

The *United States Military and Naval Magazine* continues—we cannot say to flourish; for the Editor says in this number, that the encouragement he has hitherto received, scarcely pays the expenses even of printing—but to appear regularly, and to furnish evidence that it deserves to live, even though it should die. We hope better for it, however; for it is a publication in which the pride of both services should be enlisted, to make it what they can make it, if they choose, a valuable and useful miscellany.

The *Mechanics' Magazine* is full, as usual, of all sorts of information respecting inventions for the benefit, convenience or safety of the human race. There is, among other curious things, in this number, a scheme for raising vessels or goods sunk in deep water, by means of air buoys sent down by a diving bell in a collapsed state, and then inflated under water by means of a tube communicating with the air forced from above into the diving bell. In this way, a number of balloons, for so they become, are to fly upward with their freight. If there be a spark of mechanical ingenuity in the mind, it seems to us impossible that this magazine can be even casually glanced at, without awakening it into full energy.

PLAN OF THE CITY OF NEW YORK IN 1733; by J. Hayward, Courtlandt street.—This, in the present state of the city, is quite a curiosity. It is lithographed from the original in possession of G. B. Smith, the Street Commissioner, and gives a view of the city when Dey street was about its northern extremity on that side. As a point of comparison from which to measure our onward march, this is quite striking.

NURSE'S MANUAL AND YOUNG MOTHER'S GUIDE, by RICH'D S. KISSAM, M. D.; Hartford, (Ct.) CROKER & Co.—A useful little volume for those to whose use it is dedicated. It is plainly and sensibly written, free from hard words, technical terms, or the affectation of science, and will do good extensively, if read and followed.

NEW MUSIC.—Of this we have, for the week, the following pieces from JAS. L. HEWITT:

"Not worlds on worlds in Phalanx deep," a sacred song; the words by Cowper, music by W. A. King.

"The old oak tree," a ballad, by Haynes Bailey; music by C. Herbert Rodwell.

"May you be happy;" words by Chas. Jeffreys; music by C. A. Hodson.

"L'esperance," a Waltz for the Piano; by Geo. B. Cogdell, of S. C.

"Zitti Nessun que ve," and "Ah come Nascondere," both from *Matilde Corradino*, and arranged for two performers on the Piano; by M. C. Mortellari.

"The Crusader's Bride," a cavatina, sung by Mr. Wood; music by C. A. Hodson.

We conclude the Review today, which, by reason of other indispensable occupations, we have been prevented from making more comprehensive this week, with the following curious paper on

INQUIRIES respecting the Weight of Man at different Ages. By M. Quetelet.

The Statistical Researches of M. Quetelet are well known to the public. They possess the rare merit

of at once being very exact and well arranged, even in the most minute details, and in investigating certain very important scientific and philosophical questions. Accordingly, in estimating, with more precision than had been done, the weight and the average stature of the male and the female, at different ages, (or different periods of life) and among different nations, M. Quetelet, as well as M. Villermé and other savans, have not been desirous to satisfy a vain and trifling curiosity; they have deduced principles relating to the health of man in different circumstances, to Hygiene, to the laws of conscription, and even to the fine arts. Under the last relation, which appears a little foreign, this is the manner in which M. Quetelet expresses himself in the preamble of the work of which we speak.

"In order to produce a work which may be truly capable of touching us, and of affecting our passions, we must know man, and above all, the man whom we would represent. To take a single example, the artist, who has studied only the type of the Greek physiognomies, however admirable in other respects this type may appear to us, if he reproduces it in modern subjects, it will be cold and ineffectual upon the spectator, who will perhaps admire the art and composition, but will not be deeply affected. The Greek figures, however varied they may be, on account of age, passion, and sex—have, notwithstanding, an air of family, which carries us back towards antiquity, in spite of ourselves, and withdraws our attention from the subject which we would represent.

"If one endeavors to make them, the anachronism will become more sensible. Artists at the commencement have comprehended this necessity of painting what they had under their eyes, and it is in this way that they have produced effects so magical. The noble and severe figure of Christ has nothing in common with that of Apollo nor of Jupiter of the ancient mythology. A virgin Mary of Raphael has an enchanting grace which yields to nothing in the most beautiful ancient forms, and they exert on the imagination a greater influence, because they are more conformable to nature by which we are surrounded, and because they act more immediately upon us. We ourselves in climates more remote, perceive the need, in retracing our national actions, not to present Greek or Italian figures in the midst of a battle, in which we find men, almost all of the same age, all alike covered with warlike apparel, our eye seeks to recognize, from the features and expressions of the physiognomies, the Frenchman or the Englishman, the German or the Russian. Even in the French army, the soldier of the Old Guard had a physiognomy which had become classic, and which was identified in some measure with the remembrances of the empire.

"It is certainly to the little attention that has been given to the study of the shades, by which the physical and moral qualities of man pass among different nations and in different ages, which gives rise to that monotony and coldness of the greater part of the works of the imagination. We have, indeed, perceived the necessity of studying nature, and of being true; but, I think we have not remarked sufficiently that nature is not invariable. The ancients have represented, with infinite skill, physical and moral man, such as he existed then; and the greater number of the moderns, struck with the perfection of their works, have believed that they can do nothing better than servilely imitate them; and they have not considered that the type had changed, and that, in imitating for the perfection of the art, they had another nature to study. Hence this universal cry, 'Who will deliver us from the Greeks and Romans?' hence this violent schism between the classics and the romantic; hence in fine, the need of a literature which would truly be the expression of society. This great revolution is accomplished, and it furnishes a proof the most unexceptionable of the variability of the human type, of *Homme moyen*, among different nations and different ages.

"Thus the determination of average man is not useless, even for the fine arts and letters, and he who would arrive at this determination, will have no difficulty to make artists and litterati listen to him. He would teach them to know, in a more precise manner, things which they already know vaguely: he would teach them other things of which they are ignorant, or at least he would rectify their judgment concerning a multitude of prejudices. They would receive these, in the same manner as a painter learns perspective, which, under its geometrical form, is far from being picturesque also. Moreover, they have received the researches of Gall and Lavater, with more eagerness, perhaps, than the savans themselves; it is even to their care that we owe, in a

great measure, the knowledge of the proportions of the different parts of the human body as respects age and sex."

In the little work in which we find these general considerations with others which we are compelled to omit, the author investigates what concerns the development of the weight of man in the same manner as he has determined his growth, his inclination to crime, the succession of generations, &c. Afterwards he will publish new inquiries concerning the strength, swiftness, and other qualities of the human species; inquiries which, in order to be exact, must be made by many associated observers, and upon a great number of individuals. Physicians and engineers have been sometimes led to estimate the weight of men arrived at maturity, and considered, for example, as burdens placed upon a building, or as weights acting on a machine. La Hire has made very remarkable researches of this nature. On the other hand, the legal practitioner must often be occupied with this subject, for one of the most frequent problems is to determine after death, the probable age of an individual, from the assemblage of physical qualities. On this grave question, we are generally reduced to the estimation of practitioners more or less vague; but if, in a case of infanticide, for example, we stated in the process, verbal the weight and stature of the infant, as well as those physical characters susceptible of measure, and as we might have by the side of that, well constructed tables, which would give us for the different ages, the values of these physical qualities and their mean variations, we would have terms of comparison which would be better than the appreciation of practitioners, or which would serve at least to control their assertions. We see from these examples, that the inquiries concerning the weight of man, have more than one application.

The observations of M. Quetelet were made at Brussels in the Maternal Hospice of St. Peter; he compares them with those made at Moscow and Paris, in similar hospices; and he finds little difference between the means obtained. Unfortunately the Russian and French practitioners have not distinguished, with as much care as M. Quetelet, the sex, the stature, and the weight of children observed at their birth. This renders the results less capable of comparison. M. Quetelet found for sixty-three male children, and fifty-six female, newly born, the following quantities,

	Weights.	Stature.
Male children	7.057536 lb. Avoird.	1.62732 feet.
Female do.	6.4179468	1.58467

The extremes are—

Boys.	Girls.
Minimum, 5.1608232 lb. Avoird.	2.4701376 lb. Av.
Maximum, 9.92466	9.36329

The mean weight without distinction of sex, is 6.7377414 lb. Avoird. It has been found at Paris on 20,000 observations, 6.74656332 lb. Avoird.

Q. Quetelet has made similar inquiries concerning children from four to twelve years of age, in the schools of Brussels, and in the orphan hospital—concerning young people in the colleges and in the medical school—finally, concerning old men in the magnificent hospice which has been constructed in the same city for a period of four years. The results have been completed by observations made upon isolated individuals, taken by chance from the mean of all these data. The author has been able to construct tables, which show the mean stature, the mean weight, as well as the minimum and maximum, at each age, and for both sexes. These tables show that there exists at each age, and for each sex, a constant relation between the mean weight and the mean stature, from which the author has constructed another table, more exact than those which result directly from observations on the weights. It follows, from the mean stature formerly observed by the author, for the whole population, or at least from a number of individuals much more considerable than in these last inquiries, and gives the mean weight corresponding to each stature, according to the observations which make the subject of this memoir.*

The following is a table, which we may consider as exact for the whole population of Brussels, and which, for want of a table of this sort, calculated for other countries, may serve, at least, as an approximation for the Caucasian race, and in a temperate climate.

A TABLE of the Development of the Stature and Weight.

Years.	MALES.		FEMALES.	
	Stature. Imp. Ft.	Weight. lb. Avoird.	Stature. Imp. Ft.	Weight. lb. Avoird.
0	1.64045	7.65736	1.60764	6.4179468
1	2.90007	90.841766	2.26382	19.3851692
2	2.58519	95.0101439	2.56238	23.5324716
3	2.83469	97.5093356	2.79532	26.0986093
4	3.04468	31.3839804	3.00109	26.67194
5	3.24153	34.7804194	3.19559	31.6706928
6	3.43511	38.7967752	3.38861	35.98768
7	3.62530	49.984168	3.56305	38.6841192
8	3.81240	45.7857648	3.74351	42.0805584
9	3.99492	49.954192	3.92607	47.1040598
10	4.18314	54.0783608	4.09457	51.8768900
11	4.3636	59.768508	4.26180	56.570592
12	4.54404	65.7671136	4.43005	61.7647136
13	4.79193	75.8244024	4.60310	72.6485112
14	4.89838	85.4844048	4.76714	80.941116
15	5.07397	88.69745894	4.91807	89.035376
16	5.29273	109.5461916	5.03618	96.0927636
17	5.36090	116.558618	5.10179	104.3412588
18	5.43973	127.507013	5.13132	112.5458444
20	5.49329	132.4611988	5.15757	115.3094946
25	5.51191	138.7909564	5.17398	117.5079744
30	5.52503	140.378809	5.18054	119.8327284
40	5.52503	140.4939116	5.18054	121.8866004
50	5.49322	139.8507608	5.03946	123.9807568
60	5.37740	130.074319	4.97384	119.757564
70	5.32490	131.2701696	4.96738	113.6642748
80	5.29219	127.5492084	4.84103	106.884576
90	5.29219	127.5492084	4.93775	108.8183892

We see, from this table, 1st. That, at an equality of age, the male is generally heavier than the female; towards the age of twelve years only, an individual of either sex has the same weight. 2dly. That the male attains the maximum weight about the age of forty years, and that he begins to lose, in a very insensible manner, towards his sixtieth year; that, at the age of eighty years, he has lost about 13.23288 lb. Avoird., the stature being also diminished 2.75604 inches. 3dly. That the female attains the maximum weight later than the male, towards the fiftieth year. 4thly. That when the male and the female have assumed their complete development, they weigh almost exactly twenty times as much as at the moment of their birth, while their stature is only about 3 1.4 times beyond what it was at the same period.

Children lose weight during the three first days after their birth; at the age of a week they begin sensibly to increase; after one year they have tripled their weight;—then they require six years to double the weight of one year, then thirteen to quadruple it.

To calculate the burden of an edifice, or a bridge covered with a crowd, it is well to know that the mean weight of an individual, whatever is the age or sex, is about 98.584956 lb., that is, 103.65756 lb. Avoird. for the males, and 93.7328 lb. Avoird. for the females.

During the development of individuals of both sexes, we may regard the squares of the numbers representing the weights, at the different ages, as proportional to the fifth powers of the statures.—After the complete development of individuals of both sexes, the weights are almost the squares of the statures.

The weights have varied, in the extremes, among individuals regularly conformed, from 1 to 2, whilst the stature has varied only from 1 to 1 1/3.

The inferior parts of the body are developed more than the superior. In a child, the head is equal to a fifth part; and in a full grown man, to an eighth of the whole height of the individual. It appears from a note at the end, that these proportions, vary a little among different nations; but M. Quetelet, who, in his preliminary observations, explains very well the importance of these inquiries to the fine arts does not appear to have written this work purposely for them. The activity which he has exhibited in his researches, make us believe and hope that he will resume them at another time.

This little interesting work is terminated by data concerning the weight of human bones, which be longed to individuals of different ages, a very important subject in certain cases of legal medicine.

LATE FOREIGN NEWS.—The *Sylvanus Jenkins*, packet, from Liverpool, of 8th ult., brings intelligence that may be deemed decisive of the struggles in Portugal and Spain, in favor of Donna Maria and the young Queen.

The strong places in Portugal which held out for Miguel, have almost all fallen, and Don Carlos, the pretender to the Spanish throne, had embarked, it was said, or was about to do so, for England; thus leaving the Queen Regent free to make such terms with the liberal party in Spain, as they may have the strength to exact; for we believe not much in the voluntary concessions of legitimacy to liberty.

We are concerned to find the following paragraph

from the London Times, indicating as it does, most criminal negligence on the part of one of our frigates:

The London Times of the 10th contains, the following extract of a letter from Toulon, dated May 1,—"On the celebration of the King's fete, the following melancholy accident occurred.—At 12 o'clock, all the batteries and the ships in the roadstead fired salutes. Two American frigates here also paid the same compliment to the day, but unfortunately the gunners of the Constellation forgot that some of their guns were loaded with shot, and firing within pistol shot of the Suffren, one of the balls entered a port hole, killed one of the sailors, and carried away the leg of another. Some of the shot entered the hull, and five or six men were wounded by splinters, and obliged to be sent to the Hospital.

The London Globe of the 8th, says—We have great satisfaction in stating that a telegraph despatch has been received at Paris from Bayonne dated the 6th inst. announcing that Don Carlos had embarked for England, and that the affairs of Portugal had been arranged between Don Miguel and Don Pedro. The intelligence was brought to Bayonne by the French Secretary of Embassy, who left Madrid, on the 3d.

The Liverpool Journal of the 1th May says, We have great pleasure in announcing the probable cessation of hostilities in the peninsula. The Lord Nelson, in five days from Lisbon, has arrived at Dartmouth, with news that the Pedrites had taken Figuera,—that Coimbra had declared for Donna Maria,—that the whole of the road from Oporto to Lisbon was open to the Pedrites—and that Don Miguel and Don Pedro had come to a settlement, an armistice having been agreed to. Nor is this all, a telegraph despatch was received at Paris on the 6th instant stating that Don Carlos had embarked for England; it also corroborates what we have above mentioned respecting Portugal, for the Despatch says, "The affairs of Portugal have been arranged between Don Miguel and Don Pedro." These letters by the Lord Nelson confirm the fact respecting Don Carlos and say that he had placed himself under the protection of the English.

The news reached Paris from Bayonne, whither it had been brought by the French secretary of legation, who had left Madrid on the 3d instant. Coming to us, from two sources, besides its extreme probability, we are inclined to give it every credence. We understand that the ratification of the convention between the four powers would be immediately and finally executed.

The Irish Tithes Bill as it is called, came up for discussion in Parliament on the 6th, and on deciding for a second reading the vote stood 288 to 52, majority in favor 196.

The letters from Paris, of Tuesday's date, bring the prices of the French funds very firm, the five per cent. Rentes having closed at 105f. 45c and the three per cents, at 79. 25c. Spanish Cortes bonds, which closed at 30 8/4. The Portuguese Regency were at 77.

Reduction of the four per cents. Public announcement has at length been made of the plan for the reduction of the four per cents.

Of this plan, in the form now proposed, a favorable opinion is generally expressed in the city, as a plain straightforward measure, manifesting a proper confidence in the resources of the country, and not threatened with any serious objections or difficulties in the course of its execution. It is obviously indispensable to its success that the 3 1/2 per cents. should raise to par at the least, as all persons would otherwise be dissenters to the conversion, and in this there are some persons certainly who anticipate difficulty, but we suspect the measure has been prepared with too much foresight to leave any probability of it, and that a command of money is in reserve far greater than there are likely to be dissenters to call for. At present there is an actual advantage to be made in the sale of the four per cents., and by investing the money in the existing 3 1/2 per cents., of about 5.8 per cents.; but a few operations of this kind would soon do away with that advantage, and bring the stocks to the same level. The union of the new stock with the large mass of the existing 3 1/2 per cents., though the dividends are at a different quarter of the year, is held to be a judicious feature of the measure, and has been adopted, without doubt, because the other class of 3 1/2 per cents. are redeemable at the will of the government; while the others, with the four per cent now converted, are not redeemable till the year 1840. A further conversion therefore, and on a much larger scale than this, is looked for early in the next year.—[Times.]

*The author cannot consider the results obtained in hospitals and public schools as very exact as to the mean stature of the population, because inquiries made by him concerning a great number of individuals have proved to him that the mean stature is a little more among individuals in easy circumstances than in the indigent population, who have recourse to hospices, hospitals, and gratuitous schools,

The death of *Lander*, the latest adventurer in Africa, has been before mentioned in this paper; annexed are the particulars of that death. It is grateful to be able to add, that the British Government have conferred a pension of £70 on his widow, and one of £50 on his infant daughter.

AFRICAN EXPEDITION.—Death of Mr. Lander.—We regret to learn that intelligence has been received of the death of the enterprising African traveller, Richard Lander. He was fired upon and severely wounded by the natives on the Nunn river, where he had gone for the purpose of trade, early in the month of January, and he died at Fernando Po. on the 2d of February. The following extract of a letter from Captain Fuge, of the Crown, contains all the particulars of this melancholy event that are yet known. Mr. Lander was buried by Capt. Fuge on the day he died.

"Mr. Richard Lander expired at Fernando Po. on Sunday, the 2d of February, on his way up into the interior with a schooner boat, loaded with goods for trade, and two canoes which were towed from Cape Coast by the cutter Crown. He was attacked on all sides by bushmen, all armed with musketry. One white and two black men were killed; one woman and child, with a boy were taken prisoners. Mr. Lander and the remainder fortunately managed to get into one of the canoes and pull for their lives. Mr. Lander received a shot in his hip; a seaman and two Kroomen were also severely wounded. They left the Crown to proceed up the river on the 13th, and returned to the cutter on the 21st of January. They lost every thing belonging to them, excepting what clothes they had on. Mr. Lander lost all his papers, not one remains to be shown. The Crown got under weigh, and arrived at Fernando Po, on Sunday the 26th. Mr. Lander's wound had mortified, but he died quite composed."

Lt. Allen, R. N. who had been exploring the Niger, arrived at Plymouth on Tuesday last, in the *Talbot*, 28. Lieut. Allen has completed his surveys, and immediately set off for London, with the interesting results of his expedition.

ENGLISH ABSENTEEISM.—"It is most lamentable," says the January number of the *London Quarterly*, "to observe the extent to which aristocratic emigration is at this particular time going on. We happen to know that the letters of credit granted to English continental travellers by the two principal banking houses in the West End of London, exceed this year, both in number and value, by more than a half those of any preceding year."

MONK LEWIS.—Not many readers, probably, of the present generation, know aught of the work whence *Lewis* received this title, and it is quite as well they never should. In a recent number, however, of the *London Quarterly Review*, we find a notice of a posthumous work of his, which exhibits both his character and understanding in a more favorable light than his early living publications. It is called "The Journal of a West India Proprietor," and is, in fact, his own journal, he having inherited large estates in the island of Jamaica, on returning from a second voyage to which, in 1818, he died at sea: a sacrifice, according to report, "to a very strange whim, that of persisting, in spite of all advice, to take emetics as a preventive against sea-sickness." The descriptive talent, the playful humor, and the humane and considerate temper in the treatment of his numerous slaves, exhibited in this Journal, together with numerous poetical pieces interspersed through its pages render it quite agreeable reading. We subjoin a short poem written at sea:

THE HELMSMAN.

'Hark! the bell! it sounds midnight!—all hail, thou new heaven!
How soft sleep the stars on their bosom of night!
While o'er the full moon, as they gently are driven,
Slowly floating the clouds bathe their fleeces in light.
The warm feeble breeze scarcely ripples the ocean,
And all seems as hush'd, all so happy to feel!
So smooth glides the bark, I perceive not her motion,
While low sings the sailor who watches the wheel.
'Tis so sad—'tis so sweet—and some tones come so swelling,
So right from the heart, and so pure to the ear.—
That sure at this moment his thoughts must be dwelling
On one who is absent, most kind and most dear.
Oh may she, who now dictates that ballad so tender,
Diffuse o'er your days the heart's solace and ease,
As you lovely moon, with a gleam of mild splendor,
Pure, tranquil, and bright, over-silver the seas!

A BRITISH AMBASSADOR.—From an account of "The Transactions of the British Mission at the Court of Persia in 1810-11, by H. Jones Brydges, the Ambassador, the following scene is copied:

In the preliminary treaty, there was one article left indefinite; but it was well understood between the plenipotentiaries in what manner, on the ratification of the treaty, that article was to be made definite by his majesty's government; and I had, throughout the whole of the negotiation, insisted on maintaining as a *sine qua non*, that this article should, in this respect, be left to the decision of his majesty's government. I had delivered to Meerza Sheffee, as the principal Persian plenipotentiary, the treaty signed by me, and he had in his hand the counterpart signed by the Persian ministers, apparently ready to deliver me. But all at once he laid it down on the carpet, and took it in his head to begin talking on the indefinite article, and insisted on its being made definite, before the treaty was sent to England for the ratification of his majesty's government. A little debate ensued, which of course ought not to have been the case, and which, as may be easily imagined, I was anxious to put an end to; when most unexpectedly, and perhaps fortunately for me, he as far forgot himself as to say—'Do you come here to cheat us?' The terms of this speech are in Persian so dreadfully gross, that they cannot be rendered into English by any decent words; on hearing which, I snatched up the counterpart treaty lying on the carpet, gave it to Mr. Morier, rose up and addressed the old minister:—'You stupid old blockhead, do you dare to use these words to me, who in this room represent the King of England?—If it were not for the respect I bear your master, the King of Persia, I would knock your brains out, if you have any, against the wall!' and, suiting the action to the word, I pushed him with a slight degree of violence against the wall which was behind him, kicked over the candles on the floor, left the room in darkness, and rode home, without any one of the Persians daring to impede my passage. The instant I arrived at my lodgings, I retired to my private apartments, which were in a small court separate from those of the gentlemen, and caused the outer-door to be shut. I was scarcely seated, before several persons came thundering at that door; I went to it, and asked them who they were, and what they wanted; they answered they came from Meerza Sheffee and the Ameen-ed-dowlah, that they had brought with them the treaty, with my signature, and were ordered to demand from me the counterpart, signed by these ministers. To this I answered, 'I cannot be disturbed now; go and tell your masters this is a matter which will keep till morning very well, and by that time, perhaps, Meerza Sheffee will recollect himself.' They became extremely loud and importunate, and said, 'it was as much as their heads were worth to return without the treaty.' I said, 'I will tell you what it is, my worthy friends; by G—d, if you stay here making a noise and riot, I shall soon make that as much as your heads are worth.' After a little pause, I heard them, on going away, very distinctly say, 'by G—d, this Fringe is either drunk or mad.' I requested the next morning to be admitted to a private audience of the King of Persia; my request was granted, and as soon as I had made my obeisance, his majesty said, 'so Elchee! I suppose you are come to make an apology for your unheard-of behavior last night to my vizier.' 'I am come,' replied I, 'as my duty requires me to do, to explain my conduct to your majesty; and that done, if you judge I have acted wrong, I am willing, as a private person, to submit to any censure your majesty may esteem proper; but I must declare to your majesty, the King of England does not allow his representative to apologize without his royal and special orders; and I need not tell your majesty, that in this room, and in your presence, I am representing that great and powerful sovereign.' I then repeated to the King of Persia the words the minister had made use of to me; and added, 'Suppose I had so far forgotten myself as to have made use of such words to any person deputed to the high honor of representing your majesty, would you have been well pleased if that person had been base enough not to have noticed them in the way they deserved?' The King of Persia laughed, and said, '*Hak daree*, you have right on your side; the old man should have recollected what Meerza Bozurg told him about Europeans, and especially about yourself; that in his conversation with them he must take care not to use words to them which he frequently uses to persons of great rank here; but I must call my old minister in, and you must make it up.' Meerza Sheffee soon

appeared, and the king said, 'Meerza Sheffee! *saaf-ud-dowlah*, (i. e. vizier of the empire,) here is the English ambassador, come to say he is sorry for what has happened.' 'Stop there, please your majesty; I come to say I am sorry for the occasion of it; but further I will not say.' 'Well, well,' said the king; 'it is for the advantage of my service that you two should be friends; and now, ambassador, I tell you I am well pleased with the treaty as it stands, since I am sure, from what I see of you, that whatever you have held out to us will be performed by your government.' I shortly afterwards left the palace, and in the evening I made a point of appearing at Meerza Sheffee's *meglia*, or levee; and from his politeness and attention, it appeared he thought no more of what had happened."

Only conceive, says the *London Literary Gazette*, such a scene in London! Talleyrand kicking Lord Palmerston, and calling him a stupid old blockhead, &c.; or Prince Esterhazy bestowing a caning on Lord Althorp or Lord Grey, and swearing, he'd be d—d if they kicked up a row, but he would wallopp them! Different countries require different manners, perhaps? and different ministers, different treatment? Our Meerzas and Ameen-ed-dow-dahs might not like it.

From the *Bubbles of Brunner*—a fantastic title to a very agreeable and sprightly account of the mineral springs of the Duchy of Nassau—we make some extracts to-day, that will be relished, we hope, by our readers.

ENGLISH TRAVELLERS ON THE CONTINENT, AS DESCRIBED BY AN ENGLISHMAN.

'Our *compagnons de voyage* [the party were ascending the Rhine in a steamboat] were tri-colored, Dutch, German, and French, and, excepting always ourselves, there was nothing English—nothing, at least, but a board, which sufficiently explained the hungry insatiable inquisitiveness of our travelers.—The black thing hung near the tiller, and upon it there was painted in white letters the following sentence, which I copied literatim—

"*Enfering any conversation with the Steersman and Pilot is desired to be forbore.*"

'As the vessel proceeded towards Coblenz, it continually paused in its fairy course, apparently to barter and traffic in the prisoners it contained—sometimes, stopping off one little village, it exchanged an infirm old man for two country girls, and then, as if laughing at its bargain, gaily proceeding, it paused before another picturesque hamlet, to give three Prussian soldiers of the 36th regiment for a husband, a mother, and a child—once it delivered an old woman and got nothing, then luckily it received two carriages for a horse, and next it stopt a second to take up a tall thin man, who turned out to be an itinerant poet, and who, as soon as he had collected from every passenger a small contribution for having recited two or three little pieces, was dropt at the next village, ready to board the steam-vessel coming down from Mayence.

'In one of these cartels, or exchanges of prisoners, we received on board Sir — and Lady —, a young fashionable English couple, who, having had occasion a fortnight ago, to go together to St. George's church, had (like dogs suffering from hydrophobia, or tin canisters) been running straight for wards almost ever since. As hard as they could drive, they had posted to Dover, hurried across to Calais, thence to Brussels, snapt a glance at the ripe corn waving on the field of Waterloo, stared at the relics of that great saint, old Charlemagne, on the high altar of Aix-la-Chapelle, and at last sought for rest and conjugal refuge at Cologne; but the celebrated water of that town having in its manufacture evidently abstracted all perfume from the atmosphere, they could not endure the dirt and smell of the place, and therefore had proceeded by land to Coblenz; but as they were changing horses at a small village, seeing our steam-boat cantering through the glassy waves, they ordered a party of peasants to draw their carriage to the banks of the river, and as soon as the vessel came smoking alongside, their rosy, fresh-colored French maid, their chocolate-colored chariot, and their brown ill-looking Italian courier, were all on board.

'As soon as this young London couple lightly stepped on deck, we saw at one glance that, without at all priding themselves on their abilities, they fancied, and justly fancied, that they belonged to that class of society which in England exclusively, and so modestly calls itself—good. That it was not healthy society, that its victims were exposed to

late hours, crowded rooms, and impure air, was evident enough from the contrast which existed between their complexions and that of their healthy country attendant; however, they seemed not only to be perfectly satisfied with themselves and the clique which they had left behind them, but to have a distaste for every thing else which they saw.—Towards some German ladies, who had slightly bowed to them, they looked with a vacant haughty stare, as if they conceived there must be some mistake, and as if it at all events would be necessary to keep such people off.

Yet, after all, there was no great harm in these two young people. Their heads were lanterns illuminated with no more brains than barely sufficient to light them on their way, and so, like the babes in the wood, they sat together hand in hand, regardless of everything in creation but themselves.

For running their carriage down to the shore, the brown confidential courier, whose maxim was of course to pay little and charge much, offered the gang of peasants some kreutzers, which amounted in English currency to about sixpence. This they refused, and the captain of the party, while arguing with the flint-skinning courier, was actually carried off by our steamboat, which, like time and tide, waited for no man. The poor fellow, finding that the Italian was immovable, came aft to the English couple, who were still leaning towards each other like the Siamese twins. He pleaded his case, and in a manly tone of voice prayed for redress. The dandy listened, looked at his boots which were evidently pinching him,—passed four white fingers through the long curls of his jet-black hair—showed the point of a tongue gently playing with a front tooth—and when the whole story was completely at an end, without moving a muscle in his countenance, in a sickly tone of voice, he pronounced his verdict as follows—"Alley!"

The creditor tried again, but the debtor sat inanimate as a corpse. However, all this time the steamboat dragging the poor peasant out of his way, he protested in a few angry exclamations against the injustice with which he had been treated, (a sentiment we were very sorry to hear more than once mildly whispered by many a quiet-looking German;) and, descending the vessel's side into a small boat which had just brought us a new captive, he landed at a village from which he had about eight miles to walk to join his comrades.

It is with no satirical feeling that I have related this little occurrence. To hurt the feelings of "gay beings born to flutter but a day"—to break such a pair of young, flimsy butterflies upon the wheel—affords me neither amusement nor delight; but the every-day occurrence of English travellers committing our well-earned national character for justice and liberality to the base, slave-driving hand of a courier, as well as the bad taste of acting the part of London dandy on the great theatre of Europe, ought to be checked.—*Bubbles*, pp. 26, 29.

The following paragraph, taken from a Frankfort paper of April 13th, 1834, is going the rounds under the head of "German opinions of American character:"

"We have recent news from our emigrants to America. All of them indicate that the hopes that were entertained have proved fallacious; though none of the emigrants will plainly confess that he has entirely thrown away a happier way of life. Proud and covetous merchants and speculators inhabit the towns on the coast of America and the banks of the rivers; they are of English origin, and look down with an eye of contempt on the good-natured German who seeks only an ideal liberty in a foreign country, and finds a miserable existence; who is plundered if he brings money with him, and repulsed if he appears as a stranger seeking assistance and friendship. But in the interior of the country, none can subsist but the man who has a frame hardened against every kind of privation, who can sleep on straw and dry leaves as well as on a soft feather bed, who is willing to exchange the elastic sofa for a hard seat on a block of wood; in a word, who has courage to fall back from a life of luxury to the rude state of nature."

This certainly betrays great ignorance of the condition of our country generally, but hardly more than may be found in some sections of the Union, in relation to others a few hundred miles off. The Kentuckian at home will ask the New Yorker whether he has any woods or hills in his State; while the New Yorker watches for some outbreaking of the Colonel Wildfire in a man from whom, whatever

may have been his own advantages, he may yet take lessons in politeness. The East Tennessean will speak of Boston and London as if side by side with each other, and equally far from his mountain home. The Western Virginian will talk about the "Yankee pedlers" from *Pennsylvania*, and the Bostonian and Pennsylvanian will know about as much of the Hoosiers of Indiana, as does a West Georgian of fresh codfish and anthracite coal. Step but once from the great highways of travel through which our commercial population are thronging from one end of the Union to the other at all seasons, and it appears that among residents of the middle classes, it is on the frontiers alone where the enterprising and adventurous, from all parts of the Union, from each quarter of the world, are collected, that the geographical features of our broad country, and the mode of living in different sections of it, are clearly understood. Canals and railroads have a great deal to do in making the people of different parts of the Union acquainted with each other, and dispelling the almost incredible ignorance which reigns in some districts, of the pursuits and habits of others, by no means remote. In the meantime, however, much might be effected by a portion of the numerous educated young men, who now, upon leaving college, transfer themselves at once to Europe, after viewing but very little of their own country. It is such as these—men of leisure and accomplishment, who could deviate from the usual routes taken by hurried business men and mere collecting agents, and stir up the good people in old stagnated neighborhoods to something like an aspiration for intelligence and improvement. They too, in their turn, would learn, while catching the tone of a hundred secluded little communities in various parts of the country, what a small portion of public opinion comparatively is manufactured in that well-known circle, which, with them, comprehends "the world."

In a condition of society like ours, where ninety-nine men out of a hundred are bound down to regular pursuits by the trammels of business, the roving freedom of a happy, careless few, assimilates them in some points to those classes of water-fowl, which, though they neither build nests on the strange shores to which they wander, nor enrich the woods with music at home, still bear on their journeyings, and scatter for casual production, the seeds of a thousand fruits and flowers.

SUMMARY.

[From the *Baltimore Patriot* of Tuesday.]

We learn that Col. EDWARD LLOYD, formerly Governor of Maryland, and more recently a member of the U. S. Senate, died yesterday at Annapolis, aged 56.

The deceased was a favorite son of his native state—was elected when very young to the House of Delegates, and successively to all the highest stations under government. He bore a conspicuous part on all political occasions of extraordinary interest—and was as remarkable for the munificence of his private hospitality as for his public spirit.—There are few whose death will be heard with more regret by the public; none could be more deeply lamented by those who knew his fine social qualities and peculiar accomplishments.

SUGAR REFINERY.—The New Orleans (La.) Advertiser of the 27th May, says—"There are now loading at the Sugar Refinery of Messrs. Forestall & Co. four vessels for the Mediterranean. The Refinery is situated about two miles below the city. One hundred and thirty men are employed in it, and the quantity of sugar refined amounts annually to about 12,000,000 of pounds. The whole process is done by steam, and it is said to be, without exception, the most extensive and complete establishment of the kind in the whole world."

A Sloop Burnt!—The sloop *Levant*, owned by Messrs. Fitch & Losee, of this city, loaded with Lumber, took fire last night, while lying on the Over-slaugh, and burnt to the waters edge. We understand there was no insurance, and that the loss was about \$3000.

EXPLOSION.—On the morning of the 6th instant, soon after commencing their work, Edward Oates and John Cooke were together unfortunately killed, by an explosion of one of the buildings attached to the Orange Powder Mills, near Newburgh.

The only operation required to be performed in that building, is simply passing the grains through parchment sieves, and a silk reel, by hand. The cause of the misfortune is, therefore, mysterious.

The New Orleans Bulletin of the 24th ult. says "The weather for several days past, has been exceedingly cold and disagreeable. There has been more or less Cholera in the city all the winter and spring; but latterly cases have increased, and there is reason to fear that it may prevail epidemically again as it did last June."

Wheat Crops.—The prospects for the wheat crops in this county have greatly improved during the last three weeks. The wheat fields generally have an uncommonly fine appearance, and promise the farmers an abundant harvest. The crop of grass also promises to be very abundant.—[*Poughkeepsie Eagle*.]

A passenger in the ship *Gulnare*, from Havre, at Baltimore, states that when he sailed, (April 30th) it was currently reported that Louis Philippe had pledged his private fortune to pay the American Claims, should the Chamber of Deputies again refuse. This says the *Gazette*, must be an error, as our advices by the *Sylvanus Jenkins* are to the 7th May from Paris, and no mention is made of the fact.

The State Loan.—The State Loan of \$600,000 was on Thursday last taken by E. Chancery, Esq. of Philadelphia, at a premium of two dollars and fifty-eight cents, i. e. he agreeing to pay one hundred and two dollars and fifty cents in money, for every hundred dollars of stock. The loan of \$1,665,400 remains in the market until Thursday, the 10th July.—[*Philadelphia Nat. Gaz.*]

The venerable Bishop CHASE, says the *Detroit Journal*, arrived in our city some days since; he preached on Sunday last at the Episcopal Church. This estimable man resides in the St. Joseph county, he appears to enjoy excellent health, and amid the cares and employments of a new farm in a new country, he finds leisure for intellectual labors. The occasion of his visit to our city is in part to superintend the publication of a pamphlet he has prepared for the Press.

[From the *Commercial Advertiser*.]

ECONOMICAL PENMAN.—A treatise and samples have been shewn us, entitled "The economical and expeditious Penman, or an easy method by which a free, legible and elegant style of writing may be readily acquired by a system altogether novel, and hitherto unattempted." It is for sale by the author, Mr. William Jones, late of London, at his Writing Academy, 202 Broadway. We have witnessed the best test of improvement in writing—the proficiency attained by one of his pupils, and the book referred to is the adaptation of his system to the eye. Its object is, without the aid of a master to enable the purchaser to acquire a style of writing, suited alike to the men of business and the general correspondent. Editors have special reasons for wishing that the art of legible penmanship may be more universally diffused.

A greedy Sheep.—On Thursday last, on a farm in the Aird, a ewe ate the tails of her two lambs completely to the stump! This unnatural preference of mutton to hay and turnips, was witnessed by the farmer and his servants, who interfered to save the lambs from the woolly cannibal, but without effect, as she returned to the charge when unobserved, and accomplished her purpose.—[*Inverness Courier*.]

A Persian Fable.—I was walking in a beautiful meadow with a friend, where I saw a man, who I knew to be a villain, sleeping in great comfort and tranquillity. "Good heavens," exclaimed I, "the evils which this man has committed do not break his repose!" "God," said my friend, "suffers villains to sleep, that honest men may live undisturbed."

From Rio Grande.—By the brig *John Alexander*, Capt. Berry, arrived yesterday from the above port, we learn that Capt. Baker of the brig *Ganges*, from Boston, having arrived at Rio in March, when the authorities suspecting that he had false coin on board seized the brig and took out all her cargo. Finding however, that it was all entered on the manifest, but among other things there were entered 25 boxes of soap, and as it was not entered as *shaving* soap, they fined the Captain 300 miltreas, and confined him one week in prison.—[*Gaz.*]

Our readers will, we think, be interested by the spirited account in this day's paper of the reception, by the Pawnees, of the United States Commissioner, Mr. Ellsworth, on a mission to effect a treaty with them. We are obliged by the communication of a narrative so graphic and well sustained.

Reception of the United States Commissioner by the Pawnee Indians, October 2, 1833.

The night previous to our arrival at the Pawnee Village was spent by us upon the borders of the Platte River, at about nine miles distance from the town. During the evening, several half breeds who had been sent out by the Commissioner, to gain information of the probable reception which awaited us, came dropping in, and all bearing with them promises of a friendly welcome from the different Pawnee Chiefs. At sunrise the next morning the tents were struck and placed in the heavy baggage wagons; and a more than usual bustle and note of preparation was heard in the camp, (if two tents accommodated ten persons deserve that name.) The soldiers were seated around upon the grass, examining and preparing their arms for service, in case such service might be required; and about twenty Otoe Indians, who had accompanied us across the prairie, a hundred miles from their village, either from motives of curiosity, or from sheer listlessness, caring little where or how they spent their time, were now busily engaged in ornamenting themselves for the meeting. Some had spread their blankets out upon the prairie, and were anxiously employed in tracing out various figures in vermilion upon their woolly surfaces: some were eagerly bending over the small pools of still water, which were left in the dry bed of the River, painting their faces with the vermilion which they had obtained from the whites, and manifesting all the interest and anxiety in the choice of the ornaments, which in civilized life might be expected from a young girl in preparing for her first ball. Paint was placed on and rubbed off; faces were striped first in one direction, then in another; and the advice of those who were sitting around was asked and given with all the gravity befitting so important an operation. In the meantime, two or three who had finished their toilets, seated themselves off at a short distance to serve as models for the rest; and several who had acquired some reputation for their skill in this art, were busily engaged in painting up the less gifted of their companions. Whilst this was going on in one quarter, in another, five or six Indians, who either had no paint, or cared not about the opinion of those whom they intended to visit, had stretched themselves at full length in the grass, and were keeping up an incessant drumming upon their breasts with their two fists in exact time to a chaunt, which they were letting out at the top of their lungs, and which they always wound up with a loud yell, by way of chorus.

But there must be an end of all things, and in due time there was an end of the preparations. The tents were packed; the Indians were painted and striped to resemble any thing but men; the soldiers had examined their arms; the horses were saddled; the oxen were secured before the heavy baggage wagons, and the party commenced slowly moving onward towards the village.

It was a fine sunny morning in October, the clumps of trees which clustered on the low banks of the river, the numberless small islands which dotted the surface of its broad shallow water, were alive with woodpeckers of every size and hue, who were darting among the tall dead trees which overhung the dark and muddy stream, and making their trunks resound with the incessant hammering of their small but powerful beaks; large flocks of gaily plumed parrots whirled screaming past us with a surprising velocity, darting like lightning among the branches of the trees which skirted the banks of the river.

At ten o'clock the party had travelled several miles across the prairie, and our vicinity to the village was becoming more perceptible. Mounted Indians, who had been sent out to watch for our approach, were seen here and there flying across the hills in the direction of the village, to give notice of the arrival to their Chiefs. At a distance we could perceive several bands of Indians in pursuit of large droves of their wild and fiery horses, which they were urging forward at a headlong speed in the direction of the town, and in another quarter, on the tops of a ridge of small hills, groups of five or six were standing, intently watching the motions of the party, which, from the jaded state of the oxen, were necessarily slow. The soldiers who had been lazily lounging along across the prairie, were now called in and formed in a compact body around the baggage

wagons in case of danger; and an hour more brought us in sight of the village.

Upon our nearer approach, we could perceive that the hills which surrounded the place were black with the living mass of mounted warriors which swarmed upon their tops to the number of several thousands, and who now stood silently watching the approach of the Mission. At length a single horseman detached himself from the mass, and came galloping down the hill and over the prairie to meet us. As he approached nearer, the wild free air of the rider, and the ease with which he governed his gigantic black horse, could not but raise the thought that, if the rest of these warriors were of the same mould, any resistance of our band, however desperate, would have availed but little against the attack of these proud rulers of the prairie.

Upon reaching the party, he sprang from his horse, and after shaking hands with Mr. E—, he gave directions (through the Interpreter), that the band should be drawn up in as small a compass as possible, to avoid all contact with his warriors, and after spending some time in completing his arrangements, he galloped back and gave the signal to the rest.

In an instant, the hills were deserted, and the whole mass of warriors were rushing towards us across the broad bosom of the prairie. It was a moment of intense and fearful expectation. On, on, they came, each mad horse with erect mane and blazing eye, urged forward by the bloody spur of an Indian master, and that master a being who acknowledged no superior but the Great Spirit, and no ruler save his own wild will.

They had reached within two hundred yards of the party, but still the speed of their horses was unchecked; the powerful tramp of their hoofs rung like thunder upon the sod of the prairie, and the wild forms of their riders were still urging them onward towards us, when at a signal from the Chief, the band separated to the right and left, and commenced circling around the party, in one dark, dense flood of human beings, while the whoops and yells which rung shrilly around us, and the furious and menacing manner in which they brandished their bows and tomahawks, would have led a person unacquainted with their habits to have looked upon this reception as any thing but friendly; and there is something in the fierce, shrill scream of a band of Indian warriors, which rings through the brain, and sends the blood curdling back to the heart.

Their ornaments, though wild, were many of them beautiful: the closely shaven heads of some were adorned with the plumage of different birds; others wore an ornament of deer's hair, bound up in a form resembling the cone of an ancient helmet, and a plume of the bald eagle floated from the long scalp locks of the principal warriors.

Some few wore necklaces of the claws of the grizzly bear, which hung down upon their breasts, and the bodies of some were covered with buffalo robes, or the skin of the white wolf; but the most of them wore no covering, save a thick coat of paint, which they had profusely smeared over their bodies and arms, and which many had even bestowed upon the heads and limbs of their horses. After rushing around us for some time, the chief waved his hand, and the turmoil ceased: the warriors sprang from their horses, and seating themselves around in a large circle, awaited the arrival of the Chief of the Grand Pawnees, who in a few moments advanced to meet Mr. E—, accompanied by the different chiefs of Tappaye Pawnee, Pawnee Republican, and Pawnee Loup villages.

He was a tall powerful Indian; a fillet made from the skin of the grizzly bear, and ornamented with feathers, was bound around his head: over his shoulders was thrown a large mantle, made from the skin of the white wolf, also adorned with feathers: his legs were cased in black leggings of dressed buffalo hide, worked with beads, and fringed with long locks of human hair, which he had taken from the scalps of those who had fallen beneath his arms in his various war expeditions, and which now hung down over his knees, and trailed upon the ground as he strode up to the party.

He first advanced and welcomed Mr. E. and afterwards the rest. The chiefs of the three different villages were then introduced, and repeated the words of welcome uttered by the first.

This ceremony was scarcely finished, when a movement was observed among the crowd, and in a moment after, a powerful roan horse, mounted by an armed Indian, bounded forward to the middle of the circle, where the rider sprang from his back.—He was a stranger among the tribe, and spoke not their language: a Cuyway Indian from the borders of Mexico, a member of those wild tribes, the Arabs

of the West, who are continually on the wing, sweeping those immense plains, and carrying destruction to all who are not strong enough to resist them, having no home but the prairie, no trade but war, no property save the horse that bears them, the arms which they wield, and the plunder which they strip from their victims. After pausing and looking around him for a moment, with a glance that seemed to challenge any opposition from the assembled warriors, he walked up to Mr. E. He was a slight and beautifully formed Indian, but there was a fire in his eye, a swell of the nostril, and a proud curve of the lip, which showed a spirit that brooked no opposition, shunned no danger, and which could only be quenched by the chill of the grave.*

His long black hair, which trailed behind him upon the ground, was platted together, and ornamented with about twenty plates of massive silver; a band of silver was fastened around his throat, and several large medals of the same metal hung down upon his breast; upon his arms were several bands of silver, and rings of the same upon his fingers; his leggings, though more finely wrought, like those of the other chiefs, were fringed with scalps; and a scalp, consisting of the entire upper part of a human head, hung from the bit of his fiery horse.

Upon coming up he offered his hand to Mr. E—, and in succession to the rest; and after pausing and gazing upon us for a short time, with some curiosity, he sprang upon his horse, and riding through the circle, was lost behind the more distant crowd of warriors.

After the introduction of the various Chiefs had been performed, from among the mass of grim beings which hemmed us in, and who were now seated upon the ground like so many dark forms of statuary, without voice and without motion, several arose, and coming towards Mr. E—, and Major D—, the United States Agent for the Pawnee Indians, extended the stem of their pipes to the lips of each, and instantly retiring, resumed their station in the crowd. By this action, we afterwards learned, that each had pledged himself to present a horse to the person to whom he had extended his pipe. In the meanwhile, two old men, who had assembled with the rest, and had no horses to lose by the free indulgence of liberal feelings, rose up, and by loud and vehement harangues endeavored to excite the liberality of the rest by boasting of the number they would bestow, if they but had them, and recounting the acts of generosity which they had performed in their youth, and which, as that youth ran far back beyond the memory of the eldest inhabitant, there was but little possibility of contradicting.

After they had finished, the Wild Horse. (I do not recollect his Indian name) the principal warrior of the nation, stood up and harangued the assembled multitude, launching out in a long panegyric upon the whites, which was delivered with a warmth of expression no doubt greatly increased by the sight of the wagons loaded with presents, which accompanied the party, and which are always necessary to the successful accomplishment of an Indian treaty.

This warrior was one of the most singular, as well as ferocious of the tribe; and many were the tales of his war expeditions, afterwards related to us by the trappers, when we assembled around our night fires after a long day's travel across the prairies. His height could have been but little short of seven feet and every limb of his frame was proportioned in size and strength to his giant height. Unlike the rest of his tribe, his hair remained unshaven, and hung in long tangled locks which reached nearly to his waist, and were profusely smeared with red ochre. His low retreating forehead was almost buried in wrinkles; and deep set in his head were two eyes which glowed like living coals. His nose was large and prominent, and the size of an enormous mouth was not at all diminished by two streaks of vermilion which he had drawn from each corner to his ears. He wore neither covering nor ornament, unless the profusion of black clay and red ochre which covered his body, deserved that name; but he stood out in his naked proportions, a giant among those who sur-

* We afterwards learned that this Indian had become attached to a young girl of his own tribe, who was the wife of another, but her husband having started upon some expedition she had taken advantage of his absence to leave her nation with her lover, and together they had fled to the Pawnee village which they had reached a week previous to our arrival. We were afterwards so fortunate as to see the girl, and it was admitted by all that she was one of the most elegant Indian women they had ever beheld, and that her beauty went far in extenuation of the act of her Indian lover.

rounded him, whilst the wild energy of his gesticulation as he delivered his harangue, served to show the prodigious strength which lay hidden in that form, and which only required an occasion to bring it into action. From his youth upward, he had been the leading warrior of the nation, and his deeds had spread a terror of his name through all the hostile tribes. Though no chief, his influence with the nation was equal to theirs, rendering him as much an object of jealousy to them as of dread to their enemies.

When he had finished his address, the Chief arose and spoke to his men; after which, the circle opened and forming into two lines, one on each side, prepared to escort the party into their village.

MICHIGAN.

This portion of our country is very justly attracting a very large share of public attention. To the farmer it is interesting on account of its luxuriant soil and healthful climate; to the merchant for its immense facilities for trade, being intersected in all directions by fine rivers, penetrated by deep bays, and surrounded by magnificent lakes; to the statesman and philanthropist, it is interesting, as destined to be the speedy home of hundreds of thousands of enterprising emigrants who will exercise an important influence in the affairs of the nation, and whose heterogeneous character will afford a curious subject of observation. The character of the interior of Michigan is much misunderstood. Instead of being a cold, wet region, there is no country more dry, rolling and pleasant, after you get out 15 or 20 miles from the Lakes and their connecting rivers. The innumerable little lakes interspersed through the country, serve to drain it perfectly; and one can scarce imagine a more pleasing sight than the gently rolling hills, covered with the orchard-like woods, which constitute the *Out Openings*, surrounding one of those deep, clear and crystal-like pools, abounding in fish.

It is a matter of surprise that this region is not more visited by those who travel so much every summer for health or amusement. Travelling has been rendered so convenient that it has lost all its terrors even to the most delicate. Starting from New York, for instance, in a few days we may find ourselves, after a delightful tour up the Hudson, and through the beautiful villages and cultivated fields of the interior of New York, at the Falls of Niagara, where no man can live without becoming a poet, such is the inspiring influence of the scenery. Near this too are the scenes of several of the most interesting military operations of the last war. Embarking at Buffalo, we find ourselves on board a steam ship far superior in safety and comfort to any thing of the kind to be found on the North River; and in 30 to 36 hours we find ourselves at Detroit, where we may see a most thriving city of five or six thousand inhabitants, and where we will meet an active and intelligent people, than whom none in the Union are more hospitable and liberal. Here, too, if we are so fortunate as to have a good reference, we will find a comfortable home at the house of Mrs. Snelling, widow of the late gallant Col. Snelling of the army. This lady occupies the former residence of old Gov. Hull, the only house in the city well adapted for a boarding house, where she combines the elegant taste of our eastern cities with the ease, frankness, and conviviality of the West.

After enjoying the hospitality of Detroit, and viewing the interesting region around, some of whose scenes have become truly classic, we may step on board the splendid steamboat Michigan, and wend our way to Macinac, Saut de Ste. Marie, Green Bay and Chicago; and return in the same boat, or cross the Peninsula by land, or travel eighty miles across the prairie to the falls of the Illinois, where we can take a steamboat twice a week to St. Louis, and return by way of the Ohio. Either of these routes may be travelled with much ease, little expense, and great pleasure. The whole tour from New York to Chicago and back would not occupy more than four weeks; and how much better it would be to make this tour than to idle four weeks away at Saratoga, I leave those interested to judge. The fine new steamboat Michigan will leave Buffalo on the 10th July and 1st August on this tour, and goes expressly to accommodate passengers wishing to see the regions of the Upper Lakes.

[From the Journal of Commerce of yesterday.]

DEPARTURE OF THE MORRISON.—The ship Morrison, Captain Lavender, left us yesterday, bound to Canton. She has on board as passenger, the Rev. Peter Parker, late of Framingham, Mass., who goes out as missionary to China. This gentleman, during the two or three weeks he has been in this city, has

gained the affectionate confidence of all who have had intercourse with him. Sunday before last, we had the pleasure of hearing him preach, and again last Sunday evening, of listening to a Farewell Address which he delivered in the Bleecker st. Church. On the latter occasion, notwithstanding the rain, the house was crowded to excess. Every aisle and corner where a person could find footing, even to the pulpit stairs, was occupied, and many went away, from the impossibility of gaining admittance. A delightful impression was left upon the minds of the audience by the various exercises of the evening, among which was the communication of Instructions by the Rev. Dr. Wiener, as Secretary of the American Board of Missions, and an address by the Rev. Dr. Spring.

Yesterday morning, at six o'clock, a meeting was held at the house of Abijah Fisher, Bleecker street, for the purpose of commending both the Missionary and the Missionary cause to the care of Omnipotence. Some of our friends who were present, tell us that it was a scene of rare and peculiar interest. After singing the first two verses of the 496th of the Village Hymns, "Go, messenger of love," &c., prayer was offered by the Rev. Elihu W. Baldwin. Then were sung the 1st and last two verses of Heber's missionary hymn,

"From Greenland's icy mountains."

Next a prayer was offered by the Rev. O. Eastman—after which was read the 91st Psalm—"He that dwelleth in the secret place of the Most High," &c. Prayer by the Rev. Erskine Mason. Address, by the Rev. Dr. Wiener. Parting address and prayer, by the Rev. Peter Parker. Next were read the last three verses of the Gospel of Matthew, containing the commission of our Saviour, "Go ye therefore and teach all nations." Mr. Parker then read the following hymn, and added, addressing himself to the little assembly, "I want you to sing it, for I cannot."

THE MISSIONARY'S FAREWELL.

Kindred, and friends, and native land,
How shall we say farewell?
How, when our swelling sails expand,
How will our bosoms swell?
Yes, nature, all thy soft delights
And tender ties we know:
But love, more strong than death, unites
To Him that bids us go.
Thus, when our every passion mov'd,
The gushing tear drop starts;
The cause of Jesus more lov'd,
Shall glow within our hearts.
The sighs we breathe for precious souls,
Where He is yet unknown,
Might wait us to the distant poles,
Or to the burning zone.
With the warm wish our bosoms swell,
Our glowing powers expand;
Farewell,—then we can say,—Farewell,
Our friends, our native land!

The exercises were concluded with prayer, and the benediction by Rev. Dr. Wiener.

At 9 o'clock, or soon after, Mr. Parker, accompanied by a number of missionary friends, went on board the steamboat Rufus King, and proceeded to the ship, then lying off Bedlow's Island. While towing the ship to sea, religious services were held on board the steamboat.

Mr. Parker is both a clergyman and a physician. His design is, we understand, to associate himself in labors and travels with the celebrated missionary Gutzlaff. He knows full well that the service he has undertaken is full of peril; but he has counted the cost. He leaves his home and country, (never expecting to see either again,) not only with cheerfulness, but with a glow of pious feeling which makes him a truly happy man. Possibly some of our readers may deem our language strong; but we know that those who have been present during the scenes to which we have alluded, will think it tame and cold, in comparison with the reality.

Mr. Parker is accompanied by a Chinese youth, 19 years of age, who, by some means or other, found his way to this country, and has acquired considerable knowledge of our language. Mr. P. hopes to derive much assistance from him, during the voyage, in learning the Chinese. "I no like my country's religion," said the young man, on being conversed with by Mr. Parker: "I like your religion better." "Then what do you go back to China for?" asked Mr. Parker. "To get more money," was the reply. We fain would hope, that by his intercourse with that excellent man, he may gain, with the blessing of God, what is more valuable than money, or worlds.

The owners of the Morrison, Messrs. Talbot, Olyphant & Co. have been extremely kind to Mr. Parker, and among other tokens of their interest in him and the cause he goes to plead, they give him his passage gratis. Mr. Olyphant has himself gone passenger in the Morrison, together with his eldest son

and a daughter. He expects to be absent about two years.

The Morrison got to sea about half past 12 o'clock on Wednesday, and was well off, probably, before the blow during the night.

[From the London Literary Gazette, of April 19.]

"THE VOICE OF THE WAVES."

(Written near the Scene of a recent Shipwreck.)

"Answer, ye chiming waves,
That now in sunshine sweep;
Speak to me from thy hidden caves,
Voice of the solemn deep!
Hath man's lone spirit here
With storms in battle striven?
Where all is now so calmly clear,
Hath anguish cried to Heaven?
Then the sea's voice arose,
Like an earthquake's under-tone—
Mortal, the strife of human woes
Where hath not nature known?
Here to the quivering mast
Despair hath wildly clung;
The shriek upon the wind hath past,
The midnight sky hath rung.
And the youthful and the brave
With their beauty and renown,
To the hollow chambers of the wave
In darkness have gone down.
They are vanished from their place
Let their homes and hearths make moan!
But the rolling waters keep no trace
Of pang or conflict gone.
Alas! thou haughty deep!
The strong, the sounding far!
My heart before thee dies—I weep
To think on what we are!
To think that so we pass,
High hope, and thought, and mind,
E'en as the breath stain from the glass,
Leaving no sigh behind!
Saw'st thou nought else, thou main,
Thou and the midnight sky—
Nought, save the struggle, brief and vain,
The parting agony?
And the sea's voice replied—
'Here nobler things have been!
Power with the valiant when they died,
To sanctify the scene:
Courage, in fragile form,
Faith, trusting to the last,
Prayer, breathing heavenwards through the storm,—
But all alike have passed.
Sound on, thou haughty sea!
These have not passed in vain;
My soul awakes, my hope springs free
On victor wings again.
Thou, from thine empire driven,
May'st vanish with thy powers:
But, by the hearts that here have striven,
A loftier doom is ours!"

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1853, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORBURN,
347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better justice can be done in the execution.

* Mr. Thorburn is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine.
MECHANICS' MAGAZINE and Register of Inventions & Improvements.

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the

NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them, by calling at 347 North Market street, Albany.

NOTICE TO MANUFACTURERS.

13th SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 13, 1853.

A29 U RM & F

It is stated in the St. Augustine Herald, that the Savannah and Florida Steam Boat Company propose, in connexion with the boat now running between Savannah and St. Johns, to carry their operations across the Peninsula and even to New Orleans. Peter Mitchell, Esq. of Savannah, (late of Florida, where he is known as an enterprising and talented gentleman, and also as extensively acquainted with their geography, resources and capabilities,) was recently commissioned by the company to examine the country between the navigable waters of Black Creek and those of the Santafe river, with a view to the facilities of this communication. It is proposed by the company to make an establishment on Black Creek, and another on the Stantaffe, and to communicate between these two points by a line of stages, it being but about sixty miles from one to the other. To their location on the latter river, steamboats will be accessible, and from it to New Orleans, with which they will be enabled to communicate in about two days. It is calculated, that by this route and with no other facilities over land than the usual accommodation stages and steamboats on the Atlantic and Gulf, an easy correspondence may be maintained between New York, via Charleston and Savannah, and New Orleans in eight days.

Railroads in England.—There is now building in England what they term "The great Western Railroad," which is to connect London and Bristol. Another is building between London and Southampton; another from London to Greenwich; another from London to Birmingham; another from Hull to Shelby; and the Northern Union Railroad.

An Otaheitan Bride.
The bride, Miss Kingatara Orurath, an Otaheitan, is the daughter of Demstrfgwomldammfr, one of the chiefs of the island, and is connected with most of the noble families of the kingdom. She is about sixteen years of age, of a bright mahogany color, with her cheeks tattooed in the most lovely manner, and her ears slit in a style peculiarly fascinating. Her eyes are large, and of a greenish color. Her lovely form, which was almost six feet six inches tall, was gracefully enveloped in an old blanket, and during the performance of the matrimonial rites, the fair bride stood before her happy lover modestly masticating a sugar cane. The young lady is said to be highly accomplished, and delighted the company assembled on this solemn occasion, by an exhibition of her superior skill in swimming. The bridegroom is a hearty mariner of Newport."

The body of a man six feet in height, without coat or hat, a cloth vest, satinet pantaloons, white cotton socks and brogans, with a stone of fifty pounds weight tied to his legs, was found near the bank of the river, five miles below St. Stephen's, Alabama.

[From the Village Post.]

LAND-BREEZE BETWEEN THE TROPICS.

"The forests of Brazil are filled with aromatic plants, whose perfumes are often wafted many leagues to sea."

To the billow-borne pilgrim, alone on the seas,
How sweet comes the perfume of land with the breeze!
'Tis the breath of a summer, eternal in prime;
The kindest fragrance of sun-gladdened clime!
Those wanderings of sweetness, how welcome they are!
That tell of a country unseen and afar.
Like the morning, their advent eye ushers a smile;
And the rover's heart dances in joyance the while.
To cheer his lone vigil at midnight, they tell
Of meadow and mountain, of forest and dell—
Till his eye o'er the ocean forgetteth to roam,
And he walks in his slumber the fields of his home.
Thus oft on life's billow, with bark tempest driven,
The voyager fancies the breathings of Heaven!
The past and the present remembering no more,
He greets in his vision the world that's before. C.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. E. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon dale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New York, {
Janu 29, 1833. }

SURVEYORS' INSTRUMENTS.
Compasses of various sizes and of superior quality warranted.
Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street,
Jsl 64 corner of Maidenlane.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 22 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine-wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,
WILLIAM NORRIS, Secretary.

December 24, 1833.

For further information on this subject see No. 49, page 772, Vol. 2, of Railroad Journal.

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,	Flat Bars in
300 do. 1 1/2 do. 1/2 do.	lengths of 14 to 16
40 do. 1 1/2 do. 1/2 do.	feet counter sunk
300 do. 2 do. 1/2 do.	holes, end cut at
300 do. 3 1/2 do. 1/2 do.	an angle of 45 de-
soon expected.	grees with spli-
	cing plates, nails
	to suit.

250 dn. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 5, and 6 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. RALSTON.

9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

d71meowr

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes; and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

Baltimore, 1832.

In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely anything to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.
Philadelphia, February, 1833.

Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
Germantown and Norrist. Railroad

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J25 tf

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.
mls

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTE, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Hearte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,

Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.

To Messrs Ewing & Hearte.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,

Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JUNE 21, 1834.

Should this number of the Journal fall into the hands of any gentleman who is not a subscriber, he is desired to consider it a *modest* invitation to *become so*, and to remit a \$5 bank note, and in return he shall receive the Journal commencing *either* with the 1st, 2d, or 3d vol., or at the *middle* of the 3d volume, which will be on the 1st July, and a receipt for the money. Let him look at the contents of this number, and then ask where he can get more practical and useful information for 6d. ? or where he can find a work that contains the *same kind* and amount of information for \$3 a year ?

Are the people in his neighborhood engaged in constructing railroads or canals, or M^d Adam roads ? then in the Journal will they find something to aid and promote the cause. Does any new plan or method of constructing make its appearance, or excite action, some account of it may be found in the Journal. Allow me then to urge every one who reads this, that is not a *subscriber* already, to send his order at once, and it shall be supplied, either for *past, present, or future* volumes.

Bound volumes, in two parts, \$4—in one part \$3.50; stitched in paper cover \$3.25; forwarded by mail as published once a week, \$3.

The attention of our readers is called to the article on the Chesapeake and Ohio Canal, and to that on Steam, and Steamboats. They are both interesting.

HARLAEM RAILROAD.—The Harlaem Railroad commences at Prince street, in the Bowery, and follows the line of the 4th Avenue to Harlaem, 7½ miles, 5 miles of which, to

Yorkville, are completed. The first part of it, or to 14th street, has a single track, laid in the most substantial manner on granite sleepers; from 14th to 23d street, there is a double track, also on granite sleepers; from 23d to 84th street, wooden sleepers are used, and a double track nearly all the way.

There has been much deep cutting; in some places to the depth of 30 feet, through solid rock. Also some high embankments, especially a little south of Murray Hill.

This road was chartered in 1831, with a capital of \$350,000. Cars were first used on a part of it—to Murray's Hill—in June, 1833; they now run every half hour to Yorkville. Probably 150,000 passengers have rode upon it. The cars are elegant and commodious, drawn by horses. The fare for each passenger is 12½ cents. When the road shall have been brought down to Wall street, as it should, and will be—when the citizens become satisfied that it is not only easier, cheaper, and far less dangerous than the omnibuses—thousands will ride where there are now only hundreds; and thousands will ride out and take the fresh air, and a view of the green fields, who now never, or seldom, enjoy that luxury. It *must* and will be extended to Wall street, if not to the Battery, short of which it ought never to stop, so that those living at the extremes may interchange civilities without the expense of a hack, or the inconvenience of being jammed into an omnibus, and the risk of a race in Broadway with a rival line.

This road will, I have no doubt, great as the expense is, be a good investment, when completed, for passengers alone.

BURDEN'S BOAT.

Mr. Burden's Boat has been out twice since the drawing (see page 373) was taken, and each time has acquired a greater velocity than on its previous trial. It acquired yesterday a velocity of *twenty-five* revolutions of its wheel, of 30 feet diameter, per minute, or more than 20 miles per hour.

Not having been able to accept of Mr. Burden's invitation to accompany him on his excursion on Thursday, we avail ourselves of the following from a gentleman who was on board:

Another excursion was made yesterday on

the Hudson River, and the result fully bears you out in what you have before stated, "that Mr. BURDEN will accomplish all that he has professed to do." The boat went at the rate of more than 20 miles per hour. I will venture to assert that if a person was blindfolded, and put into the cabin, he could not possibly distinguish that he was on board any vessel, even if going at its greatest speed—no noise is heard from the working of the machinery—the entire absence of that tremulous motion so unpleasant in other steamboats, is a sufficient test of its improvement. Another advantage, and a very important one, will not fail to attract the notice of every reflecting mind—it causes no swell whatever in the river; the smallest wherry can come alongside without inconvenience. It will be obvious how useful vessels similarly constructed will be on canals and narrow rivers. No injury will be done to the banks, which hitherto has been the chief obstacle to their introduction. And when it is taken into consideration, the extraordinary speed which can be accomplished by such a boat, we must come to the conclusion that it will confer great benefit on this country.

Mr. Burden is very sanguine of accomplishing all that he has promised. He is sole owner of the boat and of the patent. The contemplated arrangement with the Hudson river company last fall having been abandoned.

METEOROLOGICAL STONE.—A Finland journal gives an account of a singular stone in the north of Finland, where it answers the purpose of a public barometer. On the approach of rain, this stone assumes a black or dark grey color, and when the weather is inclined to be fair, it is covered all over with white specks. This stone is, in all probability, an argillous rock, containing a portion of rock-salt, ammonia, or salt-petre, and absorbing more or less humidity in proportion as the atmosphere is more or less charged with it. In the latter case, the saline particles, becoming crystallized, are visible to the eye as white specks.

FOSSIL HORNS.—In excavating the Lancaster Lateral Canal, near a place called the "Deep Cut," bones of extraordinary dimensions have been discovered. Among the curiosities found is a horn six feet in length, weighing 44 lbs., and measuring at the butt end sixteen inches. Also, a tooth weighing 6½ lbs.

CHESAPEAKE AND OHIO CANAL.—The following interesting and valuable communication was duly received, but it has been detained for the purpose of publishing it in another form at the same time, to accompany the forthcoming *Railroad and Canal Map*—with which we hope to be able to give some particulars relative to other canals, as well as railroads, in the United States. The apology will, we trust, be satisfactory to our correspondent, and our readers also—who is particularly requested to continue his favors, as he may find leisure. Such communications will be found interesting and useful, not only in this country but also in Europe, where they will find their way if they are to be found in the *Journal*—(we say this without boasting.)

We may now, we think, again call upon engineers and other gentlemen, connected with railroads and canals in different parts of the country, to furnish us with similar statements of the works under their charge, or with which they are familiar, that we may be able to give a condensed account of them. It is that with which the public cannot be too familiar—nothing tends more to promote a useful object than familiarity with its details.

Statistical Facts in relation to the Chesapeake and Ohio Canal. To the Editor of the American Railroad Journal.

WASHINGTON, April 11, 1834.

SIR,—The following statistical facts, in relation to the Chesapeake and Ohio Canal, I have collected from the mass of documents which have been printed by Congress and the Company, and which amount in bulk to several octavo volumes. I have not, either, all of their reports to refer to, as the price of an entire copy of the proceedings of the board of directors and engineers costs now \$20 to \$25, and many of the papers are very scarce. Such as are given below will, I hope, answer your purpose. Alter them and change them as may best suit your views.

The general convention of Delegates from Pennsylvania, Maryland, Virginia, the District of Columbia, and one or two of the Western States interested, first met at Washington, D. C., in November, 1823, to determine on the proper measures to be adopted in reference to the successful prosecution of this great work of internal improvement. The first charter was granted by Virginia, in January, 1824, which was confirmed by Maryland in January, 1825, and by Congress in March of the same year. Pennsylvania granted her charter with some restrictions, (relative to portions of the appropriations of Congress being applied to the construction of the western section, &c.) in February, 1826. All four of these legislative bodies have since passed various acts, extending and restricting the powers of the Company.

SUBSCRIPTIONS.—Books were opened in 1826, after the confirmation of the charter by the several states.

Private subscriptions, - - - \$610,000
By Maryland, in March, 1826, - 500,000
Maryland, in 1834, granted \$50,000 additional: \$25,000 cash, and the remainder when a further subscription was made by Congress.
By Virginia, in 1833, - - - 250,000
Virginia had subscribed, in 1826, her interest in the Potomac Canal Company, which was then valued at 2 or \$300,000.

By Corporation of Washington, - 1,000,000
By Corporation of Alexandria, - 250,000
By Corporation of Georgetown, - 250,000
By Congress, - - - 1,000,000

The cost, as estimated by the U. S. Engineers

on the first surveys, was \$22,375,427.69; and, by Geddes and Roberts, the company's engineers, since that time, was \$9,347,408.69.

The projected route, (and in its location, thus far, it has deviated very little from the line originally laid out,) was up the valley of the Potomac river, as far as Cumberland; thence it follows the valley of Wills' creek, as far up as the mouth of Bowman's run, from which place it is to cross the summit ridge by a tunnel, railway, or inclined planes, as the company may see fit, the privilege of selecting being granted by their charter. (It is most probable that the company will adopt a railway with stationary power, as it will in the end prove the cheapest and most convenient.) The western course is thence down Castleman's river and the Youghagany, and the Monongahela, to Pittsburgh. (It is doubtful, I think, whether this line, the western section, will be adopted, as the United States have been projecting improvements on the Monongahela river, so as to render it navigable as far as Brownsville, 55 miles by the course of the river above Pittsburgh, and it will be shorter and more convenient to end at Brownsville than its present projected termination.) The total length of this projected route is 341 miles, 676 yards, and is divided into the eastern, the middle or mountain, and the western sections, the former extending from Georgetown to Cumberland, 185 miles, 1078 yards; the middle section, thence to the mouth of Castleman's river, 70 miles, 1,010 yards; and the latter thence to Pittsburgh, 85 miles, 348 yards.

DIMENSIONS OF THE CANAL.—The size of the Erie canal was at first adopted as sufficient for the Chesapeake and Ohio Canal. But this idea was soon abandoned, and the following size determined on: 60 feet wide at surface, 42 feet at bottom, and 6 feet deep,

giving a cross section of 366 feet. But for the purpose of giving sufficient water for manufacturing purposes, the first two miles above Georgetown were widened to 70 feet, with a depth of 7 feet, and the succeeding two miles have a width of 80 feet, and 7 feet depth. Between Harper's Ferry and the Point of Rocks, in some few places, and for short distances, it has been narrowed to 50 feet, and above Harper's Ferry it has been widened to 90, 100, 120, and even 150 feet, in several places. The locks are 100 feet long by 15 wide, in the chamber, and 6 feet deep. The tow paths are 12 feet wide, and the berm bank 8 feet. All the culverts, aqueducts, and locks, are built of solid stone masonry, laid in hydraulic lime. Many of the locks are so constructed, by lengthening the side culverts and multiplying their outlets, as to be filled in one half the usual time.

In November, 1830, the sections extending from the Seneca feeder to the termination of the old canal, around the Little Falls of the Potomac, (a distance of 17 miles and 774 yards,) were finished and opened for use. The sections in Georgetown were finished in August, 1831. The sections from the Seneca feeder to the Point of Rocks, (a distance of 26 miles and 363 yards,) were open for use in the spring of 1832, and by the end of 1833 it was completed as far as Shepherdstown, (72½ miles from Rock Creek Basin, Georgetown.)

Between the Georgetown Basin and the Point of Rocks, a distance of 48 miles, 118 yards, is a rise of 217 feet, overcome by 27 locks: for the lift and distribution of which see table given below. Between the Point of Rocks and Williamsport, (to which the canal will be open from Shepherdstown this spring or summer,) a distance of 66 miles and 762 yards, is a rise of 136 feet, overcome by 17 locks: see table.

No. of lock.	Lift.	Construction.	Distance / Total distance from lock to lock.		Remarks.

Besides the above 44 lift locks, a communication with the river Potomac is to be effected through the guard locks at the entrance of the feeders from the Potomac, and also through the several lift locks designed for the Virginia trade, and constructed in compliance with the Virginia charter. Four of these locks are required to be constructed similar in size and construction

to the other lift locks of the canal, viz.: one opposite the mouth of Goose creek, which enters the Potomac, opposite the foot of lock No. 25; another at the Point of Rocks; another opposite Shepherdstown; and the 4th, near the mouth of Opequon. The latter has since, however, been dispensed with, as its purposes are subserved by the transfer of locks Nos. 41

and 42, (which were located 2 miles above the mouth of Opequon,) to 2 miles below the mouth of that river. (This transfer reduced the slack water navigation, between guard lock No. 3 and lift lock No. 41, from 7 to 3 miles, and increased the expense \$100,000. There is also a lift lock in addition to the above constructed, connecting with the Potomac opposite the junction of the Shenandoah with the Potomac at Harper's Ferry, 637 yards above lock No. 32. It has 10 feet lift, and is, in other respects, similar to the other locks.

Culverts.—Below the Point of Rocks there are, inclusive of roadways, 59 culverts, of which the total cost was \$110,000. Three of these culverts are of 12 feet span each, 2 of 16 feet span each, (one over the Tuscarora, 2 miles above the Monocacy aqueduct, and the other 1 mile below the Point of Rocks,) and 1 of 2 arches of 16 feet span each over the Little Monocacy river: the total number of perches of masonry in these 59 culverts amounts to —, costing \$51,872—32 culverts, nearest Point of Rocks, 11,357, \$50,000. Between the Point of Rocks and Harper's Ferry the number of culverts is 19, containing in all 6,839 perches of masonry, and the total span of which was 158 feet. There are, also, above Harper's Ferry, 41 culverts, the estimated price of which was \$44,300. The culverts below Harper's Ferry are generally 110 feet long; while above, owing to the contraction in the width of the canal, they do not exceed 100 feet.

Aqueducts.—No. 1. Seneca aqueduct, built of red sand stone from the immediate neighborhood, is 114 feet long between the abutments, which, with the 2 piers, rest on a solid foundation. There are 3 arches of 33 feet each. Cost \$22,784.

Aqueduct No. 2. Monocacy aqueduct, built of a white granite stone, (obtained within 3 miles of the site of the aqueduct,) is 438 feet in length between the abutments, and is 516 feet from end to end of the wing walls which project from them. There are 7 arches of 54 feet span each, and 9 feet rise, (segments of circles,) the radius of intradoes of which is 45 feet. It contains 9,788 perches of masonry, (exclusive of the rough walls in which the cut masonry of the wings terminates.) Cost, \$125,000.

Aqueduct No. 3 crosses the Catoclin, a tributary to the Potomac; it has 3 arches, a semi-circular, of 20 feet span each, and the third a semi-ellipse of 40 feet span and 10 feet rise, supported on piers, 6 feet wide by 33 feet long, while the parts under water (7 feet in depth,) are 8 by 35, and founded on solid rock. Total cost, \$33,500.

Aqueduct No. 4 is over the Antietam, a branch of the Potomac, entering 3 miles above the Government dam above Harper's Ferry. The abutments are 9 feet thick, and 106 feet apart. It has 3 semi-elliptical arches, 2 of 28 feet span, and the 3d of 46 feet span, with a rise of 10 feet each. The foundations of the piers and abutments are on solid rock. Greater portions of them are of cut stone masonry and expensively built. Lime stone from the neighborhood used. The towing path parapet is 7 feet thick at bottom and 6 at top. The berm parapet is 5 feet thick at bottom, and 4 at top. Width of track is 20 feet at bottom and 22 at top. Cost, \$22,850.

Aqueduct No. 5 is over the Conococheague, which enters the Potomac at Williamsport. It has 3 arches of 60 feet span each; two piers and two abutments. The piers are 12 feet thick at the base. The arches are 32 feet wide and 15 feet rise.

Tow-path parapet, 7 feet thick at bottom, 6 at top; berm parapet, 5 feet thick at bottom, 4 at top.

The walls are raised 7 feet above the bottom of the canal.

Estimated cost, \$40,260. Not quite finished in December last.

Feeders.—No. 1. The Little Falls feeder supplies 4½ miles of canal. An arched stone dam is thrown across the Potomac, and the admission of water into the canal is regulated by a

single guard gate, and enters at the foot of lock No. 5. Length of the dam, 1750 feet, height 4 feet. Cost —. The feeder is a part of the old canal around the Little Falls, constructed previous to 1800.

No. 2. The Seneca feeder supplies 17 miles, although at the foot of lock No. 18, at the Great Falls, an additional supply is received from the Potomac, through a small arch under the towing path. The dam across the Potomac for this feeder is — feet high, and 25,000 feet in length, and cost —. The water is admitted into the canal through guard lock No. 1. The dam is of stone and arched.

No. 3. The canal for the next 40 miles depends almost entirely for water on the supply it receives from the Potomac at the head of Harper's Ferry Falls. The dam constructed by the Government for the use of the United States armory at Harper's Ferry answers all necessary purposes here, and no more water is drawn off than was formerly used by the old canal, which has been closed since the opening of the main canal. (A small feeder from the Tuscarora, which enters the canal 17 miles below the head of Harper's Ferry Falls, also assists towards supplying this section.) The water from the Harper's Ferry feeder is admitted through guard lock No. 2, situated near lift lock No. 35. This dam is — feet high, and — feet long. Cost of company's works here —.

No. 4 supplies 23½ miles of canal. The dam across the Potomac is near —, and is 20 feet high, and 810 feet long, and 60 feet base. The water is admitted into the canal through guard lock No. 3, which is 1 mile 320 yards above the dam. Cost of dam, lock, and other works connected with the feeder, —.

No. 5 feeds 19 miles of canal, and is situated 8 miles above Williamsport. The dam across the Potomac is at —, and is 20 feet high, 706 feet long, and 20 feet base. The water is admitted through guard lock No. 4, 320 yards above the dam. Cost —.

Some facts I have not here been able to find out, but which I hope you will be able to obtain, should they be of any service.*

Costs.—The following work, done between the Point of Rocks and the Georgetown Basin:—Common excavation, 1,893,666 cubic yards; Hard pan do., 439,071 do.; Quarry rock do., 75,472 do.; Rock blasted, 398,524 do.; Embankment, 1,533,850 do.; Puddling, 96,092 do.; Walling, 231,064 cubic perches. Costing \$1,032,161; for grubbing, \$12,892; extras, \$40,800.

Extra on this section:—Pier, basin, and tide lock, at Georgetown, \$78,943; Locks, \$232,642; Lockhouses, \$16,315; Bridges, \$32,925; Aqueducts, \$23,444; Culverts, \$51,872; Waste weirs, \$8,619; Dams, \$30,491; Guard locks and feeders, \$15,404; Improvements, \$22,002.

The masonry on the dams, locks, aqueducts, pay for engineers, officers of the company, &c. are not included in the above. Items given separate.

Work done and to be done from the Point of Rocks to Williamsport—all under contract, and a great portion finished:—Common excavation, 2,733,905 cubic yards; Rock do., 439,752 do.; Slate do., 8,140 do.; Embankment, 1,350,149 do.; Puddling, 37,617 do.; Walling Stone, 181,029 cubic perches. Actual and estimated cost of the above, \$936,735.74; for grubbing, \$9,653; extras, \$3,564.13. Total, \$954,952.87, besides the masonry on locks, aqueducts, culverts, bridges, &c. &c.

I have not been able to obtain a full aggregate amount of the expenditures of the company, nor an actual statement of the entire cost of the canal. It has had to meet enormous law expenses on account of its difficulties with the Baltimore and Ohio Railroad Company; besides being subjected to very large losses in the delay occasioned by the injunction of the Chancellor of Maryland in the above case. The right of passage, too, over the various lands of private individuals has cost immense sums.

* We have not been able to fill the blanks.—Ed. A. R. J.

The pass at the Point of Rocks, held in dispute between the two companies, was \$11,153 feet long, or 2½ miles. The distance from Harper's Ferry to Cumberland, according to Geddes and Roberts' report, is 127 miles, and the amount of all the narrow passes where the works would come in collision would amount in all to 45 miles.

The reports of the united engineers, who have been at various times invited by the company to inspect the different portions of the work, are all declaratory of the perfect and substantial manner in which the work has been constructed throughout. These reports, have been called for by Congress, and, on being submitted, have been ordered to be printed. They contain a great deal of information relative to this grand work, and are worthy of perusal. This spring, notwithstanding the many delays and difficulties of the most arduous and imposing nature the company have had to contend with, will see the canal opened some distance above Williamsport, a distance of 102 miles of canal, and 14½ slack water navigation, fully complying with the charter, which required upwards of 100 miles to be completed within 5 years from its commencement, or rather from October, 1828. Some report I have just got hold of, says the entire cost of this construction was \$3,650,000, of which \$450,000 was expended from Little Falls down.

I can add that the prospects of the canal are truly encouraging. Having command of an extensive coal region, and passing through a highly cultivated valley, where there are also numerous grist and other mills, and abundant mineral resources besides the coal, they can never be at a loss for means of rendering the canal profitable. They cannot experience much competition, either from the Baltimore and Ohio Railroad, on account of the heavy weight of the produce to be conveyed, and cheapness of conveyance on the canal. The Washington city branch of the Chesapeake and Ohio canal extends from the Rock Creek Basin on the western borders of the city to the mouth of Tiber Creek, following the bend of the river Potomac, (being constructed along the bank of that river, and in some few places encroaching on the river itself,) a distance of 1 mile and 373 yards. A tide lock at the eastern termination brings it to the level of the Potomac. The cost of this branch was \$25,978.47.

Very little has yet been done on the Alexandria branch of the canal. Congress has made an appropriation of \$60,000, I believe, for the construction of an aqueduct at Georgetown, across the Potomac, for the transfer of the canal to the Virginia shore. The length of this branch is 7 miles and 416 yards, and the estimated cost \$372,204.55. The aqueduct has been contracted for some time since, and is now in progress of construction under the superintendence of Capt. Turnbull, U. S. topographical engineer. It is 1714 feet long; the canal way is to be 16 feet wide at bottom, 18 feet at top, and 5 feet deep, and thence, to Four Mile run, the size of the canal is to be 32 feet wide at bottom, 50 feet at top, and 6 feet deep. At the embankment, at Four Mile run, it is to be 18 feet wide at bottom, 36 feet at surface, and 6 feet deep. Thence to Alexandria it is to be enlarged to the established dimensions of the Chesapeake and Ohio Canal.

H. N. C.

P. S.—We have received the communication promised, giving the rates of toll on the canal, which will be given in our next.

The Undulating Railway—Final Reply of Mr. Badnall to Mr. Cheverton. [From the London Mechanics' Magazine.]

Sir,—Mr. Cheverton's dreadful inflection—*his rod*—hath, at last, fallen upon me, without his own character, or the good taste of your readers being, in the slightest degree, "ill-consulted"—without the most distant apparent inclination to render your pages the medium of a personal quarrel between himself and me! H

will not descend to imitate my dull, vituperative style! He would shudder to characterize an opponent as "a coarse practitioner from the *abattoir*!"—"a mere hacker of flesh and bones!" He is a man of more gentlemanlike bearing than to fume out false accusations! No, Sir, he stands upon too lofty an eminence! His philosophic and refined understanding could not possibly stoop to mere personal abuse, or controversial subterfuge! No, he is the very prototype of wisdom!—an immortal emblem of refinement!—a breathing picture of urbanity and peace!—gentle as a lamb—sweet as honey—mild as new milk—"parfaite amour" in toto! He is not the cur who, when he meets with an unflinching antagonist, flies growling and barking to his kennel! He is not the tamed pugilist who swears that a blow is false because he cannot parry it!—nor is he slippery as the eel, which, by its twistings, and its twinings, and its slime, evades the grasp of its pursuer, and buries itself in its native mud! No, Sir, Mr. Cheverton is a being of far different stamp!—his mental qualifications—his scientific reputation—his temper—his writings—his sentiments—will all bear the test of the most rigid scrutiny! His theories will all be established by practical results! The halo round his head will brighten as each opinion becomes confirmed by experiment! In a word, his letters on "the undulating railway," while they will immortalize the fame of the *Mechanics' Magazine*, will become never-dying monuments of sterling talent and correct observation, from the hour when that trial takes place, which a Dalton* has been indiscreet enough to recommend! Till that hour arrives, I almost feel inclined to "leave him alone in his glory," in order that I might, with double effect, magnify his transcendent name, and prostrate myself before his living monument of wisdom! But—I cannot resist the inclination which his letter has excited, to pay him some passing homage; for neither the "war-whoop of the Mohawk," nor the "inspiring blast of the clarion," shall be compared to the sounding of his brass, or the tinkling of his cymbals!

Yet how shall I, to whom "nature has been so niggardly," sufficiently extol the praise of one who, declining to quarry all ignoble game, is able to defend himself against a weapon capable of dividing "soul from body," the very "marrow from the bones?"

Immortal champion! inspired philosopher! tender and kind-hearted victor! may this humble panegyric be a memento of my deference to thy fame, as long as the *Mechanics' Magazine* may survive the wreck of time—and may that be for ages!

Having thus, Mr. Editor, in sincere good humor, squared one part of my account with Mr. Cheverton, I beg to acknowledge, like him, the gratification which I feel at the prospect of this too lengthened controversy being terminated. The venom which he thought it prudent, in the first instance, to cast on me, I good-humoredly endeavored to throw back; but his last effusion was of so different a nature—so characteristic of a noble and unoffending disposition, that I have met, as it deserved, with an unbounded expression of veneration. As you have admitted, in your valuable columns, his unmeasured declarations, I trust that equal justice may be done to me; and that you will, by publishing this reply, permit me the opportunity of proving that he who cannot, by fair and manly argument, defeat a literary or scientific opponent, stands little chance of doing so by an opposite course of conduct.

Such was my object in noticing Mr. Cheverton's extraordinary letter (vol. xx. p. 73). Had it been otherwise, my silence should have shown my contempt for the vulgar sneers and false accusations with which that document abounded. But it is passed, and I congratulate Mr. Cheverton on the victorious result of his attack.

As no unnecessary time will now be lost in trying, by ample experiment, on some line or other, the merits of the undulating question, I would propose, to your readers in general, that all further controversy should rest until the experiment be made. Practice can alone determine whether I or my opponents have been right or wrong in our anticipations, and whether Mr. Cheverton's arguments or mine will be creditably substantiated. The note which you have attached to my last communication leads me to hope that you may concur in my present opinion;* and if so, while Mr. Cheverton may try at his leisure any further experiments he may please at the National Gallery of Practical Science, I will direct my attention to the means of elucidating the problem in a far more satisfactory way. If, on a trial being made, I find myself in error, I will frankly confess my incompetency to argue this subject, and my folly at having so warmly and so boldly espoused it—if otherwise, I trust there are many of your readers who will give me credit for some patience, and for some intellectual capabilities beyond the *canaille* sphere in which Mr. Cheverton has been so anxious to place me.

The test shall not be less difficult than I originally proposed. Whether the experimental railway be 6, 8 or 10 miles in length, I maintain that *any locomotive engine will traverse an undulating line, with a load which is its maximum load on a level, in half the time which it will occupy in traversing the same distance with the same load on a dead level railway, and without greater waste or consumption of fuel.* And I, moreover, say, that *any locomotive engine will traverse an undulating line at a great velocity with a load which that same engine cannot move upon a level line.*

Whenever this trial may take place, your readers shall have ample notice of it; and if you, Sir, will undertake the office of umpire, I shall cheerfully abide by your decision.

In the mean time, it would be mere repetition, and an unnecessary prolongation of our arguments, were I to reply at length to the more solid parts of Mr. Cheverton's last letter. One or two points, however, I cannot help touching upon. First, as to "*locomotive duty*," which he so frequently harps upon. All my arguments, of late, have been almost confined to the practical consideration of locomotive duty. I do say that by employing gravity as an auxiliary force, we save locomotive power. What! Mr. Cheverton exclaims, can you take advantage of gravity without being obliged to repay what you borrow? Yes, is my reply—and yet *no perpetual motion*, Mr. Cheverton! How? Mr. Cheverton would ask. My answer is simply this, and whether it be true or false, *experience will prove—velocity is gained by taking advantage of gravity.* Friction on railways is, in my humble opinion, *not as the spaces*, but as the *times or velocities*. If this be true—and if a greater velocity be attainable on an undulating than on a level railway, there is, (exclusive of any difference in friction arising from the particular inclination of the plane,) *less friction on an undulating than on a level railway.* Locomotive steam power is therefore saved.

The next point I wish to allude to, is Mr. Cheverton's observations about a lecture given to me, or some of my acquaintances, by Professor ***** in the National Gallery. Does he mean Professor Ritchie?—if so, I was not present. That gentleman and Mr. Locke had, I know, a conversation together; but the only time that I have had an opportunity of conversing with Professor Ritchie on the subject, was

* We do perfectly; but it must be with reservation to the claims of Mr. Whitehead and Mr. McKinnon, to whose papers, in opposition to the undulating system, (now many months in hand,) we stand pledged to give insertion. We shall be glad to have their assent to the proposed postponement in the text.—Ed. M. M.

† It will occur to your readers that I have frequently stated as my opinion, that an engine would convey, on an undulating line, at least twice the load which the same engine could move on a level, at the same velocity. Such is my opinion now; but the test which is above proposed will, I am sure, be deemed sufficient to decide the question at issue, and it will be found to accord with the terms of my original challenge.

recently, when he did me the honor to spend part of the day with me in Liverpool. In a word, the only individuals whom I can call to mind as having expressed a decided opinion in my presence, when in London, adverse to the undulating railway, were Mr. Saxton and a friend of his, whom I begin to think was Mr. Cheverton; and as to any acquaintance of mine then present being afraid of their "*badgering*," I rather think Mr. Cheverton has imbibed an erroneous impression. If it were necessary, I could publish, in this letter, a list of persons who are advocates of the undulating railway, amply sufficient to out-balance the strongest testimony which Mr. Cheverton and his friends can advance against it,—but the best testimony is *practice*, and upon that I throw the merits of the case.

Lastly, Mr. Cheverton offers some important practical objections, which I confess to be more worthy of notice than any points which he has hitherto advanced. But, serious as they appear, they will not, on consideration, be found of any real weight. In the first place, we have to determine what is a *safe velocity*—that being determined, how can it be attained on a level railway with heavy loads? Unless gravity be employed at starting, as an auxiliary force, a much more powerful engine would be requisite to move a heavy load from a state of rest, than to continue it at a given maximum velocity; and if gravity be employed at starting, the engine and load must ascend again to a like summit, in order to maintain the starting advantage; and if so, what is this but an undulating railway? Does Mr. Cheverton imagine that a perfect cycloid, or a perfect arc, alone constitute my idea of an undulation? Far from it—he may descend a hill, run four miles on a level, and ascend to an equal elevation; and by doing this would realize a system of undulation which might, probably, be adopted with advantage in some cases; for, with heavy loads, a velocity might be generated by the first descent which could not, with the same engine, be generated on a dead level; and this being maintained on the level, would enable the load to ascend to a like elevation. But supposing the undulations to be a series of regular segments of circles, wherein consists the difficulty of sustaining an average velocity of 20 or 30 miles per hour, without an increase of speed? Is it necessary to work the engine down every descent? One of the leading advantages which I anticipate is the great saving of that steam expenditure which is now necessarily incurred in maintaining high velocities on a level. Again, it will require very powerful engines to attain high velocities, with heavy loads, on level railways: whereas, such powerful engines will not be so necessary on undulating railways, and for the reasons previously stated.

I now, Sir, unless again attacked by Mr. Cheverton, close with pleasure this twelve-month's warfare, anxiously awaiting the result of practical trials; and sincerely hoping, although a few waspish observations have occasionally intermingled with a subject to which they should have been altogether foreign, that some information and benefit may have been derived from the discussion.

I am, Sir, with great respect, your very obedient servant,

R. BADNALL.

Douglas, March 27, 1834.

P. S.—S. Y. and I have, in one respect, misunderstood each other. He is certainly right in believing that the pressure upon an inclined plane, (alluding to the force necessary to draw a body up,) is as the base to the length: therefore, at an angle of 45°, my statement appeared erroneous; but, taking into consideration the resolution of the forces—that at an angle of 45° the length of the base is equal to the perpendicular elevation—and that taking the length of the plane as the entire force of gravity, it forms the diagonal to two equal sides of a square; the oblique forces are therefore equal—that is, at an angle of 45°, the force of gravity which urges a body down a plane, or retards its ascent, is exactly equal to the force of pressure on the

* Alluding to the trial of the undulating railway, which Drs. Dalton and Lardner have recommended to be instituted on the London and Birmingham line.

plane. For instance, if L be the length, B the base, and E the elevation, at an angle of 45° E is equal to B ; and although the pressure on the plane is $\frac{B}{L} \times L$, yet the tendency to descend is $\frac{E}{L} \times L$; the one force, therefore, is equal to the other. I close my discussion with S. Y. with every feeling of respect.

[See page 384.]

MACHINE FOR EXCAVATING EARTH.—Mr. G. V. Palmer, of Worcester, has been ten years and upwards engaged in constructing an extraordinary engine to excavate earth, &c. for which he has taken out a patent. This engine works by steam, and is particularly adapted for cutting canals, levelling hills for railways, and removing large masses of earth. The engine cuts, at a single blow, six feet in width and three feet in depth—delivering on either side, or into carts, one ton and upwards per minute: it also cuts and sifts gravel in the same proportion for road-making. We understand it is of great simplicity of construction, and the weight of the engine does not exceed three tons.—[Manchester Courier.]

We copy the following from the forthcoming number of the *Mechanics' Magazine*:

BURDEN'S BOAT.—This "wonder of the age" made its second trial on Wednesday last, June 10th. We have all along expressed our conviction that Mr. Burden has stated nothing that he will not accomplish; we think so still, and so does every practical man we have conversed with on the subject. But we do hope, that Mr. B. will not allow his anxiety to realize his promises interfere with his judgment, or in any way prevent his doing that which he has promised to accomplish, WELL. We insert the annexed engraving as a correct representation of it, and take this opportunity of introducing to the notice of our readers a condensed account of steam engines and their inventors, compiled from authentic sources. In a few days she will make her first trip to Troy.—[ED. MECH. MAG.]

The Great American Steam-Raft of English Origin. By ALFRED CANNING. [From the *London Mechanics' Magazine*.]

SIR,—Having noticed in your Magazine for Saturday, 22d ult., an account of a raft propelled by steam, considered to be the invention of a Mr. Burden, in America, I think it due to myself to state, that in 1817 I conceived the idea of constructing a raft

similar to that attributed to Mr. Burden, with this difference, that the bows of my floaters were to be considerably more elevated than those of Mr. Burden's raft. The following year, being in Paris, and foreseeing the probability of being detained there for a considerable time, I set about constructing my raft. I took two deal planks, of 30 feet long each, 12 inches wide by 6 inches thick, and having fashioned each like a canoe, I placed them on edge, parallel with each other, about 5 feet asunder, and connected them together at about 3 feet from the surface of the water, by a decking resting upon 4 stanchions, of about 7 feet long, which rose nearly 4 feet above the deck, and served to support a handrail, as well as to maintain in square the whole frame-work, by diagonal ropes, which passed through holes in the tops of the stanchions and holes in the deck. I tried this little model raft, both with oars, a sail, and paddle wheels (worked by the feet), and found that I was not deceived in my expectations of its speed, which was astonishing. I had a rudder of sheet iron, in the shape of a fish tail, adapted to each side-piece or floater, which were connected together and acted upon by diagonal cords and a cross-bar. Prince Joseph de Chimay, his sons, and several other persons of high rank, witnessed my trials. Finding it succeeded so well, and possess so many advantages over every description of boat, as it was not liable to sink or upset, &c. &c. I determined to construct a much larger raft, and propel it by steam; but owing to the jealous spirit of the boat owners on the Seine, particularly Prosper-Colin, and Dagnet, who had great influence with the Prefect, I was not able to procure a permission to place it upon the river. Being immediately afterwards obliged to absent myself from Paris upon urgent business, I left my model raft afloat, in the care of a waterman, who lived in his barge upon the Seine, at the foot of the Pont Royal, directly under the windows of the royal palace of the Tuilleries, one of the greatest thoroughfares in Paris, where it remained for five months. Upon my return, the waterman (Laporte) informed me that several foreigners, particularly Americans, had made repeated inquiries respecting the nature of the raft, and that two American gentlemen had made drawings of the raft; and had observed, "that rafts constructed upon the same principle would suit well the lake navigation in the United States."

Should you, Sir, or any of your readers, feel desirous of seeing a sketch of my sail

or steam raft, and further particulars respecting that, and four others which I constructed subsequently, having varied the dimensions of the floaters, and the substance of which they were composed, I will furnish them with pleasure. I remain, sir, your most obedient servant,

ALFRED CANNING.

Crown Coffee-House, Holborn, March 18, 1834.

[We shall be glad to hear again from Mr. Canning on the subject, with drawings, not only of his original model, but of his more matured plans of construction, and all illustrative particulars.—ED.]

NOTE.—Since the article in our present number, on the great American steam-raft was in type, we have received a letter from an esteemed correspondent, from which the following is an extract: "The velocity attained was in still water. The vessel draws only 7 inches water. They expect, with another that is completing, to perform twenty-seven miles an hour."

Account of Steam Engines and their Inventors.

[Compiled from authentic sources.]

The elegant toys of Hero, the beautiful experiments of Porta and Decaus, the modifications of the Greek machine by the unknown Italian, the practical merit of the "water-commanding engine," the ingenious ideas of Hautefeuille, and their masterly extension and developement by Papin, contain all the rudiments required for a perfect machine, waiting only to be touched by the wand of some mechanical magician, to form a structure of surpassing ingenuity and semi-omnipotent power.

The total neglect with which these individual schemes were regarded is not the least extraordinary circumstance in the history of the steam engine, and, above all, the oblivion which followed that of Lord Worcester, whose unconquerable perseverance, at the lowest ebb of his fortune, found means to carry his splendid ideas into practice. It appears improbable, but that his mechanism, whatever it was, was forced upon the attention of many parties connected with the draining of mines; and from the character of the Marquess, it is equally remote from belief that he would fetter the introduction of his invention into general use, by a high price asked for his permission to use it. The utter novelty of the nature and power of the agent, an ignorant and absurd idea of its danger, and the total want, probably, of any mechanical means, except that of mere strength of parts to guard against accidents,

may have been the real causes of its neglect, and exclusion from practice.

Thirty years after Lord Worcester's death, a brilliant ray of improvement suddenly bursts into the history of the steam-engine, from the consummation of the labors of a Captain Thomas Savery, who had been silently employed in combining a mechanism, in which elastic vapor was the motive power.

Of the history of this distinguished man little is known. * * *

He is first presented to our observation as an author of a scheme for rowing ships in a calm, for which, after obtaining a patent, he in vain endeavored to procure the patronage of Government. "The trial of my scheme was unjustly thwarted by one man's humor," said Savery. "A regard to my duty, as well as place, will not permit me to give a biased opinion," said the umpire. "But I have tried it," replied the projector, "on a small scale, and it answered completely." "So have we," said the servants of Government, "and in our trial it failed completely."

Savery afterwards remarked: "I was necessitated to write my book; for after I had racked my brains to find out that which a great many have spent several years in vain in the pursuit of, when I had brought it to a draught on paper, and found it approved by those commonly reputed ingenious, and receiving applause, with promises of great reward from court, if the thing would answer the end for which I proposed it; after I had, with great charge and several experiments, brought it to do beyond what I ever promised or expected myself, at last one man's humor, and more than a humor, totally obstructed the use of my engine, to my no small loss; but it is the nature of some people to decry all inventions, how serviceable soever to the public, that are not the product of their own brains."

He gave an account of it to secretary Trenchard. "A few days after, the secretary told me that the king had seen my proposals, and that I need not fear, for that the king had promised me a very considerable reward, and that I must go to the lords of the admiralty to put it in practice; but that first I must make a model of it in a wherry, which I did, and found it to answer my expectations. Then I showed a draft of it to the lords of the admiralty, who all seemed to like it, and one amongst them was pleased to say that it was the best proposal of the kind he ever saw; so I was referred from them to the commissioners of the navy, who all seemed to like it, but told me that the model must be surveyed by Mr. D—, the surveyor of the navy, whose opinion I asked; but he was very reserved, and said, 'that a wherry was too small a thing to show it in, there being no working at a capstan in a wherry;' but he told me 'it was a thing of moment, and required some time to consider on; for should I,' said he, 'give a rash judgment against it, I should injure you; or for it, the charge of putting it in practice must prove a loss to the king, and endanger my employ.'"

After four months' consideration, Dummer gave his opinion against Savery. It was neither a new nor a practicable invention, being similar to one used at Chatham, in 1682, which was abandoned, and he designated, though rather disingenuously, the capstan and its trundle as "*clock-work*;" and although Savery "exhibited his wherry on the Thames, and thousands of people were

eye-witnesses, and all people seemed to like it, the public newspapers speaking very largely of it, yet all to no purpose." (p. 18.) The inexorable lords of the admiralty were "so much altered that, from commending the thing, they would not hear one word in its defence." (p. 15.) Savery, notwithstanding, "being informed by Sir Martin Beckman, the greatest engineer in the Christian world, that the thing was good, got a noble lord to show a draft of it to the king a second time, who ordered me," says Savery, "again to the admiralty, who never ordered me in before them, but, after waiting two or three days, the doorkeeper told me that my business lay before the navy. Upon which, next day, I desired a friend of mine to go with me to the navy office, that he, being a man of extraordinary judgment, and no less reputation, might be an evidence to what discourse might happen; but coming to the navy office, we found the board was rose. However, in the hall I found Mr. D—; I asked him whether any thing was come before the board concerning my business. 'No,' said he, 'not since the objections sent to the lords of the admiralty;' on which he could not but fall into an argument. I asked him some questions in relation to his objections, and in a very little time we had a great pother about superambient air and water. I found that my sailor ran himself fast aground, as men commonly do when out of their knowledge; this, indeed, made me pity him again, although I was willing to come at the plain truth of the matter, and asked him whether or no he could not bring one hundred and fifty men to work at this engine, he answered yes; then, said I, will they not have as much power to give a ship motion as one hundred and fifty men would have on shore, at a hawser fastened to the ship; this he likewise answered in the affirmative. Then, said I, it will do more than oars, or any thing but a gale of wind, and fully answer my proposals. Well, said he, with a smile, and putting off his hat as taking leave, 'We are all submission to the lords of the admiralty.'

"Not long after, a friend of mine met a commissioner of the navy, and my friend, being perfectly acquainted with my contrivance, asked the commissioner why it was not put in use by them? The gentleman offered several objections, which were, by sound reason, fully answered by my friend, that he had only this hole to creep out at. 'Sir,' said he, 'have we not a parcel of ingenious gentlemen at the board?' 'Yes,' said my friend, 'I hope so, or five hundred pounds per annum is paid them to a fine purpose.' 'Is not Mr. D—,' said the commissioner, 'one of them, and an ingenious man?' 'I hope so,' continued my friend. 'Then,' said he, 'what have interloping people, that have no concern with us, to pretend to contrive or invent any thing for us?'"

Savery, whose bluntness, probably, was no recommendation to his application, has several flings at the "boards," and his statement is wound up by a dexterous one at the contents of courtly Dummer's wig. "Whoever is angry with truth for appearing in mean language, may as well be angry with a wise and honest man for his plain habit; for, indeed, it is as common for lies and nonsense to be disguised by a jingle of words, as a blockhead to be hid by abundance of peruke."—[Navigation Improved, p. 33.]

In the pamphlet in which Savery appeals from their judgment to that of the public, he pays less attention to the reasons urged against its novelty, as well as practicability, than they were fairly entitled to receive.* In his resentment he says, that "not a tittle will he disclose of two other inventions of his until he has justice done him on account of his rowing engine." The first of these was "a gin of fourteen inches square, portable by one man, and by which one man may lift the largest cannon into her carriage." The second contrivance was a method whereby he could fight any ship, "using charge and discharge as often as six do now, and to as much purpose, without any manner of incommodation, more than by the common way, so that one half of the men need not be exposed that now are, and the rest may be kept as a reserve for boarding; the benefit of this I leave to the ingenious sailor."†

The enthusiasm of the projector was softened in Captain Savery by the experience of a practical mechanic; and he early appears to have acquired that personal consideration which usually follows a man of genius and enterprise, when his habits are those of a man of business.

At the first announcement of his machine for raising water, he had so matured his ideas, and was so well versed in the nature and power of the motive agent, that his masterly combination has left but minor objects for improvement to succeeding engineers. His mode also of introducing his invention to the notice of the public was totally different from that which had been followed by former projectors. They enveloped every thing in mystery, and endeavored to attract attention by exaggerated statements of power or economy. His first step was to explain to every one the principles, as well as construction, of his apparatus: he showed why

* *Navigation Improved*, or the art of rowing ships of all rates, in calms, with a more easy, swift, and steady motion than oars can, by *Tho. Savery*, gent. London, 1698. In 1693 a M. Duquet made several experiments at Marseilles, at the expense of the King of France, to navigate a vessel by revolving paddles, or wheels, instead of oars. The results of these trials were very satisfactory, and strongly directed the attention of philosophers, as well as mechanics, to the practicability of this application of water-wheels.—[Machines Approuvees, tome i. p. 173.]

† Sir Isaac Newton, in a report (dated Leicesterfield, January 27, 1718,) which he made to the government, on the practicability of an invention for measuring a ship's way at sea, mentions Savery as the inventor of this machine, and notices another of his contrivances. "Mr. Savery, who invented the raising of water by fire, told me about six years ago, that he had invented an instrument to measure the distance sailed, and by his description that instrument was much like this, (the one submitted for his opinion,) the sea water driving round the lowest and swiftest wheel thereof, and that wheel driving round other wheels, the highest and lowest of which turn about an index to show the length of the way sailed."

Savery complained of one of his inventions being neglected, from its resembling a mechanism with which he was unacquainted; but Savery's one, which is now mentioned, was itself only a copy from another described by Bourne, in his inventions as produced by a Humphrey Cole. De Saumarez complains, in his turn, of Savery's scheme being remembered by Sir Isaac only to get rid of his claim. The picture he draws of his pursuits and projects is an excellent likeness of a large but harmless class—can it be named?—of *simple schemers*.

"He was the son of De Saumarez, chaplain to Charles II.; although he was bred in Holland to learn commerce, he never applied himself to any trade or profession, but in an easy and quiet enjoyment of his small estate, in the island of Guernsey, he took his diversion in the experimental part of mathematics, his genius or inclination being that way for machines and inventions, wherein he spent about 22 years last past, confining himself to a retired sort of life, within his little laboratory; and of late he fixed his projects upon a particular invention, towards the improvement of navigation, which he could not bring forth to effect in the island, for want of able workmen; but he came to London on purpose, and he hath actually begun, and hopes, with the blessing of God, to bring it to some perfection."—[Memorial, p. 4.]

it was a cheaper power than that of horses or men; and he invited practical men to judge for themselves of the value of his assertions and statements, by an inspection of the machine itself in operation.

The influence of the court was at this period considered to be essential to the success of any speculation which required the aid of a monopoly. The profits might be diminished or overthrown by the obstacles which avarice and intrigue could then interpose in that quarter to its further progress; and from this circumstance, considerable importance was attached to having the countenance of those in power to any project in which the pecuniary risk required to be extensive; and Captain Savery might be said to be conforming to an almost common practice, when he exhibited a working model of his fire engine before King William, at Hampton court. That monarch, who himself had a mechanical turn, was so pleased with its ingenious construction and effective action, that he took a warm interest in its success, and permitted its author to inscribe to him the account which he published of his contrivance, under the title of "The Miner's Friend."

The great fame of the Royal Society, then adorned by the presidency of Sir Isaac Newton, made its opinion to be listened to with profound respect in matters of science and mechanics. To that body also Captain Savery carried his invention; and in their transactions for that year is a record of his successful experiment, made in their apartment, and a view and description of the machine forms the subject of an engraving in their annual volume.

For more perfectly illustrating the mode in which steam operates, we will suppose the vessel, represented in the following figure, to be filled with water up to the line A, and the

space E occupied with air, and having a plug or piston fitting it at C, and an aperture at D; now, if the aperture D be closed, and heat applied to the water, as at F, steam will be generated, and by its expansive force will raise the piston C upwards; then, if the heat be withdrawn, and the vessel suddenly cooled, condensation will take place, the steam, re-assuming the form of water, will again occupy the space below the line A, and the piston C will return to its place. In this experiment the expansive force of the steam compressed the air in the space E, and forced the plug C upwards, we will suppose, to H; but C, in travelling to H, displaced so much of the atmosphere as occupied the tube from C to H; consequently, the portion so displaced will seek to resume its natural position, and when the force of the steam is withdrawn by condensation, the weight of that portion of the atmosphere will again return the plug C to its place; by which it is obvious that the raising of the plug was the direct action of the steam, and the returning its consequent action, or the action of the atmosphere, in consequence of its having been displaced by the force of the steam.

Again, if we suppose the plug to be in its first situation, as at C, and we open the aperture at D, and apply heat, the steam will rise into the space E, and expel the air through the aperture D, which being closed, and condensation caused, the space E will

be left a vacuum, and the atmosphere seeking to occupy that space will force the plug C down to the line A; here the movement of the plug C was solely caused by the atmosphere exerting itself to regain the position whence it had been expelled by the force of the steam through D, and this effect is performed by the consequent power of steam alone.

It has been found by experiments, that the pressure of the atmosphere is equal to about 14 pounds weight upon every square inch, so that supposing the superficies of the aperture of the vessel, to contain one square inch, the power exerted by the steam in raising C to H will be tantamount to raising 14 pounds weight that height, together with the power necessary to overcome the friction and weight of the piston C, in the cylinder; and that the power exerted by the steam in expelling the atmosphere from the space E, and obtaining its consequent pressure to the raising of 14 pounds from A to C; and that the disposable power, obtained by the return of the piston from H, will, in the first instance, be equal to the raising of 14 pounds weight from C to H, less the amount of the friction of the piston C; and, in the second, will be equal to the raising of 14 pounds weight from C to A, less the amount of the friction as before. In both these instances the expansive or direct force of the steam has only been considered as equal to the displacing of the atmosphere, or what will be equal to 14 pounds pressure on each superficial inch; but if the piston C be loaded with any weight, the steam will, if urged with sufficient heat, raise it, always premising that the vessel is strong enough to resist the increased pressure. Suppose C to be loaded with 10 pounds of weight, the steam must be urged until its pressure is equal to 24 pounds, 10 pounds more, 14 pounds the pressure of the atmosphere on each square inch, and the resulting disposable force will be equal to 24 pounds more, the weight of C, less its friction returning to the place from where C was raised; so that, in this case, the pressure on the internal sides of the vessel, tending to burst it, will be equal to 10 pounds per square inch of the internal superficies, the remaining 14 pounds being counteracted by the pressure of the atmosphere on the external surface, which is equal to 14 pounds of the internal pressure. By this, it is evident that the direct force of steam may be increased without limits, whereas the resulting force or pressure of the atmosphere is manifestly bounded to 14 or 15 pounds on the square inch, according as its density varies.

A mode of applying the power of a steam-engine to navigate a vessel was suggested by Jonathan Hulls in 1737.* But the scheme,

although a nearer approach to the present form of the steamboat, can neither be considered as the first suggestion for moving wheels by steam, nor any improvement on the idea which emanated from another—nor even any specimen of mechanical skill, for it is awkward, clumsy, and inartificial; but, as his claims have been put forth to a higher place than is here assigned him, they will be better understood by a reference to the engraving, (see following page,) and the description of it, which follows nearly in his own words. It is doubtful whether Hulls ever proceeded beyond printing a description of his project.

"a, chimney coming from the furnace; b, tow-boat; c, c, two pieces of timber framed together to carry the machine, d; x, y, z, three wheels on one axis to receive ropes, s, t, u; t, being rope that goes into cylinder; m, n, two wheels on same axis with the fans, i, i, i; u, is a rope going from wheel, n, to z; that, when the wheels, x, y, z, move forward, moves wheel, n, forward, and the fans along with it; s, a rope going from wheel, m, to the wheel x, so that when the wheels, x, y, z, move forward, the wheel, m, draws the rope, s, and raises the weight, g, at the same time as the wheel, n, brings the fans forward.

"When the weight, g, is so raised, while the wheels, x, y, z, are moving backward, the rope, s, gives way, and the power of the weight, g, brings the wheel, m, forward, and the fans with it, so that the fans always keep going forward, notwithstanding the wheels, x, y, z, move backwards and forwards as the piston moves up and down in the cylinder: o, e, teeth for a catch to drop in from the axis, and are so contrived that they catch in an alternate manner, to cause the fans to move always forward; for the wheel, m, by the power of the weight, g, is performing its office while the other wheel, n, goes back, in order to fetch another stroke. The weight, g, must contain but half the weight of the pillar of air pressing on the piston, because the weight is raised at the same time as the wheel, n, performs its office; so that it is, in effect, two machines acting alternately by the weight of one pillar; of such a diameter as the diameter of the cylinder is." Hulls, aware that objections might be urged against its want of originality, endeavors to anticipate them: "if it should be said," says he, "that this is not a new invention, because I make use of the same power to drive my machine that others have made use of to drive theirs for other purposes, I answer, the application

* A description and draught of a new-invented machine for carrying vessels or ships out of or into any harbor, port, or river, against wind or tide; or in a calm. London, 1737. It is a pamphlet, by no means scarce, containing forty-eight pages, about eight of which have any reference to his invention. Hulls took out a patent.

of this power is no more than the application of any common and known instrument used in mechanism for new invented purposes."

It may, however, be observed, that he considers that it would not be practicable to place his apparatus on board of the ship which it is required should be moved—but that a separate vessel should be appropriated to its reception, and that this should be used as a tow-vessel; and he urges several economical reasons in favor of his *Tow-Boat*. The manner of converting the rectilinear motion of his piston into a rotary one, is very ingenious.*

Next in order we must place the experiments of the immortal James Watt.

From results, he saw that, in order to make the best use of steam, it was necessary that the *cylinder should always be as hot as the steam which entered it*. And also, that all the water that was formed by the condensed steam, and the injection-water likewise, should be cooled down to 100 degrees, or lower, where that was possible.

In looking to what had been done, or suggested by others, he had little to guide him in this inquiry. A rude help to his ingenuity might have been derived from some of the most common experiments with the air-pump; but at the moment when his sagacity had pointed out the direction of the path, his imagination did not enable him to follow it.

He had yielded to the difficulty, when, early in 1765, "in one of those moments when the heavenly spark of genius shone with brightness in his mind, the idea broke in upon him," that if a *communication were opened between a cylinder containing steam and another vessel which was exhausted of air, the steam would immediately rush into the empty vessel, and if that were kept very cool, by an injection or otherwise, the steam would continue to enter until the whole was condensed. And if an air-tight cover were placed on the cylinder, steam might be admitted to depress the piston in a vacuum instead of the atmosphere.* ADMIRABLE INVENTION!

When once the idea of separate condensation was started, minor improvements followed in quick succession. He imagined that the orifice for the piston-rod could be kept air-tight by means of a stuffing-box; and as it was obvious water could not be introduced to make the piston steam-tight, for if any of it found its way into a hot cylinder it would be converted into vapor, (as in some of his experiments,) he should employ wax and tallow as lubricating substances. He also thought that, by surrounding his cylinder with a casing of some substance which would prevent its heat from being abstracted by the circumbient air, and the air which was disengaged from the water, or found its way into the cylinder, he could extract by a pump, and by the same means he might employ the condensing vessel of the water which was produced by the injection and the condensation of the steam, or he would allow it to fall through a pipe thirty-four feet long into a pump or well, as practised by Newcomen and others. Thus, step by step, in the course of one or two days, in the eye of his mind, the exquisite conception was complete.

"About the time that Mr. Watt was en-

* About this period three fire-engines were in operation in France, one at Freane, near Conde; one at a coal mine at Sars, near Charleroi; a third at a lead mine near Namur.—[Gensanne, p. 300, vol. ii. *Machines Approuvees*.]

gaged in bringing forward the improvement of the engine, it occurred to Mr. Gainsborough, the pastor of a dissenting congregation at Henley-upon-Thames, and brother to the painter of that name, that it would be a great improvement to condense the steam in a vessel distinct from the cylinder, where the vacuum was formed, and he undertook a set of experiments to apply the principle he had established, which he did by placing a small vessel by the side of the cylinder, which was to receive just so much steam from the boiler as would discharge the air and condensing water, in the same manner as was the practice from the cylinder itself, in the Newcomenian method—that is, by the snifting valve and sinking pipe. In this manner he used no more steam than was just necessary for that particular purpose, which, at the instant of discharging, was entirely uncommunicated with the main cylinder, so that the cylinder was kept constantly as hot as the steam could make it. Whether he closed the cylinder as Mr. Watt does, is uncertain; but his model succeeded so well, as to induce some of the Cornish adventurers to send their engineers to examine it; and their report was so favorable as to induce an intention of adopting it. This, however, was soon after Mr. Watt had his act of parliament passed for the extension of his term; and he had about the same time made proposals to the Cornish gentlemen to send his engine into that country. This necessarily brought on a competition, in which Mr. Watt succeeded; but it was asserted by Mr. Gainsborough, that the mode of condensing out of the cylinder was communicated to Mr. Watt by the officious folly of an acquaintance, who was fully informed of what Mr. Gainsborough had in hand. This circumstance, as here related, receives some confirmation by a declaration of Mr. Gainsborough, the painter, to Mr. T. More, late secretary to the Society for the Encouragement of the Arts, who gave the writer of this article the information; and it is well known that Mr. Gainsborough opposed the petition to parliament through the interest of General Conway." [Hornblower, in Gregory's *Mechanics*, p. 362, vol. ii., first edition.]—On this statement, a writer in the *Edinburgh Review* observes, "We believe and hope, for the sake of the memory of a very respectable man, that the conversation is not accurately represented. It remains upon record that Mr. T. More was examined as a witness on the trial of a cause of Bolton vs. Bull, in 1792, at which time Mr. Hornblower himself was also examined as a witness, but on the opposite side from Mr. More. Mr. M., on this occasion, was asked, whether he had read the specification of Mr. Watt's invention, and whether, in his opinion, it contained a disclosure of the principles of the steam-engine? To this question he answered, 'I am fully of opinion that it contains the principles entirely, clearly, and demonstratively.' He was then asked, 'Did you ever meet with the application of these principles before you knew of Mr. Watt's engine?' His answer was, 'I do declare I never saw the principles laid down in Mr. Watt's specification, either applied to the steam-engine previous to his taking it up, or ever read of any such thing whatever.' It is not easy to reconcile these two answers given by that gentleman on his oath, with the words that Mr. Hornblower has put into his mouth. Mr. Gainsborough's idea, whatever it was, was posterior by more than twenty years." (1)

[P. 328, vol. xiii.]—We know not if the claim which is put forth in the above extract is the same as that alluded to by the late venerable Professor Jardine. "I happened," says he, "to be tutor to Dr. Roebuck's sons at that time (when Watt was at Kinneil); I had then the pleasure of seeing the experiments on a great scale, which were carrying on. This accidental circumstance, and this opportunity, connected me so much with what was going on, that when they were completed I was asked by Mr. Watt to go with him to Berwick, when he went to give in a specification of his invention before a Master in Chancery, previous to the obtaining of a patent. And many years afterwards, when a groundless and frivolous charge was brought against Mr. Watt, by a person who claimed a share in the invention, I was called to give evidence of what I knew of this in Chancery. It is needless to add, Mr. Watt was triumphantly victorious."

The failure of both Fitch and Rumsey to carry their schemes into practice, as it had previously done in another, settled the dispute as to priority of invention in America.

Oliver Evans, about the same period, had been maturing a plan for using steam of an elasticity ten times greater than that employed in the condensing and atmospheric engines. And his proposal was further remarkable, as embracing a device to propel waggons on common roads, by a steam-engine instead of horses. "But all united," says he, "in condemning the scheme, except two gentlemen, (one of whom was a projector himself,) and indeed one, who has the name of a celebrated engineer, continued to oppose them for a long time after they were fully in operation."

One of his adversaries was a Mr. Latrobe, who uniformly opposed steamboat projects, as well as those for steam carriages. Fifteen years after this period, and three years before they were finally established, (unfortunately for his reputation,) he printed a report against their practicability. We quote it as containing some facts respecting steam navigation. "After the American Revolution, a sort of mania began to prevail, which, indeed, has not yet entirely subsided, for impelling boats by steam-engines. Dr. Franklin proposed to force forward the boat by the immediate action of the steam upon the water. Many attempts to simplify the working of the engine, and more to employ a means of dispensing with the beam in converting the libratory into a rotary motion were made. For a short time a passage-boat, rowed by a steam-engine, was established between Bordentown and Philadelphia, but it was soon laid aside. The best and most powerful steam-engine which has been employed for this purpose, (excepting, perhaps, one constructed by Dr. Kinsey, with the performance of which I am not sufficiently acquainted,) belonged to a few gentlemen of New-York. It was made to act by way of experiment upon oars, upon paddles, and upon flutter wheels; nothing in the success of these experiments appeared to be sufficient compensation for the expense, and extreme inconvenience of the steam-engine in the vessel.

"There are, indeed, general objections to the use of the steam-engine for impelling boats, from which no particular mode of application can be free. These are—1st, The weight of the engine and the fuel; 2d, The large space it occupies; 3d, The tendency of its action to rack the vessel and render it

leaky; 4th, The expense of maintenance; 5th, The irregularity of its motion, and the motion of the water in the boiler and cistern, and of the fuel vessel in rough water; 6th, The difficulty arising from the liability of the paddles or oars to break, if light, and from the weight, if made strong. Nor have I ever heard of an instance verified by other testimony than that of the inventor, of a speedy and agreeable voyage having been performed in a steamboat of any construction."

In 1786, when Evans applied to the legislature of Pennsylvania, for an exclusive right to move land-carriages by steam, "they conceived me to be deranged," says he, "because I spoke of what they thought impossible, and they refused to grant the privilege I prayed for." The authorities of Maryland, to whom he next applied, with more wisdom than their neighbors, granted his petition, on the principle that what he asked for could injure no man, and might cause him to produce something useful." But with all his perseverance, his reputation for practical knowledge, and his privilege to boot, Evans could not persuade any person of substance to think so favorably of his steam-waggon, as to furnish him with the means to try one on a common road. And the drawings and descriptions of his scheme which he sent to England, to find a patron there, produced no better result.

The history of the result of another attempt to navigate by steam, which was made in Scotland, by Mr. Patrick Miller, of Dalswinton, has been lately given to the public by his son.* Mr. Miller, in 1787, had published a description and drawings of a triple vessel, moved with wheels, and gave a short account of the properties and advantages of the invention. "In the course of his explanations, he suggested that the power of a steam-engine may be applied to move the wheels so as to give them a quicker motion, and consequently to increase that of the ship. It may readily be believed, that this hint of his intention to apply the power of steam to the wheels of his double and triple vessels was not hastily thrown out. In the course of his various experiments on the comparative velocity of his vessels, with those propelled by sails, or by ordinary oars, which had given occasion to several interesting and animating contests for superiority, he had strongly felt the necessity of employing a higher force than that of the human arm, aided as it might be by the ordinary mechanical contrivances; and in this view, various suggestions were successively adopted, and in their turn laid aside. Thus, at one time, it occurred to him that the power of horses might be usefully employed; while, at another, the aid of wind itself seemed to furnish the means of counteracting its own direct and ordinary operation. But among all the possible varieties of force, that of steam presented itself to his mind, as at once the most potent, the most certain, and the most manageable."

"In Miller's family there was at this time, as tutor to his younger children, Mr. James Taylor, who had bestowed much attention on the steam-engine, and who was in the custom of assisting Miller in his experiments on naval architecture, and the sailing of boats.*

* A short narrative of facts relative to the invention and practice of steam-navigation, by the late Patrick Miller, Esq., of Dalswinton, drawn up by his eldest son."—(Edinburgh Philosophical Journal, 1834.)

One day, in the very heat of a keen and breathless contest, in which they were engaged with a boat on the Leith establishment, this individual called out to his patron, 'that they only wanted the assistance of a steam-engine to beat their opponents;' for the power of the wheels did not move the boat faster than five miles per hour. This was not lost on Miller, and it led to many discussions on the subject; and it was under very confident belief in its success, that the allusion was made to it in the book already mentioned.

"In making his first experiments, Miller deemed it advisable, in every point of view, to begin upon a small scale; yet a scale quite sufficient to determine the problem which it was his object to solve. He had constructed a very handsome double vessel, with wheels, to be used as a pleasure boat on his lake at Dalswinton, and in this little vessel he resolved to try the application of steam." On looking round for a practical engineer to execute the work, Taylor recommended a Mr. William Symington to his attention, whom he had known at school, and who had recently contrived a mode of applying the force of steam to wheel carriages; and he accompanied Miller to the house of a Mr. Gilbert Meason, in Edinburgh, to see the model. Pleased with this specimen of Symington's ingenuity, he employed him, in conjunction with his friend Taylor, to superintend the construction of a small steam-engine, to work a double or twin boat. And in the autumn of the same year, the engine, which had brass cylinders of four inches in diameter, was fixed in the pleasure-boat on Dalswinton Loch. "Nothing could be more gratifying or complete than the success of this first trial, and while for several weeks it continued to delight Miller and his numerous visitors, it afforded him the fullest assurance of the justness of his own anticipation, of the possibility of applying to the propulsion of his vessels the unlimitable power of steam. On the approach of winter, the apparatus was removed from the boat and placed as a sort of trophy in his library at Dalswinton, and is still preserved by his family as a monument of the earliest instance of actual navigation by steam" in Great Britain.

Symington, in the succeeding year, was again commissioned by his patron to try the experiment on a greater scale; a double vessel, sixty feet long, was to be fitted with an engine and revolving paddles, suited to the supposed exigencies of the case. The engine and machinery were constructed at Carron, and in the course of six months the vessel was ready to be put in motion. In December, 1789, it was taken into the Forth and Clyde Canal, and in the presence of a vast number of spectators, the machinery was put in motion. "This second trial promised to be every way as prosperous as the first. It happened, unluckily, however, that the revolving paddles had not been made of sufficient strength, and when they were brought

* Mr. Miller, at various periods of his life, had embarked in many great schemes of improvement, and, among others, had expended large sums in experiments on the improvement of artillery and naval architecture. It was in the course of his speculations and experiments on the latter subject, that he was led to think of devising some mode of constructing or propelling vessels in circumstances where the ordinary resources of the nautical art were insufficient or unavailing; among these, the construction of double and triple vessels, to be moved by wheels placed in proper situations, had occurred to him, as calculated to prove of essential service, and he accordingly built and equipped several vessels of this description.

into full action, several of the float-boards were carried away, and a very vexatious stop was, for that day, put to the voyage. The damage was repaired, and on the 25th of December the steamboat was again put in motion, and carried along the canal at the rate of seven miles an hour, without any untoward accident, although it appeared evident that the weight of the engine was an overburden for the vessel, (her planking being only three quarters of an inch thick,) and that under such a strain it would have been imprudent to venture to sea. The experiment, however, was again repeated on the two following days; and having thus satisfied himself of the practicability of his scheme, he gave orders for unshipping the apparatus, and laying it up in the storehouses of the Carron Company."

"It may naturally occasion surprise and disappointment," continues his son, "that I should have to terminate here this account of my father's experiments on steam navigation; that he did not follow up these prosperous and decisive trials of its efficacy, with the same spirit and perseverance, which had been so conspicuous in many other instances, must for ever be matter of regret to his family, as it was to himself in the latter years of his life." The fact, however, was, "that he had to complain of the enormous expense in which he had been involved; and I may be permitted to add," continues his son, "that by this time my father, in the prosecution of his various schemes of a purely public nature, and without the slightest chance or expectation of reimbursement, had expended upwards of thirty thousand pounds." And, being by this time ardently engaged in agricultural pursuits, his attention was more easily turned from the objects of his former speculations, than those acquainted with his character would have been prepared to anticipate.

"Be that as it may, it cannot be anticipated that in point of fact he had fully established the practicability of propelling vessels of any size, by means of wheels or revolving paddles, and of adapting to these the powers of the steam engine, although, in the subordinate details of execution, great room remained for minor improvements.

"Of my father's peculiar and undoubted merits as an inventor, I have," continues his son, with a pardonable partiality, "endeavored to give a fair and unvarnished account; and of the reality of that invention, as carried into actual practice in the years 1788 and 1789, no demonstration more unequivocal can be desired than that, with his few but most satisfactory experiments, the prosecution of this momentous discovery remained suspended for many years, in a state of inactivity and neglect, till, at a period comparatively recent, it was revived in America, and in this country, by persons who can be proved to have derived their first lights from the experiments at Dalswinton and at Carron. But I have felt no other desire than to record the facts immediately connected with my father's operations, and to establish the priority of his claims to the credit of having originated, and carried into practical execution, an improvement in the nautical art, by far the most important of which the present age has to boast; and the ultimate effects of which, on the future intercourse of mankind, the most sanguine imagination would attempt in vain to predict."

The narrative which Mr. Miller gave of

his father's attempt to construct a steamboat, and from which we have made some copious extracts, agrees with an account of the same experiments which was given in a sketch of navigation by steam, inserted in the Supplement to the Encyclopedia Britannica.

Symington, who appears to have been more sanguine than his first patron, of the practicability of navigating vessels by steam, nearly twelve years after his experiments at Dalswinton Loch, found an opportunity to bring his scheme under the notice of a nobleman, who was zealous to encourage projects which had for their object the improvement of inland navigation. Symington, who imagined that a boat moved by wheels could be introduced with great economy, as a substitute for horses, in towing boats on canals, succeeded in inducing Lord Dundas, of Kerse, to assist him to make an experiment, on a great scale, on the Forth and Clyde Canal, with machinery, resembling in its principle that of the Dalswinton model, but modified to suit the purpose which he had more immediately in contemplation.

The result of this application, and the character of his patron, may here be noticed with reference to Symington on another account, besides its connection with a history of his experiment. From an expression in Miller's narrative, that his father was discouraged from proceeding farther from a feeling of disgust at having been involved in unnecessary expenses, an inference might be drawn unfavorable to the memory of an ingenious and worthy man.

But Miller's complaint is, in truth, a very common one; and the estimates even of the most experienced mechanics will probably continue to differ widely from the final outlay, even although those artists have been experimenting on their own means.

"Mr. Miller," says Symington, in his narrative, "being very much engaged in improving his estate in Dumfriesshire, and I also employed in constructing large machinery, for the lead mines at Wanlockhead, the idea of carrying the experiments at that time any further was entirely given up, till meeting with the late Thomas Lord Dundas, of Kerse, who wished that I would construct a steamboat for dragging vessels on the Forth and Clyde Canal, instead of horses. Agreeably to his Lordship's request, a series of experiments, which cost nearly three thousand pounds, were set on foot in 1801, and ending in 1802, upon a larger scale (than those on Dalswinton Loch) and more improved plan, having a steam cylinder twenty-two inches diameter, and four feet stroke, which proved itself very much adapted for the intended purposes. Having previously made various experiments in March, 1802, on the Forth and Clyde Canal, Lord Dundas and several other gentlemen being on board, the steam packet took in tow two loaded vessels, each of seventy tons burden, and moved with great ease through the canal, a distance of nineteen and a half miles in six hours, although the whole time it blew a strong breeze right a-head of us, so much so, that no other vessels could move to windward in the canal that day but those we had in tow, which put beyond the possibility of a doubt the utility of the scheme in canals and rivers, and ultimately in open seas. Though in this state of forwardness, it was opposed by some narrow-minded proprietors of the canal, under a very mistaken idea that the undulation of the water, occasioned by the

motion of the wheel, would wash and injure its banks. In consequence, it was with great reluctance laid up in a creek of the canal, exposed for years to public view, where Henry Bell from Glasgow, who also frequently inspected the steamboat at Carron, in 1789, did also particularly examine this."

During the time that he was engaged in this experiment, Symington received a visit from a Mr. Fulton, "who," says he, "politely made himself known, and candidly told me he was lately from North America, and intended to return thither in a few months; but having heard of our steamboat operations, he could not think of leaving the country without first waiting upon me, in expectation of seeing the boat, and procuring such information regarding it as I might be pleased to communicate. He at the same time mentioned, however advantageous such an invention might be to Great Britain, it would certainly be more so to North America, on account of the many extensive navigable rivers in that country. And as timber of the first quality for building the vessels, as also for fuel to the engines, could be purchased there at a small expense, he was decidedly of opinion it could hardly fail, in a few years, to become very beneficial to trade in that part of the world; and that his carrying the plan to North America could not turn out otherwise than to my advantage, as if I were inclined to do it, both the making and superintending of such vessels would naturally fall upon me, provided my engagements with steamboats at home did not occupy so much of my time, as to prevent me from paying any attention to those which might afterwards be constructed abroad. In compliance with his earnest request, I caused the engine fire to be lighted up, and in a short time thereafter put the steamboat in motion, and carrying him four miles on the canal, returned to the place of starting, to the great astonishment of Fulton and several gentlemen, who at our request came on board. During the above trip, Fulton asked me, 'if I had any objections to his taking notes respecting the steamboat?' to which question, I said 'none;' and after putting several pointed questions respecting the general construction and effect of the machine, which I answered in a most explicit manner, he jotted down, particularly, every thing then described, with his own remarks upon the boat;" "but he seems," says Symington, "to have been altogether forgetful of this, as, notwithstanding his fair promises, I never heard any thing more of him till reading in a newspaper an account of his death."

From these facts, the author of the sketch thinks it is very evident Symington was the first person who had the merit of successfully applying the power of the steam engine to the propulsion of vessels, and that there can be but one opinion, that, in its influence on the fate of a most ingenious man, there existed not enterprise enough in Scotland to encourage this excellent artisan to repeat his interesting and important experiments on the river Clyde.

About the time Symington had abandoned his experiments, M. Des Blanc, a watchmaker at Trevoux, had built a steamboat, and made some experiments with it on the river Soane. The first attempts were so successful as to bring forth the Marquis de Jouffroi, with his prior claim; the final result, however, was as hapless as the Marquis's.

NEW-YORK AMERICAN.

JUNE 14—20, 1834.

LITERARY NOTICES.

LETTER XXXI.*

Lexington, Kentucky, April 6th.

It was a beautiful day, that on which I left Cincinnati; and when, after crossing the Ohio at noon, I found myself upon the Kentucky bank of the river, and checked my horse to look back for a moment upon the noble town and the fair stream that bathed its walls, I could not but admit that the amphitheatre of green hills opposite to me did really shut in "The Pride of the West," if not the most beautiful city in the Union. But I confess I was not sorry to escape from its elegant and profuse hospitalities, and to find myself once more on horseback and alone, free to rove wherever fancy or caprice should lead me.—The "voice of Spring" had long been abroad in the land, and the perfume of blossoms and flowers that met my senses as I rode by the scattered gardens in the little town of Covington, seemed to rebuke the taste which had kept me so long within a city's walls. From a green knoll on the edge of the village I took my last look of the beautiful Ohio, and then pausing vainly a moment to catch the words of a song which a young girl was warbling to her piano in a pretty cottage near, I struck down the side of a grassy slope, and crossing a brook, soon found myself riding through a tall wood on the high road to Lexington. The evening soon after closing in, left me but little opportunity of observing the country, which appeared to be generally heavily wooded, and broken up into undulations so short and frequent, as to make the office of ploughing the hill-sides no sinecure. The aspect of a broken country was so agreeable to me, however, after being so long upon the prairies, that I was not sorry to find but little alteration in the scenery, when I arose and advanced upon my journey the next morning. But for the present I was no longer solitary. I had not got a hundred yards from the house where I passed the night, before I heard a voice from an enclosure near the road, calling out, "Hallo, stranger; I reckon you and I are cutting out for the same place; so hold on a bit, and you shall have some company." But before this considerate traveller could gain the road, I was overtaken by a young man of genteel appearance, who at once drew up by my side and entered into easy conversation, according to the custom of the country. After riding a mile or two together, he asked me if I would eat an apple, and, upon expressing assent, instead of drawing the fruit from his pocket, or saddlebag, as I expected, I was not a little surprised to see him stop in front of a respectable looking house, and halloo till a half a dozen negroes made their appearance from the log cabins around the door. "I say, Aunty," cried my companion to an active looking wench, who advanced before the rest, "has your master got any apples in the house?" "Only a few barrels left, young master." "Well, then, bring us a dozen." A large basket containing as many of the finest pippins as we could stow about our persons, was, a moment after, brought to the road side and held up to us, as we sat on horseback; and, after dividing the contents between us, I was very naturally about to pay for them, but the young gentleman told me that I would only insult a decent farmer's family, (not a soul of whom was known to him,) by paying for what "no Kentuckian would be brute enough to refuse a stranger."

My companion soon after parted from me, and entering a deep wood, I was so much engaged in listening to the mellow whistle of the red-bird and marking the shrubs and flowers that were putting forth their virgin blossoms around me, that I insensibly deviated from the turnpike (so called) and took a road which after an hour's riding through a romantic forest, brought me up at last by a mill, where I learnt how many miles I had wandered from the way. The beautifully secluded dell through which my path now led in recovering the main road, left me nothing to regret in having thus added to my journey. It was watered by a deep brook, along whose steep banks the red-bud and the wild plum put forth their delicate blossoms in rich profusion, and the various singing birds, which the glare of noon had driven from the

* The publication of "A Winter in the West" having been determined upon, the four intervening letters, describing the city of St. Louis, the sail up the Ohio, and the various points of interest around Cincinnati, with a sketch of the society in that beautiful town, have been reserved for publication in a more compact form.

road side and open fields far into the forest, kept here the woods alive with music.

My path, at first but little more than an Indian trail, widened at last into something like a wagon road; and I came finally to a number of log cabins, scattered along the road at some distance from each other. Near one of one, I was not a little struck at seeing an old gray-headed negro ploughing the few acres which surrounded the miserable shantee, while a stout, hale looking fellow of forty was lounging indolently in his rude and dirty doorway. It was the first object I had seen to remind me unpleasantly that I was now in a slave State.

A pretty cottage, with some shrubbery around it, stood near the spot where I regained the highway toward sunset; and near at hand was a small grave yard, protected from the road by a slight fence, with a rank growth of weeds along its border. Pausing a moment to observe the various rude memorials to the dead that reared their gray heads in the yellow sunlight, my attention was fixed by a young fair-haired girl of sixteen, kneeling by the side of a new made grave, and bending her head toward the recent sod, apparently in an attitude of prayer. Upon looking more narrowly, however, I discovered that she was only engaged in planting flowers around a spot which was probably hallowed in her affections. Her bonnet was thrown back upon her shoulders; and there was nothing to screen her features from view except the long hair, which waved in locks of gold on either side of her pensive countenance, which—so intently was she bent upon her graceful task—was only completely exposed when she raised her head, as if startled by the sound of my horse's hoofs, as I moved from the spot.

The evening had completely settled in upon the lower grounds as I looked from an eminence down into the little valley whence rose the white chimnies of the house where I was to pass the night. It stood in straggling and broken form, one story in height, on the margin of a lively brook, which rattled along the base of the hill; the various buildings comprehended in the mansion making quite an imposing appearance as they extended their low and irregular front along the road side. There was a fence of rough slabs, whitewashed, about ten feet in front of the porch, with a number of different lengths placed upright near it, to answer the double purpose of a horse block to mount from and a style to cross the fence with. A limping gray-headed negro received my horse at the door, while the landlord took my saddle-bags, and ushered me into a wainscotted and white-washed chamber, where another traveler, who had arrived but a few minutes before me, was comforting himself with the contents of a pitcher of cider, which stood at his elbow. "Come, sir, come," he exclaimed, upon my entrance—"Come, sir, take a drink; this cider goes very well after an evening ride." "Help yourself, stranger," added the landlord, "while I tote you plunder into the other room." Then, while I joined the cider drinker in his thin potatoes, the landlord soon returned, and finding that my immediate destination was Lexington, he told me, with an air of great satisfaction, that "I would have company all the way, for that that gentleman was going on in the morning." The other, a plain farmer, with whom I had now exchanged some common-places about agriculture, which nearly exhausted my stock of information on that subject, rejoined with animation that he was very glad I was going his way, as "he allowed the gentleman to be right good company, and he did not mistrust but what we'd have a tip-top time of it."

The faintest streakings of dawn were hardly perceptible in the east when our horses were brought to the door the next morning; and mounting by the light of the young moon, which showed like a mere gash in the blue vesture of heaven, we moved in a brisk trot from the door of the hostelry. The twilight seemed to be losing its sombreness as we gained the top of the opposite hill; and then entering a wood of ancient beeches, the chirp of the grey squirrel, and the grating call of the ma-ma-twa, or cat-bird, impatient to commence his morning song, rivalling in sweetness the finest music of the woods, foretold the approach of day; and, indeed, the sun was already up, and the wild bee humming around the blossoms of a majestic tulip tree, as we emerged from the forest beneath its gnarled branches that extended across the road, and framed in a miniature view of cultivated country below us, whose aspect beneath the uprising sun was perfectly delicious. "Save your praises, stranger, until you get twenty miles nearer to Lexington," cried my companion, as I gave loose to my admiration and delight in no measured terms. The scenery of this part of Kentucky reminded me much of that in the eastern section of

Putnam county in the State of New York. There were the same abrupt hills, cultivated apparently to the utmost, wherever their inclination was not too great for the plough, and having all their steep places covered with a vigorous growth of forest trees, while at every interval between their bases some saucy brook would make its presence known as it capered along over the stones that paved its path to some more majestic and tranquil stream.

It was high noon when I approached the environs of Georgetown, and looked down from an eminence on the banks of the Elkhorn—a pretty winding stream about fifty yards wide—upon its beautiful race-course. It was an immense meadow of the finest and firmest turf, studded here and there with noble elms and sycamores the original growth of the forest and having two sides bounded by the river, while thickly inclosed grounds, scattered copses, or sunny slopes, waving with new wheat, gave repose to the eye upon the remaining two. The town itself looked very flourishing, and appeared to be well built, chiefly of brick; but wishing to reach Lexington early in the evening, I rode directly through it.

The country now became much more level, and the soil richer than any I had seen since crossing the Ohio. The inclosures, too, were all in better order, and I now, for the first time, saw some of those beautiful wooded pastures, which, as they are the pride of Kentucky, are peculiar, I believe, to this State. An occasional villa, embosomed in trees and shrubbery, was soon after observable. The distance at which they stood from the road indicating the taste of their proprietors in one essential point, while it left one to guess how it had displayed itself in others. The frequency of these tasteful residences continued increasing, until the collection at last assumed the appearance of a village, and finally, after travelling a few hundred yards on a M'Adamized road, I found myself riding over paved streets through the beautiful town of Lexington, the various gardens and shrubbery around the doors of the houses leading one so insensible into the business parts of the town, that you are in the heart of the place before becoming aware that you have passed the suburbs. The town, which is regularly laid out upon a level plot of ground, is well built of brick and wood, and has the sidewalks of its broad streets almost invariably lined with ornamental trees; so that, with the numerous vacant lots cultivated as gardens, and in which even thus early, the song of the mocking-bird may be heard, Lexington approaches nearer to the *rus in urbe* than any town of its size that I have seen.

Soon after entering the town, my fellow traveller drew up his horse by my side, and mentioning that "we must part here, perhaps never to meet again, stranger," he, for the first time, enquired my address with some interest, and took a very kind farewell of me. He was a plain and unpretending man, in very moderate circumstances, and spoke upon few other subjects besides religion, slavery, and the state of agriculture in Kentucky; but the attention with which I listened to the exposition of his views, while studying him as a fair representative of one of the most important classes in the community, seemed sufficiently to have won his good opinion; and I must say, that if the farmers of Kentucky are generally gifted with the same conscientiousness and moderation, with equal liberality and desire for improvement, they will compare to advantage with the cultivators of the soil in any part of the Union. Nor have I as yet, since crossing the Ohio, met with any of those "half-horse and half-alligator" characters, which flourishing for a few years on the banks of the Mississippi, have now for the most part withdrawn themselves beyond the frontiers, or live chiefly in the imagination of those who confound the wild boatmen of the western waters with the far different people who dwell upon their borders.

I am now established for a few days at Postlethwaite's Hotel in the centre of the city of Lexington, and will give you, in my next, the result of various excursions which I meditate in the neighborhood.

THE EARTHQUAKE IN SOUTH AMERICA.—A newspaper, brought by the Orbit, Captain Moncrieff, from Jamaica, contains some additional particulars of this dreadful calamity.

PASTO, 22d Feb. 1834.—I have to inform you that the town of Santiago, adjoining the parish of Sibundoi, situated to the east, and at the distance of 12 or 14 leagues, was built over a hidden volcano, which burst on the 29th ult. at 7 o'clock in the morning. The

earth shook so violently, that that alone ruined the ancient Rio Bamba, which may afford you some means of drawing a comparison. A run of land about 3 leagues long and 2 broad, sunk, with the forest which covered it; and its superficies presents now the aspect of a savanna, covered with stones and sand. Although the trees which covered the spot were as old as the world, there has not a root of them remained, nor even a leaf to indicate the place where they stood.

During 24 hours that the earth shook without ceasing for one instant, the town and environs were rendered a heap of ruins; the cottages of the peasants were swallowed up by the earth which yawned at every point, and the churches of Santiago and Sabundoi were ruined, and also my house, under the ruins of which I was buried. But, as if by a miracle I escaped from my sepulchre; for the same convulsion which swallowed up my house, threw it up afterwards upon the superficies of the earth, and I then managed to get out, although I was dreadfully crippled. The waves which the earth formed, rolled, in every sense of the word, similar to those of the sea, and to as great a height as happens when the ocean is enraged by a tempest. Eighty persons were swallowed up by them, with all their live stock; and the only ones that could escape were those of us who were able to run up a hill, which, although it shook as well as the rest, did not sink, neither did the waving of the earth affect it. PEDRO LEON Y LOPEZ.

FROM CANTON.—By the fast sailing ship Horatio, Capt. Howland, which sailed on the 2d of March, Canton papers have been received here dating only three and a half months back. They contain, however, but little news. The paper of the latest date says, "We hear from native authority that another disturbance has broken out amongst the hill tribes on the borders of Canton Province, near Leen-chow. Troops, it is said, have been ordered to the spot for the purpose of reducing them to submission."

The expulsion of the Catholic missionaries from Macao, appears to have been founded upon an old claim set up by the king of Portugal to permit no Roman Catholic missionaries to visit Asia, without his royal license being first obtained.

The last week has been prolific in arrivals, consisting of no less than three American vessels from England; one of them Amanda, sailed so lately as the 18th October, from London, brings only three newspapers, which contain nothing of interest. The other ships are the Alert, sailed 15th September from London and the Philip 1st from Liverpool, 30th September; the packets of neither of which are yet delivered.

Report states that a leading house in London had sent off a courier in July last, with despatches for Canton, by the overland route through Russia and Siberia, in the hope of arriving before the ships then sailing. We think it difficult to believe, however, that an undertaking so unlikely to accomplish the object in view, should have been seriously contemplated, far less attempted.

We learn that the Russian State Councillor, Foss, Secretary to the Russian Academy of Sciences, was about to set out from St. Petersburg to Peking, through the eastern Siberia, and had determined to devote three years to the journey.

Steam Communication with Suez.—We are happy to observe that effectual measures have been at length resolved upon to establish a steam communication with Suez, not only from Bombay, but also from Beagal.

The intention appears to be that four quarterly trips shall be made in the year, two by the government steamer Hugh Lindsay from Bombay, and two by the private steamer Forbes, from Calcutta.

FROM JAMAICA.—The ship Orbit, from Kingston, has brought files of papers to the 21st ult. Nothing important can be gathered from them in regard to the complexion of affairs in the English islands.

"Our accounts" says a Kingston paper of May 16th, "from the country by yesterday's post are neither flattering nor disheartening. Some correspondents dread the approach of the first of August, while others anticipate happier times. We hope the latter will not prove false prophets. It is pleasant to hear that the Police force is organizing with a greater rapidity than was expected: yet some complain of pay, &c. When the House meets, their first duty will be to settle this question.

The Despatch states, that the Marquis of Sligo was much indisposed.

H. M. ship *Forte* arrived at Kingston on the 14th from Barbadoes, with £30,000 sterling, all in shillings and pence, which had been transhipped from H. M. ship *Belvidera*. A Kingston paper of the 20th says: "The quantity of specie issued on Saturday by the Receiver General, appears to have given new life to the city. Change now being afforded, complaints will necessarily cease."

There has been a total failure of the plantain crop in Demarara.

The Legislature of Tortola have adopted resolutions expressive of their entire disapprobation of the Emancipation Act, and of the arrangements of the Government for the distribution of the compensation money.

KINGSTON, APRIL 28 TO MAY 24.—Mr. Christie, and his boy, are supposed to have been drowned near Green Bay, as the boat, paddle, &c. had been found.

SPANISH TOWN, April 25.—A party of gentlemen, consisting of eight, headed by John Sterling, Esq. proceeded about one o'clock this morning, from this Town to the wood above Tulloch's Estate, and adjoining Keith Hall, the property of J. G. Vidal, Esq. in St. Thomas in the Vale, for the purpose of breaking up the haunt of a band of desperate runaways, located in the midst of that extensive wood, who have been for some time committing depredations on the adjoining properties to a very great extent, especially among the cattle. These gentlemen, after a very fatiguing search in the woods, discovered their haunt, surrounded their huts, and after a desperate resistance, succeeded in capturing ten of the gang, among whom was (by her allegation) a free woman. Several shots were fired by these brigands, and they resisted, with sword in hand, their assailants; the latter, however, as above stated, mastered them, not without being unavoidably obliged to inflict some wounds upon three or four of them. They then searched their huts and found the carcasses of four beeves cut up, and a quantity of arms, ammunition, &c. The gallant little corps having fired their huts, brought them and their booty into town.

Mr. Joseph Tyrell, has commenced an action against the Editor of the Jamaica Despatch, and laid his damages at 5000*l*; Mr. T. having been accused in said paper of ill-treating Mr. John Scott.

The Jamaica Advertiser of May 20, says—The quantity of Specie issued by the Receiver-General on Saturday, appears to have given new life to the city. Change being now afforded, complaints will necessarily cease.

Hector Mitchell, Esq. Mayor of Kingston, had been upset in his carriage, and considerably but not dangerously hurt.

The Ship of war *Forte*, Com. Pell, had arrived at Kingston from Barbadoes, with 90,000*l*. in silver, which sum arrived there in the *Belvidere* from England.

LATEST FROM EUROPE.—By the packet ship *Orpheus*, arrived at this port on Saturday, we have received our files of English papers to May the 16th. The foreign news contained in them is of trifling amount, and not very interesting in its quality.

The Cotton Market continues to disappoint mercantile expectation, and to rise under the pressure of great arrivals. The sales continued large.

A great meeting has been held in London by the dissenters, for the purpose of petitioning Parliament for an entire separation of Church and State.

Paris, it is stated, cannot be said to be tranquil.

Accident at Toulon.—In the Chamber of Deputies on Wednesday, M. Eschesseriaux begged leave to remind the Chamber of an unfortunate event which took place at Toulon the day of the King's fête, when an American frigate in that port fired seven times upon a French vessel called *Le Suffren*, and killed two of the crew. He was inclined to think that this misfortune must have been the result of mistake or accident. As a proof of this, I shall read a letter written by the captain of the American frigate to the Maritime Prefect. It is as follows:—"Sir. It is with the profoundest regret, that on my arrival from Marseilles I learned the sad accident occasioned by the salute given by my frigate in honor of the King's fête. It is impossible for me to express what I feel upon this occasion. To understand it, I beg of you to put yourself for a moment in my situation, and I beg of you to except the most positive assurance I can give you of the profound grief of all the officers and crews of the American vessels who were at Toulon when this fatal accident happened." The letter then states, that the man whose malignancy had

caused the accident had been put under arrest, and should be brought to a court martial. The captain terminates his letter by entreating, that as a testimony of the regret felt for the accident, a sum of 5,000*fr.*, which had been subscribed by the officers and crews of both the American vessels, should be given to the families of the sufferers.

"Accounts from Alexandria give the most gratifying details respecting Egypt. Mehemet Ali continues forwarding with unremitting energy the work of this interesting country's regeneration, and adopting measures to increase his revenues, and to improve his army and navy. Egypt's prosperity being entirely regulated by the Nile's foundation, and this being very irregular, the Pacha has taken the wise determination of establishing, at the point of the Delta, locks, which, by commanding the river's waters, will insure their annual rise. The beneficial results of this important undertaking are incalculable. A Polytechnic school for the formation of officers, has by his orders been established at Boulac. The Professors of Mathematics, Drawing, Natural Philosophy, &c. are Europeans.

The establishment of Railways across the Isthmus of Suez is in contemplation. A report, stating the probably advantageous results of this undertaking, has been, after his own request, submitted to the Pacha's consideration.

The Sultan seeing himself, contrary to the most formal assurances, not only abandoned by his pretended friends—the English and French—but hearing them unblushingly express the high satisfaction the conduct of the Emperor towards him had given them, has reluctantly ratified the treaty of St. Petersburg. In remuneration of the important services which, as he is taught to believe, Achmet Pacha has conferred upon his country, his Highness has granted him, for life, the revenues of the district of Bolou and Gatzamboli, in Asia Minor.

FRANCE.

"Conflicts between the students who frequent the *Guinguettes* (tea-gardens,) in the quarter of Mont Parnasse, and the police, and between the populace and some soldiers of the 35th regiment, took place on Thursday last, outside the barriers, and appear, indeed, to be of hourly occurrence. Great numbers of arrests and domiciliary visits continue in Paris and throughout France. On the other hand, the Chamber of Peers daily discharge scores of prisoners against whom no evidence appears on the investigation of their cases. Dr. Gervais and the Editor of the *Messenger* having refused to go to trial on Saturday, they were condemned respectively to fines of 1000 francs, and to imprisonment for an alleged libel on the police. A new trial will be the consequence of this curious proceeding. We regret to learn that very serious apprehensions are entertained for the consequences of the first public discussion of the late melancholy events in Paris."

The late affair at Lyons.—Official returns from the Arsenal of the quantity of ammunition consumed during the six days of fighting:—2,204 cannon shot—360,000 cartridges (presumed musket)—580 kilogrammes, or nearly 1,200 English pounds of gunpowder, for mines and petards.

The National Guard of Tarbes and of twenty districts in the neighborhood of Lyons, have been dissolved.

The *Courrier de Lyons* of Tuesday states, that on Sunday last a numerous body of working-dyers assembled at a public house on the Quai de Bon Ren contée, for the purpose as it was presumed, for forming a combination for an increase of wages.—They were, however, immediately surrounded by the police, aided by strong detachments of troops, and 22 of them seized and taken to prison. A powerful sensation was created in that quarter of the town, but it does not appear that any excesses were committed.

PARIS, May 11.—The budget was voted yesterday *en masse*, by a majority of 241 against 70. The amount fixed for the general expenses, is 1,030,090,547 francs, and for the special credit allotted to public works, 27,590,000 francs, not including the supplementary credit, which Soult has demanded, and will obtain, of thirty-six millions, to increase the effective army to 420,000 men in these piping times of peace.

Cholera in Paris.—Some of the French medical journals state a certain number of cases of cholera have been met with in Paris during the last month; it does not appear, however, that they have been of great severity; indeed, from those which are given in detail, they should be disposed to say that the disease was no more than is usually met with when the weather becomes warm, and such as would not have attracted the slightest notice anterior to the irruption of the more formidable disease from the east.

GERMANY.

AMSTERDAM, MAY 6.—According to intelligence from Frankfort, dated 3d May, which we have received to-day, some disturbances took place there on the night of the 2d. Some students confined in the guard-house broke out, the soldiers fired on them, and the report having caused a great multitude to collect, many citizens fell victims to the fury of the soldiers. Ten innocent persons, it is said, were killed in this manner. Three students lost their lives, and two escaped.

LONDON, MAY 14.—A fatal affray took place at Frankfort on the 6th instant, between the populace and the armed force of the city. Three soldiers were killed, and it became necessary that the Prussian and Austrian troops should occupy the city to prevent further effusion of blood.

Extract of a letter of the 6th inst. from Frankfort:—"The unfortunate occurrences of the 3d instant have created great ferment here. The Senate, the Legislative body, the burghers, and the armed force of the town, particularly the Company of Chasseurs, cry out against one another with daily increasing acrimony. Yesterday morning, at 7 o'clock, the funeral of Frederick Schreiner, a blacksmith, who was killed before the constable's guard house, was followed to the burying-ground, which is about half a league from the town, by a very great crowd of people. In the course of the day several serious disturbances occurred at the public houses in the suburbs, in which two men were killed and several seriously wounded. Similar disorders arose in the commune of Bornheim, where also blood was shed. At nightfall a large body of Austrians entered the Zeil, the central street, and succeeded in clearing away the multitude which surrounded the guard-house, uttering desperate threats. An assembly of the burghers of Frankfort have agreed upon a petition to the Senate and Legislative body, complaining of the police, the officer of the guard, and the soldiers, who fired upon the people. It is said to have been signed by 800 of the wealthy citizens, and there is every reason to apprehend that the irritation will continue to increase until satisfaction is granted."

SPAIN AND PORTUGAL.

LONDON, 12th May.—It now turns out that the account of the embarkation of Don Carlos for England, at least at the time and in the manner described, is a fabrication. From the quarter, however, in which it was circulated, there can be no doubt that such a piece of intelligence was transmitted by the telegraph to Paris, and that the opprobrium therefore of such an infamous deception does not rest on this side of the Channel. At present the whole affair is involved in so much mystery that it is impossible even to form a conjecture of the exact origin of it, but every one in any way connected with Spain, is highly indignant at the imputation, and will not spare any trouble to bring the authors of it to light.

ARANJUEZ, MAY 5.—The treaty of alliance between England and France and the two kingdoms of the Peninsula has, probably, been already laid before the House of Commons. The details have not yet been published in this country, although some ill-defined rumors have got into circulation on the subject.

The Portuguese question may now be said to be settled, and the affairs of the Peninsula generally must henceforth lose much of the interest which has hitherto attached to them. It is true there are croakers at Aranjuez who make themselves heard as loudly as in other places, and who seem to take a perverse delight in anticipating the horrors of a general war. The departure of M. Liebermann, the Minister of Prussia, from Madrid, without leaving behind him a Chargé d'Affaires, as the Neapolitan Minister had done, has served to give some color to these alarms. Among better informed people, however, it is not doubted that the northern alliance will acquiesce very quietly in the new arrangements, and, like certain ill-tempered curs, however much they may growl for a little, will only fawn the more they are beaten.

In pursuance of a new arrangement, a strong Spanish force has marched to the relief of the Portuguese General, the Baron Bernordo de Sa. Boats of draught and burden and every sort of wheel carriage to be found near the frontier has been pressed into the service of the expedition, so that we may daily expect to hear that a blow has been struck in Portugal, which if promptly followed up, will not only decide the fate of the Usurper, but with him the hopes of the pretender to the Spanish throne.

In the mean time, it is but too evident that these more vigorous measures have not been begun a single day too soon. The latest intelligence from the

seat of war in the northern provinces is far from being of a flattering description. The despatch of Quesada is understood by those who are best acquainted with the subject as little better than an apology for a very serious defeat.

LATEST FROM EUROPE.—By the Sovereign, Capt. Griswold; the Eagle, Captain Lyon; and the Henri IV., Captain Castoff,—we have received European papers to the 20th ult. With much speculation upon the affairs of the continent, they contain hardly a fact of interest enough to copy.

The dates from Paris are to May 15th. Arrests, particularly of editors, continued to be frequent.

Two extraordinary votes or credit for the War Department, amounting to about £890,000 sterling, were agreed to by the Chamber of Deputies on Tuesday; one portion of it, however, by a majority of 54 only.

Paris May 15.—The King has granted from his privy purse the sum of 10,000fr. to be distributed at Lyons amongst the innocent victims at the late riots.

The Bill introduced into the House of Commons for the repeal of the Septennial Act has been lost, but the minority was so respectable in numbers, that the passage of a similar measure at no distant day is very probable. Ministers opposed the measure.—On the subject of Portuguese affairs, Lord Palmerston stated, in answer to some questions that were put to him in the House, "that a treaty which related to the affairs of the Peninsula had been signed by the Plenipotentiaries of England, France, Spain, and Portugal, and that as soon as it should be ratified it would be laid on the table of the house; that the ratifications of three of the parties had been received in London; that the approaching arrival of the ratification of Portugal had been officially announced, and that it might be confidently expected that the vessel bearing it would reach England in a few days.

At the levee of the King of England, on the 7th ult., Captain R. F. Stockton and Lieut. Alex. Slidell, of the United States Navy, were presented by Mr. Vail, the United States Chargé d'Affaires.

The cotton market continued in a very animated state, with a gradual advance in prices.

FROM EUROPE.—By the packet ship Silas Richards, Capt. Nye, which sailed from Liverpool on the 24th ult. we have received our files of English papers up to that date.

The only news of especial interest is the decease of the true patriot and friend of liberty, General Lafayette, of which our readers will find an account on page 384.

LIVERPOOL, MAY 24.—On Thursday week the annual debate on the septennial act took place, on the motion of Mr. Tennyson. After a sharp discussion—distinguished for very little argument and very many words—the motion was lost by a majority of 50.

It is generally rumored that ministers and Mr. O'Connell have come, or are coming, to some sort of a compromise on the Irish tithe bill. It is pretty certain that Sir Francis Burdett and Lord Ebrington have communicated with the member for Dublin on this point; and it is said that Sir Henry Parnell has been employed by ministers to negotiate the matter. It is supposed that if the appropriation clause be not adopted this session, it will be left over for subsequent consideration, which, no doubt, would end in its adoption. Mr. O'Connell has just addressed a letter to the editor of the *Dublin Pilot*. Speaking of ministers, he says:—

"They have solemnly pledged the Parliament to remove 'the just complaints' of the people of Ireland. A cabinet minister—one of the first in rank, and one of the highest in talent—has publicly and unequivocally declared that the tithe system in Ireland, as it relates to the established church in its present form, 'is a just complaint.' Shall it be redressed? Alas! I fear not. But why should I fear either alternative? If this 'just complaint' be redressed, then the people of Ireland will have obtained a great, a solid, a permanent advantage. If it be not redressed, then the honest, the undismayed repealers, will, with me, point to the falsification of the Address, and exclaiming against 'the living lie,' feel more deeply how impossible it will be to expect justice from any other than a domestic legislature. * * * For my part, I am ready to make every sacrifice to obtain the fulfilment of that promise."

The newspapers say that Mr. O'Connell is to be made Master of the Rolls in Ireland. At present, we suspect that this is a premature announcement.

If ministers will stop "agitation" by doing justice to Ireland, we do not see why the best lawyer in Ireland—which O'Connell is—should not be placed on that bench which Curran occupied.

[From the National, May 20.]

SPAIN.—A letter from Madrid, of the 17th, says: "Our President of the Council has just transmitted an official note to the Representatives of the Powers which have not yet recognized our Queen, inviting them to do so immediately, because, since the death of King Ferdinand, the Sovereigns have had ample time to convince themselves that the Spanish nation considers Isabella as Queen both *de facto* and *de jure*, and that the weak minority which is fighting in Navarre in the name of Don Carlos, is not a party, but a faction. Should this recognition not be immediately made, the President of the Council intimates to those that may refuse, that they may apply for their passports in 24 hours.

"The Foreign Ministers, doubtless, after consulting together, replied, that they expected the orders of their Cabinet on the communication which had just been addressed to them, at the same time as a copy of the Royal Statute. The Papal Nuncio, who received a similar communication, has answered to the same effect. This act of our Ministry is not public, but you may consider it as certain that it was previously discussed with the Plenipotentiaries of France and England.

"Since the treaty of offensive and defensive alliance between France, England and Portugal, has been made known here, our troops no longer content themselves with seeking in Portugal after a grotesque Pretender; they combat the Miguelites in concert with the Generals of Don Pedro.

"General Quesada, greatly mortified by his late defeat near Viterria, has taken the field with 6,300 men, to combat Zumalacarreguy. The Government has just given orders to all the columns in Old Castile, on the banks of the Douro, and in part of Aragon, to proceed by forced marches to his assistance. Part of our garrison is gone to take up positions on the road to Burgos, and to cover the points which the other troops have left."

A courier arrived yesterday from Constantinople with the answer of Admiral Roussin to the despatch announcing his appointment as Minister of Marine.—The Admiral entreats his Majesty to permit him to retain the Embassy at Constantinople. In consequence Admiral Jacob has been appointed Minister of the Marine and the Colonies, and last night took the oath in the presence of the King. The Ordinance by which the above appointment is made appears in the *Moniteur* of this morning.

VIENNA, MAY 6.—We know for certain that the Poles are to leave Switzerland. It seems that the measures adopted by the adjacent states have rendered the Confederation much more disposed to listen to the well-founded remonstrances that have been addressed to it. In this case it acts conformably to its own interest; for what would become of its foreign commerce if all the issues were closed against it. Interest is paramount to principles, and whatever attachment to the cause of the Poles may exist even at Bern in a certain party, it must give way to necessity.

BRUSSELS, May 19.—The Court will go into mourning for a month, on account of the death of the Prince Royal.

The remains of the Prince will be embalmed, and deposited in the Church of St. Gudule, in the sepulchral vault of the Dukes of Brabant. It is supposed that the funeral will not take place for several days. It was at first contemplated to inter the remains of the Prince in the Cathedral of Malines, but it has been decided that they shall be transferred to Brussels.

Their Majesties saw nobody the day before yesterday. We are told it would be found difficult to form an idea of the profound affliction which they feel at the loss of the first fruit of their union. The King was obliged to make a great effort to sign some of the letters of notification laid before him by Minister for Foreign Affairs. The Ministers and several persons high in office went to Lacken, but could not be admitted. The Theatres will be closed for three days.

The sepulchral vault of the Dukes of Brabant, in the chancel of the church of St. Gudule, was opened on the 19th. Several tombs and numerous epitaphs of the ancient Dukes of Brabant were found; one in particular, of the date of 1380, in a perfect state of preservation. On the tomb was deposited an enormous silver sword, with the arms of Brabant chased on it; on another tomb is a gold vase, with the arms of Austria, containing the heart of the Archduke Er-

nest, who died Governor-General of the Netherlands at the end of the 16th century.

SUMMARY.

Dr. Jones, in a letter to Professor Silliman, states that there is a colony of Gipsies in Louisiana. They were brought over by the French at an early period, and colonized. They have lost, however, their wandering gipsy habits, and attend to regular business. Their complexion is darker than the French, and they still call themselves gipsies or Egyptians.

A new Muzzle.—In the Select Council on Thursday evening last, as we learn from the Philadelphia Gazette, Mr. Meredith introduced an ordinance, calculated more effectually than those now in existence, to secure our citizens against the dangers apprehended from dogs in the summer season. It provides that after the first of July next, instead of the leather strap now used, all dogs shall be muzzled with a substantial wire basket, placed so as effectually to enclose the mouth, and prevent snapping or biting. This muzzle is believed to be much easier for the animal than the strap now used, while at the same time it is more effectual. A dog with a strap is not prevented from biting, but with the wire basket, this will be impossible, as the whole mouth is enclosed. The apertures between the wires will enable him to drink with as much facility as if he were without a muzzle. The ordinance was adopted without opposition, and promptly concurred in by the Common Council.

Some persons lately employed in quarrying stones at Guernsey, Ohio, came across the body of an Indian child completely petrified. This extraordinary specimen was found imbedded in a solid mass of rock, and has the appearance of a stone image, somewhat imperfect, to be sure, yet on the whole, a very fair outline of a young Indian—done in limestone. A small row of Indian beads (too hard originally to need petrification, we suppose) was found in the same cavity.

Large and Valuable Cargo.—The fine new ship Solon, Captain Lambert, of Portsmouth, (N. H.) for Liverpool, being her first voyage, was cleared this morning by L. Trapmann, with a cargo of 1900 bales of Cotton, weighing 618,607 pounds, and valued at \$101,151 89.—[Charleston Patriot, June 14.]

INTERESTING MEETING.—It is intended that the Jupiter shall sail for Liberia on Wednesday. Among the passengers will be the Rev. Mr. Skinner, Missionary and Physician; Mr. Searl, a graduate of Amherst College, and Mr. Finley, a graduate of Princeton, Teachers, under the patronage of the Ladies' Association of this city. Mr. Searl is also the Vice-Agent of the New York City Colonization Society, charged with selecting a suitable place for locating the proposed new Colony.—Dr. Webb, from Washington, D. C. and Dr. McDowell, from Edinburgh, Physicians, in the employ of the Parent Society, will also sail in the Jupiter—together with Eunice Sharp, a colored woman of education and piety, from Vermont, who goes forth of her own accord and notion, to devote herself to the cause of education in Africa. Preparatory to the embarkation of this self-devoted band, appropriate religious services were last evening celebrated in the Brick Church, in which the congregation of the late Cedar street Church united.—An admirable address for the occasion was pronounced by the Rev. Cyrus Mason, and the concluding prayer by Rev. Dr. Young.—[Com. Advertiser of yesterday.]

Liberia Herald.—Several gentlemen connected with the type, printing, and paper business, have thought it time that the Herald should appear in a new dress. Some of the donations are as follows: E. White, 100lbs. small pica; Connor & Cooke, 100lbs. pica and a small font two line do., G. & D. Bruce, job type, flowers, &c. Hoe & Co. three pair cases, brass rules; printing office furniture, &c. Gracie, Prime & Co. six reams medium paper; Editors Observer, two reams imperial do.—[Jour. of Com.]

Le Repareteur, of Lyons, gives the following characteristic anecdote of the behavior of a French soldier during the late riots in that city:—"In the Quartier du Collège, just at the termination of the disastrous struggle between soldiers and citizens, one of the insurgents suddenly rushed forward, and putting his musket almost to the face of a soldier, pulled the trigger. The musket missed fire, upon which the man throwing off his jacket, kneeled down, and addressing the soldier, said, 'It is now your turn—here is my breast; I am a Republican.' The soldier did not move from his ranks, nor did he offer to raise his musket, but coolly said, 'I don't know how to fire so close,' and allowed the man to depart."

The 29th Annual Report of the Trustees of the Public Schools of this City has been published, and shows gratifying results of their extensive and faithful operations. The advantage conferred upon the city by these invaluable institutions can hardly be too highly prized, or too carefully guarded and perpetuated. So excellent and efficient is the system of this Society, that its adoption, on proper modifications, may be confidently recommended to other cities and indeed to many smaller towns.

Extract from the Report of the Trustees. In the report of last year, it was stated that there were on the registers of the 26 schools, contained in the 11 buildings belonging to the society, and in the school at the Alma-house, . . . 7,034
And of 6 primary schools, . . . 792

Making a total of . . . 7826
at that time under the instruction in the schools of the society. Since that period, there have been 14,214 received into, and 10,774 have left the day schools; and there are now attending them the greatly increased number, which is classed as follows:

On Registers of 11 Boys' Schools,	3354	
Do. 11 Girls' do.		2795
Do. 3 Boys' and Girls' Schools	} 450	227
vis. No. 1, 6, and 9,		
7 primary departments,	1412	1412
17 Schools,	745	870

Boys, 5961, GPs, 5304

Showing a total of 11,255 children now belonging to the public schools in this city.

There are at this time in the employ of the public school society, 49 teachers, 28 assistant teachers, and 75 monitors—the aggregate of whose salaries for a year amount to 35,650 dollars.

The following account of the employment and improvement of the children during the past year, is too interesting not to deserve a place in every newspaper in the land.

The first class learn the alphabet, and the ninth is the highest reading class.

2259	have been promoted from 1st to 2d Class.	
2343	do do	2d to 3d do
2546	do do	3d to 4th do
2525	do do	4th to 5th do
1557	do do	5th to 6th do
1621	do do	6th to 7th do
1303	do do	7th to 8th do
562	do do	8th to 9th do
1820	do	to writing on paper.
3291	do	to addition and subtraction.
2375	do	to multiplication and division.
1143	do	to the compound of 1st four rules.
714	do	to reduction.
497	do	to rule of three.
963	do	to practice.

Of the 6826 children in the Schools, as distinguished from those that are primary, and the primary departments, there are—

1838	studying Geography.
874	do Grammar.
93	do Book-Keeping.
281	do History.
523	do Astronomy.
126	do Algebra.

[The report was signed by Peter A. Jay, President, Robert C. Cornell, Vice President, George T. Trimble, Treasurer, Lindley Murray, Secretary, and 79 Trustees.]

Sudden Death.—CHARLES BALDWIN, Esq., an eminent legal practitioner, and a highly respectable citizen, was yesterday struck by the hand of death in a manner awfully sudden and impressive. He lodged at the City Hotel, and had just seated himself, without any indication of indisposition, at the large dinner table of that establishment, when, on reaching out his hand to receive a plate that was handed to him, he fell back lifeless. The vital spark was, as if in the twinkling of an eye, totally extinct.—[Courier & Enquirer.]

More Shipwrecks!—A few days since, we published a list of ten square rigged vessels, bound from the old country to Quebec, which have been cast away this season, accompanied by the loss of 456 lives, besides all on board a bark unknown. The Montreal Gazette received last evening, adds eight more to the number of vessels, accompanied with the loss of 248 lives, making a total of eighteen vessels, and 704 lives lost!! It does seem to us, that after making all due allowances for difficult navigation, such a constant succession of disastrous shipwrecks indicates that crazy ships are employed, or

that they are commanded by incompetent men. The latest date of the loss of any of the vessels mentioned is May 10th. And yet the number lost up to that date, was nearly one-eleventh of the whole number (205) arrived prior to the 27th, (17 days later) The eight additional vessels lost are as follows:

A vessel, believed to be from Cork, and to have been wrecked near the Magdalen Islands, about the 9th May, said to have 250 emigrants on board, of whom two, the only survivors, had arrived at Charlottetown, Prince Edward Island.

Brig Patriot, Anderson, from Aberdeen for Quebec, lost at Cape Rosier, Gaspé, May 7, on lives lost.

Bark Diadem, Shears, from—, wrecked on Cape Gaspé, 7th May, all saved.

Brig Scarborough Castle, Moey, from Hull, abandoned at sea in long. 41, 30th April, all saved by the Retreat, from Alloa.

Brig Cherub, Welsh, from Greenock, struck on Goose Island, river St. Lawrence, 5th April, crew and passengers saved, vessel condemned and sold.

Brig Trafalgar, form St. Johns, N.B. struck on a piece of ice in the Gut of Causo, no lives lost—vessel since lowered into Arichat.

Brig Robert William Harris, Ferrie, from Liverpool, for Newfoundland and Quebec, struck on a piece of ice, 25th April and sunk in twenty minutes—crew saved after being five days in the boats.

Brig Isabella, Simpson, from Leith, went on shore at Cape Chat, in a snow storm, passengers and crew, 97 in number, all saved except the mate.

THE FUNERAL OF A GERMAN STUDENT.—I was one dark January night occupied at my writing desk, weaving a woof of historical events, crossed with a warp of fiction—or sketching some light profile of national portraiture—or endeavoring to rouse a spark of English feeling for the trampled-on country in which I could not live without being interested for it—but whether it was a volume, or a monthly or a daily "article" at which I worked is of small matter to the event by which my labors were interrupted.

A low, moaning melody was borne on the gusts which swept down the valley of the Neckar, at the opening of which the town of Heidelberg is situated. Its main street, running for a mile between the river and the mountains, formed a channel for the free passage of the dirge, for such I soon ascertained it to be. Looking from my window, I observed a lurid glow rising above the house tops and throwing its red reflection upon the snow which covered them. A waving cloud of thick smoke marked the line of the procession, the leaders of which soon appeared coming round a slight curve in the long narrow street.

I immediately knew it to be a student's funeral which thus roused with lugubrious harmony the snow enveloped dulness of the place, and sent out a crowd of youths to parade the town, many of them in costumes incongruous with the season, and not quite consistent with the scene; but the whole solemnity showing an arrangement of martial discipline which made it more than commonly impressive.

The six leaders were wrapped in dark cloaks, and stalked on some paces before the band, composed of horns, bugles, and bass instruments, whose wailing tones swelled out as the procession approached, in a strain of comingled depth and wildness. Next appeared a young man of almost gigantic height, dressed in a suit of black, with large military boots and spurs, a huge cocked hat, trimmed with white feathers, a colored scarf across the shoulders, a long white cavalry gauntlet reaching nearly to his elbows, and a drawn rapier in his hand. He was the director of the various manoeuvres, and his motions of command were obeyed along the whole moving column, whose double files, of some hundreds in number, stretched down the entire length of the main street.

All the men thus forming the living hedge at both sides carried torches, which were flourished in irregular movements, some dashing the blazing ends against the frozen snow on which they walked, producing by the mixture of flame and smoke, a strangely solemn effect of brilliancy of gloom. There were a couple of dozen of the youths dressed in the same grotesque mixture of civil and military costume as the chief captain, and who followed his comrades in regulating the march. But not a word was spoken aloud, no sound was heard throughout the peopled streets save the oppressive harmony of the dead march, in strains indescribably plaintive and original, the slow tramp of hundreds of feet, and the heavy tolling of the church bell, as the procession approached the burial ground, which was a short distance from, but not in sight of, the house I occupied.

The coffin bearers wore suitable cloaks, sombre and fitted to protect the wearer from the frosty air

and flakes of snow which were hurried on by the east wind. But at each side of the bier walked six or eight chief mourners, all bareheaded, dressed in full suits of black, with silk stockings, thin shoes, and *chapeaux de bras* under the arm! How civilization and refinement lose themselves in burlesque, thought I; and what a chance there is of those foolish followers of an absurd fashion falling victims in their turn, but to a death less glorious even than that which had sent this one to his last account!

A concentrated blaze of light, rising far above the tall and leafless trees, soon marked the spot where the mortal remains of the young duellist were lowered into the earth, while his hundred of former companions stood round in serried circles, doing honor to his obsequies. I could not withdraw from the contemplation of the scene, although it was only through the mind's eye it was evident. The whole procession had passed out of sight, with the straggling citizens of both sexes, young and old, by whom it was accompanied in solemn silence. The long street was quite abandoned, and the rays from the lamps which swung at wide intervals across, fell heavily upon the snow and the dark buildings at either side. Suddenly a loud burst of song rose upon the air. The deep harmony of hundreds of male voices was joined in the requiem, and quite overpowered the instrumental accompaniment. It was sad and solemn beyond all description. No female notes lightened the full throated harmony. Never did sorrow find a more fitting tone than in the chorus of that deep lament.

I could no longer resist the desire to mingle with the throng. An impulse of sadness hurried me resistlessly along, as the swell of the sea heaves a vessel on its silent course. I was soon at the door of the grave yard. But all was once more still. The death dirge had ceased, and the earth heap was loosely piled over the body which had taken its dark berth below. The crowd quickly began to hurry forth. In a moment or two the band appeared outside, and it struck up a new, but a not less solemn strain than before. It was one of those fine martial airs to which men move to battle, which thrill through the nerves, and call the dull or stagnant feelings to arms. Every one present seemed to feel the inspiration. The procession which was now formed had all the appearance of a military train. There was no coffin, no bier, and apparently no mourners. A tone of excited, of desperate ardor pervaded those whose measured steps so lately kept time with the melancholy music of the dirge. The horns echoed along the wood-covered hill, at the foot of which the procession now moved back towards the building of the University, and the majestic ruins of the castle above returned the bugle's notes in wild and unearthly mimicry.—The grotesque diversity of costumes worn by the students, their countenances varying from beardless animation to hair-covered ferocity, the gestures with which each man tossed his flaring torch above his head, the glittering of the sword blades here and there, the wintry harshness of the scene, the wind gusts heard at intervals in the skeleton branches of the trees, all formed a whole of combinations, each one in fierce keeping with the rest.

We,—for I had joined the crowd and felt myself identified with the ceremony—arrived at the large square of the university. Here the leaders halted the torch bearers in double ranks, at each of the four sides; and at a signal given, every one advanced towards the centre, and flung his flambeau on the earth. In a few minutes the accumulation of fiery brands formed a considerable pile; and, while a thick volume of smoke and flame rose up, and was carried rapidly down the wind, the whole assembly once more shouted a chorus of almost stuning harmony. Every one knows how the German youths are trained up to vocal music! and the effect of several hundreds, on such an occasion as this, singing in parts and without a note of discord, one of their grandest national hymns, baffles imagination and defies the pen.

It requires but little strength of fancy to believe that the spirit of patriotism rose on this union of incense and melody. It seemed emblematic of that holy desire for freedom which swells and glows in the German heart. A people imbued with a strong passion so developed cannot, I thought, be doomed to perpetual thralldom. There is a longing after a liberty that must some time find a vent and secure a triumph.

BEETHOVEN.—From La Revue Francaise.

When Beethoven was young, at the age of twenty eight, as every one knows, he was struck with deafness. But it is not equally well known that this infirmity rendered him unhappy, mortified and irritable. "O my friends," he would say in his energetic lan-

guage, "you who believe me to be obstinate, ill-natured and misanthropical, and who represent me as such, you do me great injustice. You are not aware of the secret but powerful reasons which cause me to appear such in your eyes." Beethoven declared that from his childhood he always strongly felt sentiments of benevolence towards the human race.—But having become deaf, he bade adieu to the world; or if he ever mingled with his fellow men, it was to suffer—for he could not bring himself to say "Speak louder—I am deaf." He could not resolve to acknowledge the imperfection of a sense, perhaps more important to him than to any other individual, and which he once possessed in a rare state of perfection.

"I," said Beethoven, "am altogether cut off from society. I cannot listen to the conversation of my friends—to me is denied all the happiness which is usually derived from social intercourse—and when I struggle to overcome my repugnance to mingle with society, you can hardly conceive of the agony of my feelings, when some one near me listens with apparent delight to the sounds of distant music, which I cannot hear. At such times I am almost tempted to commit suicide. One thing only binds me to life. It is my extreme devotion to the art of Music. I cannot quit the world until I have produced all which I am capable of producing."

EDINBURGH—*Strange Bed-fellow*.—About a week since, an old woman, residing in a house on the Castle-hill, was unexpectedly surprised, on awaking from her night's rest, to find a strange animal lying at her back, with one of its paws laid over her shoulder. Screaming with affright, she left her bed, and seizing a towel, she beat it with all her might, when, with one bound, it sprang to the furthest corner of the room, and at length took refuge in another bed which stood in the same apartment. When the poor woman had a little recovered from her alarm, and had dissipated the idea that it was a visitor from the nether regions, she remembered that a collection of wild beasts were at present exhibiting on the Mound, and began to suspect that her lodger belonged to the number. It was discovered that one of the kangaroos had made its escape during the night, and going up to the Castle-hill, had found this poor woman's door open, and, upon examination, finding that it might be as completely accommodated beside her as in its own den in the menagerie, betook itself to rest, which, however, was broken in upon in the morning in the manner we have mentioned.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.
Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 144 Water street,
J81 61
corner of Maidenlane.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of Duffee, May & Co. offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jervis, Eng. M. & H. R. B. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon dale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York;
Janu 2 y 28, 1833.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedmen; and those kinds imported which cannot be raised to perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

W. THORNTON,
347 N. Market st. (opposite Post Office.)

Catalogues may be had at the Store; if sent for by mail, will be forwarded gratis. Orders solicited early, as the better notice can be done in the execution.

Mr. Thornton is also Agent for the following publications, to wit:—

NEW YORK FARMER and American Gardener's Magazine.
MECHANICS' MAGAZINE and Register of Inventions & Improvements; and the

AMERICAN RAILROAD JOURNAL and Advocate of Internal Improvements; and the
NEW-YORK AMERICAN, Daily, Tri-Weekly, and Semi-Weekly; either or all of which may be seen and obtained by those who wish them by calling at 347 North Market street, Albany.

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J 15 15

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES (furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.
m19

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTIE, at the sign of the Quadrant, No. 43 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude. For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartie.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,
Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

To Messrs Ewing & Heartie.—As you have asked me to give my opinion of the merits of those instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,
Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.
m18

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway Carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 23 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burthens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine-wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,
WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 49, page 772, Vol. 2, of Railroad Journal.]

RAILWAY IRON.

	Flat Bars in
Ninety-five tons of 1 inch by 1/2 inch,	lengths of 14 to 15
200 do. 1 1/2 do. do.	feet counter sunk
40 do. 1 1/2 do. do.	holes, ends cut at
800 do. 2 do. do.	an angle of 45 de-
800 do. 2 1/2 do. do.	grees with spli-
soon expected.	cing plates, nails
	to suit.

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, and 5 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. BALSTON,
9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.
d71msovr

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.)

Baltimore, 1832.
In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sights, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying off rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.
Germantown, February, 1833.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY B. CAMPBELL, Eng. Philad.,
Germantown, and Norristown Railroad

THE UNDULATING RAILWAY.

(Continued from page 373.)

The Editor of the London Mechanics' Magazine afterwards states, that

"An Attentive Reader of the Undulating Controversy" proposes that a sum of money should be staked on the result of a trial of an undulating line. He requests us to ask, 'Whether Mr. Badnall and Mr. Cheverton have confidence enough in their respective opinions to come forward singly, or supported by their friends and advocates, and stake a sum of money on the event?' He, for one, he adds, 'would be happy to back Mr. Badnall.' The wager, our correspondent suggests, might be laid so that 'the winner should pay for the expense of the trial; which expense, in case of failure, would be merely that of laying down the rails and taking them up again, on any projected line.' The sum he names is from £1,000 to £2,000."

This challenge has brought Mr. Badnall out again, and we presume for the last time. The controversy has been conducted with good feeling on both sides. The result we shall soon know, and our readers shall very speedily be made acquainted with it.

WAGER OF £1,000.—Sir: In your "Notes and Notices" of last week, I observe a correspondent suggests that a wager might be laid between Mr. Cheverton and myself, or our friends, on the result of a trial on an undulating line. Individually, I am not in the habit of offering or accepting bets, but if Mr. Cheverton feel inclined to adopt the recommendation of your correspondent, I shall be happy, on the part of my advocates, to enter, (through the medium of your Magazine,) into an agreement with him, and if he be similarly inclined, to stake £1,000 on the result of a trial on five or ten miles of road. The stakes to be lodged in a banker's hands. I trust that the memorial which has been presented to the London and Birmingham Railway Directors may induce them and their engineer, Mr. Stephenson, to institute, as I anxiously anticipate, an impartial trial on that line of road, on their own account; in which case, if Mr. Cheverton be the winner, he will gain £1,000 without deductions. Should he prefer betting a greater sum, I shall be happy to submit his offer to those of my friends who may feel inclined to speculate.

The only sum that I, in conjunction with my partner, Mr. Stephenson, should feel disposed to win or lose, (which may be added to the stakes,) would be the expense of a dinner and wine, at the Albion Hotel, Aldersgate street, for all who have written on the subject, *pro or con*, in the Mechanics' Magazine—your worthy self, Sir, being President.

Yours, very obediently,
RICHARD BADNALL.

Manchester, April 7, 1834.

Riots and Murder on the Washington Rail Road.—The riot among the labourers employed on the Washington Rail road, of which we made brief mention in yesterday's *American*, it seems first assumed an appearance that attracted notice, on Sunday evening. The parties arrayed against each other are known as the *Fardowns* and the *Corkonians*. On Monday morning a body of militia hastily collected in the neighborhood, succeeded for a time in restoring apparent quietness by the arrest of a number of the rioters, but they afterwards congregated in great numbers and came to open collision. Some of the shanties, or temporary houses of the laborers, were destroyed, but the injury on that day seems to have been confined to themselves.

Yesterday morning Gen. Ch. S. Ridgely having transmitted a requisition to this city for a reinforcement of troops, a detachment of Infantry and Riflemen, under the command of Major Finley, proceeded to the scene of the disturbance. It was composed of Captains Hickman's, Branson's and Cheves' corps of infantry, and Captains Cook's and Maguire's corps of Riflemen. The troop of horse commanded by captain Bouldin also marched on the same service.—[*Baltimore American*.]

Postscript.—At half past eight, last night, we

saw one of the members of the troop of horse, who had just returned to the city. He informs us that the troop arrived at the place of riot yesterday morning, in advance of Major Finley's command, and that they found the rioters pretty well tranquilized, although in the early part of the day there had been some violent passes between them. One of the rioters, who had fired at Gen. Ridgely, was shot in the mouth, and this, our informant states, was the only occasion on which fire arms were used. Major Finley's detachment arrived on the ground in the afternoon, and when our informant left, matters were apparently quiet. In the course of the contests which had already taken place, a number of shanties were burnt. Four persons, it appears, were killed in the affrays, one of whom was a female. The rioters arrested will, it is supposed, be escorted to Annapolis jail to-day.

Iron Case.—United States District Court, June 17 and 18—Judge Betts presided. The United States vs. John F. Sarchet. This was an action to recover the amount of a bond passed by the defendant to the Collector for 750 dollars, being the duty claimed at three cents per lb. on iron studs or stays, and links, imported by the defendant, but which he contended was illegal, and should have been but one cent. per lb. on the stays as castings of iron not otherwise specified, and that the links should have been admitted duty free as a non enumerated article, or at most that they were only subject to a duty of 25 per cent. ad valorem as a manufacture of iron. The Collector claimed duty on both articles as parts of iron chains, partly manufactured, and as such subject to 3 cents per lb.

Verdict.—That the links were subject only to a duty of 25 per cent. ad valorem as a manufacture of iron, and the studs to one cent. per lb., as castings of iron not otherwise specified. This verdict reduces the amount of duty claimed by the Collector nearly 75 per cent.

For the United States. Mr. Price, the District Attorney, and Mr. Philip Hamilton.

For the Defendant, Messrs. Charles Walker and D. Prescott Hall.—[*Jour. Com.*]

DEATH OF GENERAL LA FAYETTE.

LAFAYETTE IS NO MORE. This true patriot—this noble philanthropist—this patriarch of liberty, in many lands, weighed down with years and honors, has yielded up his valuable life, and left a place that no man breathing can be made to fill. He died in the 77th year of his age, in the full possession, up to the last moment of his existence, of all his mental faculties. He died, as we learn from an English paper, on Tuesday, the 22d of May. "During the last fifteen years of his life, he was the only individual alive who had taken a leading part, and figured in a conspicuous manner, in the event of the first revolution. His political career is so well known, that it would be hardly necessary to enter into any thing like an account of it here. Up to his last hour he retained the fullest possession of his mental faculties.—The infirmities of age had only visited his physical frame. Both he and his intimate friends had perceived many months ago that he had begun to sink. The decay of nature, however, was more rapid with him than it had threatened when its first decided symptoms became visible. The venerable General was born on the 1st of September, 1757, and consequently wanted little more than three months to complete the age of 77. The wondrous scenes in both the New World and the Old, in which the name of Lafayette was prominently distinguished, are among the most remarkable in the annals of mankind; and we may safely aver, that history does not in all her records possess a name which has passed through the searching ordeal of public opinion, even in the darkest and most tempestuous times, more pure and unsullied than his whose death we are called upon to deplore."

The English papers generally, in speaking of this event, mention it with a due sensibility to the manifold public and private virtues of the illustrious deceased. They speak of him always, however, as "good" rather than "great;" the mere appendage of great events, not the moving spirit among them—a view of his

character, which will unquestionably be concurred in by the mass of mankind; for the majority of men estimate the superiority of their fellows solely by the indications of power—of power, under whatever shape it may present itself; no matter how unequal may be its developments, or how destructive its display. What mind does not shrink before the blazing intellect of Byron—the iron ambition of Napoleon. But how few can appreciate the moral grandeur—the wonderful assemblage—the just balancing and development of good and great qualities in the character of Washington! and yet that character was as much a *phenomenon*, as singular a departure from the wonted exhibitions of human nature under its most glorious aspects as ever had a place upon the annals of mankind.—Unhappily for the best interests of the human race men always connect the idea of extravagance with ability, and moderation is ever considered the sure indication of mediocrity. The justness of Lafayette's life, the singular devotion to principle under all circumstances which marked the career of the pupil of Washington, is, viewed by this light, sufficient to abnegate his title to greatness, who was great in every thing but crime. Who rushed foremost wherever the good were up and doing in the service of mankind, and sunk into obscurity when evil men were the popular idols. The chivalric champion of Liberty, where Washington led the way: the unheard of exile when Marat and Robespierre had triumphed: the lonely recluse when the splendors of Napoleon's reign made despotism popular: and the first assertor of the people's rights when Bourbon stupidity had uncovered the chains his victories successfully gilded.

But he was not great! Why? Because he did not place the crown of Louis Philippe upon his own temples! Because after turning king-maker, and choosing that man for the head of the government he deemed most worthy, expectation has been disappointed in the pseudo-republican Bourbon? Because he was so true to his principles as to refuse a throne, or because he selected the wrong person to place upon it? By such reasoning thrones make men great, and the unworthiness of those in whom we trust is fatal to our own superiority of character. Lafayette was great—great in the only true sense of the term;—for real greatness, like a noble edifice or a perfect poem, does not exist in the eccentric display of grandeur or brilliancy in some of the details, but in the due proportion, the perfect adjustment, and consummate glory of the majestic whole.

For our own part, we can never listen with patience to those who delight in depreciating—to intimate the want of intellectual power, always does depreciate—the few nobly great men who live on the pages of the world, to teach us, when despairing of the onward destiny of our race, that there have been some who have dared to be honest, under all circumstances, and who have retained their benignity and love of mankind, when philanthropy became a reproach, and a byword. History will regard Lafayette as one of those immortal benefactors of our race, who have stretched their arms beyond one generation to embrace the children of centuries in advance—a living model of goodness in every age. There the honesty that rose to the dignity of heroism, and the moderation which in classic story would be dignified as the loftiest philosophy, will leave unquestioned the greatness of Lafayette.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nails with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 13, 1833. A29 if R M & F

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JUNE 28, 1834.

CHESAPEAKE AND OHIO CANAL.—The following communication gives the rates of tolls on this canal, which may be interesting to many readers of the Journal, as well as a document for future reference. We ask a similar statement for every canal and railroad in the country, and we desire it may be forwarded with the least possible delay. We promise to give an account of five, and perhaps more, to every gentleman who furnishes us with one, and to pay the postage into the bargain.

CITY OF WASHINGTON, May 27, 1834.

To the Editor of the Railroad Journal :

SIR,—I forwarded, some time since, by a private conveyance, an answer to your letter asking for information relative to the Chesapeake and Ohio Canal, which gave you such statistical information respecting that grand work as I could collect. I am not aware that it has yet reached you, though it has been nearly a month, if not more, since I wrote it. I could not then get a copy of the rate of tolls demanded on the canal, but having since succeeded, I forward them to you. This rate is only temporarily established, and it is probable, ere long, that a more favorable change will take place. Should you determine on publishing the inclosed, you will be pleased to notice the fact that this arrangement in respect to the tolls is only temporary.

Boats or scows, either empty or having cargoes, the tolls on which shall not pay 5 cents per mile, shall be charged at the rate of 5 cents per mile, and 3 per mile cents for any additional

distance, which shall be considered as in lieu of the tolls on such cargoes.

Boats used chiefly for the transportation of passengers shall pay 10 cents per mile for the first 15 miles, and 8 cents per mile for any additional distance, which shall include the toll on passengers and their customary baggage; but all other merchandize transported therein shall pay the established rate of toll.

Articles.	Quantities.	Per ton for first 15 miles.	Per mile over 15 miles.
Tobacco, - - -	per ton of 2 hhd.	2 cents	2 cents
Wheat, - - -	" 40 bushels	2	2
Flour, - - -	" 10 bbls.	2	2
Oil, - - -	" 100 bbls.	2	2
Corn Meal & Rye chop, - - -	" 40 "	2	2
Oats, - - -	" 40 "	2	2
Flax and Clover Seeds, - - -	" 2940 lbs.	2	2
Hemp and Flax, - - -	" 35 bushels	2	2
Potatoes, - - -	" 2940 lbs.	2	2
Hay and Straw, - - -	" 35 bushels	2	2
Wood, - - -	per cord of 128 c. ft.	2	1
Bark (Tanner's), - - -	" "	3	1
Lumber, Plank, - - -	per 1000 ft. bd. mea.	2	2
" Square timber, - - -	70 cubic feet	2	2
" Shingles, - - -	3000	2	2
" Laths, - - -	5000	2	2
" Barrel Staves, - - -	1000	2	2
" & Headings, - - -	" "	2	2
" Hhd. Staves, - - -	500	2	2
" & Headings, - - -	" "	2	2
Charcoal and Coke, - - -	per ton of 56 bushels	2	1 cent
Coal, - - -	" 28 "	1	1
Apples, - - -	" 12 bbls.	2	2
Cider Ale and Beer, - - -	" 8 "	2	2
Whiskey and Pork, - - -	" 7 barrels or 2 hhd.	2	2
Wine & Foreign Spirits, - - -	per ton of 250 galls.	2	2
Live Stock, Cattle, - - -	4 to the ton	2	2
" Sheep, - - -	30 "	2	2
" Hogs, - - -	15 "	2	2
Lime, - - -	per ton of 28 bushels	2	1
Plaster, Stone, - - -	" 2240 lbs.	2	1
" Ground, - - -	" 28 bushels	2	1
Stone, Rough, - - -	per ton of 15 cub. ft.	1	1
" Cut or Wrought, - - -	" "	2	2
" Grind and, - - -	" "	2	2
" Mill Stones, - - -	" "	2	2
Iron, Pls, Castings, and Bars, - - -	per ton of 2240 lbs.	2	2
Salt, - - -	" 35 bushels	2	2
Flsh, - - -	" 7 barrels	2	1
All other articles - - -	" 2240 lbs.	2	2

The above rates are established for the present for the use of the canal between the city of Washington and Harper's Ferry Falls; and the same rates per mile will be demanded for the use of any portion of the river between the Little Falls and the Harper's Ferry Falls; for the use of the river above Harper's Ferry Falls, the tolls established by the late Potomac Company will be demanded.

The canal is now in active operation, and will soon, I believe, be opened for several miles above Williamsport, where the slack water navigation of the Potomac is used, (for a distance, I think, of upwards of 7 miles,) making in all a distance, from the Georgetown basin, of upwards of 110 miles.

I have used some exertions to obtain you subscribers, and have had the promises of several

to write for your Journal. I hope the patronage of this year will be such as not only to warrant its continuance for years to come, but, at the same time also, a continued improvement in its appearance and contents, such as has marked its progress from its first establishment.

I should like you to have a copy of Dr. Wm. Howard's report on the improvement of the Monongahela River, which is, at present, a favorite project in the western part of Pennsylvania, and one which, if executed, will tend as much as any other work of internal improvement to add to the resources of that region of country, so rich in mineral and agricultural products, and where the arts have attained such perfection. Your obedient servant,

H. N. C. !

INTERNAL IMPROVEMENTS.—The Richmond Enquirer states that "the following resolution has been unanimously adopted by the Common Council of this city. They open again the great subject in which the interests of the city and of the whole State are so deeply concerned.

"The act of the Virginia Assembly, which passed the 14th February, 1834, entitled 'An act further to amend the act, entitled 'An act incorporating the Stockholders of the James River and Kanawha Company,' having continued the books of subscription for the stock of said Company open until the 31st December next, and having declared that the payment of one dollar upon each share subscribed by individuals or corporate bodies, at any time before the said 31st December, shall render such subscription valid.

"Resolved, That the Cashier of the Bank of Virginia be, and he is hereby, authorized, to draw on the Chamberlain of this city for the sum of four thousand dollars, payable the first day of November next—it being for one dollar per share on 4000 shares of stock subscribed by the Corporation of Richmond to the James River and Kanawha Company; and that the Chamberlain be directed to accept said draft, and to furnish the Second Auditor with a copy of this preamble and resolution."

A new locomotive Engine has been built at Schenectady, at the workshop of the Mohawk Railroad Company, which bids fair to excel even those of Mr. Stevenson.—[Albany Daily Advertiser.]

A COTTON FACTORY has been established at Greensborough, N. C. It has five hundred and twenty-eight spindles in operation, and is capable of manufacturing between two and three hundred pounds of thread per day.

ON THE DIP AND DECLINATION OF THE NEEDLE.

To the Editor of the American Railroad Journal:

SIR,—P. G. V., in your last number, appears anxious that the variations of the compass should be taken by practical surveyors in the United States in June and December, so that in a few years the long sought for problem may be settled. He may in a short time learn, from some observations which have been made in the city of Philadelphia, with great care, several times in the day, for nearly a year past, much of what he wishes to know; and further, that the irregular and disjointed observations of surveyors through the country, giving what they might suppose to be the correct variation of a place, could not be relied on, as it has been known to vary as much as ten minutes in half an hour. To obtain the correct variation, a number of regular observations daily for a length of time would be required, and then a few observers through the country would answer all necessary purposes.

If the writer of the following communication thinks he has reason to complain that it has not sooner appeared, he will please recollect that we too have some cause to complain—not of his communication, for we like that, and should be pleased to receive others upon the same subject, giving a complete history of the process of *railroad making*—but that he has no name or signature by which he may be known. We like to know our friends, and therefore desire that each should have a “handle” by which we can take hold of him, especially when we have occasion to “handle” him without gloves; he will, therefore, in his next, please to choose one to suit himself, or we shall have to call him the gentleman, not the “fellow,” “with the claret-colored coat,” or some other distinguished no-party man. He will also please pardon the long delay of his favor, and let us hear from him again soon.

[For the American Railroad Journal.]

In the last, having conducted our exploring party from the head-quarters, Hopelul Town, we left them, along with some of the Directors of the road, enjoying a well provided dinner at Mr. Willis' cottage.

Having finished their rustic feast, the chief, after giving Mr. Wilder his last and particular instructions, summoned the carriage, and with the former occupants, (together with Wilder,) set off at a good speed for the summit of the hills upon which they then were. Here determining the important “point de depart,” and setting down W., the chief, (Mr. Safeside,) took an affectionate leave of him, wishing, as usual, all success, &c. &c., from thence continuing on the journey to his “other railroad,” which by this time wanted his presence. Mr. Policy, the co-assistant, having had, as the sailors say, “sailed before,” knew well enough that he was losing little by being of the party that continued on. One might have almost read in the smirking looks he cast back toward Wilder, they were so expressive, embodied in words like the following: “Now, my boy, you have honor before you—amuse yourself to your heart's content—a pleasant introduction to the hemlock swamp!”

The whole party, or rather, as it was for the present, parties, had been dismissed early on the afternoon of Mr. Safeside's departure, for the purpose of giving them an opportunity to make some transitory residence sure, but at the same time with strict injunctions to appear at head-quarters early the ensuing morning.

The sun was scarcely peering from behind the thickly foliated hills in front of Mr. Willis' cottage, its beams yet playing among the

misty scuds around them in the valley, as the young engineer in vice-command rose from his cot, and summoned his aid, Moyston, to arrange the several forces as they were coming in along different paths to the quarters. The bustle of presenting themselves, the ringing of the chains, resounding blows from the axes and hatchets in trying them, and now and then the merry peels of laughter among the men, was an amusing and novel sight to the cottagers, as well also to the little paradise of nature around.

The well provided breakfast over, commenced the final disposition of axes, hatchets, levelling rods, pike staffs, chains, stretchers, (for the chief never would have these left behind, even though measuring in mire waist deep,) tripods, and, although mentioned last, of the most importance to old Hardy, the surveyor—the dinner basket: all these to their respective and jealous bearers.

First in the procession, as it turned in a shrubbed lane leading down in the valley, was the short and rough looking Hardy, (you well remember his grotesque squab figure, and merry Hogarth face,) with his white staff and glittering brass circumference, or ‘compa’s,’ as he termed it, followed by two or three flag-men, with bright hatchets, tastefully slung in leathern belts, nicknamed by their facetious leader “knights of the red,” of the “yellow,” or of the “white,” according to the tints of their several flags. Next were four stout and heavy built chain bearers, with their new shining (for this day) chains, borne by the “hind-men,” and the “pins” and vermeil colored tallies by the “fore-men,” with hatchets also slung by their sides; after these followed some six or seven “axe-men,” with ponderous and new axes thrown across their brawny shoulders; and immediately joining, the “rod-men,” with their long white and graduated rods, with bright brass ends, and tastefully colored vanes—these the most important characters of the “force employed.” The rear was brought up by Wynn, who, by some unknown means, had contrived to get a hatchet, and not being equally successful in obtaining a belt, he had rigged across his side a sheath made from a purloined end of Mrs. Willis' clothes line. Ambitious also of an honorary badge, we had folded up two or three sheets of paper and tied them around his neck with a piece of red tape; to look as near as possible like the field-books of Moyston, Mr. Wilder, and his surveyor, Hardy. Hardy, who was famed for his knowledge of “blazed faces,” of old decayed and antiquated “line trees,” and highly conversant in determining overgrown and illegible “line letters,” was to appearance the greatest character in the whole party. Intimately acquainted with the country to be explored, and having made his appearance strongly backed by one of the most influential directors, he came with peculiar grace into the party; and surely, we cannot covet him his feelings of “elevatedness,” (his own words)—they were innocent; his sudden dignity was inspiring; it was harmless, too, for it was the very summit of his hitherto ambitious dreams; and we were about to say, of course—his happiness was complete. Moving on, as was observed, at a quick pace, Hardy soon found the spot that had been described to him, and was just setting his staff in rest as Mr. Wilder commenced the work of the day. Returning after a short examination of the swamp, (for it was a dense hemlock morass through which they were to run their lines,) he began by directing Hardy where to place his compass, arranged the chain-men, and placing his level upon the tripod, made some few more hasty observations; then, taking the flag-men with him, plunged boldly into the dark marsh, having previously given some instruction to Moyston, who remained by the level, respecting the men that were left behind to cut “stakes,” &c. Wynn following, was shown, as they proceeded, where to station the axe-

men, at a certain number of paces from the beginning,—if, indeed, paces could be determined in striding thus ridiculously through the mire. Following the course of a little rivulet, that struggled along murmuring through the roots of the giant trees, the young engineer came to the point he had marked out the preceding afternoon, as the most feasible course for the all-important “main line.” Stationing a flag at the point for direction, he gave the remaining force orders to transpose themselves at about equal distances apart, as near as possible in a line with each other, stretching in a direction toward the “white” and “yellow” (flags), that were now to be placed by him immediately between the places mentioned, which at last, by dint of much noise, bruised shins, (we would really not have this terming considered a *vulgarism*, but must absolutely confess we know of no other word by which we could express this *tender* and important, not to mention *prominent*, feature of the human frame, and as we would speak *feelingly* when adverting to it, must remain our only claim to justification,) endangered necks, and great hal-loo-oo-ing, he placed the flags as near the line as circumstances would allow. Then dropping the axe-men in such a manner as to give present satisfaction, orders were given to “clear the way.” “Hal-loo men, sweep clean the underbrush.” “I’ll take this tree.” “You fall, too, upon that pine,” and like observations. Hardy, incensed at some one for not chopping exactly as he wished, fell to, himself, so lustily and so furiously, that, unluckily, by a slant blow, nearly severed one of the chain-men's arms off. A momentary confusion succeeded, but soon all were busy again; and as the lusty axe-men spent their full efforts in vigorous blows upon the deep resounding hemlocks, the high hills and impending rocks along the valley echoed back the fast falling strokes, which in their turn were again sent back—and on—and back—and back—fainter—fainter—till beyond the power of hearing. Then the loud, deep, lengthened crash of some giant tree, falling beneath united efforts, and adding its own resilience to the elastic earth, would shake around, the noise swamping like the pealing of thunder along the echoing mountains, reverberating from cliff to cliff.

Thus having made the first bold stroke, returning to the compass he directed the view toward the far distant flag, then setting down the bearing of the line, notwithstanding Hardy's desire to dispute with the assistant about a second or two, or something still nicer in the point; and after giving a few necessary but here unimportant orders, he requested the surveyor to keep just ahead of the level, and exactly upon the same course, till further orders: at the same time pointing out some objects to be observed, &c. &c. Thus far having suited his mind, he commenced levelling over the cleared way. Here, if you had approached the opening that was made through the thick trees, and as you directed your view down the narrow vista, you would see, at perhaps a considerable distance off, a flag-man standing upon a prostrate trunk of tree, or some other elevated spot, with a soon observed red, or white, perhaps yellow flag, dwindled to a mere spot, moving above his head; again, if attentive, you would catch a glimpse, and now lose it; then, perhaps, in the same line, you would see a different color resting upon the dark green foliage, will-o'-wisp like also, caused by the waving motion of some heavy intervening tree, at whose base the resolute and destructive axe was busy: perhaps as the rays of the sun, now approaching the meridian, found their way through the opening foliage, a gleam of reflected radiance would circle upon the polished plates of the instruments, or, may be, like a bright star upon the brass tipped levelling rod. Here you would see some lusty fellow drawing his midly chaining course through the expressively termed “bad spots” in the swamp:

no way, as Cooper's scout says, "to circumvent the evil," for the line must be measured, and the line must be cleared, every one's road sooner or later leads over the same way.

Do you see those fellows following just after little Hardy with his compass? That unfortunate one, (a fore chain-man,) throwing his arm about, (especially as he is out of hearing of the level,) is venting his curses at some innocent root that his chain has got "locked" into: now twitching it with a broad and vigorous sweep, he calls down upon his head the imprecations of the "hind-man," for pulling "his end" into a worse state than the fore-man had just unlocked his own from. Then again, as you saw the flags dancing and dodging among the trees, keeping motion with their bearer's gait, you might hear Mr. Hardy's loud clear voice, "Lo-oo the red—fifty feet e-e-a-st"—"way ten more;" then in a louder and more agitated manner, "where the d—l are you going; ba-a-ck twenty!" "Hold, you gander—ho-o-o-l-d there!"—"Steady so!" and then came the deep collected "down!" This was followed by the mid-man's "east-er," and "we-est-er," and "taut! down! on!" The axe-men's incessant blows, Mr. Hardy and his hind-man's "Lo-oo-os" and "wa-a-a-ys," and the running to and fro of men, gave the scene you beheld quite an animated appearance. It was seldom that you heard the young assistant's voice among the din of the scene; sometimes, however, as he looked far up the line, an undue jerk of the chain, or the chilling sound of an axe falling upon a stone, (none, however, who know not the value of a good axe, can comprehend that chilling sensation,) would call forth the sharp and clear "hal-lo there, you Jones, or you Stephen!" (addressing the person,) "Moyston, that man must be remembered." These words, although slight, were perfectly intelligible to whom they were meant for. To be sure, you would also hear the "up!" for dinner, and the more gratefully sounding "put up!" at night.

RAILROAD ACROSS THE ISTHMUS OF DARIEN.—

We perceive, by the following extract from a Panama paper, that this great enterprise is likely to be undertaken under highly favorable auspices. The results to commerce, from the establishment of a land carriage of this description, between the two great oceans, cannot fail to be of a highly important character.

"To the Deputies of the Provincial Assembly of Panama:

"Gentlemen,—The opening of a carriage road or railway from the Atlantic to the Pacific, has for a long time engrossed the minds of many persons, not only in this capital, but in far distant countries; for knowing the important situation of this province, it is impossible not to conceive the advantages that would accrue, should this new path be opened to general commerce. Such a flattering idea had given rise to various projects to carry this grand work into execution, which have not been realized, perhaps from the lack of a perfect knowledge of the localities, or from a want of sufficient funds, or may be from the political vicissitudes that the country has been subjected to of late. But now that we have fortunately acquired the re-establishment of the empire of the law, and tranquillity has been pretty well secured, I believe that an impulse ought to be given to this interesting undertaking, upon which depends almost the absolute vitality of this declining province.

"With such an object in view, I take the liberty of soliciting that there be granted to me an exclusive privilege, on the same terms that the old chamber of the district granted to Mr. Malcolm McGregor, that I might endeavor to get this project put into execution, not doubting that the honorable chamber will receive and protect my request; and being penetrated with

its justice and public convenience, will decree favorably.

"Panama, October 2, 1833."

Some days ago, we published an extract from the "Constitucional de Cundinamarca," concerning a project to open a more secure and speedy commercial communication across the Isthmus of Panama. Since then a Panama paper has fallen into our hands, from which we have derived more authentic information regarding this most interesting enterprise. From it we have translated the memorial of Mr. Paredes, which is prefixed to this article. In the same paper, the provincial decree, granting the privilege to that gentleman, also appears, along with a copy of the former one granted to Mr. McGregor. The new decree contains some slight modifications of the articles of the old; one of them is, that the road shall reach to the city of Panama, and another, that Mr. Paredes is not bound by the old decree, which only allows two years to carry the project into execution from the day of its passing, otherwise it becomes null and void, but that the new patentee is not bound, nor does he enter into the enjoyment of the privilege until the day that the Governor of the province shall communicate to him that the decree has been approved of by the National Congress.

We feel a considerable degree of pleasure in giving publicity to the Memorial which Mr. Paredes presented to the Provincial Chamber, and which is submitted for approval to the National Congress of New Granada, now sitting, and we cannot for a moment doubt that body will receive kindly a project upon which depends the future happiness, not only of the Isthmus, but also of this Island; for when once such an expeditious communication between the Atlantic and the Pacific shall be opened, will the navigation round Cape Horn be tasked, which causes so many dangers and loss of time? Certainly not: for the general deposit will be in this island, from whence will be dispatched the cargoes for the ports in the Pacific, which are now supplied by vessels round the Cape.

It has been also very satisfactory to us to learn that some of the respectable merchants of this city have offered their support to Mr. Paredes, to carry this great work into operation, assuring him that in London a great many more will purchase shares in the company, which, added to those in Jamaica and Panama, will form a sufficient number for the execution of the project, without even counting upon the capitalists of France and the U. States.

We understand that the concessions in favor of the Memorialists could not have been more munificent, whether we consider the extending the privilege to the long period of forty years, or whether we consider the permitting of the exclusive transport of all kinds of merchandize, produce or metals, in carriages belonging to the company. These are truly powerful stimulants, to induce the European and American capitalists to take a considerable share in an enterprise which offers such incalculable advantages. The most authentic accounts that have reached us state that the distance from Porto Bello to Panama is only 14 leagues, and that the expense of putting the plan into active operation will cost nearly half a million of dollars.

The good reputation of Mr. Paredes, his commercial relations with this city, the facility with which he expresses himself in different languages, added to his honorable character and personal activity, incline us to augur well of the undertaking, whilst the grandeur of the enterprise makes us quite sensible of his patriotism, his judgment, and the knowledge which he possesses of the important situation of his country. If every Colombian thought as he does, that country would soon prosper, and instead of civil war and intestine quarrels, peace, good order and tranquillity, and industry, would be established upon the firmest basis.—(Kingston, Jam. Chronicle.)

On the subject of the proposed communication by steamboats between Calcutta and England, the Calcutta Courier of the 23d January has the following paragraph:

STEAM COMMUNICATION WITH ENGLAND.—Capt. Ross has proceeded to Socotra in the pilot brig Henry Meriton, taking with him Capt. Jump, who, we believe, will return in charge of the vessel. Capt. Jump is spoken of as likely to be the future commander of the Forbes on her trips to the Red Sea, for which he has tendered his services. In the mean time, arrangements are making to forward coal to the several depots. The Fette Salem is now receiving 500 tons of English coal for Judda, at the freight of 27 rupees per ton,—a very low rate compared with the terms on which the Red Sea depots were provided for the Hugh Lindsay. A suggestion of Capt. Ross is now under the consideration of the committee, to anticipate the departure of the Forbes on the first trip, by altering the date to the 20th April instead of the 1st May, as lately announced. The motive for the alteration is, that starting on the 20th of April, it is believed that the steamer will be able to get down the bay and clear of Ceylon before the earliest period at which storms are to be apprehended.

We understand that the Merchants' Steam Committee have given in a plan to government, offering to undertake to keep up a quarterly communication with England by the Suez route, both from Calcutta and Bombay, with four large steamers of 800 tons burthen, each of them furnished with a pair of 100-horse engines—one of the steamers to run from Bombay, two from Calcutta, and one between Alexandria and the British Channel,—provided government will give them five lakhs annually in compensation for carrying the mail and all public dispatches.

NATURALIZATION OF FISHES.—At a late meeting of the Zoological Society, were read two letters from Mr. J. B. Arnold of Guernsey, detailing his experiments in the naturalization of sea fishes in a lake chiefly supplied with fresh water. The area of the lake is about five acres; its depth various; and its bottom also various, being muddy, gravelly, and rocky. The water is, during nine months of the year, drinkable for cattle, but in consequence of a supply which it receives through a tunnel communicating with the sea, is rather salt in summer, at which season the fishes do not come down so plentifully as at other times. The fishes introduced into the lake have been the grey mullet, sole, turbot, brill, plaice, bass, smelt, and grey loach. All of these have thriven well, and are believed to have increased in numbers; the grey mullet especially is known to have bred as freely as in the sea itself. A single whiting having been caught for three successive years, was found to have grown considerably; a pilchard also thrived well. All the above-mentioned fishes were placed in the lake, except perhaps the brill; but others, as the silver bream, appear to have introduced themselves. It is even suspected that hybrid fishes have been produced, as several have been caught which were unknown to persons well acquainted with the species usually met with on the coast of Guernsey. Mr. Arnold adds that sea fishes, after having been naturalized in his lake, have been transferred to ponds of spring water, where they have not only lived, but done well; and that such naturalized fishes have been carried to a long distance, being much more tenacious of life than those caught in the sea.—[Proc. Zool. Society.]

QUIETUDE.—Happy, indeed, would be the condition of mankind, were all disposed to cultivate that harmony and friendship so desirable and necessary to the welfare and prosperity of society—the world would be similar to a paradise, and the people, if not angels, would approach the character ascribed to them—mankind, as they ought to be considered, would present a band of brothers, happy, quiet and

content. Our citizens, from the highest to the lowest, would be satisfied with their respective stations, and the agitation which now pervades society would rest in quiet and repose.

If there is any quiet on earth, the farmer may be said to enjoy it: with a competence in store, the honest fruits of his industry, he thrives secure from the turmoils of those who pursue other avocations for subsistence. The mechanic, the professional man, and all who support themselves by speculative measures, must expect to contend against the current of disappointment, and prop their sinking hopes by anticipating future prospects, and although their situation may appear enviable to the unscrutinizing eye; on the contrary, they have abundant reason to envy those who live on the fat of the land, enjoying the bounties dealt out by Nature with a liberal hand.

To JOHN O. N. RUTTER, *Wine Merchant, for his Invention of an improved Process for generating Heat, applicable to the heating of Boilers and Retorts, and to other Purposes for which Heat is required.* Sealed March 30, 1833.

The subject of this patent is the employment of bituminous, resinous, or oily matters, in connection with water as a combustible material, which, it is said, will produce a fuel for furnaces, boilers, &c. capable of giving out a very intense heat. Strange as the suggestion of applying water as a combustible material may appear, it is reported to have been found extremely advantageous, economical, and convenient. We of our own knowledge can say nothing upon the subject, but merely give the patentee's views and recommendations in reference to the manner in which he proposes to employ those materials for the production of heat.

Bituminous, oleaginous, resinous, waxy, or fatty substances, are to be employed: as coal tar, which is to be combined with water in certain proportions. It is proposed that a stream of coal tar shall be allowed to flow from a reservoir through a pipe with a stop-cock, and likewise a stream of water from another reservoir through a similar pipe; that the two streams shall meet, and fall into one general receiver with a funnel tube, by which they may be together delivered into the furnace.

The proportions are recommended to be one gallon of coal tar to one gallon and a half of water, the flow of the two liquors to be regulated by suitable apertures or stop-cock. These quantities of materials are to be slowly discharged from the funnels that the whole shall occupy from two to three hours in its delivery into the furnace; and where the furnace is of such magnitude as to require it, several of these funnel tubes may be employed, each delivering its supply of materials in the proportions and times stated.

It is not necessary to use water in a pure state, to be mixed with the coal tar, as foul water will answer the purpose equally well; and on ship-board, where the invention may be usefully applied to steam navigation, the bilge-water from below, or sea-water, may be pumped up and employed for the purpose, and on land the ammoniacal liquor from gas works will also suit as well as fresh water.—[London Journal.]

STEAMBOAT TRAVELLING.—The cabins of western steamboats present peculiar aspects. They possess all the splendor and comforts of an eastern boat, and afford other pleasures which we meet with nowhere else. A per-

son embarking on a steamboat generally expects to remain on board for a longer time than is necessary to perform the trips elsewhere. He prepares himself for the formation of new acquaintances. The boat gets under way, and no one holds himself aloof from the advances of his fellow voyager. A feeling of general interest is soon acknowledged and felt. Intimacies are entered into, and each one contributes from his own resources to the general fund of amusement. By this means the hours are beguiled of their weariness, and that, which under other auspices would be tedious, becomes a source of pleasure.

But the most inveterate talkers will tire. Recourse must be had to other resources. If the voyager has been considerate, and supplied himself with those mute, yet ever interesting companions, agreeable books, he is at no loss. But if he have not prepared himself with a shield against the attacks of enemies he is in a pitiful condition. He lounges about the cabin—promenades the guards—gazes at the sublime scenery of the river hills—and eventually, in a fit of desperation, throws himself into his berth, and seeks in the oblivion of sleep, to forget that he is a bore to himself. Perhaps an ingenious companion who is similarly conquered by dullness, devises an expedient for relief. Gaming, we are sorry to say, is much too common; and no one must consider a proposition to have recourse to that dernier resort of dullness, as any other than a genteel proposition. A proposition is made that the tedium of the hours be lost in the excitement of the card-table. Such propositions are frequently acceded to.

Now, we believe many can date the commencement of their sinning in this way from a vacant hour of steamboat travelling. A taste for such excitements has thus been originated, which has eventuated in the moral degradation of its victims. If any expedients can be adopted to guard against such occurrences, they should be entered into by such as are desirous for the welfare of their fellows with alacrity.

An interesting book, by affording agreeable entertainment, would preserve the mind from the dreary inaction of lassitude. The sickly feeling of satiety is exceedingly propitious for the advances of vice. No man when under the influence of a healthy intellectual activity wishes for change. It is in those moments when that by which we are surrounded fails to yield us pleasure, that we sigh for change, and are most liable to listen to the voice of the tempter. The seductions of vice are yielded to, and inroads are made on our moral principles. The enemy once having got possession of our bulwarks, our condition is exceedingly precarious.

Under the weight of such considerations, we plainly discover the great utility of healthy excitement. If each steamboat possessed a small library of well selected works, a pleasant resource would be afforded. The expense would be but small. The advantages would be great. A steamboat with a library on board, would be preferred by every sensible man, to one which was unprovided with books. We commend the consideration of these suggestions to those engaged in fitting up steamboat cabins, and who are disposed to lessen the evils of humanity.—[Cincinnati Mirror.]

SHEET IRON GIGS.—These gigs are continuing to grow as rapidly numerous as they are increasing in public estimation. A very beautifully fitted up one was this week finished by Messrs. Reid and Hanna, and Messrs. Walker, for the Paisley Canal. Two others are in a state of great forwardness for Dublin; and several others, for various canals, are also in preparation. This business of gig making has extended to Johnstone, also, where there are six or seven of them getting forward for various canals both in Ireland and Scotland. Steam-coaches will find in these gigs most powerful competitors to contend with.

The increase of trade upon all the canals on which they have been introduced is quite astonishing. The bustle at the basin here and at Port Eglinton, by the hourly departure, is quite enlivening, and we understand the travelling by the Forth and Clyde Canal is increased in a most astonishing degree. Indeed, from the speed they have attained, and the low prices charged to Edinburgh, Stirling, Alloa, &c. no other result could be expected.—[Paisley Advertiser.]

MONTHS.—This division of the year appears to have been used before the flood; and as it is naturally framed by the revolutions of the moon, the months of all nations were originally lunar, that is, from one new moon to another. In a more enlightened period, the revolutions of the moon were compared with those of the sun, and the limits of the months, as the component parts of a year, were fixed with greater precision. The Romans divided each month into *Calends*, *Nones*, and *Ides*; the *Calends* were the first day of the month, the *Nones* were the seventh, and the *Ides* the fifteenth of March, May, July, and October; in the other months the *Nones* fell on the fifth, and the *Ides* on the thirteenth. The days of each month, according to this form, were counted backwards; thus, the 18th of October was called the 15th day before the *Calends of November, &c.* In the year 1793, the French Government had a new calendar constructed, in which they adopted the following fanciful designations for each month:

French.	Signification.	English.
AUTUMN—		
1. Vindemaire,	Vintage month,	from Sept. 22
2. Brumaire,	Foggy month,	Oct. 22
3. Frimaire,	Frosty or sleety month,	Nov. 21
WINTER—		
4. Nivose,	Snowy month,	Dec. 21
5. Pluviose,	Rainy month,	Jan. 20
6. Ventose,	Windy month,	Feb. 19
SPRING—		
7. Germinal,	Springing or budding mo.	Mar. 21
8. Floreal,	Flowering month,	April 20
9. Prairial,	Hay harvest month,	May 20
SUMMER—		
10. Messidor,	Corn harvest month,	June 19
11. Thermidor,	Heat month,	July 19
12. Fructidor,	Fruit month,	Aug. 19

This new calendar, which, after all, was only a plagiarism, or copy of one used in Holland from time immemorial, like many of the absurd institutions which sprang from the French Revolution, was laid aside in a few years, from the circumstance of its utter unfitness for the seasons, even as they occur in the several provinces of France itself; how much less applicable, therefore, must they have been to other countries, where the climates and seasons vary so much from each other! A calendar, to be worthy of universal adoption, must be capable of universal application. Not so that of the French *Philosophers*, which, independently of its discordance with those of all civil-

* Noah, as we find it recorded in the Bible, reckoned by months of thirty days each; and from him that mode of computing the year is supposed to have been adopted by the Chaldeans, Egyptians, and other Oriental nations.

ized nations, had not even the merit of indicating those very seasons from which it professed to derive its character. The late Mr. Grifford ridiculed this new-fangled method of registering time by the following ludicrous but happy translation of the republican months and seasons:

AUTUMN . . . Wheezy, sneezy, freezy;
WINTER . . . Slippy, drippy, nippy;
SPRING . . . Showery, flowery, bowery,
SUMMER . . . Hoppy, croppy, poppy.

MACHINE FOR MAKING BRICKS.—Messrs. Harkness, Sawyer, and Frelove, have now in successful operation a machine which has excited the admiration of all who have witnessed its operation. It produces twenty bricks in a minute, and these too, not the unshapely and rough masses of mud, which we usually call bricks, but a square and smooth body of clay, so hard, when they leave the press, that they are fit to set immediately into the kiln for burning.

The moulds (four in number) in which they are pressed are made of polished steel plates—which plates are set in a cast iron box; and the whole banded with strong wrought iron bands. The machinery is so constructed that the mould is fixed in a solid stationary frame; and after the pressure is made upon the clay in the mould, the bottom of the mould rises, and throws the brick to the top, so that it may be conveniently taken off. It is found by experience, that not less than 50 tons pressure upon each brick will answer the purpose. This amount of pressure is, of course, wanted only at the very last moment of the impression; or, in other words, can be pressed with very little effort into a space within, say, one-fourth of an inch of the proper thickness. After it is thus far pressed, it then requires at least 50 tons to bring it to a proper degree of density. The machine in question is so constructed as to give this great pressure at the time it is wanted, and no other. In fact, it would be difficult to find, in all the mechanical operations now in use, a more perfect adaptation of the means to the end. And it is thought by many scientific gentlemen, who have examined the matter, that no other application of the mechanical powers will ever be made to effect the same object.

It is only necessary that the utility of this machine should be known, in order to introduce it into general use. The beauty and durability which it will impart to the brick buildings of the country must make it an object of great public interest. Add to this, the reduction of expense which must ultimately follow, and I cannot but regard the improvement of the gentlemen above named as of equal importance to any which has been introduced for the last 20 years.

The following practical statement, which has been obtained from the patentees, will no doubt interest such of your readers as are engaged, or may feel disposed to engage, in brick making.

A brick press can be put in operation for about \$6.

The expense of carrying on the business for a month is as follows:

1st. 6 hands at \$10 per month - - \$60.00
Boarding same at \$1.25 per week, - 30.00
2d. 3 boys at \$6 per month - - 18.00
3d. 2 horses at \$15 per month, - 15.00
4th. 60 cords of wood at 90 cts. per cord, 54.00
The setting and burning of 180,000 bricks, at 40 cts. per 1,000, - 72.00

\$249.00

The above are the regular expenses per month of carrying on a horse power press. The press, when in operation, makes 20 bricks in a minute, or 2,000 in 8 hours. Deducting, however, for loss of time and other contingencies, 1-4th for every day's work, leaves the amount of 7,500 bricks per day, or 180,000 per month; which, at \$3.50 per 1,000, are worth \$630.00. Deduct the expense of making which is 249.00 and there remains a clear profit to the owner of \$381.00.

per month; or, \$1,905.00 for 5 months, the time that could be conveniently occupied each season in brick making.

The above estimate is based upon the price of brick, of labor, and of boarding at Mount Vernon. In many places, labor and boarding would doubtless be more expensive. But in such places, the price of brick would probably be increased in proportion.—X. Y. Mount Vernon, May 15, 1834.—[Ohio State Journal.]

AMERICAN TONNAGE.—From the Report of the Secretary of the Treasury recently made to Congress, the Registered, Enrolled, and Licensed Tonnage of the United States amounts to 1,439,450 21.95 tons, divided among the States and Territories as follows:

	Tons.
Maine,	192,714 63-95ths
New-Hampshire,	17,126 54 "
Massachusetts,	395,924 23 "
Rhode-Island,	40,907 22 "
Connecticut,	52,878 79 "
Vermont,	1,531 4 "
New-York,	319,209 80 "
New-Jersey,	33,143 53 "
Pennsylvania,	88,162 11 "
Delaware,	13,265 64 "
Maryland,	80,705 70 "
District of Columbia,	17,225 3 "
Virginia,	43,877 55 "
North Carolina,	32,142 17 "
South Carolina,	15,560 75 "
Georgia,	8,651 45 "
Ohio,	9,683 72 "
Tennessee,	3,047 1 "
Michigan,	1,753 74 "
Alabama,	7,210 31 "
Mississippi,	925 43 "
Louisiana,	61,171 73 "
Florida,	1,911 28 "
Key West,	1,091 72 "

It will be seen that New-England owns nearly one half of the whole tonnage of the country. Massachusetts owns more than one-quarter, and has the largest amount of tonnage of any State in the Union, having upwards of twenty-six thousand tons more than the State of New-York.

We give from the same Report a view of the tonnage for each year from 1815 to 1832 inclusive. It will be seen that from 1828, the date of the Tariff law, to 1830, there was a very extraordinary falling off of the shipping interest; and that in 1831 and 1832, after the opening of the West India Trade, and the settling of the tariff question, there has been a gradual increase.

	Tons.
1815,	1,368,127 78-95ths
1816,	1,372,218 53 "
1817,	1,399,911 41 "
1818,	1,225,184 20 "
1819,	1,260,751 61 "
1820,	1,260,166 24 "
1821,	2,298,958 70 "
1822,	1,324,699 17 "
1823,	1,335,565 68 "
1824,	1,389,163 2 "
1825,	1,423,111 77 "
1826,	1,534,190 83 "
1827,	1,620,607 78 "
1828,	1,741,391 87 "
1829,	1,260,977 81 "
1830,	1,181,776 43 "
1831,	1,267,846 29 "
1832,	1,439,450 21 "

[Boston Post.]

TEXAS—Brazoria.—This town is located upon a wooden elevation of peach-land, as it is termed. The spot was chosen as the most commanding and healthful, besides commanding other advantages. One street stretches along the river Brazos, and one parallel with it further back, while other streets, with trees still standing, are laid out to intersect these at right angles, to be cleared as the wants of the citizens may hereafter require. A speedy settlement is calculated upon with perfect cer-

tainity. The first tree was cut in the year 1828, and the town now contains several hundred inhabitants. Such is the increase of population, that some families are obliged to camp out, for want of better accommodations. Mrs. Holley, in her interesting "Letters" from Texas, written two years since, says there is a great want of mechanics, none being there except carpenters. The town is thirty miles from the mouth of the river above mentioned. It contains a good boarding house, the proprietors of which are from New-York. A gentleman, graduated at Yale College, has opened a school, in which the higher branches of education are taught.

Honey Tree.—By these is meant hollow trees, in which the bees deposit their honey. They are very abundant, and honey of an excellent quality, and in any quantity, may be obtained from them. The employment is very profitable. The wax thus obtained is a valuable article of commerce in Mexico. The hunters frequently throw aside the honey, and save only the wax.

Texas is divided into three distinct tracts—the level, the undulating, the mountainous or hilly. The whole coast is level, but free from marsh. A belt of prairie, about ten miles wide, extends along the coast. Back from the prairie the land is heavily timbered with pine, ash, cedar, cypress, and other forest trees. The alluvial bottom lands of the Brazos, San Bernard, and Colorado, are from three to twenty miles wide. They are heavily timbered with various kinds of oaks, cedar, pecan, elm, mulberry, and other forest trees common in the alluvions of the Mississippi.

There is an immense cane-brake, as it is termed, extending along the Cane-brake creek seventy-five miles, and in width is from one to three miles. The Colorado and Brazos rivers, which were swollen by the spring and autumnal freshets, are of a deep red and very turbid. Three thousand pounds of seed cotton and seventy-five bushels of Indian corn are an average crop on the alluvions, which are easily cultivated. One of the branches of the Brazos river is salt, and the land bordering on this river has a fertility (owing to this circumstance) which is truly extraordinary. The alternate deposits of the salt and fresh branches form a soil of a light reddish brown color, impregnated with salt and nitre. The whole valley of the Brazos is what is called mulatto soil, and is the best in Texas. The earth, when brought up to the surface from a depth of twenty feet, will yield as good crops as the surface itself.

Ten miles from the town of Bolivar there is a tree which measures 19 feet in circumference. The country between the rivers and creeks is open, level, rich, and elevated prairie, colored with luxuriant grass, and nothing can surpass these vast natural meadows. Even in the winter season, the pasture is sufficient to dispense with feeding live stock. On many accounts the prairies are deemed more valuable than the alluvial bottoms for cultivation. The soil of the prairies is a deep black mould, mixed with sand in various proportions.

Of the settlements, besides Brazoria, a town has been laid off at the mouth of the Colorado, called Matagorda, and is destined to become the depot of the Colorado, and of an extensive fertile country.

Above the level region, the country becomes undulating. This kind of land extends in a northerly direction up the Colorado, Brazos, and Guadalupe rivers, from 150 to 200 miles above the level region, and reaches to the mountain range of Texas. This undulating section is deemed as desirable a residence for man as can be found on the face of the earth. It is bountifully watered, abounding in bold rivulets and springs of the purest water. Successful experiments have been made on these undulations, of wheat, rye, oats, flax, &c. Lime stone and building stone in abundance. Indigenous grapes of various sorts grow in great profusion, and natural vineyards await the hand of the vine dresser.

Attempt to assign the Cause of the Spontaneous Combustion of Charcoal. By Mr. JOHN DAVIES, Member of the Wernerian Society of Edinburgh, &c. and Lecturer on Chemistry, &c.

In the above interesting paper, no attempt has been made by the author of it to furnish an explanation of the phenomenon which he has established and described; and as every inquiring mind will direct its attention to a rationale of the operation, I presume that some remarks which have occurred to me within the few last days, and which may at least supply some aid in the discussion, may be without impropriety appended to the paper. These remarks, though theoretical, are countenanced by experimental analogies, which, if they fail to establish the accuracy of the speculation, may, at least, excuse its introduction.

A statement of the mode in which the charcoal in question is made, will be necessary in the subsequent explanation. Small fragments of wood, generally stripped of their bark, are put into iron cylinders, and exposed to intense heat, in order to effect the distillation of the volatile constituents for the manufacture of iron liquor. Now, Mr. Brunner resorted to a similar procedure in obtaining potassium from potash and charcoal; and as we know that potash may be procured from the wood employed by Mr. Hadfield, we have in his manufacture the same operation and the same materials as in M. Brunner's experiment, and may therefore expect the same results. The only difference would be, that as M. Brunner used much potash, he procured a large proportion of the metallic base; while in the other case the potassium must be in small quantity, because all the potash present would be only that supplied by the wood subjected to distillation: and yet, upon the whole, the quantity extracted under the latter circumstances is not inconsiderable; for it is by the combustion of such wood in America, where it is of comparatively little value, that the potash is principally formed which is consumed in the arts and manufactures in every part of Europe.

It is manifest, therefore, that in the formation of Mr. Hadfield's charcoal, potassium must, in small quantities, be liberated.

Supposing the presence of potassium in fresh charcoal to have been established, we have now to explain its operation; and this appears to be effected upon the assumption that the metal lingers in the pores of the charcoal, incased, as it were, in the substance, until it be at length exposed to the action of atmospheric air and aqueous vapor. This view of the subject derives plausibility from the facts, that the combustion does not commence at any considerable depth below the surface; and that when a thermometer is introduced into the mass, the ignition generally originates in that place; that is to say, the combustion occurs exactly where it might be expected, since it takes place at the part which, favorably situated, is most exposed to the action of the supporter of combustion.

This general view of the spontaneous combustion is directly countenanced by the excellent paper of Colonel Aubert, inserted in the "Bulletin des Sciences Militaires" for January, which Mr. Hadfield has offered me the opportunity of consulting. This ingenious foreigner shows by a number of decisive experiments, that the absorption of

air and moisture is indispensable in the production of the phenomenon. He proves also, (what Mr. Hadfield has in a different way very clearly confirmed,) that no carbonic acid is formed before the incandescence occurs—a fact strictly in accordance with the hypothesis which I have offered; since upon this hypothesis the oxygen of the air, instead of forming an acid with the carbon, produces, by its superior affinity, an alkali with the potassium. The next position which he establishes, is that the carbon increased in weight in proportion to the quantity of air and moisture absorbed; and this should, according to the explanation suggested, occur, the alkali formed being much heavier than its metallic base. It appears that, to produce the ignition, the charcoal should not only be reduced to powder soon after its formation, but that the sooner it is so reduced the more certain and considerable will be the effect. Now, this fact also is entirely consistent with the explanation, because, when the pulverization has been delayed, air and moisture will have gradually produced the alkali, by a process imperceptible, because the minute portions of potassium would be at comparatively distant intervals from each other, and thus would not be in sufficient quantity at any one place to produce a sensible effect.

Colonel Aubert pulverized a mixture of coal and sulphur, and he found that under these circumstances no ignition ever occurred. The reason is obvious: for the potassium, which has been conceived to be the cause of the combustion, entered during the trituration into combination with the sulphur.

He also triturated charcoal with nitre, and he again found that the spontaneous combustion was prevented. Now nitre, by mingling with the potassium, would check its too rapid absorption of oxygen; and the effect of his experiment is in this way sufficiently accounted for.

The presence of the potassium seems to account for the circumstance, that when charcoal is moistened and subjected to heat, carburetted hydrogen is set at liberty. In this instance it would appear that the water is decomposed, the hydrogen evolved, and the oxygen united with the potassium to form the alkali. If the heat be continued, carbonic oxide would be evolved; the oxygen absorbed in the first part of the operation being again detached from the metallic base. Now this explanation corresponds precisely, I believe, with the order in which, in such an experiment, these gases are produced.

All these circumstances observed by Mr. Hadfield and Colonel Aubert appear, therefore, perfectly reconcilable with the supposition that the spontaneous incandescence is owing entirely to the oxidation of the potassium liberated from the wood during the manufacture of the charcoal.

Dr. Thompson, in the second volume of his History of Chemistry, published since my paper was read to our society, has thrown additional plausibility upon my explanation, by his attempt to show that phosphorus owes its property of catching fire, when in contact with oxygen, to a little potassium, which is reduced to the metallic state during the formation of the phosphorus.—[Phil. Mag.]

STEREOTYPE METALLOGRAPHIC PRINTING.—By Dr. Alexander Jones, of Mobile, Alabama.—I offer this name, as I have nothing

better to designate it. It means simply the transferring of printed letters, from the pages of a book, or newspaper, to the polished surfaces of metallic plates, especially of soft iron. My experiments are not yet completed, yet I feel satisfied that the result is entirely a practicable one, if carefully conducted with proper instruments.

The best plan on which to conduct the experiment is as follows: Take two plates of very soft iron, of moderate dimensions, give one face of each a very true and fine polish, so that, when applied by these faces, they shall uniformly fit and adhere together. Moisten two slips of printed newspaper, or parts of a leaf from a book, of the size of the plates, apply one to the polished face of each plate, and interpose between them a fold or two of silk paper, and then clamp the plates together. Give them a gentle heat over the fire, then place them in a vice, and apply a strong screw power. On separating them and gently removing the paper, the letters will be seen, distinctly formed on the faces of the two plates. Now, as printer's ink is formed of lamp-black and oil, upon which acid acts very little, the faces of the plates may be slightly touched over with diluted sulphuric or nitric acid, which, if skilfully applied, acts on the iron, and leaves the letters raised. When the printer's ink contains some bees-wax, the experiment is more complete. These plates, once formed, may be converted into steel, on the plan of Mr. Perkins; after which they would probably print from 10,000 to 20,000 copies without being materially defaced. An expert mechanic, with proper machinery, could in a day or two form a sufficient number of plates to print off 20,000 copies (500 pages) of an octavo volume.

Other metals, as copper, brass, and type metal, with slight variations, can all have letters transferred to them in the same manner, and can be used as printing plates; but none of these will have the durability of iron.—[American Journal of Science.]

Correct Fusing Points of Metals and Alloys, and other important Temperatures, upon various Thermometrical Scales. [From the Repertory of Arts, &c.]

In the thirteenth edition of Parkes' Chemical Catechism, edited by Mr. Brayley, jun., which has just appeared, we find a "Table of the Effects of Heat," (p. 606), in which the higher temperatures have been corrected by the editor, agreeably to the pyrometrical researches of Mr. Daniell and other chemists. As we do not remember to have seen any connected view of the results, as to the correct fusing points of metals and alloys, &c., which Mr. Daniell has obtained by the use of his new register pyrometer, we subjoin an extract from this table, containing the temperatures from 212° upwards. It may be requisite to state, for the information of such of our readers as may not be acquainted with the present state of pyrometry, that Mr. Daniell has shown (as we find it explained by Mr. Brayley at p. 70, notes, of the Chemical Catechism,) that "the degrees (above the zero of 1077° Fahrenheit, which is stated to be a red heat visible in the daylight,) of Wedgwood's pyrometer, instead of being equal to 130° of Fahrenheit, as supposed by its inventor, are equal only to about 20°;" and that consequently the range of that instrument, instead of including 3200 degrees of Fahrenheit, did not really include more than about 5000°: this will account for the great difference of the corresponding temperatures of Fahrenheit, &c., and Wedgwood, as here stated from the new edition of the Chemical Catechism, from those given in former editions

of that work, and also in many other publications on chemical subjects.

Fusing Points, &c. on the scales of Fahr. Reau. Cent. Wedg.

Water boils, and "fusible metal" [$\frac{1}{8}$ bismuth, $\frac{1}{8}$ lead, $\frac{1}{8}$ tin, smelt]	212	80	100
Sulphur melts	216	89	111
Nitrous acid boils	242	93	116
Camphor melts	288	114	142
Sulphur burns slowly	303	120	150
Pewter melts, [lead $\frac{1}{2}$, tin $\frac{1}{2}$]	403	165	206
Tin melts	442	182	227
Type metal melts, [lead 16 parts, antimony 1]	507	211	264
Sulphuric acid (sp. gr. 1.848) boils	590	248	310
Lead melts	612	258	325
Mercury boils	662	280	350
Zinc melts	773	329	412
Iron bright red in the dark—hydrogen gas burns?	800	341	427
— red in twilight	884	386	475
— red heat in daylight	1272	551	700
Enamel colors burnt, or burnt-in,* on porcelain,	1392	605	756
Bronze melts, [copper $\frac{1}{2}$, tin $\frac{1}{2}$]	1446	629	786
—, [copper $\frac{1}{2}$, tin $\frac{1}{2}$]	1534	668	835
Diamond burns?	1552	676	845
"Orange heat" (Prinsep)	1650	719	899
Brass melts, [copper $\frac{1}{2}$, zinc $\frac{1}{2}$]	1672	730	911
—, [copper $\frac{1}{2}$, zinc $\frac{1}{2}$]	1690	737	921
Bronze melts, [copper $\frac{1}{2}$, tin $\frac{1}{2}$]	1750	794	955
Silver melts	1873	818	1023
Copper melts	1996	860	1091
Gold melts	2016	862	1102
Delft-ware fired	2072	967	1179
Cast iron melts	2786	1224	1420
Cream-colored stone-ware fired	2992	1316	1645
Temperature of the maximum of expansion of platinum, being nearly the highest degree of heat attainable in a laboratory wind-furnace,	3280	1444	1805
Flint glass furnace, greatest heat?	3552	1253	1956
Soft iron melts, according to Clement and Desormes, but in all probability an estimate considerably above the truth,	3945	1406	2118

Mr. Brayley observes, at the end of the table, "The still higher temperatures, derived from the experiments of Mr. Wedgwood, which were here given in former editions of the Chemical Catechism, are now omitted; a comparison of them with the results obtained by Mr. Daniell, by means of his pyrometer, having shown that they cannot be relied upon. Some of the temperatures given in this Table above that of ignition, or 800°, must also be regarded as doubtful, and all of them must be regarded as approximative merely.

*This is a technical term used by enamellers, glass and porcelain painters, &c., to denote the fixing of the color, they employ, by means of vitrification, on the substances painted upon.

ANCIENT MARKS ON PAPER.—Every one knows how often we are obliged to refer to ancient times to explain common terms of art, and words which are in every one's mouth. We have a curious instance of this in the names which are given to the different sorts and sizes of paper. We all talk of *foolscap-paper*, *post-paper*, and *note-paper*;

and paper-makers and stationers have other terms of the same kind, as *hand-paper*, *pot-paper*, &c. Now, the term *note-paper* is clear enough, as it evidently means paper of the size fit for notes; while *post-paper*, we may suppose, means the larger size, which is used for letters sent by the post. But when we come to *foolscap* paper, we are altogether at a loss for an explanation; and here we find we must look to something else than the size of the paper as to the origin of the name. Now, if we go back to the early history of paper-making, we find that terms which now puzzle us so much may easily be explained by the various paper marks which have been used at different times. In ancient times, we know, when very few people could read, pictures of every kind were very much in use where writing would now be employed; every shop had a sign, as well as every public house; and these signs were not then, as they very often are now, only printed on a board; they were always either painted pictures, as many inn signs still are, or else models of the thing which the sign expressed, as we still sometimes see a bee-hive, a tea-canister, or a doll. For the same reason, printers had always some device which they put upon the title pages, and at the end of their books; and paper-makers used marks to distinguish the paper of their manufacture from that of others. Some of these marks becoming common, naturally gave their name to different sorts of paper; and as names, we all know, remain very long after the origin of them is forgotten, and the circumstances changed, we shall not be surprised to find the old names still in use, though perhaps in some cases they are not applied to the same things they originally denoted. It will be the best way, perhaps, to mention briefly the chief paper marks which have been used, as they occur in the order of time. The first paper-maker in England is supposed to have been John Tate, who is said to have had a mill at Hertford; his device was a star of five points within a double circle. The first book printed on paper manufactured in England was a Latin one, entitled *Bartholomeus de Proprietatibus Rerum*. It was printed in 1495 or 1496. The paper seems to have been made by John Tate, the younger, and had the mark of a wheel. The paper used by Caxton, and other early printers, had a great variety of marks, of which the chief are the ox-head and star, the letter P, the shears, the hand and star, a collared dog's head, with a trefoil over it, a crown, a shield, with something like a bend upon it, &c. The ox-head, sometimes with a star or flower over it, is the mark of the paper on which Faust printed some of his early books; but the open hand, which was likewise a very ancient mark, remained longer in fashion, and probably gave the name to what is still called *hand-paper*. Another very favorite paper mark, at a somewhat later period, was the jug or pot, which seems to have been the origin of the term *pot-paper*. It is sometimes found plain, but oftener bears the initials or first letters of the maker's name; hence there is a very great variety of figures, every paper maker having a somewhat different mark. The hand and pot marks existed from 1539 to 1639, as may be seen in old Bibles. The foolscap was a later device, and does not seem to have been nearly of so long continuance as the former. It has given place to the figure of Britannia,

or that of a lion rampant, supporting the cap of liberty on a pole; the name, however, has continued, and we still denominate paper of a particular size by the title of foolscap paper. The figures have the cap and bells which we so often read of in old plays and histories, as the particular dress of the fools, who formerly formed a part of every great man's establishment. Post-paper seems to have derived its name from the post-horn, which was at one time its distinguishing mark. This is of later date, and does not seem to have been used before the establishment of the General Post-Office, when it became the custom to blow a horn. This mark dates from 1670 to 1679. The mark is still sometimes used; but the same change which has so much diminished the number of painted signs in the streets of our towns and cities, has nearly made paper marks a matter of antiquarian curiosity, the maker's name being now generally used.—[Saturday Magazine, No. 11.]

CARRIAGES.—Wheel carriages for pleasure are generally supposed to have first come into use in England in the reign of Queen Elizabeth. But long before that time carriages of some sort were used on state occasions, or for the conveyance of sick persons. Even in the time of the Saxons, a clumsy kind of car, on four wheels, was employed to carry great personages; and Stow tells us, that, during Wat Tyler's insurrection in 1380, Richard the Second, "being threatened by the rebels of Kent, rode from the tower of London to the Miles End, and with him his mother, because he was sick and weak, in a *whirlcote*," which is supposed to have been a sort of covered carriage. "Chariots covered, with ladies therein," followed the litter in which Queen Catherine was carried to her coronation with Henry the Eighth. But Queen Elizabeth's is the first that was called a *coach*. In 1564 William Booner, a Dutchman, became the Queen's coachman, and about this time coaches were brought into general use in England. In 1588 Queen Elizabeth went from Somerset House to Paul Cross, to return thanks on the destruction of the Spanish Armada, in a coach presented to her by Henry, Earl of Arundel. These coaches must have been clumsy uncomfortable machines. They had no springs, and the state of the streets and roads must have made travelling in them any thing but easy. But fashion brought them into such general use, that in 1607 Dekker complains that "the wife of every citizen must be jolted now." And in 1636 there were 6000 of them kept in London and the neighborhood. At first they had only two horses, but afterwards the number was increased. In the reign of James the First, "the stout old Earl of Northumberland, when he was got loose, hearing that the great favorite Buckingham was drawn about with a coach and six horses, thought he might very well have eight in his coach, with which he rode through the city of London to the vulgar talk and admiration." In general, however, it was thought disgraceful in those times for the male sex to ride in coaches. "In Sir Philip Sydney's time, so famous for men at arms, it was then," says Aubrey, "held as great a disgrace for a young gentleman to be seen riding in the streets in a coach, as it would now for such a one to be seen in the streets with a petticoat and waistcoat, so much is the fashion

of the times altered." Sir Walter Scott says, it is a tradition in Scotland, that chaises or chariots were first introduced into that country in 1745. Before that time the nobility were accustomed to travel in vehicles somewhat resembling Noah's ark, and the gentry on horseback; but in that memorable year, the Prince of Hesse appeared in a carriage of this description, "to the admiration of all Scotchmen, who regarded it as a coach cut in half." When we compare the clumsy things in which even our kings formerly rode, with the convenient and light carriages of the present day, we cannot help admiring the progress which our workmen have made in this and every other branch of art, and hoping that their skill may always find that encouragement which it so well deserves.—[From a paper in the *Archæologia*, by J. H. Markland, Esq.]

AGRICULTURE, &c.

USE OF MARL.—A correspondent of the *Baltimore Farmer and Gardener* thus speaks in favor of this manure:

I have been favored with the use of this mineral, as a manure, for more than twenty years, in neighboring states; and have, in many instances, witnessed the most wonderful improvement from its application. There is a great variety in the composition of this article; all of which require a corresponding difference in the component parts of the soil to which it is to be applied, for profitable results. He who goes to work with this manure without a knowledge of the composition of either his soil or his marl, will but flounder in an uncertain ocean of wild "experiment," and in many instances may expect to lose both his labor and his "deposits."

In New-Jersey there are three principal strata of this substance, differing materially in their composition, and in their adaptation for particular soils. The first stratum lies near the Delaware, is met with along the banks of creeks, and in the bottoms of wells—in one instance within my knowledge, it was penetrated nearly one hundred feet; but without going through the layer. This abounds with a large proportion of shells, and other fossil remains. The second stratum, farther up the country, has fewer shells, of a black color, and is granulated, by reason of which it has obtained the name of gunpowder marl. The third stratum lies still farther up the streams, and bordering on the regions of pines—this species strongly impregnated with sulphurous acid; so much so, in some instances, as to corrugate, and even excoriate, the cuticle on the hands of the laborers in the pit—has no undecomposed shells, color black, green, and sometimes blue, which has been used as a pigment for painting. I was acquainted with one tract of land which abounded with this latter species of marl, and was rendered almost entirely barren. With the exception of here and there a scrubby white oak, the soil was almost as bare as the beaten pathway. It had not been thought to be worth the expense of an inclosure, until it fell into the hands of a gentleman who understood something of the science, as well as the art of agriculture, and knew how to appreciate the value of a retort in the hands of a ploughman. On discovering the composition of his sterile soil, he knew how to apply the appropriate remedy, and after inclosing a lot, it was ploughed deeply, dressed with a coat

of the hydrate of lime, and laid down to clover; and a finer crop, of that valuable grass I never witnessed. Here the uncombined acid of the soil, uniting with the calcareous matter, formed the sulphate of lime, or plaster of Paris, which enters largely into the composition of clover, and forms its proper nourishment.

At this cheap rate, was this barren waste converted into a rich and beautiful meadow; not exceeded in value by any bottom meadow within my knowledge.

Had marl of the first mentioned species been applied to this land, it would have produced the same effect, in proportion to the quantity of undecomposed calcareous matter which it contained. The second species would have produced little or no effect; but had the last mentioned kind been used, it would have been like adding fuel to the flame, and would have rendered the sterility more lasting and obstinate. It was refreshing to witness the effect of this blooming spot, surrounded by the dreary waste. It could only be compared to the effect on the furnished caravan, when, traversing the blowing sands of Arabia, he descries in the horizon the lonely palm tree, marking the site of a solitary spring of water.

Preparation of Beet Sugar. By Dr. F. WURDEMANN. Being an extract of a letter from Dr. Wurdemann, of this city, now in Paris, to Dr. Ravenel, and communicated by him for publication in the *Southern Agriculturist*.

"PARIS, December, 1833.

"The beets are collected when ripe, or little before that time, and immediately brought to the cleaning machine. This consists of a cylinder composed of rills of wood, and revolving in a trough filled with water; into this cylinder, the beets with their tops, as torn from the ground, are put, and thoroughly washed; one objection to cutting off the tops before washing, is that a quantity of saccharine matter escapes. They are then brought to the rasping machine, which breaks down their cellules, and reduces them to fine pulp. In some places the beets are brought dried to the manufactory. They should then be cut in transverse slices, and dried in a stove heated somewhat below the temperature of boiling water, that being sufficient to destroy the principles of organic life in the beet, and which militates against the action of affinity present in all inorganic substances. The temperature should be below 112 degrees of Fahrenheit, as it appears that at that point the coloring matter is formed readily, either from a re-action taking place between the principles contained in the beet, or during the maceration, from the water used in that process. For the same reasons the time and degree of heat used in maceration should not exceed that requisite to extract the saccharine matter.

The quantity of fibrous matter contained in the beet is so small, in proportion to the liquid, and the cellules containing the latter are so minute, that it requires a most complete rasping to prepare them for the press. The presses most esteemed are those which press but a small quantity at a time, and that with expedition; as by these means most juice is obtained from the pulp. They are of two kinds, the screw and the hydraulic; but the limits of this paper will not permit me to give you a description of either; suffice it to say, that the pulp, having been placed in strong, closely woven cloth, is submitted to these presses, and the juice flows immediately into cauldrons, (coppers,) in which it undergoes the process of defecation. From good beets Dombasle obtains 85 per cent. of juice; from good and indifferent, 60 per cent. is usually got. From boiling them and then cutting them in slices, over which a current of water flows successively, he

has obtained 90 per cent.; 60 lbs. of juice of good white beets yield from 4½ lbs. to 5 lbs. of raw sugar; those grown in rich wet soils give less.

The juice thus, or otherwise obtained, is subject to a spontaneous alteration, which is important to know. If exposed to the atmosphere, it gradually acquires a stringy and oil-like consistence, which, increasing in proportion to the evaporation of the liquid, at last resembles that of the white of an egg. These changes take place in less than twenty-four hours, when the temperature is at 20 degrees to 24 degrees centigrades. The mass which before this change never showed any free acid, now contains both acetic and nanceique acids, (the latter described by Braconnet in 1813—*Annales des Chimie*.) It is supposed that this alteration takes place in the beet itself when kept in too large heaps, and thus subjected to too high a temperature. It is the formation of this viscous matter which presents a great obstacle to the crystallization of the sugar, and which, gluing together the crystals, prevents the molasses escaping. To guard against this alteration of the juice, the utensils used in keeping and stirring the beet juice should be kept scrupulously clean, and the greatest celerity possible should be used in all the necessary operations, from the grinding to the defecation. The instruments of wood must be frequently washed with the greatest care, and when laid aside, should be covered with milk of lime, and which should not be removed before their immediate use is required. One of the best means to prevent this alteration in the beet juice is to employ small coppers, capable of containing about two hectolitres (two hundred English quarts) each; five of this size are capable to serve for the fabrication of 30,000 lbs. of beet juice per diem. Although the heat may be applied to a large copper long before it is filled from the juice flowing from the presses, too much time passes before it is full, and arises at the temperature of 70 or 80 degrees centigrades, at which temperature the juice may be considered safe from the alteration above mentioned.

I will not dwell on the *modus operandi* of the substances used in the defecation of the juice, but proceed, at once, to state the process most generally adopted. The quantity of lime varies from 2½ to 3½ "grammes" for each "litre" (quart) of the juice. As a general rule, the quantity must be increased in proportion to the quantity of saccharine matter contained in the juice. The purest lime should be used, and in its greatest degree of causticity, and it should be reduced into a clear pap by means of a little water before put into the coppers. It is best to put it in the copper as soon as a few buckets full of juice have flowed in, it acting in preventing the decomposition already so much insisted on, which is apt to take place to a more or less great degree before the juice arrives at the requisite degree of temperature.

Two methods are now used to complete the operation. One consists in preventing the boiling of the juice, by extinguishing the fire before it arrives at 100 degrees temperature, and then being left at rest for half an hour, when the scum rises to the surface; the liquid is afterwards drawn off by a cock placed near the bottom of the copper.

The method preferred by Dombasle is to continue the fire under the copper, and, when near the boiling point, watch the first bubble which swells under the scum; immediately take a ladle full of the juice from the spot where it arises, and pour on the spot a quart of cold juice, which checks the action immediately; the same operation must be repeated as often as a bubble appears, (which must never be permitted to burst and spread over the scum,) until, by examining the liquor taken up in the ladle, the defecation is found complete, when the fire must be extinguished, and the liquor allowed to rest for a half hour before drawn off; always guarding the bubbles, which may continue to rise, from bursting by the means already indicated. By this method, the operator is rendered com-

plete master of the work, and in those cases in which sufficient lime has not been used, he can have time to add more when he finds that complete defecation will not take place. For this purpose he has only to dilute a quantity of the milk of lime in the cold juice, which he pours into the copper. Even the introduction of the cold liquid alone sometimes produces a remarkable effect: a single quart changing the state of the liquor and causing the separation of the fæces in large flakes. The complete defecation is known by the liquid in the ladle being of a fine white wine color, and perfectly transparent, and that the fæces are divided into large flakes, which settle quickly to the bottom of the ladle. The liquor having been drawn off, the scum and residue are then placed on cloths extended over a table composed of wooden ribs, and having an elevated border; below this is placed an inclined plane, which conveys the juice into a reservoir containing the rest of the clarified juice. The cloths should be of cotton in preference to wool, which the lime, still retained by the fæces, is apt to rot.

Now, place the juice thus defecated into coppers destined to concentrate it. The form of the different coppers is not an unimportant object. Those used in defecation should be deep, viz. the depth half their diameter; and when bullocks' blood is employed in defecation, they should be as deep as wide. The coppers for concentration should be as wide as one foot in depth to four or five feet in diameter, those for cooking differ from these last only in having their bottoms three "lignes" in thickness at least. The combustible matter is pit-coal or wood, and the furnaces must be adapted to each. Animal charcoal is used in the concentration; that made from bones and not horns is employed. Its action is not confined to removing the color, but it acts also in an inexplicable manner, enabling the syrup to support a higher degree of temperature; and without it, it is almost impossible to cook the syrup on an open fire, which process will now be described.

Place the clarified juice into the concentrating coppers, and saturate the excess of lime, if it exist, by diluted sulphuric acid; it should not be rendered completely neuter, only so far that the purple (tournesol) paper changes slowly blue. Then pour in the animal charcoal in the proportion of $1\frac{1}{2}$ lbs. to a "quintal" (100 lbs. weight) of the liquor. Boil and continue the concentration until the hot liquor supports (porte) 20 degrees *a l'areometre de Beaume*. It is then withdrawn and left to deposit in deep wooden vessels, and kept in a cool place, where it precipitates during cooling a great quantity of calcareous salts, among which the malates are most abundant. When the syrup is perfectly clear, (at the end of twenty-four hours usually,) it may be submitted to the action of cooking (cuite.)

Being placed in the cooking coppers, carry it by a brisk fire to 32 degrees of *areometre de Beaume*. Extinguish the fire, and throw in animal charcoal, in the proportion of $\frac{3}{4}$ lbs. to a quintal of the juice which has furnished the syrup, viz. half the quantity employed the first time. Let the syrup now cool to about 75 degrees, stirring it occasionally to mix the charcoal well with it; then carry it into the clarifying coppers, and submit it to the usual clarification of bullock's blood; it is then drawn off clear and the cooking proceeded with. The scum, &c. is placed on woollen cloths to drip. The preceding is considered the most difficult part of the process. The cooking coppers now receive it, and the point of concentration is told by touching the ladle dipt in the syrup and drawing out the thread. The thumb being below, when the finger is drawn from it, the thread should break at the thumb. The thermometers used for this purpose are rejected by M. Dombasle, as not to be relied on. When of the proper consistency, it is poured out into the "rafrachissoir," where it crystallizes.

The method recommended by Payer is to evaporate the defecated juice to twelve degrees of Beaume, without adding any animal char-

coal; then draw off all the liquid into a filter filled with animal charcoal; evaporate rapidly the filtered liquid to twenty-five degrees of Beaume, and filter again through a filter of Dumont with fresh animal charcoal. The syrup is thus rendered ready for the cooking, it yields more crystals of a more beautiful hue, and the suppression of the bullock's blood no longer leaves a portion soluble and alterable. Payer recommends also the copper on a pivot for cooking the clarified juice, it (cooking) being in this accomplished in five or eight minutes, while the other method requires thirty or thirty-eight minutes; moreover, the alteration is six times less in syrup cooked in this than in the usual stationary coppers. The fire being brisk, the ebullition is commenced in one minute in every part of the copper; frequently the syrup is too viscous, and rises in a thick froth, and, incompletely wetting the bottom of the boiler, hazards the burning of the sugar; to check this instantaneously, throw in a small quantity of fresh butter, four or five grammes, which Dombasle recommends to have been previously melted, as that operation prevents the sugar receiving any flavor from it; as soon as the syrup, by means of the touch, is found cooked, draw the cord, and thus canting the copper, its contents pour out at once; open the stop cock, and proceed with the process; seven or eight products being thus united in the rafrachissoir, it is rolled into the rooms containing the forms, for much of the French beet sugar (raw) is in loaf form.

I have thus, my dear sir, given all the information I possess relative to the manufacture of beet sugar from the expression of the juice to the crystallization. I have drawn freely from the latest and most esteemed works, but as yet have not been in a refinery. I thank you for the hint, how I may render my stay here serviceable to my native city; and shall use my endeavors to gain admittance into a refinery before my return.

I am, with great regard, dear sir, yours,
F. WURDEMAN.

APPLES FOR OXEN.—Last season a widow lady residing in New-Jersey bought a pair of working oxen for \$55. She had them fed on apples and grass, with the addition of four or five bushels of ears of corn. She sold them in the fall to the butcher for \$94. The apples were the kinds of which the best New-ark cider is made.

Report on the Cultivation of Turnips with Compost applied in a peculiar manner. By MR. HUGH MUNRO, Assynt by Evanton, Ross-shire.

[The following is from the Transactions of the Highland Society of Scotland, and the plan may be worthy of imitation in some instances.]

I had a field of nine acres, which I wished returned into grass, and from the little experience I have as a farmer of four years' standing, I considered that grass after turnip eaten off by sheep would be better than after any other course. I at one time thought I should be obliged to purchase bone-manure for this field, not having any fold manure; but the expense of bones for nine acres, at twenty-five bushels per acre, at 2s. 10d. (the price last season), would £3 10s. 10d., or £31 17s. 6d. I have, however, heard that fourteen bushels of bones per acre have been applied to raise turnip with success, which makes £1 19s. 8d. per acre, or £17 17s. for nine acres. So I determined to try and find a substitute that would be cheaper and equally effective, in which, I am happy to say, I have succeeded beyond my most sanguine expectations. I got some of the small tenantry to bring to me a quantity of peat-moss, for which I paid £2 10s. I then mixed all the chaff from the mill, the fire-ashes from my own house, together with the sweepings and fire-ashes, &c. &c. of my servants' houses, (for which I gave straw to bed their pigs,) the scrap-

ings of roads and ditches, and then wetted the whole with the superfluous urine from the fold, having added a little lime and horse dung, and turned it frequently till it was well pulverised; and in this way I prepared 45 single cart loads. During the winter, I drilled from the stubble the field intended for turnip, and let it lie exposed to the weather in that state until the end of May, when I harrowed it smooth, and then drilled it again by splitting the former drills. I then put a light roller over the drills to make it smooth, and commenced laying down the turnip in the following manner. I had five men with large dibbles made of hard wood, with which they made holes eight inches apart on the top of the drills, pressing down the dibble with the foot, each man having a single drill, followed by a woman with a basketful of the prepared manure,* and into each hole made by the dibble she placed a handful of manure. After her, followed a girl with a little bag of turnip seed†, putting from three to six or more grains on the top of the manure, with her fore finger and thumb, drawing a little earth over it; and in this manner I carried on five drills at a time with fifteen people, viz. a man and two women to each drill. The whole went on like clock-work, and I finished the nine acres in four days, at an expense of about £5, including purchase of peat moss. The turnips grew rapidly, and I had them cleaned in the usual manner, sometimes leaving two plants in one hole, which I found to answer well, especially if the plants happened to be a little distant from each other, say about two inches. I have thus raised an excellent crop of large turnip, by applying only five single cart-loads per acre of this prepared manure, and the expense of the whole does not exceed £5; indeed, they are so good, that I am now stripping one half previous to putting on the sheep. Every one who has seen the turnip has been surprised, and several in my neighborhood intend adopting the same plan next year. I shall now attempt to make some observations on this plan which I have adopted.

1st. Where the land is foul with weeds, the usual mode of cleaning should be adopted, and then drilling the land once.

2d. That the manure to be prepared should be made as strong as possible, by the superfluous urine of the court-yard in winter; and that the scrapings of roads and ditches, with rubbish of old houses, &c., would be preferable to peat-moss. A boll of lime should also be mixed with every ten cart-loads, and, when well attended to, less than five cart-loads per acre will be found sufficient.

3d. I observe that, although the season may be dry, and the sides of the hole liable to fall in, yet, by making the women with the manure follow the dibble quickly, this inconvenience (and I may say it is the only one) will be obviated in a great measure; and where this was done, I found no difference in the crop of turnips.

4th. This plan can be followed in all kinds of weather, and better while raining, which is not the case in the usual method.

5th. Where five or more grains of the seed come up together, (forced on by the strength of the manure over which the seed is immediately placed,) they will force themselves through, even should the soil be barked by rain, wind, and sunshine. And,

6th. Should dry weather be the character of the season while sowing the turnips, they will show a healthy braid, the manure, which is their food, being close at hand, and they not being obliged to push their delicate roots through a quantity of earth in search of nourishment, as in the method now in use.

* The manure is taken to the field in carts from where it is made, and the driver fills each woman's basket as they may require it.

† I only expended 2 lb. of turnip seed for each acre.

HAIL.—Hail fell in St. Francisville, La. on the 27th of March, and killed some sheep, chickens, &c. Some of the stones were as big as turkey's eggs.

CULTIVATION AND MANAGEMENT OF THE TOBACCO CROP.—Having an increasing number of subscribers in the southern states, we deem it due them to occupy a portion of our pages, even for their exclusive benefit.

To the Editor of the Farmer and Gardener.

SIR—To enable us to answer the numerous inquiries, which are constantly made relative to the cultivation of tobacco, we requested an extensive and highly intelligent planter (of whom we have received ten varieties of seed of the choicest Maryland sorts) to give us his views relative to the proper mode of cultivation and management.

We have the pleasure of enclosing his remarks on the subject. If you think them worthy a place in your valuable paper, publish them; the result may prove useful to your numerous subscribers. Respectfully,
yours,
SINCLAIR & MOORE.

Baltimore, May 20, 1834.

The ground is prepared as you would for cabbage seed; in addition, it is always, when taken from new ground, burnt by placing a quantity of brush upon it, then set on fire, for the purpose of cleansing it from all filth. The repetition of burning may be avoided by always weeding up the bed after you are done with it for the season. The quantity of seed required is about a wine-glass full to ten yards square; but in this we differ in practice very much—we know if we could be certain it would always come, that this quantity would be enough; and as it is uncertain, we most always sow three times as much, with the calculation, should it be too thick, to rake out the over quantity. This raking is of rather a recent date, and is done by a small rake made of 10d. nails, put about five-eighths of an inch apart, with sharp points; and it is used with a little slight of hand, so as to divide the plants without leaving them in rows. This operation is performed when the plants are about the size of a five cent piece, which is usually in the early part of May, and just before we think of planting.

Planting is usually done from the latter part of May to the 10th of July; here again I must refer you to the mode of preparing and planting cabbages in hills. The size of the plants, about three inches broad, are the best size to plant out; when transplanted they are also cultivated very much as cabbages, only oftener worked with the plough and hoe.

Usually, in the middle of August, tobacco will signify its approach to ripening by buttoning and blossoming, at which time we quit working it, and proceed to break off the blossoms to such a leaf as we think will ripen as soon as the bottom leaf, (which we call topping tobacco); after this it will commonly put out suckers just above the joints of the leaves, these must be broken off, and then we think it time to house. *Cutting and housing:* This is done with a similar instrument to a butcher's cleaver. After it is cut it may lay for a little time, until the leaves fall and will not break by handling.

From the ground it may be taken in large loads to the tobacco house, where it is usually pegged (a wooden peg six inches long is driven into the butt, by which it is hung on the sticks in the house,) but sometimes split; this is done by a knife, splitting the stalk down nearly to the butt, before it is cut down in the field, and when brought to the house it is

straddled across the sticks, instead of being hung on them by the peg. The sticks are placed on the bearers in the house about six inches apart, the plants put from four to six inches apart, according to the size, where it is cured either by fire or suffered to cure by the air. It is considered cured when the stem of the leaf is dry. *Stripping* comes next; for which we choose moist weather, the only time it can be handled without crumbling, and tie it in bundles, from which it is generally put in bulk and watched that it does not heat; after which the bundles are straddled across the sticks for *conditioning* to pack; here it must be noticed that the bundles get completely dry, and then as soon as moist weather again enables you to handle it, it must be taken down and put in large bulks and weighed; this is called *close bulks*, here it is ready for packing; that process is so generally known that I do not deem it necessary here to say any thing about it.

The kinds. Tobacco is esteemed mostly for two reasons, one for *quality*, the other for *quantity*. It is supposed the thinner jointed tobacco generally cures the brightest, but I do not entirely subscribe to this opinion, as I have often seen the thick jointed of as good color. Am inclined to think there is more in the soil than in the kinds; a poor hickory soil will produce a good color, when I have seen such black soil produce very dull tobacco; but as a general rule, give me the thick jointed sort, and upon tolerable strong loam. Rich stiff soil will not produce a bright crop, but will give a heavy crop; quite sandy soil, on the other hand, is likely to produce bright, but a light crop. So, upon the whole, I should prefer the thick jointed tobacco, and upon a loamy soil of pretty good strength, to produce the most profitable crop.

Tobacco is a very troublesome crop; it never being off hand. The seed of the new is sown before the old crop is packed and sent to market. It is subject to many enemies, among them the fly in the bed and in the field; when small, the ground worm, the bud worm, the web worm, and lastly, and most destructive, the horn worm; these come in immense quantities, and are similar to the Tarmata worm. They will, from the eggs laid upon the leaves, grow in a few days as large nearly as your finger, and will, in a short time, leave nothing of the plants but the stems and stalk. These worms are the common enemy; they commence with the first growth of the tobacco, and at different periods follow it up until the crop goes to the house. Our plan of defence is to pick them off by hand, or use turkeys; they are best, because more expeditious. Turkeys, by driving them into the tobacco, will regularly examine each plant and pick them off.

I neglected in its place to say what time the seed should be sown—from February to the first of April is the best time; and the quantity raised per acre is generally one thousand pounds from 3,500 to 5,000 hills, according to the quantity of land.

PLOUGHING IN GREEN CROPS.—I have found by experience, that when a spring crop is taken off, and wheat is to follow, the best method is to harrow thoroughly, immediately, which causes all the seeds of grain which may have scattered, or of weeds, to vegetate. About two weeks before seeding, turn all the green stuff and stubble under the soil, there to remain and rot. If ploughed the second time,

much of the stubble is brought to the surface and lost.—[Genesee Farmer.]

AN IMPROVED BEE HIVE.—The box or hive to be made of inch plank, say about two feet three inches by twelve inches wide; the upper part of the box to be partitioned off, allowing just space sufficient to admit a drawer of about ten by twelve inches deep. This drawer is to slide upon the horizontal partition, and to be made to fit the inside of the box exactly. In the bottom of the drawer a hole is to be made, say about one and a half inch in diameter, and a corresponding one in the partition, so as to allow the bees to pass up from the lower part of the hive into the drawer. In the outer side of the drawer, a pane of glass is to be fixed, in order to ascertain when the drawer is filled with honey. Over the glass, a sliding shutter is to be placed, to exclude the light; or the upper end of the plank, forming the back side of the box, or hive, may be sawed off, and fastened with a hinge and button, so as to answer in place of the sliding shutter. When the honey is wanted for use, remove the shutter from before the glass, and having ascertained that the drawer is filled, introduce a little smoke into the top of the drawer by means of a tobacco pipe; and when the bees have been driven into the lower part of the hive, separate the drawer and partition with a case knife, remove the drawer, and having emptied it, return it to its place again, and the bees will commence working in it immediately. By this method the honey will be always pure, without bee-bread, or dead bees, and not a single bee need be destroyed; and moreover, it has been tested by many years, trial, and found to answer the intention completely. Z.

P. S.—The drawer should have a top screwed on, so as to be more readily opened when the honey is to be taken out; and any space between the drawer and the sides, or top of the hive, should be filled with some kind of cement, so as to prevent insects from making a lodgment within the hive.

A CURIOUS HORTICULTURAL ANECDOTE.—When Sir Francis Carew had rebuilt his mansion house at Beddington in Surrey, he planted the garden with choice fruit trees. There he was twice visited by Queen Elizabeth; and Sir Hugh Platt, in his Garden of Eden, tells a curious anecdote relating to one of these visits. "I conclude," says he, "with a conceit of that delicate knight, Sir Francis Carew, who, for his better accomplishment of his royal entertainment of our late Queen Elizabeth, led her majesty to a cherry tree, whose fruit he had of purpose kept back from ripening at least one month after all cherries had taken their farewell of England. This secret he performed by straining a tent or cover of canvass over the whole tree, and wetting it now and then with a scoop, as the heat of the weather required; and so by withholding the sun-beams from reflecting upon the berries, they grew both great, and were very long before they had gotten their perfect cherry color; and when he was assured of her majesty's coming, he removed the tent, and a few sunny days brought them to their maturity."—[Platt's Garden of Eden.]

LEMON TREE.—In the green-house of the late Hon. T. Bigelow, of Medford, there is a lemon tree, which, besides its foliage, its buds, and flowers, has on it about three hundred lemons. These are of course of all sizes, from the smallest to the largest, which are sixteen inches in circumference. The tree is supposed to be about fifty years old. It was given to Mr. Bigelow by the lady of the late Hon. Wm. Gray, about twenty-five years ago. It is emphatically a perennial, being never without foliage, flowers, and fruit. Perhaps some of the credit of rearing and perfecting this splendid exotic may belong to the gardener, whose watchfulness and care have been applied to it during the whole time that it has been in its present place.—[Boston Courier.]

NEW-YORK AMERICAN.

JUNE 21—27, 1834.

Our table is so covered with books, that have accumulated there during the season of long documents, that it is almost impossible to turn one's pen around in hitting off a paragraph upon any of the prevailing subjects of interest. We are, in fact, suffering from a plethora of new publications, and without waiting for our usual weekly relief through the review, we must begin to practice a little daily depletion. Opening the first volume that comes in our way, we find it to be a collection of Aphorisms, from various authors, ancient and modern, embodied under the title of "The Moral Testament of Man," and neatly published by Key & Biddle, of Philadelphia. Without pausing a moment to examine the propriety of the title, as applied to a book made up of the sayings of Chesterfield and Rochefoucault, Byron, Bulwer, and others of the modern novelists, blended with the more orthodox good things of Johnson and Goldsmith, we will, as briefly as possible, say all we have to add by way of codicil to the Moral Testament. We never believed much in aphorisms, for great men say so much merely for effect, and say it at the same time so well, that they easily succeed in passing off sound for sense, and lead us to swallow antithesis for truth. An absurd instance of the kind occurs at this moment to us in the popular sayings of Lacon—(whose best things, by-the-by, are stolen from the Greek and the French Aphorists)—where he says that "Many a man has been canonized who ought to have been cannonaded." There is nothing as bad as this in "The Moral Testament," though the author of Lacon is largely quoted. But the compiler should have omitted one of the following quotations from Bulwer, which to most apprehensions seem to nullify each other:

"To be pleased with one's self is the surest way of offending every one else."

"The great secrets of being courted are to shun others and seem delighted with yourself."

Such an oversight, however, may be readily forgiven in consideration of the following capital quotation from Lavater, which is new to us:

"Who in the same given time can produce more than another, has vigor; who can produce more and better, has talents; who can produce what none else can, has genius."

That is, that genius is an *inventive or creative faculty*: the power either of bringing new resources to light, or of combining old materials in forms hitherto undreamt of. This to us has always appeared the true and simple, the only definition of a term which sophomores and sages will never cease puzzling themselves about. Genius may be called a gift because it seizes those things by intuition, which talent arrives at by process of meditation.

The quotations from Chesterfield in this volume are generally well chosen, though he might have been quoted more largely to advantage. Whatever one may think of Chesterfield's morals, his system of manners has this advantage over most others, that it is founded upon philosophy, and would suit all peoples in every age. The more modern writers of the subject treat only of the conventional dicta of the circles which they profess to paint,—of fleeting fashions, which have nothing to do with the essentials of good breeding, and which, however important at Almack's, would never enable a man to pass muster as a gentleman among the Turks and Spaniards—and they, if Lord Byron, Mr. Slidell and Dr. Dekay are to be believed, are the most really polite people in the world.

The great difference between Lord Chesterfield's doctrine and the prevailing English tenets—as exem-

plified in the man of breeding of his day and the man of ton of ours—was that the first was always to study what was due to his neighbor, the last to be ever on the qui vive as to what is due to himself. The former was presumed to be so much of a gentleman ingrained that he could not be affected by courteous intercourse with his inferiors. The latter seems to be held so precariously polished that the slightest contact with any object less soft and smooth than himself may brush the golden flour from his butterfly wings, and subject him to a loss of caste. The Chesterfield gentleman was born of the world and meant to shine in it. He that superseded him came from a London parish, and is suited to no other atmosphere. The raw material of the first abounds in West Virginia and Kentucky; the last you may see in a manufactured state by stopping an hour at any of the steam boat landings along the Hudson, and observing the air with which it steps ashore among "the natives." They however, may be best studied by seeing each meet one of its kind. The former, when he encounters a brother, seems to know him by intuition, the latter always waits until certain masonic signs pass between him and the party he wishes to recognize. In this month, green peas are their ordinary medium of communication, and the mystic figures are made with a fork. It must be admitted, however, that the Exclusive has this advantage over the Chesterfieldian—he is never alone; the real man, and the affected character always making good company for each other.

[FOR THE NEW YORK AMERICAN.]

Steamboat Native, Ohio River, June, 1834.

Oh you pampered New Yorkers, puffing and blowing in the heat and bustle and politics of your Babylonian phalanx, in the name of justice I entreat you send some investigator from the bevy of your uncomfortable idlers, and see with your own eyes, and tell with your own tongues, and—let conviction rest upon it—that Nature hath exhausted neither wardrobe nor jewel case in the decking of your thrice immortalized North River.

I am floating on the tranquil Ohio—which is just now in one of its happiest moods, neither hurrying on with a phrenzied haste, and spilling its unwelcome riches upon the grain fields—nor yet low, turbid, and uninteresting, as the best bred rivers will sometimes find themselves in the languor and heat of summer. The wheel of the "Native" has dislocated an arm, and the momentary pause having called me from my lounge, I am overwhelmed with a richness of scenery that never met my eye before, and in the fullness of gratification, I do protest (since that is the fashion) against a monopoly of praise that hath almost swollen your Anthony's Nose with satisfaction. The beauty of the Hudson River scenery consists, if I am right, in dark, precipitous and frightful cliffs, huge projecting rocks, and battlement-like embankments, and that in the upper country, more particularly in mighty barren hills of a grotesque figure. It has much of the stupendous and sublime for every eye, and is of that wild and Alpine character that ambitious young men, and amateurs in the Arts, like to be thought to admire—such as honest lairds and yeomen's sons break their necks after in Switzerland. Here then is the difference. The Ohio, calm, placid, unruffled as a Christian, is all smiles and love. On its banks, on either side, honest labor has earned a peaceful home, and the proprietors (no swollen cities) have put up—in well selected positions, sometimes on a point projecting into the river, and sometimes at the foot of a gently rising hill—a shelter, after the rude fashion of the country, often adding a beauty to the aspect that his art never intended. Here is a field in the dark green mantle of wheat—on the other side, extending far up the hill—where the trees have been girdled and left for time to fall, their naked and leafless branches outstretched as if in the agony of a protracted fate—is the dark, rich looking soil where the Indian corn is struggling into existence. The bosom of the river is covered with a variety of boats, and just before us is one of that huge and cumbrous fashion, so long known on these waters, barely solicited into motion by the joint efforts of the current, and the sweeps and poles of the boatmen. These last are singing—with rather more vehemence than melody—and as the boisterous echo returns from the shore, it mingles with the happy laugh of some young

adventurers, whose rickety shallop is dancing about in our wake. The immediate margin on either side, is fringed with hazel and beach, whose clustering foliage overhangs the water, bending with a grace—and you may trace the river wending far away, till the hills close in upon it, and all is lost and indistinct but the deep blue color, and the undulating outline against the sky. However, I do not desire to make a picture, and all I mean to say, is, that no man whose heart beats at beholding the independent and substantial comfort of a people, can view the Ohio scenery without feelings of satisfaction and gratitude that may fail to be aroused by the curious presentations of the Hudson.

I might say more, but we have a metaphysical Dutchman on board who is getting entirely too audible, and so, Adieu, H. S. E.

Our readers are indebted to H. S. E. for the foregoing animated invitation, and we sympathize fully with him in his lively admiration of the beautiful Ohio. But it was heretical in him to institute so close a comparison with the Hudson. He might as well compare Hebe with Juno, or rather the head of Autinous with that of the Apollo; Lalla Rooke with Childe Harold; or the delicate gazelle of the Indies with the antlered elk of our western prairies. No one will deny the far flowing river of the West, the exclusive title of *La Belle*, by which it ever will be distinguished above all rivers that seek the sea: no one at least that has seen the place of its birth in Pennsylvania, where Virginia and New York send two of their most beautiful streams to mingle and bear a united tribute to the father of rivers: or, after hurrying for days on the boiling and turbid current of his desolate waters, turned aside from their cheerless bosom, to glide over the transparent tide, and loiter by the arcadian banks of the beautiful Ohio.—But the Hudson—the lordly majestic Hudson—mingling so much grandeur with its beauty, and blending as many various charms together, as could be concentrated in its short passage to the sea—there is in our humble opinion on stream upon the continent that can in no romantic beauty of the highest order compare with it. There is a part of the Hudson, however, but little known by its warmest admirers, which, after repeatedly visiting, we have found more attractive than those scenes which have elicited admiration from travellers in all parts of the world. It is the northwest branch of the River, where it ceases to be navigable, and wanders about through the most broken and picturesque country in the Union, to hide its head in a hundred beautiful lakes. He who glides over their lonely waters—for the banks of many of them are still as solitary as those of the wildest waters of the Far West—he who glides over their transparent bosoms, or moves along their mountain shores where in one place frowning cliffs will darken the silent tide, and in another a fringe of silver sand receive its undulations, while, where the primeval woods slope more gradually to the shore, the wild deer steps unfrightened from her green covert to stalk along the snowy strand—could almost predict the infinite beauty and grandeur, the boundless variety of attraction that the stream which derived its birth from such sources would bear with it on its course.

[FOR THE NEW YORK AMERICAN.]

The Corner Stone.—A correspondent in one of your late numbers, inquires after the origin and meaning of laying the corner stone with invocation of the Divine blessing. As a religious rite, I apprehend its origin as Jewish, its application to type the coming Messiah, and would refer him to Isaiah, 28th chap. 16v. Solomon (himself a type) may have first introduced the custom in the building of the Temple, another type of the same glorious Person. In the New Testament scriptures, the same appellation is given to it: 1st Peter, 3d chap. 6, 8, where the Redeemer is styled the head of the corner; in Ephes. 2d chap. 20., the *Chief Corner-stone*. Builders of systems and temples have too often disallowed such a reference to the ceremony,—have too often considered him a stone of stumbling and rock of offence; but to those that look for Him, He is precious, as is every type and shadow that applies to (either) his Divine character or Divine mission. May you and I, Messrs. Editors, build on this (His) foundation *alone*, not wood, hay and stubble, but gold, silver, precious stones.—[Rev. 21st ch. 1v.]

Christians are the Temple of God, (Corin. 6th ch.

16v.) but it is in Christ alone, building on Him as the "Hope of Glory," and that the building is fitly framed (Eph. 2d ch. 21v.); for other foundation can no man lay than that is laid, Jesus Christ.—[1st Cor. 3d ch. 11v.] SCOTUS.

[FOR THE NEW YORK AMERICAN.]
A HINT TO TRAVELLERS.

Mr. Editor: As the warm season is approaching, and many persons are casting about to see when and where they may spend a few months in search of health, novelty, or amusement, or all united, perhaps a word of advice from an old stager may not be taken amiss by those who have had less experience.

I am a way-faring man; I am told that the bump of "locality" is mightily developed upon my pericranium; I delight in change. When wearied of the iron bound streets,—the piles of brick and mortar,—the heat and noise, and the endless, unvarying throng of the city, I love to rush into the open air, into the midst of fields and forests, and the neighborhood of the rushing waters.

And then, again, when I become tired of solitude and myself, I return with new zest to the presence of man and to the luxury of social life; and I find the pleasures to be found on either hand increased a thousand fold by the contrast.

The restless energies of our countrymen are daily opening new scenes, and offering new invitations to the tourist and traveller. The last one of these which I have visited "in search of the picturesque," was afar "down-east—in the midst of the "rocky mountains" of New Hampshire.

It is a lake of a most unpronounceable and unspellable Indian name, called by the present natives, as near as I can reduce it to writing, WIN NE-PE-SAW-KEE. If you were to endeavor to pronounce it as it is written by geographers, (Winnipisseogee), the people thereabouts would not understand you.

It is a beautiful, but very irregular, sheet of water, some twenty-five miles in length, and of no particular breadth, as Davy Crockett would say; full of islands, having exactly 365, as they say of all lakes and bays when the number is large, and not easily ascertained: it resembles Lake George in the clearness of its waters, but is, I think, superior to that famous lake in the variety, and even boldness of its surrounding scenery. Those who like the authority of great names, may find in the steamboat's album (for they have a very pretty steamboat there) the recorded opinions of Dr. Kirkland, and I think, of President Adams also, that in beauty and sublimity, it equals all and surpasses also most of the show-scenes of Europe; and I understand that the Rev. Mr. Bigelow, whose published travels in Sicily and Great Britain prove him to be a good judge, says that "Loch-Lomond" and the other Scotch lakes are not to be compared with it.

The sublime, but bare and solemn scenery of the White Mountains is about sixty miles distant from the north end of the Lake; at which point, by the way, at a quiet little hamlet, is a very nice and well provided public house.

From the Notch of the White Mountains you can return home by "crossing the country" to Saratoga, or, in an infinitely more agreeable manner, by descending the beautiful valley of the Connecticut, to Hartford.

The better way of reaching this Lake, by those who are not pressed for time, is to go to Portsmouth, where you will find a most elegant Hotel, kept in what I understand was the mansion house of the late Governor Langdon; 'tis called the Rockingham House, and in the minutiae, as well as the essentials, is equal, in my humble opinion, to any of the "crack" houses of the day.

DR. SYNTAX.

P. S. If you mean to fish for the salmon, trout, perch, and pickerel of the Lake, or the inimitably fine brook-trout of the mountain streams of New Hampshire, you had better take your fishing-gear with you. Every thing of that sort in the granite State, like their politics, is execrable. S.

[From the New Orleans News.]

LATEST FROM MEXICO.—By an arrival yesterday, we had Tampico papers of the 2nd June, from which some translations have been made.

MEXICO, MAY 18.—We are assured that the supreme government as just received intelligence by express that the city of Jalapa has opposed its civil authorities, and made the same declaration against

the government that the towns of Orizava and Cordova had just done before.

MAY 21.—We have seen several letters from Puebla, stating that on the night of the 17th inst a band of about 200 armed men seized on the convents of St. Domingo and St. Augustin, loudly demanding the deposition of the actual government of the city and state, and making the same proclamation in favor of religion and the church, that was done at Orizava and Cordova.

Last Monday, Senor Gonzales Angulo left here for Puebla, as a commissioner on the part of the general government, but the nature of his instructions has not transpired.

Yesterday, Colonel Gonzales Pavon, at the head of 200 cavalry, left this for Puebla. The prudence of this officer, and the instruction he has received to act with moderation, lead us to hope that the spirit of hostility in this city will soon cease.

Note by the Translator.—From the complexion of a political essay in one of the Mexican papers, it would seem that about a month ago, the President, Santa Anna, had evinced some hesitation concerning the line of policy he would pursue in future, that is, whether he would join the party of the clergy or that of the reformers. We regret to add, that letters from Vera Cruz state, that Gen. Santa Anna had joined the cause of the priests, and, with part of the army, are now determined to resist all reforms, and to carry back Mexico as near as possible, to what it was under the Spaniards. Indeed, we should not be surprised to see a Spanish or French prince in our neighborhood before the expiration of twelve months.

SUMMARY.

Our city has seldom witnessed a scene more imposing than the funeral procession of yesterday. The military array was greater and more brilliant than we recollect to have seen it, and their muffled drums, and measured march, their reversed arms, and mournful ensignia, had a peculiarly solemn effect—while the long procession, composed of the various societies, with their shrouded emblems and melancholy dirges, added every thing to the ceremonial.

Pursuant to previous arrangements, the different societies and associations, the officers of the General and State Governments, the members of the fire companies, the students of the colleges and universities, the public officers, the military, and other individuals invited, assembled at about two o'clock in the neighborhood of the City Hall. Their places in the procession were assigned them by the Marshals, and at about three o'clock, the procession commenced its line of march, in the following order:

The various volunteer military companies, preceded by the Grand Marshal of the day.

Clergymen of different denominations, wearing appropriate badges.

The Governor and Lieutenant Governor of the State, the Mayor of the city, and the Orator of the day.

The Common Council of the City, attended by City Marshals.

Officers of the U. S. and State Courts, members of the Bar, and of the State Legislature.

Officers of the Army and Navy of the United States.

A number of French residents followed, dressed in deep mourning, bearing a splendid banner inscribed, "A tribute to departed worth."

The Grand Lodge to the State of New York, in splendid Costume. A number of banners were borne inscribed to the illustrious departed.

The Faculty and Students of Columbia College, and of the N. Y. University, dressed in silk gowns.

The Fire Department came next, bearing a splendid urn, with appropriate devices. The different companies marched in respective order, each company with its badges, emblems and banners. The engine No. 5 displayed a magnificent banner with the inscription, "He is dead, but still liveth."

Then followed the Trades' Union Societies—the Journeymen Bakers, Cordwainers, Cabinet and Chair Makers, House Carpenters, Typographical Society, Saddlers, &c., the Hibernian Benevolent Society, Gold and Silver Artificers, Tin and Sheet Iron Workers, and Journeymen Tailors, Smith's Benevolent Society, Musical Instrument Makers, &c.

The URN, and the EAGLE, which were used on this occasion, were the same sacred emblems that were exhibited at the funeral solemnities on the death of WASHINGTON.

The URN was conveyed on an open carriage drawn by four white horses, guarded by the Lafayette Guards, and followed by the Revolutionary Pall bearers, members of the Cincinnati Society, in open barouches.

To form an idea of the immense number of individuals forming the procession, a morning paper states that when General Morton arrived at the Battery, a large number of the persons joining in the ceremonies had not yet left the Park. The scene in Broadway Chatham street, and through the whole route of the procession, far surpassed any exhibition of the kind ever witnessed in this city. The streets were lined with a dense mass of citizens, and every house on the line was filled even to the roof with spectators of the solemn scene. The public buildings, such as the Museum, and others, appeared to contain some thousands, even to the roof.

Shortly after six o'clock the procession began to arrive at Castle Garden. Some detachments of military had previously been stationed on the Battery, and by lining the promenade leading from the entrance on Broadway to the bridge at the garden, kept the ground free for the passage of the procession.

The Garden was in various places, indeed wherever circumstances admitted it, hung with black cloth. In the gallery opposite the rostrum in front of the great saloon, a temporary orchestra was erected, which was shrouded in mourning, and was occupied by the Band and Choir of the New York Sacred Music Society. The rostrum was covered with the American Ensign and with folds of black crape.

The Societies as they entered took their places in different parts of the Garden, and their various banners all shrouded and elevated in every direction, added materially to the solemnity of the scene. The funeral Urn, with the four greys which drew it, was placed between the fountain and rostrum, the company of Lafayette Guards being stationed around it.

About an hour having elapsed, the funeral service commenced with the following Hymn, arranged to the music of Handel's Dead March in Saul:—

Unvell thy boom faithful tomb,
Take this new treasure to thy trust,
And give these sacred relics room,
To slumber in the silent dust.
Nor pain, nor grief, nor anxious fear
Invas thy bounds. No mortal woes
Can reach the peaceful sleeper here,
While angels watch the soft repose.
Break from his throne, illustrious morn!
Attend, O earth! his sov'reign word;
Restore thy trust—a glorious form
Shall then arise to meet his Lord.

The Right Reverend Bishop Onderdonk, of the Protestant Episcopal Church, then read from the 15th chapter of the First Epistle of St. Paul to the Corinthians, commencing at the 20th verse to the end. He also read part of the Episcopal Service for the Burial of the Dead, during which, and at the close, the following pieces of music were performed and sung:

MARCH—PLEYEL'S HYMN.

RECITATIVE.

I heard a voice from Heaven, saying unto me, Write, blessed are the dead who die in the Lord.

CHORUS.

Even so, saith the Spirit, for they
Rest from their labors.

LUTHER'S HYMN

Great God! what do I see and hear?
The end of things created,
The Judge of mankind does appear,
On clouds of glory seated:
The trumpet sounds—the graves restore
The dead which they contained before—
Prepare my soul to meet him.

WHEN THE EAR HEARD HIM.

When the ear heard him, then it blessed him; and when the eye saw him, it gave witness of him.

CHORUS.

Why should we start and fear to die?
What tin'rous worms we mortals are!
Death is the gate of endless joy,
And yet we dread to enter there.
Jesus can make a dying bed
Feel soft as downy pillows are,
While on his breast I ease my head,
And breathe my life out sweetly there.

The most solemn part of the procession (says the Mercantile) we witnessed last night at 11 o'clock. It was the return from Castle Garden of the Horse and Urn, accompanied by the Lafayette Guards, with torches burning, and drum and fife playing the dead march.

The Funeral Oration of the Hon. James Talmadge we did not hear, but by those who had that pleasure, it is spoken of as eminently happy.

The public feeling displayed yesterday—for one deep and solemn feeling seemed to pervade the whole mass of our assembled population—gave a moral effect to a pageant which, for its orderly arrangement and imposing details, was every way worthy of New York. From Providence, Salem, New Haven, at the East; from Alexandria, Fredericksburg, Richmond, on the South; and several towns Westward,—which the melancholy news has reached,—we hear of immediate measures for similar public expressions of feeling. A spontaneous tribute to departed worth, characteristic of a high-toned people. The fitting requiem of one whose noble deeds seemed ever as instinctive as the grief that mourns him, and broad in their benefits, as will be the sorrow for his decease.

The following are the five distinguished Cadots in each Class, as determined at the examination, which terminated on the 16th instant.

- | | |
|----------------------------|--------------------------------|
| 1st CLASS. | 2d CLASS. |
| 1. William Smith of N. Y. | 1. Chas. J. Whiting of Me. |
| 2. John Sanders of Flo. | 2. John H. Martindale of N. Y. |
| 3. H. Loughborough of Ken. | 3. Geo. W. Morell of N. Y. |
| 4. Thos A. Morris of Inda. | 4. Chas. H. Bigelow of Mass. |
| 5. Robt. Allen of Md. | 6. Geo. M. Legate of — |

- | | |
|-------------------------------|------------------------------|
| 3d CLASS. | 4th CLASS. |
| 1. Jas. L. Mason of — | 1. John W. Gunnison of N. H. |
| 2. Danville Leadbetter of Me. | 2. Henry W. Beaham of Conn. |
| 3. M. C. Meigs of Penn. | 3. Edwin W. Morgan of Penn. |
| 4. Alex. Hamilton of N. Y. | 4. Alex. B. Dyer of Misso. |
| 5. Barnabas Conkling of N. Y. | 5. John Bratt of N. Y. |

We understand that the Polish Committee having exhausted all its funds, have adjourned *sine die*, and that a statement of its expenditures will be published in a few days.

It will afford a large part of the American people great satisfaction to learn that Mr. McDuffie has resumed his seat in the House of Representatives, in improved health.

The Washington Globe of Tuesday, says:—"The Board of Commissioners under the Convention with the Two Sicilies, have terminated their fourth session. We understand that the Commissioners have disposed of all the cases ready for trial up to this date.

The French Academy of Belles Lettres has proposed for the Volney premium, for next, the following theme:

"To determine the grammatical character of the languages of North America, known under the name of Lenni Lenape, Mohegan and Chippewa."

The premium is a gold medal worth 1200 francs, which our venerable fellow-citizen, Mr. Duponceau, could win against all the world.—[Nat. Gaz.]

We have a pleasant instance, (says the National Gazette of yesterday, how the Secretary of a despotic chief may be used, in the following anecdote related by Sir Harford Bridges, in his account of his mission to Persia:

New Duties of a Secretary.—General Gardanne, on his introduction to Mohammed Ally Meerza, had presented him with a very fine pair of rifle-barrelled pistols, made at Paris, the barrels of which, the General assured the Prince, were worked with such nicety, that a ball delivered from them would fly to the distance of twenty yards, so true as to strike invariably the centre of a piastre, a piece about the size of our half crown. The Prince had received the General in a room which opened to a large walled court, and from the spot where his highness was seated to the wall was pretty much the distance for which the general had vaunted the precision of his pistol. As soon as he was dismissed, the prince turning to his secretary, who was standing by him, said, "Come, let's try the Frenchman's pistols; go and hold out your hand against the wall." The astonished and trembling secretary, after some remonstrance, found himself obliged to obey, and stand the shot.—The prince fired, and fortunately missed his mark.

A Polite Curate.—In the church service, for the thanksgiving of women, on a certain occasion, the curate of —, afraid of offending his patroness, who was a person of quality, introduced the word lady instead of women; and accordingly said, "Oh, Lord, save this lady thy servant;" when the clerk made answer, "Who putteth her ladyship's trust in thee."

Melancholly Occurrence.—Extract of a letter to the Editors of the Philadelphia Commercial Herald, dated Louisville, (Ky.) June 12.—A shocking occurrence took place here last week. A Mr. C. married Miss Buckner last week, a beautiful and interesting woman, of one of our most respectable families. On that evening Mrs. Buckner (the mother of the bride) had a large quantity of custard made, and sent to the houses of her married children. On Sunday Mrs. Foster (her daughter) was taken ill, and died in a few hours. While the company was assembling for her funeral, a daughter of her's became suddenly ill, and the funeral was postponed, that both might be buried together. Before this took place, Mrs. Buckner died; and one after the other, eight have died; and nine more are dangerously ill.

Poison having been suspected, the servants are all in prison, but there is no evidence, external or internal, to prove the charge. The contents of the stomach show no appearance of poison. The symptoms in all resemble those of Asiatic Cholera; yet no one else in town has been attacked, and not one of that devoted family who avoided the custard. All who ate of it have died or are ill. The physicians and magistrates are all in alarm and bustle, and no two people seem to agree in opinion as to the true cause of this melancholly visitation.

The above deaths from eating custard, had they occurred on "The American Bottom" in Illinois, or in those small neighbourhoods in Kentucky and Tennessee, where that singular disease, "the milk sickness," has been known for years—would have been unquestionably attributed to that complaint. The symptoms of "the milk sickness," which is always traced to drinking the milk or eating the meat of cattle affected in a peculiar manner, are, as described by the western people, precisely those of Asiatic cholera.

Since writing the above, we find the following in the Louisville Focus:

"A report is again going abroad of the prevalence of the Cholera at Louisville. There is no foundation for it. Up to this time, not one of our citizens has exhibited symptoms of that disease. The physicians, two or three days since, supposed that several individuals to whom they were suddenly called, were laboring under attacks of cholera, but the cases proved to be the effects of *poison*. The unfortunate victims were poisoned with arsenic at a wedding party on Sunday evening. Near a dozen have already died, and there are several others who cannot long survive. One family of the first respectability, is almost entirely swept off. The atrocious deed is supposed to have been perpetrated by a negro who is now in jail."

We have copied an account of a dreadful mortality in a family of Louisville, Kentucky. The following paragraph from a late number of Galianani's Paris Messenger, furnishes a similar case:

"The Courrier du Midi, of Montpellier, of the 6th instant, relates, that, after a grand dinner given by a widow lady, on the occasion of the marriage of her daughter about three weeks before, supplied by a respectable Restaurateur, out of fifty guests who partook of the feast, thirty were taken ill and showed symptoms of having been poisoned by verdigris. Antidotes were promptly administered, and all the sufferers were relieved and ultimately restored, except the mother of the bride, who expired on the morning of the 5th, after suffering dreadful agonies. This is a new instance of the danger of neglecting to be careful in having copper culinary vessels well tinned."

Sudden Deaths.—The Harrisburg (Pa.) Chronicle of Monday, states the following remarkable instances of sudden death as having occurred recently in Susequehanna township, of that county.—"On Thursday last, Isaac Diller and John Johnston. The former fell down in convulsions while at the plough. The latter carried him home, and complained immediately of sickness, fell down and shortly after expired.—They both died within half an hour."

The New Orleans Bulletin of the 5th ult. says, we understand by the late arrivals, that the Cholera has disappeared from the banks of the Mississippi above, and that there is at present no sickness on the river. There is yet some cholera in this city; there is enough to justify the extreme caution; and at the first appearance of dysentery, no matter from what cause it may be supposed to spring, medical aid should be invoked.

NEW ORLEANS JUNE 7.—As rumor is prone to exaggerate in these matters, we have taken the trouble to ascertain from the proper authorities, the number of funerals in New Orleans lately.

During the last month of May, 491 persons were buried.

During the five days of June, 90 persons were buried.

Ten years ago, the average number of interments per month, was about 120. Setting down the increase of population in New Orleans, at 59 per cent. in ten years, the monthly interments, were the city healthy, should not exceed 180.—[News.]

Sudden death.—We learn with much regret, that Col. Cyrus Baldwin, brother of the celebrated engineer, died yesterday morning at his residence in Middlesex Village. He appeared to be in his usual firm health the evening previous. The cause of his sudden decease was attributed to an affection of the heart, and we understand a *post mortem* examination was to be made to-day to ascertain the fact.—[Lowell Journal.]

It is stated in a West India paper, that the Commissioners appointed for the Colony of Demerara, under the Slavery Abolition Act, for ascertaining the average prices at which slaves were sold between 1st January, 1823, and 31st December, 1830, had closed their investigations, which fixes the average at £116 sterling. The slave population of Demerara is estimated at 70,000.

PUBLIC REVENUE IN NEW-YORK.—Revenue accrued in the District of New-York for the 1st quarter, ending the 31st March, 1834, \$3,148,455 87. First quarter, 1833, \$3,123,166 81. Increase, \$26,289 06.

These facts we have ascertained at the Custom House this morning. When it is considered that on the 3d of March, 1833, the entire duty on tea, coffee, most kinds of spice, and a great many other articles, was abolished,—and that on the 31st December, 1833, all duties on linens, linen cambrics, worsted stuff goods, manufactures of silk and worsted, and of silk coming from this side of the Cape of Good Hope, were abolished, and that on all goods of every description, one-tenth of the excess above 20 per cent. ad valorem was repealed on the same 31st of December, 1833, the above results appear to us very surprising.

They are, however, in perfect accordance with the fact which we stated a day or two since, that the number of arrivals at this port from foreign countries has been greater by 44 during the first quarter of the present year, than during the corresponding quarter of 1833, and greater than ever before, unless possibly in 1816 and '17, immediately after the war.

The reader will observe that the revenue above stated is the revenue *accrued* [not collected] during the quarters mentioned; and of course that cash duties and short credits will not affect the amount. They will also bear in mind that the importations of 1833 were uncommonly large, amounting, in round numbers, to \$109,000,000.—[Jour. of Com.]

Many of the goods on which the above revenue accrued have been sent back again, and consequently the drawback allowed will subtract from the revenue.

TO REMOVE A HARD COATING OR CRUST FROM GLASS AND PORCELAIN VESSELS.—It often happens that glass vessels, used as pots for flowers and other purposes, receive an unsightly deposit or crust, hard to be removed by scouring or rubbing. The best method to take it off is to wash it with a little diluted muriatic acid. This acts upon it and loosens it very speedily.

A PETRIFIED PAPOOSE.—Some persons employed lately in quarrying stones at Guernsey, Ohio, came across the body of an Indian child completely petrified. This extraordinary specimen was found embedded in a solid mass of rock, and has the appearance of a stone image, somewhat imperfect, to be sure, yet, on the whole, a very fair outline of a young Indian, done in lime stone. A small row of Indian beads (too hard originally to need petrification, we suppose,) was found in the same cavity.

[From the Albany Daily Advertiser.]

Coincidence.—The 20th of May—the day on which Gen. La Fayette expired, is somewhat marked in Chronological history. On that date of the month, Americus Vesputius sailed on his first voyage of discovery, and that date of the month, witnessed the last mortal agonies of Christopher Columbus.

On the 20th of May, General Lafayette, with an inferior force, baffled the British General, Grant, who, at the head of 7,500 men, attempted to surprise the Marquis, at Barren hill. Lafayette's retreat on that occasion, was pronounced to be a masterly military manoeuvre.

It was on the 20th of May, at a later period, that Lafayette's hope of a free French republic, experienced a total destruction, in the ceremonial were Napoleon Bonaparte was declared Emperor.

These coincidences may appear somewhat trivial, but they are curious, and worthy of a passing notice.

Literary.—We learn from the Boston Transcript that—

Lilly, Wait & Co. have in press, and will publish in a few days, the second number of "The Pilgrimage beyond the Sea," from the pen of Professor Longfellow. The admirers of the exquisite sketches contained in the first number, may be assured that the second is fully equal to the former. Among its best papers we would include "The Baptism of Fire," "An Old Soldier," and "The Valley of the Loire."

A valuable musical manuscript by Guillaume de Machault, who was valet de-chambre to Philippe le Bel in 1307, has been discovered in the Royal Library at Paris. It contains several French and Latin authors, ballads, &c. and concludes with a mass, which is supposed to have been sung at the coronation of Charles V. in 1364, and which proves that at that time they were acquainted with the art of composition in four parts.

Encouragement of Learning and the Fine Arts in France.—The annual expenditure of the State and of the Civil List, for the several establishments in favor of Learning and the Fine Arts, is estimated at 120,000*l.* a sum tenfold the amount of that which is expended for similar purposes in Great Britain. This sum is exclusive of various extraordinary grants of large sums of money devoted to the purchase of collections of marbles, coins, and antiquities.

Steamboat Curiosity.—A little boat called the *Caroline*, came into harbor a few days since, which was built in South Carolina, has made her way through Quebec, &c. here, and is bound, we understand, for the Mississippi, through the Lakes.—[Buffalo Journal.]

Steamboats in the West.—An official list of Steam Boats on the Western waters, on the 1st of January, 1834, gives the whole number 234, whose aggregate amount of tonnage is equal to 39,000 tons—they have cost three millions of dollars. The total yearly expense of running them is four millions and a half.—66 boats went out of service during 1831, '32 and '33—of these, 15 were abandoned as unfit for service; seven were lost by ice, 15 were burned, 24 snagged, and five destroyed by being struck by other boats—thus 51 were lost by accidents. The investments in these boats are now decidedly unprofitable—the business is overdone, and though of incalculable advantage to the valley of the Mississippi, they are too often the ruin of their owners.—[Moor's Price Current.]

Boat Race.—Two of the barge clubs, who have their boats on the Schuylkill, undertook on Saturday afternoon, to have a rowing match. The boats were the *Dart* and the *Falcon*—rowed each by six members, with a steersman, all in the uniform of their respective clubs. The distance was three quarters of a mile. The *Falcon* beat about ten yards. The race was said to have been well contested.

Distressing.—We learn from Capt. Mayhew, of the ship *Warren*, recently arrived at that port, that Capt. Charles Spooner, of the ship *Erie*, of Newport, whose extraordinary marriage to Mingatara Oruruth, a native of Otaheite Island, has been lately noticed in most of the papers of this country, was deprived of his bride soon after his marriage, under the following painful circumstances: She had gone into the water to amuse her husband with an exhibition of her extraordinary feats of swimming, for which she is said to have been very remarkable, when she was attacked by a large shark. The shark first seized her by a limb, but releasing his hold, he made another attack, and with one effort of his powerful jaws, severed her body in two. The unhappy

husband was a spectator of this awful scene, but could render no assistance.—[Bristol R. I. Gaz.]

BALTIMORE, JUNE 26th.—The *Marion*, *Morgan*, and *Sharp Shooter* Rifle corps returned to this city yesterday afternoon from the Washington Rail road, bringing with them eleven of the rioters, including one charged with murder. They were all committed to jail. The detachment left the ground at eleven o'clock yesterday morning, up to which time no further disturbance had occurred. [The detachment, composed of the Mechanical Volunteers and Independent Blues, which left this city yesterday morning on the same service, were passed about mid-day on their march to the ground.]

The London Court Journal of the 10th ultimo, describes London at this period in these terms—

"The season is unfolding prosperously. The Drawing rooms are brilliantly attended;—the last ball at Almack's was one of the best we ever saw, and graced by the appearance of seven fair *débutantes* of the highest rank, beauty, and fashion;—the Italian Opera abounds in attractions;—the English theatres, although no longer either national or classical, afford fertile sources of amusement and discussion;—the Exhibitions are all open, most of them displaying merit of a high order;—the Literary and Scientific Institutions are in full activity;—the streets are alive with equipages;—Kensington gardens and the Parks brilliant with verdure;—our aristocratic absentees have returned from the continent and are commencing their course of spring gaieties;—book-sellers, auctioneers, the shops and the places of public amusement, vie with each other in attempts to engage the notice of the public;—in a word, all those objects of attraction which it has been our business and pleasure to illustrate, are re-assembled in renewed interest around us, to excite us to further activity and animate us with freshened energies."

CHINA.—The Chinese Repository, published at the end of February, has the following paragraph:

Since the 9th inst. this city (Canton) has presented a scene of festivities, rejoicings, and congratulations which is usual throughout the Chinese empire during the holidays of new year. In the mean time there has been an unusual amount of suffering, especially among the lower classes of the inhabitants. Great numbers of the poor, who were rendered houseless and penniless by the inundation last August, have perished during the winter. No one can describe the wretchedness of some of these sufferers, and none but an eye-witness can conceive it. Morning after morning, and in the same place, we have seen two, three, and four dead bodies; and in the narrow compass of a few rods, we have seen at noon-day more than 20 individuals stretched on the ground half naked, and either senseless or writhing in the agonies of death, caused by hunger. No man cares for their bodies; none for their souls.

We learn from the Journal of Commerce that letters of a recent date from Liberia, were received here yesterday. They announce the death of Mr. Matthew Laird, and Mrs. Laird, missionaries of the Western Foreign Missionary Society, who sailed from Norfolk on the 6th November last, and arrived at Liberia on the 31st of December.

They died of the African fever, to which almost every new comer is subject. Rev. Mr. Finney, the acting Governor, had been very ill, but was recovering. The decease of Mr. and Mrs. Laird will of course be seized upon by Immediate Abolitionists as an evidence that the frown of Providence rests upon the Colony, or at any rate, that a Colony so invaded by disease and death ought not to be supported. Weak minds may possibly be operated upon by such suppositions; but none others can be. The same argument precisely, and with still greater force, might have been urged against the Colonies at Plymouth and Jamestown; and may now be urged against the mission at Bombay. Jamestown and Plymouth are now healthy, and have been so for a century; Liberia may be so too, after the surrounding country is cleared up and cultivated. It would be strange indeed, if the civilization of a Continent was to be accomplished without some loss of life. But if loss of life is so dreadful a thing to the Abolitionists, then we say that ten lives are saved by the Colony, in the prevention of the Slave-trade for two or three hundred miles along the coast, where one is lost. When a few more such Colonies as Liberia, Sierra Leone, and Cape town, are planted along the coast, the Slave-trade will be dead forever.

Ship on Fire at Savannah.—We express our acknowledgements to Captain Sisson, of the schr

Exit, for the following account of a fire on board the ship *Hull*, lying in the harbor of Savannah:

"SAVANNAH, JUNE 16.

"The ship *Hull* of Boston, Captain Knox, laden with cotton, for Liverpool, ready for sea, is on Fire, supposed to be in the after part of the lower hold.—Smoke was discovered coming out of her after hatch early this morning, when she was immediately dropped down below the town, and grounded on about 200 yards from the lower wharf. There are two engines in flats, playing into her, and they are knocking out the forward lumber port to allow her to fill. There are also flats alongside taking out cotton. The bottom on which she is aground is hard sand, and the tide is flowing. Her cargo will be saved, partly damaged; and I have no doubt the ship will also be saved. N. B. Sisson.

"N. B.—Main hatch is nearly burnt through.—With haste. N. B. S.

[The *Hull* had cleared with a cargo of 928 bales upland, and 8 bales Sea Island Cotton on board.]

The arrival yesterday of the ship *Josephine*, from Ireland, was quite an unexpected circumstance.—This ship formerly sustained a high reputation, and was considered one of the fastest sailers out of this port. In December, 1832, she was wrecked in Donegal Bay, where she laid nearly buried in the sand for about fifteen months, and was considered as totally lost. In a heavy gale and very high tide last spring, the ship was driven from her bed upon a potato field near the beach. In this situation, after being stripped of her copper, she was observed by an American captain, who, finding her frame was sound, purchased her as she lay, and employed workmen at 6*d.* each per day, to dig a canal in which he could convey her to the sea. The workmen had only just completed this canal, when another high tide fortunately arose, and swept the ship into deep water. She was then taken to Sligo, repaired, and has safely arrived again at her original home.—[Merc. Adv.]

The Missouri (St. Louis) Republican of the 9th inst. states that the nett profits of the Orphans' Fair, held in that city last week, amounted to \$1,505.

A lady who died in England in 1816, bequeathed to six of her horses an annuity of £50 each. These happy and well-fed horses died at the respectable ages of 28, 29, 31, and 33. The last but recently departed this life, having enjoyed his annuity more than seventeen years, and received about £800.

THE CHEROKEES.—In the Senate on Friday, Mr. White of Tennessee, from the Committee on Indian Affairs, in answer to the petition of John Ross and others, of the Cherokee Tribe of Indians, reported the following resolution:

Resolved, That the President of the United States be authorized and requested to cause to be ascertained upon what terms the claims of the State of Georgia and its citizens, to the lands of the Cherokees east of the Mississippi, can be extinguished, and communicate the same to Congress at the next session—and that the further consideration of the memorial be postponed to that time.

Crops in Illinois.—A late paper from Peoria says: "We are informed by the farmers in our vicinity, that the crops have every appearance of being productive. We have had, during the last few days, a succession of warm showers—the fields of small grain never looked better."

The great error in vaccination is said to be the removing it from one subject to another. The original infection, or one remove, will, it seems, always be found a certain antidote to small pox; but after one remove, it is affirmed to be unsafe, and hence is brought into unmerited disrepute.

Coroner's Inquest.—A coroner's inquest was held on Monday afternoon on the body of Mr. George Clayton, which was found floating in the river at the foot of Reed street. Mr. Clayton has been missing for some weeks, and was married only a few days before he disappeared. Verdict—death from accidental drowning.

Pity.—In passing, said a neighbour, a Porter House on one of the Avenues, I saw standing by the fence, a horse just ready to die with old age, and hard and cruel usage. Whilst I was looking at and pitying the once noble, but now most miserable animal, an old man with trembling limbs came staggering and loitering out of the door, and bringing up near the horse, began to belch and vomit, exhibiting the most disgusting, painful, and pitiable sight. Ah! said I, is the monster in human shape who has caused such misery and degradation to come before me?

It will be seen by our Washington letter to-day, that public surmise in relation to the late nominees to the Senate, is fully confirmed. Mr. Stevenson and Mr. Taney have been rejected, and Mr. Butler confirmed without a division. The National Intelligencer gives the vote on Mr. Taney's nomination a little different from our correspondent, making it 18 and 28 instead of 30, 15.

THE POLISH SCYTHMAN.—A finished lithograph, by a young Pole, is now attracting much attention at the print shops in Broadway. It represents a Polish Scythman in the full costume of that "indigenous soldier." The impressions are sold for the benefit of the brave Exiles.

Hercules, Jun.—Signor Schiatta, the Italian, now exhibiting at Walnut street Theatre, is one of the most extraordinary wonders of the day. His feats of strength are certainly the most marvellous efforts ever witnessed in this city. He will lift ten, and in some instances, twenty times as much as any other person. It is said he can balance any thing but the Post Office accounts.—[Philad. Intell.]

Surgical Operation.—A very large tumor was removed, a few days since, from the side of a young lady, by Dr. Smiley, of this city. Some idea may be formed of its dimensions from the fact, that after the operation, which diminished one-third of its size, it measured twelve inches and a half in circumference, and weighed only half an ounce less than one pound. No bad symptoms took place, and the young lady has entirely recovered from the effects of the operation. Few instances have occurred in which an operation of such magnitude has been attended with so few bad effects.—[Phil. Nat. Gaz.]

MORE SHIPWRECKS.—The Montreal Gazette, of Thursday, contains some particulars of two other losses at sea, not hitherto reported. One, the Proselete, of Limerick, with 223 passengers, all of whom have been safely landed at Richibucto, (Nova Scotia,) in a lamentable state of misery, and the other name unknown, but described as being from the west of England, with 280 passengers, 7 of whom only are saved.

[British square rigged vessels bound to the British Colonies, lost this season, including the above, 23. Lives lost, 734, besides all on board of a bark unknown. Total number of passengers arrived at Quebec to 14th instant, 14,137. Consequently, the lost are to the saved as 1 to 19 and a fraction. Of all the emigrants bound to this port this season, not one has lost his life by shipwreck.—[Jour. Com.]

"Isn't there a large tree standing before your door?" inquired a wag of a green looking Jonathan from the country. "Yes—why?" was the answer. "Because," said the wag, "I thought from your appearance that you grew in the shade."

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.
Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 134 Water street,
corner of Mulienlane.

ALBANY SEED-STORE AND HORTICULTURAL REPOSITORY.

The subscriber having resumed the charge of the above establishment, is now enabled to furnish traders and others with FRESH GARDEN SEEDS, upon very favorable terms, and of the growth of 1833, warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and sowing of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised in perfection in this country; these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Also—French Lucern, White Dutch Clover, White Mulberry Seed, genuine Mangel Wurtzel, Yellow Locust, Ruta Baga, and Field Turnip Seeds, well worth the attention of Farmers.

STEPHENSON,
Builder of a superior style of Passenger Cars for Railroads.
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of New-York and Harlem Railroad, now in operation.

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.
J8
ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Nott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTTE, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude. For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartte.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES P. STABLER,
Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1833.
To Messrs Ewing and Heartte.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,
Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 23 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine-wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,
WILLIAM NORRIS, Secretary.

December 2d, 1833.

For further information on this subject see No. 49, page 772, Vol. 2, of Railroad Journal.

RAILWAY IRON.

	Ninety-five tons of 1 inch by 1/2 inch,	Flat Bars in lengths of 14 to 15 feet counter sunk holes, end cut at an angle of 45 degrees with splitting plates, nails to suit.
200	do. 1 1/2 do. 1/2 do.	
40	do. 1 1/2 do. 1/2 do.	
800	do. 2 do. 1/2 do.	
600	do. 2 1/2 do. 1/2 do.	
	soon expected.	

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 3 3/4, and 3 1/2 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and incorporated Governments, and the Drawback taken in part payment.

A. & G. BALSTON,
9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy; also, a Railroad Goniometer, with two Telescopes; and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested:

Baltimore, 1832.
In reply to thy inquiries respecting the instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all Instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the van's sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to later angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,
JAMES P. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1833.
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.
Germantown, February, 1833.
For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

AMERICAN RAILROAD JOURNAL, &c.

NEW-YORK, JULY 5, 1834.

The citizens of Taunton, Mass., are about constructing a branch from that place, to meet the Boston and Providence railroad—distance about 10 miles—probable expense \$80,000.

NEW LOCOMOTIVE.—By the ship New-York, the Saratoga and Schenectady Railroad Company have received another Locomotive Engine in addition to the one now in use on their road. It is from the celebrated manufactory of Stephenson & Co., and will probably be ready for operation in the course of ten days.

IRON WHEELS.—We saw a waggon in Court street this forenoon, which, from the novel construction of the wheels, excited considerable curiosity in the passers-by. They were made entirely of iron—the outer part of the wheel was formed from a single piece of iron about an inch and a half square—the spokes were round, and five-eighths of an inch in diameter. The naves were constructed in a new and ingenious manner, by which the friction is much diminished; and the whole appearance of the wheels conveyed the idea of usefulness, neatness, and simplicity.

On inquiry, we learned that these wheels were calculated to sustain a weight of a ton and a half—and that wheels of the ordinary construction, to sustain so great a weight, would weigh about the same as these newly invented wheels. The expense also, we were informed, will not vary materially from those in common use. They were manufactured by Mr. Hale, of South Boston; and we believe this is the first attempt of the kind to manufacture all the parts of the wheel of iron. The advantages to be derived from this invention are neatness, safety, and durability.—[Boston paper.]

RAILROADS IN VIRGINIA.—We fully agree with our correspondent as to the importance of the two, or more properly one, railroads to which he refers in the following communication, and we trust we have good reason to anticipate an early movement towards their construction. Virginia has, it is true, done very little towards the improvement of her natural advantages—too little, indeed, for the station she has always maintained amongst the States of the Union; but we think we perceive the dawn of a better day for her. Petersburg has led the van; Norfolk is following her, and Richmond must in self-defence do something, or she will be left so far behind as not to be thought of in the same day; and she will hardly stand that. Richmond will attend to the construction of a railroad to Fredericksburg, Fredericksburg to the Potomac Creek, and then Petersburg or Richmond, or both, will finish the chain by making a railroad between those two towns, which will intersect the State.

RAILROADS IN VIRGINIA.

To the Editor of the Railroad Journal.

There are two works in Virginia of the most useful and important character, but which will not be undertaken for some time yet to come, on account of the want of energy or interest of the citizens of that section of the country in their completion. They are railroads, one from Ck. Landing to Fredericksburg, (a little over ten miles in length), and the other from Fredericksburg to Richmond (about sixty miles.) They are on the great southern mail route from Washington City to New-Orleans, and are, (the former more particularly), essentially necessary to the speedy transportation of the mail and passengers. From Fredericksburg, (a distributing post-office), the mail routes diverge to Maysville and Guyandotte westward, and southward to Richmond, Norfolk, Petersburg, Charlottesville, &c., into North and South Carolina, Georgia, &c. The mail at present is conveyed in steamboats from Washington to Potomac Creek, (a tributary to the Potomac river), 60 miles, and thence in stages to its various destinations; and owing to the miserable state of the roads throughout Virginia, more particularly during the winter—I refer you to the far-famed poem of Moore's, on

his ride over a portion of them, for a better description than I could give)—there is no calculating with certainty on the arrival of the stages at the proper time, or of their bringing the mails with them when they do come, (notwithstanding the extra allowances of our worthy postmaster.)

A survey for a railroad from Potomac creek landing to Fredericksburg, was made in the spring of 1832, and the line located across the peninsula, dividing the waters of Potomac and Rappahannock rivers. From some cause or other, only a common turnpike was constructed over a portion of the line, and the attention of the citizens generally, and of the Legislature, being too much absorbed at the time by the James River and Kenawha Canal, to feel interested in any other work of internal improvement, very little of the stock of this road was subscribed for, and no interest felt for its construction. The report of the engineer who surveyed and located this road, not having been printed, I cannot procure a copy, of which I should like to send you one, as it contained much statistical information respecting that section of the country. Yours, respectfully,

H. N. C.]

HUDSON AND ERIE RAILROAD.

To the Editor of the Railroad Journal.

I find, from the late numbers of your Journal, that there is some prospect of an entire survey being made of the Hudson and Erie Railroad. The feelings of the citizens of the lower part of the state have led them to determine on the route of this railroad through the lower tier of counties, without probably reflecting on the possibility of a better, cheaper, and more practicable route elsewhere, for accomplishing their object. Upon reference to a map, you will find that the streams watering that section of the country generally run parallel to each other, with lofty and continuous ridges of mountains between them. These ridges are most generally unbroken, affording no opportunities for the passage of a railroad, except at an immense expenditure of money for stationary power, more, in fact, than could be warranted, I think, by the travel and transportation over such a route, for years, at least, to come. Why not then seek for the best location of such a work, without limiting the researches of the engineer to one particular route

within the confines of a portion of one state! Instead, for instance, of commencing at Tappan or Nyack, and crossing the Catskill mountains, where there are several continuous and successive ridges to be crossed, and all (or most of them undoubtedly) requiring separate stationary engines (and some of them several) to overcome the ascent, start from opposite the city of New-York, and taking the route of the Hudson and Paterson railroad to Paterson, (where you have even now a road constructed to your hand by way of commencement,) turn northward, thence following up the valley of the Rancocus, a branch of the Passaic, (I think,) and crossing, at the most suitable place, the ridge dividing it from the valley of the Ramapo, up which you pass into Orange county. The Deer Park Gap, in the Neversink mountains, would here be a good place for crossing that range into the valley of the Neversink river, down the valley of which will lead to the Delaware river. Here you can follow up the valley of the Delaware nearly to the New-York and Pennsylvania line, and finding the most convenient crossing place, pass the intervening ridge to the waters of the Susquehannah; thus on to lake Erie.

These hints I throw out more as an inducement to those interested, to give to the engineer unlimited power to locate the road over the best route, whether passing through New-York alone, or passing into New-Jersey and Pennsylvania, than through any certainty on my part of its being better than any other. It will moreover become a national road in a great measure, and the wishes of the citizens of the lower counties of New-York can be gratified by the construction of lateral roads into the several counties, (following the valleys of the several streams to effect that object,) and the object of a road better fulfilled by giving a wider sphere for the action of the road, and more extended means of increasing its resources after its construction.

Take these hints as a basis for any remarks you may wish to make on the subject. I have hardly time to throw them into proper shape for publication. Yours, respectfully,

H. N. C.

A Compound Reciprocating Rotary Steam Engine, and an Improved Boiler, invented by SIMON FAIRMAN, of Lansingburgh, New-York. [From the Mechanics' Magazine and Register of Inventions and Improvements.]

This engine and boiler may be used separately, or the two together, as may be most convenient; the engine may be connected with any other boiler, and the boiler with any other engine.

This invention presents to the public, in a fair and practical form, the long-sought desideratum of a steam engine producing a rotary motion, without undue complication and liability to disorder; without the inconvenience of fly wheels and cranks; and giving the full power of steam without being subject to the constant loss of impetus by the action and re-action of heavy masses of metal.

It will be easily discovered, by examining the drawing, that this engine and boiler, when connected together, will occupy but a very small portion of the space required by the engines and boilers of the same power in common use, and that the weight of both engine and boiler are equally reduced; and as the cost, especially of the engine, is also reduced, at least in the proportion to its size and weight, it follows of course that, in all cases where a rotary power is wanted, it must be entitled to a preference equal to all those savings and conveniences, and for all locomotive purposes, still much greater.

And it must be no less obvious, on in-

specting the plan of the boiler, that, besides its compactness, it is capable of producing a given quantity of steam with less fuel than is required for the boilers now in use.

As in the annexed drawing the engine and boiler are connected together; and, as to communicate an idea of the boiler, it was necessary to give a sectional view, showing the form of the inside, the description will require a kind of mixed reference alternately from one drawing to the other.

A, figure 1, represents the boiler entire, the inside of which is explained by figure 2. The furnace door is shown in figure 1, through which the fuel is inserted into the furnace, b, figure 2. The water is contained in three concentric double hollow cylinders, numbered in figure 1,—1, 2, 3. It is received from the supply pump, E, figure 1, into the outer cylinder, No. 1, and passes thence through bent tubes, a, a, into the inner cylinder, No. 3, which forms the furnace, from which it passes through the tubes, c, c, figure 2, into the centre pan at the top, d, which pan is connected with the middle cylinder, No. 2, from which enclosure and pan it goes through the upright or main conductor, D, figure 1, to the engine.

The fire goes from the furnace, b, and the top of the inner cylinder, thence down between that and No. 2, and, passing under No. 2, goes up between that and No. 1, and

out through the small pipe, B, figure 1; and, when necessary, the draught is accelerated by a blower in the cylinder, n. The bottom of the furnace has a grate and ash pan, which need no description.

The spaces between the double cylinders, and in the centre pan, in which the water and steam are contained, are shaded in the sectional view, and the furnace and spars between the cylinders through which the fire passes are left white.

C, figure 1, represents the water tank; F, the safety valve; G, the horizontal pipe forming part of axis, through which the steam is conducted to and from the engine.

a, a, a, a, are four cylinders, in all respects similar to those of the common reciprocating steam engine; which cylinders stand at right angles with each other, with their bottoms resting upon a cylindrical hub, or centre; the cylinders of course forming a cross.

b, b, &c. are the slide rods, part of which only are seen. The bottoms of the slide rods are attached to the flanges round the tops of the cylinders, and their tops to a rim of cast iron, c, which rim also steadies and supports the tops of the cylinders by four straps, or parts of arms, d, d, d, d, which are bolted to the tops of the cylinders.

e, e, e, e, are four arms, connected with said rim by studs of sufficient length to leave

Fig. 2.

room between said arms and the cylinders for the connecting rods to revolve, and to which arms is attached the main or driving pulley, *f*, or in place thereof a cog-wheel, as the case may require.

The connecting rods and cross-heads being mostly hid in the representation, are so nearly in the common form as to need no description. But the feet of the said connecting rods are connected together by a moveable joint, so as to revolve round a centre-pin, which is removed from the centre round which the cylinders revolve, just half the length of the stroke of the pistons.

The steam is conducted through a hole lengthwise in the main axis *G*, and out through a hole in the side thereof into the bottom of each cylinder successively, as they revolve.

On the side of each cylinder is a tube, passing from the bottom to the top, and also connected at the bottom with that which lets the steam into the bottom of the opposite cylinder, so that when the steam is let into the bottom of one cylinder it enters the top of the one opposite; and as the feet of the connecting rods revolve round a centre at some distance from the centre of the main axis, as the pistons act and re-act, the cylinders must of course revolve round the axis; and when each cylinder has passed round to the opposite side from whence it filled, the steam escapes through a hole on the opposite side of the axis into a hole lengthwise of the axis, and parallel to the one by which it entered, and goes off through the discharge pipe *i*.

Mr. F. will engage to construct an engine and boiler of fifty horse power, of strong and permanent workmanship, which (both engine and boiler) shall stand on a circle of six feet diameter, and will not vary much in weight from three tons. And operating with a steady rotary impulse and without any jar, its operation will be much pleasanter in steamboats, and also prevent the injury done

to the boats by the constant racking motion of the engines now in use.

This engine and boiler will be in operation in a few days at 246 Water street, New-York.

Since the above was in type, we have received the following from Mr. Fairman:

To the Editor of the *Mechanics' Magazine*:

SIR.—However I may be reduced, by the misfortune, or rather the folly, of having undertaken to invent useful mechanical improvements, my pride is not so far overcome as to be willing to ask any services on the score of charity; but if, from any other motive, you should see fit to give this a place in your Magazine, I wish you better remuneration for so doing than to meet the fate of an inventor.

I had long been led to believe that a rotary steam engine, simple, operative, and sure in its construction, with an efficient boiler, both so compact, and consequently light, as not to overburthen their own power, and peculiarly adapted to locomotive purposes, was a desideratum for which the enlightened public would liberally reward the inventor, if such an inventor could be found. I had good authority for so believing. Many respectable writers on the subject of steam power, have noticed the importance of such an invention, but all I have seen have considered it impracticable.

Mr. Nicholson, in his *Operative Mechanic*, (Philadelphia edition, page 206,) says: "All steam engines, as yet noticed, have their action by the movement of a piston, in a cylinder, and act by what is called a reciprocating motion. In engines of this description a very considerable degree of power is expended in arresting the motion of the different working parts, and putting them into action in a contrary course. This has claimed much attention of engineers, and

many attempts have been made to construct an engine in which the action of the steam should operate in a continuous manner, without bringing the parts to a state of rest."

Again he remarks, (page 213,) "The reciprocating motion in steam engines is a loss of power, which cannot be denied, for the momentum of the beam and other parts, passing in one direction, have suddenly to be arrested and moved in the opposite direction, which produces a loss of power."

"Rotary action has been sought, therefore, with propriety, but has not yet been attained with advantage."

Since Mr. Nicholson wrote the foregoing, the importance of locomotive steam powers has nearly doubled, and yet I have known of no attempt which was likely to succeed in effecting the desired object.

With these views of the subject, and believing, or at least hoping, it was practicable, I undertook, and have no hesitation in stating, that I have effected all that the subject required. I have constructed an engine and boiler as little liable to disorder, and as easily kept in repair, as any other, and, I believe, with at least double the power, in proportion both to the cost and weight, of any which has come to my knowledge.

But my want of pecuniary means compelled me to let the engine and boiler which formed the first experiment, and which could not be expected to be perfect, go out of my control, and be placed where, by awkward management, if it be not condemned, it will discredit rather than benefit the invention. No man of judgment would expect perfection in a first experiment; but fortunately there was no mistake perceived in the engine, and but for a slight miscalculation in the boiler, I would not wish my reputation to stand, as an inventor, on a better foundation.

I cannot now invest the necessary sum in materials to exhibit my invention to the public, but if any gentleman or company interested in procuring the best locomotive engine and boiler, after due examination of my plan, will furnish materials, I will hazard all the labor of constructing them at short notice, and will guarantee, as far as my labor goes, that they shall not vary essentially from the following calculations:

A boiler, which shall expose 160 feet of heating surface to the water, and shall possess sufficient strength to work steam under 100 lbs. pressure to the inch above the atmosphere, and which, of course, must produce a sufficiency of steam for a fifteen or sixteen horse power; an engine with 4 cylinders, 6 inches diameter, 18 inch stroke, making four double strokes at each revolution, and 50 to 60 revolutions per minute, working off from 78 to 94 feet of steam.

The whole engine, boiler and furnace, shall only occupy a circular space of three feet six inches diameter; and shall weigh less than a ton. A boiler and furnace sufficient for a fifty horse power shall stand on a circle six feet in diameter.

All which facts are respectfully submitted by the public's humble servant,

SIMON FAIRMAN.

P. S.—I have no wish nor reason to find any fault with the conduct of the gentleman in whose hands my steam engine is placed in New-York. I have found nothing ungentlemanly or unfair in his conduct. The only difficulty is, the engine was taken away prematurely.

S. F.

The Steam Engine.—Security against accidents from the explosion of steam, being a subject of such extreme interest to the community, we insert the annexed report, made to the House of Representatives on the 26th ult., by Mr. White, of Louisiana, from the select committee to which was referred the memorial of Benjamin Philips of Philadelphia, who suggests a contrivance by which the double advantage is obtained of increasing the power of the engine, and at the same time preventing mischief from explosion.—[Nat. Intel.]

The Select Committee to which was referred the memorial of Benjamin Philips, of Philadelphia, report: The object of the memorialist is to invite the attention of Congress, and the public generally, to certain improvements devised by him in the use and structure of the steam engine. The model of his apparatus accompanied by drawings and diagrams, illustrative of its principles, have been submitted and examined. Whatever other advantages may be supposed to be combined in the scheme, the committee have considered it chiefly, if not exclusively, in reference to its comparative safety, or exemption from the danger of explosion.

It seems to be a point conceded by scientific observers, that, among the primary causes of explosion in steam boilers, one of the most prominent may be traced to the want of a constant and regular supply of water, while the engine is in action. The usual means employed, as the committee are advised, both for supplying the consumption of the boiler, and for ascertaining the quantum of water in that receptacle, are inadequate and uncertain. The forcing pump is liable to derangement; and when the water has fallen so low as to superinduce the circumstances of danger, neither the common gauge-cock, nor the common safety valve can be relied on for an accurate indication of the state of things so essential to be known. By the plan submitted, these effects appear to be remedied. A constant and uniform supply of water, and a test water gauge, indicating to the eye, at any moment, the precise level of the fluid in the boiler, form a part of the melioration suggested.

But what appears to the committee to be the distinguishing feature of the plan, is that it contemplates the employment of the steam at any given pressure, without a corresponding stress on the boiler. The result is obtained by generating the steam at a very moderate pressure on the boiler, from whence it is conveyed for use, to one or more receivers, in which, before it is applied as the momentum to the engine, it may be raised by flues heated from a separate furnace, to any required degree of elasticity.

The committee are of opinion, that if the scheme be feasible, of which they do not doubt, it must of itself be an important step towards the GRAND DESIDERATUM. Confined in a separate reservoir, not in immediate connexion with the boiler, the steam, however rarefied, would not be liable to be suddenly injected with water, a process which all concurring experience proclaims to be the proximate cause of many of the most dreadful accidents that have occurred.

The form and position of the contemplated receiver is believed to present another condition of security. Placed vertically on the deck, with different chambers or compartments connected by valves, the steam at its greatest tension naturally rushing through the valves into the upper chambers of the recipient, if ever explosion should take place, it would be a mere effusion of steam, and not of heated water; and the discharge would be upwards, into the open air, leaving untouched the passengers and the property embarked in the vessel.

There are other particulars in the mechanism, of the usefulness of which, practical engineers alone are competent to form an accurate estimate. It will suffice to say, that as a whole, the committee consider the contrivance as reflecting credit on the science and ingenuity of the proprietor, and that his plan is worthy of a full and fair experiment.

On the question as to the power and the inexpediency of aid and co-operation on the part of the Government in experiments of the kind, the committee have come to an affirmative conclusion. When it is considered how intimately the subject matter connects itself with the general welfare, looking to the protection of the lives and property of the whole people, that it involves considerations of naval and national defence, as well as the general interests of commerce, it is not thought that any valid opposing argument can be drawn from the want of power, much less objection be raised on the score of policy.

The committee have thought proper to recommend

a small sum to be placed at the disposal of the Secretary of the Navy, to test the improvements in this branch. It is believed that a reasonable expenditure of the public money for this subject, would coincide with the universal sense, and meet the applause of the nation. The knowledge of the mode of controlling and directing with safety this powerful, but hitherto dangerous, agent in the affairs of men, would be cheaply purchased at the cost of millions.

TRENTON, (N. J.) JUNE 28.—*Delaware and Raritan Canal.*—On the 25th inst. a large Barge from the Delaware and Chesapeake Canal, left Bordentown in the morning, with the Directors of the Company and a number of the Stockholders on board, on an excursion of inspection of the locks, bridges and other works of the canal, and arrived at Trenton about 12 o'clock. She then went up the feeder as far as Lambertsville. On the following day the Barge, with the Directors, &c. proceeded on the main canal hence for New Brunswick. The canal, we understand, is now open for the passing of shallops, &c. from the Delaware to the Raritan—the supply of water is good, and appears to be abundant for a depth of 6 and 7 feet.

A large supply of water was let into the Canal of this Company on the 24th inst. On the night following, the embankment on the west side near the Assanpink, gave way, occasioning a heavy breach, which will take a week or more to repair.

[From the *Lansingburgh Gazette.*]

MR. EDITOR,—I beg leave through the medium of your paper, briefly to notice several communications in your two last numbers, of which I have the honor to be the subject.

I utterly disavow having knowingly in my composition a particle of ingratitude; and as I have no reason to doubt that the pieces alluded to were dictated by a spirit the most friendly for my interest, I as sincerely reciprocate to them every kind feeling which grateful sympathy can dictate.

I am well aware, however, from long observation, confirmed by a good share of experience, that whoever attempts to lessen the burden of Labor, or render it more productive, by the invention of a labor-saving machine, not only sets himself up as a mark, like a man in the pillory, for men of feeling to pity, and fools to throw rotten eggs at, but puts himself upon a fair chance to end his days in a poor-house or a prison; and I have the mortification to confess that something, which I have reason to fear is a radical defect in my constitution, has placed me among that unfortunate class of beings called inventors.

But I beg leave to state, that inventors, (poor wretches,) have feelings, and sometimes even pride, as well as other people; and as I have a little share of that added to my other misfortunes, I wish those respected friends of mine to consider that it cannot but be painful to me to be exposed as an object of public sympathy. I have been foolish enough to invent some labor-saving improvements, and men have been benefitted by them who seldom thanked me, and much more seldom paid me; and it is true, I have lately invented and constructed a *steam engine*, on a plan which, whatever may be its mechanical force, will force its way into use, and will benefit the world when I am forgotten. And it is equally true, that it has found its way out of my hands, without any fair compensation; but, thank Heaven, I still enjoy health, and strength, and air, and sometimes sun-shine, as plentifully, perhaps, as if I had never invented any thing; and if Heaven will continue me these blessings, and my friends will favor me with such jobs as will occupy my time, and keep me from committing any more acts of invention, I

will thank them more for such patronage than for ten times the amount in commiseration.

SIMON FAIRMAN.

Lansingburgh, June 3, 1834.

Animal Mechanics, or Proofs of Design in the Animal Frame. Part II., showing the Application of the Living Forces. [From the Library of Useful Knowledge.]

(Continued from page 343.)

Here we find a very beautiful muscular apparatus which is necessary to the perfect adjustment of these cords. The cords are attached to small muscles called *columnæ carneæ*, C C, or fleshy columns, which at their other extremities are incorporated with the muscular wall of the ventricle itself. The use of these muscles is now to be explained. Had the tendinous cords of the valves been tied to the inside of the wall of the ventricle, without the intervention of these muscles, as the walls of the cavity approach each other during their contraction, the tendinous cords would have been let loose, and the margins of the valves carried back into the auricle. But, by the intervention of these muscles, they are pulled upon and shortened in proportion as the sides of the cavity approach each other.

On the whole, then, we perceive that this apparatus, which is as intricate as the rigging of a ship, consists of a variety of fleshy columns and cords, many of which, in fact, run across the cavity of the ventricle.

We are about to exhibit another form of a valve, much simpler, and yet we are bound to believe equally effectual; which tends to support the opinion expressed above, that besides preventing the retrograde motion of the blood, this intricate apparatus of the ventricle is intended more effectually to agitate and to mix the different streams.

At the root or origin of the great artery, called the *Aorta*, there is a firm ring, to which the valves now to be described are attached. The necessity of this will appear evident, since, if the ring could be stretched by the force of the heart's action, the valves or flood-gates would not be sufficient to close the passage; their conjoined diameters would not equal that of the artery which they have to close. These valves are three in number: they are little half-moon shaped bags of thin membrane, which are thrown up by the blood passing out from the ventricle, but by the slightest retrograde movement of the blood, their margins are caught, and then, being distended or bagged, they fall together and close the passage. There are some curious little adjuncts to these valves, which ought to be explained, as shewing the accuracy of the mechanical provision.

When the margin of the valve is thrown up by the blood passing out of the heart, it is not permitted to touch or full flat upon the

Fig. 5.

side of the artery, for, if it did, it would not

be readily caught up by the blood that flows back; there is, therefore, a little dilatation of the coats of the artery behind each valve, by which, although the margins of the valve be distended to the full circle, they never cling to the coats. These valves, then, are never permitted to fall against the coats of the artery, and therefore they are always prepared to receive the motion of the reflux blood.

Fig. 6.

Let this figure represent a transverse section of the root of the aorta: A A, the inner circle, is the margin of the three valves thrown up to let the blood pass. B B B are three semi-circular bags, formed by the dilatation of the coats of the artery at this part, receding from the margin of each of the valves—consequently, in such a manner as to leave a space between the valves and the sides of the vessel.

To strengthen the valves, a tendon runs along their margin, like the bolt-rope or foot-rope along the edge of a sail, and these ligaments are attached to the side of the artery, and give the valve great strength.

Fig. 7.

These valves, we have said, are semi-lunar, consequently, when they fall together there must be a space, A, left between them. If we put the points of the thumb, fore and middle fingers, together, there is a triangular space left between them; such a space between the convexities of the three valves would be a defect.

Fig. 8.

This figure represents the artery open, and the semi-circular valves, like little bags, attached to the inside.

Three little bodies like tongues are therefore attached to the middle of the margin of each valve, and these, falling together when the valve is shut down, perfect the septum and prevent a drop of blood passing backwards.

GLASS TILES.—M. Dorlodot, a glass manufacturer, at Anzin, in France, has invented a species of glass tile, of great solidity and transparency, which, it is thought, may be substituted with much advantage in all cases where skylights are now employed. The existing excise

laws of Great Britain oppose, however, an insuperable bar to their adoption in this country, unless under circumstances where expense is no object.—[Mechanics' Magazine.]

MORAL PRINCIPLES THE SAFEGUARD OF LIBERTY.—The following, from the Scottish Guardian, although not correct in all its statements or reasoning, deserves, says the Annals of Education, deep reflection, and we have been gratified to see it circulating extensively through our newspapers.

Two Magistrates of Paris recently made a tour through the United States, and in the course of two years collected important information regarding the statistics of crime and education. In the state of New-York, 500,000 children, out of two millions, are at public schools; that is, a fourth part of the population, and £240,000 are annually expended for this purpose. Yet in this State crime increases, and that, too, though the means of subsistence and employment are so much more easily obtained than in any other countries. In Connecticut, education is still more extended, and nearly a third part of the population is at school. Yet crimes multiply to a frightful extent. The Journal of Education, stating these facts, draws this cautious conclusion: "If knowledge cannot be accused of causing this increase of crime, at least it has not prevented it."

On turning to France, and examining tables of the comparative proportion of instruction in its different departments, during a period of three years, the western and central provinces have been found the most uneducated—15, 14, 13, 12, and 8 per cent. only being able to read and write; but, according to an essay on the moral statistics of France, presented to the Academy of Sciences, the minimum of crime is to be found in these uneducated departments, and the maximum in Corsica and in the south-eastern provinces, and in Alsace, where nearly half the population can read. The different employments of the population may account for the difference in part; yet still we may again draw the cautious conclusion, that if education has not caused, at least it has not been seen to prevent crime.

The only ascertained moral effect of intellectual education was stated in last March by the Lord Chancellor, in the House of Lords. In Russia, where education can scarcely be said to exist, out of 5,800 crimes committed within a certain period, 3,500 were accompanied by violence; while in Pennsylvania, where education is generally diffused, out of 7,400 crimes, only 640 were accompanied by violence, being in the proportion of $\frac{1}{12}$ of the whole number, instead of $\frac{1}{3}$, as in the former case. Thus the only ascertained effect of intellectual education on crime is to substitute fraud for force—the cunning of civilized, for the violence of savage life. Nor would even this small change be permanent. A highly intellectual community, without moral principles and the habits of self-denial which religion imposes, would only prove a sleeping volcano, ready to awaken every moment, and overthrow those very institutions under which it had been fostered. To increase the intellectual power, and enlarge the knowledge, of a man void of principle, is only to create in him new desires, to make him restless and dissatisfied, hating those that are above him, and desirous of reducing all to his own level; and you have but to realize universally such a state of society, to fill the cup of the world's guilt and misery to the brim. What do we say then? Not certainly that education is to be withheld from any member of society,—for that question is now decided, whether we will or not,—but that from the infant school, upwards to the university, it must be a thorough Christian education, in which our youth shall be trained in the ways of virtuous self-control, and piety and righteousness wrought into the understanding and into the whole habit of man. A perfunctory religious

education will no longer serve—not mere Bible reading—but Bible education. The understanding must be enlightened, and the heart must be gained over to the side of truth and righteousness. In short, the grand aim of education must become, not merely the formation of intellectual habits, or the acquisition of secular knowledge, (as is too exclusively the case in present times,) but the formation of the Christian character. Men have hitherto been prone to take for granted, that it was only necessary to teach the art of reading, and before this new power all vice and error would flee away. These are dreams of men ignorant of themselves, and ignorant of our poor nature. Men must be trained to piety and virtue as they are trained to any other habits, whether intellectual or physical; and the moral man must advance contemporaneously with the intellectual man, else we see no increase from our increased education, but an increased capacity for evil doing.

The following application of this truth to our own country and its peculiar dangers, from the Northampton Courier, is another gratifying evidence of the increased interest taken in the subject.

"We believe that there is much truth and justice in the remark, that other influences besides that of force must be exercised, to keep the Union of these states permanently together. Statutes may be enacted, constitutions framed, and interests multiplied, but if there is not a primary feeling of moral obligation and fraternal duty, to cement and enforce them, the duration of this government, like all others, is extremely questionable and uncertain. Pecuniary interest, and common defence, and general prosperity, are but transient ties, which can be thrown off to suit the excited spirit of the times, or changed to meet any pressing emergency. They are but selfish bonds, which yield at the rude touch of popular disaffection, and are easily rent by the misguided voice of public sentiment, and vindictiveness, and clamor. But if legal enactments and obligations, and physical wants, and common defence, do not constitute security against dissolution, what influences can be exerted to sustain and strengthen a civil compact of such stupendous weight and importance as our own? If these things fail, what iron will enter the souls of men, to enforce their moral obligations, and to impress upon them the maxim of 'union,' with certain safety and security?"

We think a moral obligation, and religious feeling, and fraternal affection, which is founded in the heart, and has its emanations from the soul, if rightly cultivated, will insure this purpose, and guarantee its permanent duration. Some deep abiding sentiment, some strong affection of the mind, some radiating influence from the heart, which rises above selfishness, and pecuniary wants, and sordid interest, which all feel and acknowledge, is what should be cherished and cultivated, to bind with adamant chains the different parts and sections of this our own favored country together.

Yes; it is by cultivating the sense of 'moral obligation and religious feeling,' and the 'fraternal affection,' which is their necessary concomitant and result, that our own union is to be maintained, (for we are unwilling to add the qualification which is chilling so many hearts,) and not by constitutions of parchment, or even by the arm of power. If our laws are not supported by our feelings, and principles, the force which we use to maintain them, may indeed make us fellow prisoners, or fellow subjects, but never can unite us as brethren or fellow citizens. France has long sought to establish moral principle on some other basis than that of Christianity; but she has renounced this visionary plan; and now requires the New Testament to be employed as the text book of morals and religion in every school in the empire. Let us profit by her example, and retain the precious legacy of our purer, happier ancestors.

AGRICULTURE, &c.

CULTURE AND EXTRAORDINARY PRODUCTIVENESS OF THE OXALIS CRENATA.—We are indebted to the Quebec Mercury for the following interesting article :

This vegetable has been newly introduced in England, and on the limited experience a brief acquaintance with it has enabled those who have cultivated it to acquire, it is regarded as a plant of considerable promise and well worth attention. It is cultivated by tubers, and we have great pleasure in adding another instance of greater feeling with which the efforts of our new Quebec Society for the Improvement of Agriculture are encouraged by societies, having the same purpose in view, in the mother country, in announcing that some tubers of this plant have been forwarded to its Society, by the Royal Devon and Cornwall Botanical and Horticultural Society, accompanied by the fourth annual report of their Committee, from which we extract the following notice of the *Oxalis Crenata*.

"It is cultivated by tubers, which being furnished with eyes like those of the potato, may, like it, be divided into several cuttings ; but, as the substance of the tuber is the magazine destined by nature to sustain the plant till it acquires sufficient strength to draw its nutriment from the soil, it will perhaps be advisable not to make the division too small, or rather to plant the tubers whole, and reverse the division till after the plants have acquired such a size as to be independent of the nutriment of the parent tuber. While their culture is restricted to the limited operations of the garden, and perhaps also even after they have attracted the attention of the farmer, Mr. Beaton recommends making the tubers germinate in pots protected from the severities of the early spring ; a practice which will facilitate the subsequent division just recommended. They should not be planted out in the open ground till the advancing season has removed all danger of severe frost. When transplanted, they should be put in ground well dug and rendered permeable to their roots, and should not be set closer than from four to six feet apart. They will grow well, as Mr. Beaton observes, in any light soil, but a very rich soil is best for a heavy crop. The best method of planting would perhaps be to set them between drills, the earth of which may from time to time be brought down over them with a hoe. The thick succulent stems which are thrown up in profusion during the summer make excellent tarts, resembling those of rhubarb or gooseberries, but requiring less sugar ; while the leaves are a grateful food to many domestic animals, and the tops and smaller branches may be employed as cuttings to extend its culture, and augment the production of tubers. Cuttings of this kind, stuck in the open ground without any peculiar care, as late as the 26th of last October, were found, when examined on the 16th of the following month, not only to have thrown out radical fibres, but to have commenced the formation of tubers. The plants flower during the greater part of August and beginning of September, and when covered with a profusion of golden blossoms, make a handsome appearance in the flower garden. Cuttings taken at this time, even when loaded with flowers, root freely, and produce their tubers at the usual season. In October the production of tubers commences, and such is

the profusion with which they are thrown out, that, in rich soils, they not only fill the ground to the exclusion of every thing else, but frequently even form on the stems above the surface of the ground. As the production of these tubers does not appear to commence at present earlier than the first of October, and as their growth and production may be affected by cutting the herbage after that day, it would be worth while to determine the question by a careful examination of the produce of two plants growing in circumstances perfectly similar, the herbage of one of which had been cut after this period, while that of the other was left untouched. The herbage when cut during the summer months is rapidly reproduced ; and Mr. Beaton states that on the 27th of last September he obtained no less than ten pounds' weight of green food from a single tuber, planted six feet apart from any other. He considers this herbage as superior in summer to every other kind of green fodder for cattle.

Attempts having been made to discourage the experiments now prosecuting for the purpose of ascertaining the real value of the *Oxalis crenata*, as an article of sustenance for man, as compared with other productions of a similar nature, the secretary of the Horticultural Society feels it his duty, as a friend to every improvement calculated to add to the comforts of the poor, and provide for the wants of our increasing population, without attempting to give any positive opinion, or create hopes which may terminate in disappointment, to lay before the society from time to time such facts as may come to his knowledge from authentic sources, accompanied with such suggestions as those facts may present ; distinguishing, however, the facts from the theory, and leaving his readers to estimate the value of the latter from the details of the former. On the 7th of April, a tuber of the *Oxalis crenata*, weighing only 28 grains, was planted in an old cucumber bed, in a garden on the east side of Plymouth. About five weeks after, two offsets were taken from it and planted separately in the common soil of the garden. The parent plant grew with surprising vigor, and soon spread over an elliptic space, the transverse diameter of which measured three feet seven inches, and the conjugate diameter three feet one inch. Early in November, the proprietor, having accidentally disturbed the ground, broke off a few tubers from one of his plants, which he cooked, and found to be most delicious, resembling the flavor of a mealy potato, without the slightest trace of acidity. On the night of the 25th and the morning of the 26th November, there was a smart frost, which injured the herbage of the plants, and from which they did not again recover. On the 14th of December, he at length took up the roots, when he found the produce to be as follows :

Parent plant, 407 tubers, weighing 7 lbs. 8 oz. 14 dr. 22 gr.					
Two off-sets, 198 " " "	3	8	0	0	
Total, 605	11	0	14	22	

being a return of no less than two hundred and seventy-five thousand per cent., a return almost unparalleled in the annals of horticulture. Of these tubers, one, now in the possession of the secretary, who will be happy to show it to any desirous of examining it, displays the singular form of a compressed cone, or rather triangle, two of whose sides measure one inch and six-eighths, while the remaining

side measures two inches, so that it is as nearly as possible equilateral, with a thickness of nearly six-eighths, and weighs 300 grains, or nearly 14 times the weight (28 grains) of the tuber originally planted ; this one tuber alone being a return of no less than 1392.86, or nearly 1393 per cent. The time occupied from the planting to the digging did not exceed 251 days, or the time usually required for the potato to bring its tubers to perfection, and there is reason to believe that this period might have been advantageously shortened by a month or more, for when the proprietor tried the tubers in the early part of November, they were superior in flavor to the best potatoes, while some of those dug on the 14th of December last, had acquired more or less of an acid taste, which was disrelished by many. It has been already observed that the plants were cut off by the frost of the 26th of November, after which it is probable that the growth of the tubers, as to size, ceased to advance, and nothing consequently was gained by leaving them in the ground—but as the frost was followed by a succession of warm humid weather, favorable to vegetation, it appears probable that, although ceasing to advance in size, the tubers, or many of them, began to germinate ; now the process of germination, as in the familiar instance of malting, is well known to be accompanied with the formation of sugar, from the absorption of oxygen, both from the decomposed humidity and from the surrounding atmosphere, by the farinaceous portion of seed. In plants, however, whose product, in place of being saccharine, is a peculiar acid, as in the family of the sorrels, it is not improbable that the combination of the oxygen during the progress of germination, with the farinaceous portion either of the seeds or roots, forms that peculiar acid which, from the genus by which it is furnished in the greatest abundance, has been termed the oxalic acid ; and hence, those tubers which, prior to the 26th of November last, were perfectly sweet, became subsequently, from the commencement of germination or malting, more or less acid according to the degree of progress made. This hint, founded perhaps upon an erroneous analogy, is merely thrown out for the purpose of calling attention to the subject, eliciting information from those more competent to supply it, and removing any unreasonable prejudice which may have been created in the minds of those who have tasted the tubers at an improper stage of their growth. As for those whose fears may have been alarmed by the information that oxalic acid exists in the *oxalis crenata*, it is but just to relieve their apprehensions by stating that the acid does not exist in its deleterious state, but in the form of a neutral salt, the super oxalate of potassa, whose effects, in the common wood sorrel of the hedges (*Oxalis acetosella*), the sorrel dock (*Rumex acetosella*), and other similar vegetables freely used as sallads, are eminently antiscorbutic and beneficial to the health.

It is stated that the tubers of those plants of the *oxalis crenata*, which have blossomed, are larger and better than those of plants which have not flowered : the fact, if correct, is important, and deserves inquiry, especially as the reverse is said to happen in the case of the potato (*Solanum tuberosum*.)"

ON THE PRESERVATION OF POTATOES.—Potatoes at the depth of one foot from the

ground, produce shoots near the end of spring; at the depth of two feet, they appear in the middle of summer; at three feet of depth, they are very short, and never come to the surface; and between three and five feet, they cease to vegetate. In consequence of observing these effects, several parcels of potatoes were buried in a garden at the depth of three feet and a half, and were not removed till after intervals of one and two years. They were then found without any appearance of germination, and possessing their original firmness, freshness, goodness, and taste.—[Ann. Soc. d'Agric.]

CHURNING BUTTER.—Not many days since, on entering the house as usual about dinner time, I found my family very much perplexed about the cream which they had been churning for about two hours, and yet no signs of butter. On examination I found the cream was worked into a perfect froth. I was satisfied that unless something could be done to change its nature or condition, churning would be useless: I therefore threw into the churn as much common salt as I could hold in my right hand; I then put the churn in motion, and in 15 minutes, by the clock, the butter had perfectly separated from the milk.—[Ohio Farmer.]

SILK.—The Connecticut Silk Manufacturing Company are to receive \$11,500, to aid and encourage them in establishing a silk factory; Messrs. Gay and Botton, mechanics of Lisbon, \$2,000, as a remuneration for their labor and expense in inventing and constructing silk machinery; the Mansfield silk factory, \$1,500; the State House yard, \$8,000, and the remaining \$2,000 goes into the State Treasury.—[Hartford Review.]

MANURE FROM HOGS.—This is the season for farmers to avail themselves of every opportunity to collect every substance that can be made into manure. Let every farmer look about him and endeavor to find sources of increasing his manure. The following is from the Northern Farmer:

One of the regular means which every farmer possesses, for the increasing of his stock of manure, and which is by no means the least valuable, is by many totally neglected. It is that of making their hogs serviceable in this business. Upon this point, I can speak from past experience, both in respect to the loss from neglect and the advantages derived from these valuable animals, when employed for this purpose. It was my practice, till within the last fifteen years, to permit my swine to roam at large in the highway, in the summer season; or what was but little better, confine them in a pasture, for three or four months during the warmest of the season; carrying whatever I might have to give them as feed, to the place in which they were confined. I began, however, after a while, to consider this course of turning hogs to pasture, or permitting them to run in the highway, to be altogether wrong. Upon mature reflection, I concluded that by confining them in a close yard, and furnishing them with the materials for making manure, the profits would be amply sufficient, not only to repay me for all the trouble of furnishing the materials, but would also enable me to give them better keeping; and, in this respect, my anticipations have been fully realized. One er-

ror, however, I committed in the outset, and I have noticed the same fault in others. It was this: my yard was at first made at least three times too large, embracing about two and a half rods of ground, for three or four hogs, the number which I generally keep; and I have seen yards including a much larger space made by some farmers, for an equal number of hogs. Now this, where the object is the making and saving manure, is, in my judgment, wrong; for, in so large a space, the quantity of materials put into the yard must be very great, or it must lie very thin over the yard; in either case, the benefit received from three or four hogs is but small. At least I found it so, where the materials, of whatever nature they might be, were put in one season and carried out the spring following. I therefore diminished my yard to twenty feet by fourteen, about one-third of its original dimensions; and I find this space to be sufficiently large for four hogs; and, I believe, large enough for even six to make manure to advantage; for in this space, materials sufficient for twenty or twenty-five loads of manure may be deposited in the course of one season; and what to me seems of the first importance in this business, is the hogs are kept continually on the materials except when in their house, for the purpose of eating and sleeping.

My method of supplying these materials is the following: after having cleared their yard at the season of planting, I put into it such portions of straw as I may have left on hand after the season of foddering is past; and if I have not a sufficient quantity of this, to furnish the necessary supply till vegetable substances attain to a sufficient growth to be profitably collected, I put in earth collected from the low places, by the side of the high-way; though this I more generally place in or near my barnyard, in a situation to receive and retain the wash that might otherwise escape from that. Brakes and weeds of any kind are valuable. These I make use of to the extent they are obtainable, when in a green state; as I consider green vegetable substances, for this purpose, far more valuable than dry. Potato tops when pulled for early use, before they become dry and shrivelled, I consider equal if not superior to any other green substances for this purpose. Pea-vines I usually put into my hog yard, after the peas are threshed off; and if some are put in before being threshed, they are as gratefully received by the inmates of the yard. Buck-wheat straw I have made use of, but I deem this to be of all substances the least valuable for the purpose of making manure, when it has ripened into a dry state, however valuable it may be when ploughed under in a green state, as it unquestionably is; being at that stage of its growth one of the most juicy plants of the vegetable kingdom.

I add nothing by way of materials to my hog yard, after the first of September, at which time I generally commence feeding, for the purpose of fattening; and by the middle or twentieth of December, my usual time for killing my hogs, I make from four to five loads of manure to each hog so kept, superior to the summer dung, obtained by yarding my cows. And the quantity made by my hogs is for each one double to that made by each cow for the same period of time.

Thus I have endeavored to present to the readers of the Farmer my method of adding to my stock of manure by the aid of my

hogs from fifteen to twenty loads annually: whereas, I used formerly, as too many do at the present day, who call themselves farmers, entirely to neglect all these advantages, the improvement of which is so essential to profitable farming. It is to be hoped, however, that no farmer, who has the opportunity of reading an agricultural paper, is so remiss, in relation to that which is so conducive to his best interests. MATTHEW BUELL, JR.

Newport, May 31st, 1834.

HOING CORN.—After such an unfavorable spring as we have had this year, the hoeing of early planted corn is rather a disagreeable employment than otherwise.

When the soil is of a clay loam, and was early ploughed and planted, after which were heavy rains, and the soil has become hard, and the corn looks pale and sickly, it is often abandoned as not of sufficient promise to compensate for the labor of cultivation; but young farmers should remember, that after they have done their duty by carefully ploughing and hoeing, much depends upon the weather, during the months of July and August, for producing a good crop of corn, and although the plants may continue stunted during much of the month of June, yet if the ground is kept in good condition, a fine crop may be realized.

Many are apt to say, in case of dry weather, during the month of June, "that the ground is so dry that it will do corn more hurt than good to hoe it." Never mind, if the ground is dry, stir it the more, it is the best way to guard against drought; in short, do not neglect hoeing, for stirring the ground without manuring is better than manuring without stirring.—[Goodsell's Genesee Farmer.]

EFFECTUAL SECURITY AGAINST THE BEE MOTH.—As soon as your bees commence working in the spring, examine your hives, and with a slab of wood, or piece of hoop iron, scrape the stand immediately under the hive, also around the inner edges of the box, taking care to remove all the web that may be attached to any part of the stand or hive, as the whole secret consists in keeping them free from the web formed by the moth or fly. Having completed this operation, provide yourself with four square blocks of wood, and place one under each corner of your hive, so as to raise it not quite half an inch from the stand; this will enable you to clean the stand without removing the hive. This scraping operation must be repeated every three or four days, if there should be any appearance of web forming on the stand, or around the inner edges of the hive. It seems necessary to remark that the moth or fly makes its attacks by a kind of regular approach, first forming its web on the stand, and then extending it up the sides of the hive until it gets complete possession. By a little attention in cleaning the stand and hive, as directed, you will certainly secure your bees from the ravages of the worm. In the winter, the blocks must be removed from under the hive, so as to allow it to rest immediately on the stand, which will secure it against the attacks of mice, &c. On this plan, it is advisable to make an entrance for the bees by cutting a perpendicular slit, in the front of the hive, half way from the bottom, say two and a half inches in length, and one-eighth of an inch wide, with a kind of a shelf just under it, to serve as a resting place for the bees going and returning to the hive. After being a little used to it, the bees seem to prefer this entrance to the one at the bottom of the hive. This plan has proved an effectual security against the worm, after every other remedy has failed; and not a single hive has been lost since it was adopted. Z.

MANGOLD WURTZEL, OR FIELD BEET.—We are happy to find that farmers are awake to the cultivation of this crop, and so great has been the increase of demand for seed, that it has

THE COILING SYSTEM OF CULTIVATING GRAPE VINES IN POTS.—At page 164, we inserted an article on this interesting system. We subjoin some additional facts from the Gardener's Magazine.

This coiling system is certainly a completely new feature, and, I think, a very valuable one, in the art of grape-growing. Is it not a matter of great importance that, in consequence of my discovery, a gardener, who may go to a situation, in the autumn, where no grapes have previously been growing, may be enabled to produce there easily, for the ensuing season, from 500 to 1000 bunches of fine grapes? All that is wanting to enable any gardener, so circumstanced, to do this, are the prunings of the vines from any garden, that would otherwise be thrown away, and, of course, a convenient frame, pit, or house, for growing them in. If abundance of shoots can be produced, and there is a sufficient extent of frames, &c., either temporary or permanent, two, three, or five thousand bunches may thus be produced in a garden where grapes were never seen before.

The coiling system is nothing more than taking a long shoot or cutting from a vine, cutting out all the buds except a few at the upper end, and then beginning at the lower end, and coiling the shoot round and round, say from three to six or eight times, the inside of a pot of 12 or 14 inches or more in diameter. The shoot may be of any length, from 6 feet to 30 feet, and it may be entirely of last year's wood; or the greater part of it may be of old wood, provided 3 or 4 feet at the upper end be of new wood; because, as every gardener knows, the buds from young wood are more certain than those from old wood of producing blossoms the first year. The vine being coiled round in the pot, and plenty of drainage being put in the bottom, take care that the end of the shoot left out of the pot, on which the fruit is to grow, be not injured at the point where it separates from the coil. This shoot may be 2 or 3 feet long; and to keep it steady, it may be tied to a stake, or coiled round two or three stakes. After this, fill up the pot with a rich loamy soil, pressing it firmly against the coil, as if you were making firm the end of a cutting. Unless this is done in such a manner as to bring every part of the coil in close contact with the soil, it will not root so readily as it otherwise would do. The next operation is, to wrap up all that part of the stem which is above the pot with moss, and this moss must be kept constantly moist till the grapes are formed. The pot should now be plunged in bottom heat, either in a pit or forcing-house; but, wherever it is plunged, care must be taken to regulate the temperature of the atmosphere of the house, in such a manner as to prevent the top of the vine from being excited before the roots. If this should happen, the young shoots produced will soon wither for want of nourishment. Abundance of air, therefore, should be given for several weeks, so as never to allow the temperature of the atmosphere of the house, frame, or pit, to exceed 45 or 50 degrees, while the temperature of the medium in which the pots are plunged may be as high as 65 or 70 degrees. When, by examination, you find that fibres are protruded from the coil, the temperature of the atmosphere may then be gradually raised when the buds will break, and the shoots will grow apace.

The shoots proceeding from that part of the stem above the pot should be led up to within 8 or 10 inches of the glass, and there trained, at that distance from it, towards the back of the pit or house. It is needless to state to the practical gardener, that each shoot will require to be shortened, free from laterals, &c. Each vine will produce from three to twenty or more bunches, according to the length of coil and variety of grape. I have now (Jan. 17, 1834,) upwards of 200 coiled branches in pots, and nearly fifty of them in action; some with twenty bunches of fine grapes upon them.

I was asked the other day, whether vines so

treated would not require frequent shiftings into larger pots; or, at least, to be shifted once a year. To this I answered, that while we had a plentiful supply of prunings from our own vines, or could procure them from those of our friends, the best mode would be to treat the plants, after they had borne one crop, as we do the roots of asparagus, and other plants that we force: that is, to throw them away. If, however, you should wish to keep the coiled plants a second year, and the pots should be found to be too full of roots, turn out the ball, shake the soil from the coil, and cut away all the roots close to the shoot; then repot it as before. If this be done in winter, the plant will produce an excellent crop the following season; probably a better one than if the roots were allowed to remain, and the ball shifted into a larger pot or box. The pot or box is in either case soon filled with young vigorous fibres, like a hatch of young maggots, each eager for food, and consequently sending it up in abundance to supply the crop above. Can there be a doubt but that this is a far superior mode to keeping pots, or even fruit tree borders, filled up with old inert roots?

Before my bunches are clearly developed, I have thousands of eager mouths or spongioles, extending along the coiled shoot, and each gaping for food; some of these rootlets are 3 feet long, and before the vines are out of blossom, many of them are 6 feet in length, and matted round and round the pot. You will easily understand from this how important it is to supply vines so treated with liquid manure, either by watering from above, or by a supply from a saucer or feeder from below.

I am, Sir, yours, &c.

JOHN MEARNS.

Wilbeck Gardens, Jan. 17, 1834.

ART OF MANAGING SHEEP.—Sir: I have been very desirous of ascertaining the particular method in which Mr. Barney, of Philadelphia, manages his sheep, that enables him so far to exceed every body else in producing fine mutton, and good wool.

On his late visit to this city, I put the question to him, wherein consisted his superior management of sheep? He gave the following reply: He said a gentleman visited him not long since, and on going to his sheep-yard, and viewing it, asked him the same question. He showed at that time, from fifty ewes, upwards of sixty lambs, all lively and brisk, with a loss, I think he said, of three or four. The gentleman observed to him that he had his shed covered with dead lambs; and asked wherein the secret in breeding lay. Mr. Barney observed to him, you stuff your sheep with dry food. Yes, as much good clover hay as they will eat, was the reply. Mr. B.—You give them no water, but suffer them to go out in time of snow and eat it as they are disposed to do? Yes. Then, said Mr. Barney, there lies the secret. Your sheep fill themselves with dry hay; they get no water; and they have not a sufficient supply of gastric juice to promote the digestion of the hay in the stomach; they cannot raise it to *chew the cud*; they lose their appetite; are thrown into a fever; and cannot bring forth their young, or they bring forth a feeble, starved lamb, that falls off and dies the first exposure to the cold or rain. On the contrary, I take care to provide my sheep with good clear water in summer and winter. I feed them regularly with hay through the winter, and give them ruta бага and mangel wurtzel every day. The ewes produce me 120 per cent. increase in lambs. You cannot, says Mr. Barney, get along without ruta бага and mangel wurtzel.

This gentleman has just sold his sheep for upwards of \$17 per head to the butchers. It is his opinion that sheep are the most profitable stock that a man can raise; and it appears he makes use of no expensive food, or increased quantity of it. But the secret of raising good stock of every kind consists in maintaining that regular and cleanly mode of proceedings, which preserves the digestive organs of the ani-

mal in a healthy state, and enables them to convert what they eat into chyle, suitable for the nourishment of the animal. Respectfully yours, A.—[Farmer and Gardener.]

DISEASE IN THE FEET OF SHEEP.—As the persons employed on the farm of Anthony Anderson, Esq., at Dorchester Bridge, were shearing his sheep, on Thursday, the shepherd called his attention to a small orifice bust, at the separation of the foot of one of these animals, and told him that it was a disease called the *worm in the foot*, which Anderson, though an experienced farmer, informs us he had never seen, or indeed heard of. The shepherd advised that the wound should be pared down so as to get at the head, and with a strong needle he passed some doubles of thread through it, and extracted what he called the worm. It appears to be a *Hydatid*, or bladder-like skin, containing a fluid not unlike starch, and a small portion of a hairy substance, resembling the short wool on the legs of sheep. Mr. A. extracted one such worm, from each foot, all similarly placed at the articulation of hoofs; and found five or six of his sheep afflicted in like manner. After extracting the cause of the disease, whatever name be applied to it, he filled the cavity with pepper and salt.—[Quebec paper.]

APPLES FOR LIVE STOCK.—A farmer in Blandford says cows fed with apples in the autumn will give milk as abundantly as in June, and that he cannot perceive any difference in the beneficial effects of sour and sweet apples. Another, in East Granville, says he can make as good pork and beef with apples as potatoes. It is the opinion of many that a bushel of the former nearly equals in value a bushel of the latter. Such facts we think are of great value to the farmer: if he can convert his apples into beef and pork, or by them increase the products of the dairy, then a way is opened for the conversion of fruits into money without going through with the longer and more tedious process of converting them into cider, and that into brandy, and that into money. Again, if pork, beef, butter and cheese, can be made from apples, they will yield a greater profit to the farmer than if he make these articles by the aid of potatoes or grain, since they cost but little.—[Westfield Journal.]

MIXTURE FOR CATTLE AND SHEEP.—It has been recommended, by a gentleman who tried it, to mix salt with unleached wood ashes, in the proportion of one quart of fine salt to one half-bushel of ashes, and place the mixture under cover, where the animals can have access to it. This composition, our informant said, preserves the health of the animals, increases their appetite, and he believed would preserve sheep against the rot, and horses against botts.

[From Sir Samuel Moreland's Perpetual Almanac, Ready Reckoner, and Gardener, published in the reign of Queen Anne.]

Directions relating to the Purchasing of Land.

First see the land which thou intend'st to buy,
Within the Seller's Title clear to lie;
And that no Woman to it doth lay claim
By Dowry, Jointure, or some other Name,
That may it cumber. Know if bound or free
The Tenure stand, and, that from each Feoffee
It be released; that the Seller be so old,
That he may lawful sell, thou lawful hold:
Have special care that it not Mortgaged be,
Nor be entailed on Posterity.
Then if it Stand in Statute bound or no,
Be well advised what Quit rent out must go,
What Custom service hath been done of old,
By those who formerly the same did hold;
And if a wedded woman put to Sale,
Deal not with her, unless she bring her Male;
Thy bargain being made, and all this done,
Have special care to make thy Charter run
To thee, thy Heirs, Executors, Assigns,
For that beyond thy life securely binds:
These things foreknown and done, you may prevent
Those things Rash Buyers many times repent,
And yet when you have done all that you can,
If you'll be sure, deal with an honest man.

NEW-YORK AMERICAN.

JUNE 28—JULY 3, 1834.

LITERARY NOTICES.

MIRIAM COFFIN, OR THE WHALE FISHERMEN; 2 vols. New York: G. & C. & H. Carvill.—An original American novel is not so common a publication but that we always take one up with more interest than is created by the reprint of some new fiction from the British book market; and *Miriam Coffin* is a work which, in more respects than one, will repay perusal. It wants many of the requisites of a finished novel, but it contains some most admirable scenes, and abounds in graphic descriptions of manners;—the manners of a race which, though immortalized in the magnificent periods of Burke fifty years since, are still but little known to their own countrymen. We congratulate the Nantucket whalemens upon having at last found an annalist to record their daring adventures with a pen that seems guided by the soul of a sailor.

The scene of the story, to be in keeping with the roving characters that move upon it, shifts to every part of the world; and though we have hesitated a little in making our selection between the picturesque islands of the Pacific, and the not unromantic peculiarities of Nantucket itself, we believe that none of our readers who enter into the spirit of the following bold scene upon the coast of Africa, will complain of the preference we have given it over all others in the book.

Not Ocean's monarch shall escape us free!

Masanillo.

Soon the sport of death the crews repair:
Redmond, unerring, o'er his head suspends
The barbed steel, and every turn attends;
Uuerring aimed, the missile weapon flew,
And, plunging, strike the fated victim through.
While his heart the fatal javelin thrills,
And flitting life escapes in sanguine rills!

Falconer.

Among the indentations of the coast of Western Africa, the bay of Walwich may be traced upon the chart. This bay was much resorted to, in years past, for the right-whale—or the species that live by what whalers call "*suction*." The bay contains good anchorage ground, and shelter for ships; and, at some periods of the year, known to whale-fishermen as the season for feeding, the coast along its margin is visited by these huge animals in pursuit of food, which consists principally of "peculiar kinds of small fish, that keep in shoal water about the bay and herd or school together in countless numbers. Thousands of the mullet, the roman, the stone-bream, the harder, the mackerel, and many other varieties that abound in African bays, together with myriads of the Medusan race, are sucked in by the right-whale for a breakfast, through the vertical bars of whalebone that stud its mouth, like the gratings of a prison window, or the palings of a picket fence.

There are but few persons who do not know the difference in the formation and habits of the two principal species of the *cetaceous* tribe—the *mysticetus* and the *cachalot*—which are the object of pursuit of the whale-fisherman. They are called the *right-whale* and the *spermacetti*. The former has immense jaws of bone, without any well-defined teeth, but with a groove of dark fibrous material within its huge mouth, called whalebone, through which to strain its food;—keeping mostly in shallow water, and living upon small-fry; disappearing from the surface at short intervals; remaining under water but for a few minutes; breathing, or ejecting from its blow-holes, columns of water, in two perpendicular streams, or *jets d'eau*, on rising to the surface, and producing inferior oil. The latter, to wit, the spermacetti, has tusks of ivory on a huge dropping under-jaw; blunt, clumsy head, and broad tail; frequenting none other than the deepest water; diving deep and perpendicularly; staying long out of sight, and, on rising, blowing or spouting in a single jet, or stream, which inclines to the horizon; and producing a better quality of oil, though in smaller quantity according to its bulk, than the right-whale. The spermacetti yields, in addition to its oil, a valuable matter called *sperm*, which is highly prized as an article of commerce; and also produces that rare aromatic drug, called *ambergris*.

Jethro, with his son Isaac, remained in London, intending, when his business should be finished there, to take passage home in some merchantman bound for the colonies.

The *Grampus* set sail from the Thames. The place of her rendezvous with the *Leviathan* had been appointed at Walwich bay. The *Grampus*, without any remarkable incident, arrived first upon the spot; and had waited for her consort for several days.—Some forty whaling vessels, of all nations, were riding at anchor within the bay, waiting the expected visits from the whales. Day after day—week after week—had glided away, since the arrival of the major part of the fleet, but not a solitary animal had as yet made his appearance. The *Grampus* was fitted out for the sperm-whale fishery, and had taken in her three years' provisions at London. Her captain and crew, who had been some time idle, now longed for sport; and they cared very little,—since wait they must for the good ship *Leviathan*, in order to double The Horn in company,—whether the invitation to amusement should soon come in the shape of a right-whale, a spermacetti, or a razorback;—the last the most dangerous and least productive of all.

Africa has a burning, sultry coast. The sun was sending a lurid glare upon the sea, which heaved long and sluggishly in the bay, without a breath of air to curl the crest of the swell. The crews of the assembled ships were at their early breakfast, and the officers and men on the lookout were lazily gazing upon the mirrored surface of the water, or listlessly walking to and fro upon their posts. In many of the whale-ships,—particularly in those that had previously been in Northern latitudes,—a crow's nest, or a sort of sentry-box, surrounded, breast high, by canvass stretched as a protection against the weather, and covered with an awning,—was perched on the maintopmast, or at the topgallantmast head. In these places of look-out a man is always stationed to observe the approach of the whale, and to communicate his motions to those on deck. But in the *Grampus*,—destined as she was for temperate latitudes in the Pacific,—no other accommodation was provided for the sentry, than the bare maintopgallant cross-trees, where for hours together the lynx-eyed watcher sent forth his anxious regards upon the ocean, and deemed his station a post of honor,—as it always proved of extra profit, if he should be the first to discover a whale within pursuing distance.

"Dull work!" said Seth, slowly pacing the deck;—"work," by my hopes!—in this accursed climate, where scorching air blows from the great African desert:—and as for amusement,—we may feast our eyes, if we like, by looking upon armies of naked Hottentots, 'capering ashore,' smeared with slush, and surfeiting upon tainted blubber!—who mock us in our commands, as we coast along the bay,—repeating, as they follow us, our very words like an echo—and mimicking our minutest actions, when we attempt to make ourselves understood by signs. Poor brutes!—The Creator has smitten their continent and their minds alike, with barrenness; and has given to the one its arid plains, which defy the hand of cultivation,—while the souls of the people are unblest with the refreshing dews of intelligence. But what boots it?—they are happier, in their ignorance, than we who boast of knowledge, but who are restless in our desires.

—As the Ocean—

In one unceasing change of ebb and flow."

The reflections of Seth, upon the blessings of ignorance, were interrupted by a thrilling cry from the mast-head.

"*Flocks—flocks!*" was the welcome salutation from aloft. The half-eaten meal was broken off,—and the rush to the boats was tumultuous. It was like that of an army of practised gladiators, in the arena of the Coliseum. The alarm was heard by the crews of other vessels; and the intelligence spread like wildfire that a whale was entering the bay.—Four boats were lowered—manned—and put off from the *Grampus*, in less than half a minute after the cry was uttered aloft. A hundred other boats were instantly in motion, and bearing down upon the animal. Some, however, took the precaution to separate from the rest, and this divided the chances of capture. None could count with certainty upon striking the prey, for his course was irregular while in pursuit of his food. The whale is not a vicious animal, unless wounded; and, if not frightened, will move off sluggishly from his pursuers, and appear and disappear at regular intervals:—so that, if the direction is well observed when he sinks, (or shows his *flocks*, or forked tail, as he dives,) a pretty accurate calculation may be made as to the place of his reappearance.

The whalers in the boats that had scattered, had their share of excitement in turn; while those who had headed the whale, when he sunk from their sight for the first time, saw with mortification, by the indication of his *flocks*, that he had already deviated largely from his first course. As a score of

others were already near the spot where he would next rise to blow, the first pursuers naturally lay upon their ears;—but they were watchful of the event of the chase.

Macy, with his two mates, and an approved boat-steerer, had each command of a separate boat. The selection of the crews for these boats, is in fact a matter of taste or favoritism with these officers of the ship. The captain has the first pick of the whole crew;—and, if his judgment is good, he chooses those of the most powerful limb and muscle, quickness of apprehension, and readiness of execution. The next choice falls to the first mate;—the second officer's turn comes next;—and the siftings of the crew fall to the boat-steerers. It may readily be believed that Macy, who was an experienced whaler, was altogether discreet in his choice, and had a crew of oarsmen who might be pitted against any other crew of the whole fleet. To say that they were Americans, and experienced whale-fishermen, is sufficient assurance, of itself, that they were competitors for all whaling honors, against the whole world. It is still, as it was eminently then, altogether un-American to admit of superiority in this business. It was, therefore, with deep chagrin that Macy saw the game escape him; for thus far he had led the van of the attack; while the whalers in some fifty boats in the rear, if not altogether content that he should be their leader, were at least satisfied, that to be beaten by him was no dishonor.

The Englishman, the Dane, the Dutchman, the Swede, as also representatives, of other European nations, were Macy's ambitious competitors, for the honor of killing the first whale of the season—the long and the strong pull was exerted to carry off the prize, and fair words of encouragement were offered, and enforced in the blandest and most persuasive manner, by those who controlled the boats. Some, uselessly enough, where so many were engaged, pulled after the animal in his devious course after food; while others rested on their oars to watch the result, and to take advantage of his wanderings. The scene was most animating—and but a few minutes served to scatter the boats in every direction; to sprinkle the bay with dark moving spots; to people it with life—sinewy life; in short, it was an exhibition of the noblest of God's creation, both animal and human, waging a war of extermination, and threatening death and destruction by collision.

The noble animal—for it was a right-whale of the largest class—held on its course up the bay, scooping its food from time to time, and annihilating its thousands of small fish at a dive; leaving the boats far in the rear, and darting off in new directions, until those who were most on the alert, or rather those who pulled the most constantly, were fain to give up the chase and lie on their oars. The whale approached the anchorage ground of the ships; and its speed was increased as it shoaled the water, in proportion to its eagerness after its flying victims. The small fish, driven before their huge devourer, clubbed together, and concentrated in schools of such magnitude, that the ships were surrounded, as it were, with a dense mass of animal matter, huddling together for common safety, or flying in swarms, before their common enemy, like the multitudinous and periodical flowings of the herring from the Greenland seas.

Intent upon his prey, the whale appeared unconscious of the dangerous vicinage of the ships, and played among them with a temerity that evinced a tameness, or perhaps an ignorance of its danger, that plainly showed he had never been chased by the whaler, nor hurt by the harpoon. His eager pursuit after food may, however, account for his recklessness; for, generally speaking, the instinct of the whale is sufficient, upon all occasions, to avoid an unusual object floating upon the water; and at such times the nicest stratagem of the art of the whaler is required to capture him.

The persecuted tribes have been chased so often—pursued so relentlessly, from haunt to haunt, that they must not be unnecessarily scared; for, if they are, the pursuit may as well be abandoned first as last. No crew can row a boat, for any length of time, to keep pace with a frightened and fugitive whale.

The animal, gorged with its fishy meal, at last commenced its retreat from the bay; and the boats manœuvred to head him off as he retired. Obeying the instinct of his nature, he now showed his *flocks* and vanished from the sight, before the boats could get within striking distance. A calculation being made where he would next appear, (for beneath the water the whale does not deviate from a direct line in his horizontal progress,) a general race ensued; and each strove, as if life were on the issue, to arrive first upon the spot. Some twenty minutes' steady and vi-

gorous pulling found the foremost boats a full mile behind the whale, when he arose again to breathe.—Several boats were unluckily ahead of Seth in the chase, as their position at starting enabled them to take the lead, when the animal began to push for deeper water. But Seth's men had been resting on their oars, while nearly all others had exhausted their strength, in following the whale among the ships; and the captain judged rightly, that in darting after his toney prey, he would lead them all a bootless dance. He had determined to wait for the retreat, and then to hang upon the rear of the enemy. There were others, however, acquainted with the soundings of the bay, whose tactics were scarce inferior to Seth's; and the advantage gained over him by several boats was proof of this, or at least of the superior accuracy of their calculations. It was a long time since Seth had given chase to an animal of the right-whale breed;—he had grappled, of late, only with the spermacetti.—and, therefore, it was not to be wondered at, at this time, and under the circumstances, that some of those around him should beat him in manœuvring in the bay. But, in the steady chase, he knew that he could count upon the speed and bottom of his boat's crew, and he was now resolved to contest for the victory.

"We have a clear field now, my boys—give way steadily—we gain upon them—give the long pull—the strong pull—and the pull together—keep her to it—heave ahead, my hearties!" Such were the words of Seth, as with eyes steadily fixed upon a certain point, and with his steering oar slightly dipping at times, he guided the light whale boat unerringly towards the place where he expected the whale to re-appear. One by one he had dropped his antagonists by the way, until three only remained manfully struggling between him and the prize. The whale again breathed at the surface, and the distance between the headmost boat and the animal was found to be diminished to half a mile—while the ships in the bay were run "hull down." The pursuers were now out upon the broad ocean. Those who had abandoned the chase in despair, were slowly returning to their ships. The rigging of the vessels were manned by anxious spectators, watching the motions of the tiny specks out at sea, with beating hearts. The whale again cast his flooks into the air, and sank from the view of his pursuers. Now came the tug of war.

"You must beat those foreigners ahead," said Seth, to his men, "or crack your oars: they are of good American ash, and will bear pulling," continued he:—"Give way with a will!—Pull—pull, my lads;—that whale will not sink again without a harpoon in his body:—and 'twill never do to tell of at home, that we allowed men of other nations to beat us. Keep your eyes steadily on your oars;—mark the stroke of the after oar, men—and give way for the credit of the Grampus!"

Here Seth braced himself in the stern-sheets—seized the steering oar with his left hand, and placed his right foot against the after oar, just below the hand of the oarsman.

"Now pull for your lives!" said he, "while I add the strength of my leg to the oar!—Once more!—Again, my boys!—Once more—There,—we pass the Spaniard!"

"Diabolo!" exclaimed the mortified native of Spain.

The additional momentum of Seth's foot, applied to the stroke oar, had done the job; but two more boats were to be passed,—and quickly too,—or all the labor would be lost.

"At it again, my boys!—steady—my God, give way!—give way for the honor of the Grampus. One pull for old Nantucket!—and—there—we have shown a clean pair of heels to the Dutchman!"

"Hagel!—Donder and blizem!" said the Hollander.

"There is but one boat ahead," said Seth;—"It is the Englishman!—We must beat him too, or we have gained nothing! Away with her, down upon him like men!—One pull for the Grampus, my boys!—another for old Nantuck!"

The American now shot up alongside of the English boat;—but the honor of the nation, too, was at stake; and they bent to their oars with fresh vigor. Five athletic Englishmen, each with a bare chest that would have served for the model of a Hercules, with arms of brawn and sinew, swayed their oars with a precision and an earnestness, that, for a minute, left the copest doubtful. The English commander, seeing how effectually Seth managed the stroke oar with his foot, braced himself in a similar attitude of exertion;—and his boat evidently gained upon the Nantucketer! Seth saw the increase of speed of his rival with dismay. The

whale, too, was just rising ahead. The bubbles of his blowing, and of his efforts at rising, were beginning to ascend! It was a moment of intense anxiety. The rushing train, or vortex of water, told that he was near the surface. Both commanders encouraged their men anew by a single word; and then, as if by mutual consent, all was silent, except the long, measured, and vigorous stroke of the oars.

"For old England, my lads!" shouted the one.

"Remember old Nantucket, my boys!" was the war-cry of the other.

Both plied their oars with apparently equal skill; but the hot Englishman lost his temper as the boat of Seth shot up again, head and head with him—and he surged his foot so heavily upon the after oar, that it broke off short in the rowlock! The blade of the broken oar became entangled with the others on the same side, while the after oarsman lost his balance, and fell backward upon his leader.

"I bid thee good bye!" said Seth, as he shot ahead.

"Hell and damnation!" vociferated the Englishman.

"Way enough—peak your oars!" said Seth to his men. The oars bristled apeak, after the fashion of the whale-fishermen. The harpooner immediately seized and balanced his weapon over his head, and planted himself firmly in the bow of the boat. At that instant the huge body of the whale rose above the surface; and Seth, with a single turn of his steering oar, brought the bow dead upon the monster, a few feet back of the fin. Simultaneously with the striking of the boat, the well-poised harpoon was launched deep into the flesh of the animal.

"Starn all!" shouted Seth.

The boat was backed off in an instant; and the whale, feeling the sting of the barb, darted off like the wind! The well-coiled line flew through the groove of the bow-post with incomparable swiftness, and it presently began to smoke and then to blaze with the rapidity of the friction. Seth now took the bow with his lance, exchanging places with the harpooner, and quietly poured water upon the smoking groove, until it was cooled. The oars were again peaked, and the handles inserted in brackets fixed on the ceiling of the boat beneath the thwarts—the blades projecting over the water like wings; and the men, immovable, rested from their long, but successful pull:—and much need did they have of the relief, for a more arduous, or a better contested chase, they had never experienced.

The line in the tub was now well nigh run out; and the boat-steerer, with a thick buckskin mitten, or nipper, as it is called, for the protection of his hand, seized hold of the line, and, in a twinkling, caught a turn around the loggerhead, to enable the man at the tub oar to bend on another line.

The rapidity of the animal's flight the while was inconceivable. The boat now ploughed deeply and laboriously, leaving banks of water on each side, as she parted the wave, that overtopped the men's heads, and effectually obscured the sight of every object on the surface. The swell of the closing water came after them in a heavy and angry rush. The second line was now allowed to run slowly from the loggerhead; and a drag, or plank about eighteen inches square, with a line proceeding from each corner, and meeting at a point like a pyramid, was fastened to it, and thrown over to deaden the speed of the whale. Another and another drag were added, until the animal, feeling the strong backward pull, began to relax his efforts:—and presently he suddenly descended, though not to the full extent of the slackened line.

It now became necessary to haul in the slack of the line, and to coil it away in the tub carefully; while the men pulled with their oars, to come up with the whale when he should rise to the surface. All things were soon ready again for the deadly attack.

The ripple of the whale, as he ascended, was carefully marked; and when he again saw the light of day, a deep wound, close to the barbed harpoon, was instantly inflicted by the hand of Seth. It was the death blow.

"Starn all!" was the cry once more—and the boat was again quickly backed off by the oarsmen.

The infuriated animal roared in agony, and lashed the ocean into foam. The blood gushed from his spout-holes, falling in torrents upon the men in the boat, and coloring the sea. The whale, in his last agony, is a fearful creature. He rose perpendicularly in the water, head downwards, and again writhed and lashed the sea with such force, that the people in the retreating boats, though ten miles distant, heard the thunder of the sound distinctly. The exertion was too violent to last long:—it was the

signal of his dissolution. His life-blood ceased to flow, and he turned his belly to the sun! The wail of the Grampus floated triumphantly above the body of the slaughtered Leviathan of the deep—and the peril of the hardy crew was over.

TALES AND SKETCHES, SUCH AS THEY ARE, by Wm. L. Stone, 2 vols.—Unwonted neglect on our part, and an accidental misplacing of these sprightly and agreeable volumes, have delayed this notice, which should have been given some weeks ago. We mention them now with unavoidable brevity—our columns being crowded with matter previously prepared—because we are unwilling to continue the delay. In the deluge of multifarious publications through which we wade every week, we are happy now and then to find a work strictly American, though it is seldom that we have to notice two publications on the same day to which that characteristic applies. It is certainly no mean recommendation of "Tales and Sketches." They come before the world unpretendingly, and from a writer who, in a different capacity, has long entertained and effectually served the public. We are glad to see that he can occasionally depart from the drudgery of a daily paper to luxuriate in the regions of fancy, and, while doing so, can weave into his fiction so much that is valuable and interesting of historical fact.

A BRIEF VIEW OF THE CONSTITUTION OF THE UNITED STATES, by Peter S. Duponceau, LL. D.; Philadelphia.—This work by the venerable provost of the Law Academy of Philadelphia, should be perused by every one who would familiarize himself with the opinions of one of the most celebrated lawyers in our country upon the most important instrument in its archives. The volume is for sale by Mr. Wiley, Nassau street, and also at Carvill's.

JOHN MARSTON HALL, by the author of *Richelieu*; 2 vols., Harpers.—The mantle of Sir Walter, like that of Shakspeare, will hardly within the same century, if ever, descend upon another. But among all the competitors for the wand of the great magician, Mr. James certainly deserves the palm for success, in the heroic romance. He treads more gracefully, and with more vivacity, in the steps of his great master than any of his pupils; though the measure in contrast is still but the walk of a minuet to the march of a giant. The present production will be read with pleasure by his admirers as reviving agreeable associations with a former favorite,—the hero being "Little Ball O'Fire," the spirited urchin that figures in so many scenes in the life of "Henry Masterton." The scene of the story is laid at the French Court in the reign of Louis the 14th, and the details are managed with all that minute knowledge and keeping of costume in which Mr. James is second only to the great Scottish antiquarian.

THE COMPLETE WORKS OF SIR WALTER SCOTT, with a Biography, &c. &c., Vol. VI. New York—Conner & Cooke.—In calling the attention of our readers again to this cheap publication, we could only repeat the terms of approval applied to the previous volumes, the present one being, in every respect, equal to the others. It contains, with *Tales of a Grand Father*, the *Lives of the Novelists* and his *Notice of Byron*, &c.

LECTURES ON PHRENOLOGY, DELIVERED BEFORE THE YOUNG MEN'S ASSOCIATION FOR MENTAL INSTRUCTION, IN THE CITY OF ALBANY; by Amos Dean.—We had marked a long extract from this work, for quotation, as the best mode of showing its claims upon the general reader. It shall be given hereafter; and, in the meantime, we can only observe, that those who would be readily initiated into the new science that is so rapidly gaining ground in the teeth of all ridicule and opposition, are much indebted to Mr. Dean for his neat and comprehensive essay.

THE REPUBLIC OF LETTERS, No 3.—We have intended as each successive number appeared, to no-

tice this judicious publication. To those who are not apprized of the plan upon which it is conducted, it is merely necessary to observe, that it is a weekly issue of a beautifully printed quarto sheet at six cents a number, each number containing one or more octavo volumes. When it is added that "The Man of Feeling" and "The Vicar of Wakefield," two of the finest classics in our language, may thus be had for the sum of 12 1/2 cents, it will be seen, that both from the true taste and the liberality with which it is conducted, there can be no publication which promises better to diffuse abroad a knowledge of the models of polite literature than the Republic of Letters. The last number published contains "The Tales of the Hall," by Crabbe, one of the most vigorous of modern writers. His style, indeed, though strikingly original, is often overdone; and his subjects are of so coarse a character as frequently to leave a harsh and unpleasant impression upon the reader; but there is ever a truth to nature in her humblest guises, which renders his minute delineations and skillful dissections of character invaluable.

North American Review.—The eighty-fourth number of this journal will appear on the first of July. The contents are as follows:—1. Life of Schiller.—2. The Philosophy of History.—3. Roman Literature.—4. Usury and the Usury Laws.—5. The Free Cities of Flanders.—6. Life and Writings of Crabbe.—7. Helen.—8. Miss Peabody's Key to History.—9. Origin and Character of the Old Parties.

[From the Journal of Commerce.]

FURTHER FROM LIBERIA.—In yesterday's paper we announced the death of Rev. Matthew Laird and wife missionaries of the Western Foreign Missionary Society, who arrived in the Colony on the 31st December. We have now the painful duty to add the death of Rev. John Cloud, missionary of the same society, and Rev. S. O. Wright, of the Methodist Missionary Society. The wife of the last named gentleman died in February last. Her death has been before announced. Among the emigrants by the *Jupiter*, which arrived at the Colony on the 31st December, there had been no deaths except a woman of seventy five years, and two children under twelve. Mr. and Mrs. Spaulding, Methodist Missionaries, were to leave Liberia on the 12th of May, in the ship *Argus* for Boston. Their object is, to procure a reinforcement and recruit their health. They are soon to return to the Colony, as is also Mr. Temple, a colored Assistant missionary, who has arrived in the *sch. Edgar* at this port. Mr. Jones, who has also arrived in the *Edgar*, is about to proceed to Kentucky for his family. The general health of the Colony is good. We have had the pleasure of an interview with Messrs. Temple and Jones, and are happy to state that they are in excellent spirits in regard to the Colony, and think it the best place for the colored man which the world affords. Mr. Temple has not fully recovered from the effects of the fever. Annexed is a letter from Rev. Mr. Pinney, Colonial Agent, to R. S. Finley, Esq.

Monrovia, May 10, 1834.—Mr. Temple, the last of the band of Presbyterian missionaries who landed in Africa the first of January last to try its perils, will hand you this note, and communicate more at length the tidings my pen is loth to speak.

Mr. T. will, I trust, do good while at home. He is desirous of ordination and expects to return very soon. The vessel sails in about two hours, and time is short. Our losses do not dishearten me. I trust the church will not be discouraged. God is about to try us, but I hope some good will be found, and faith which shall not tremble though a thousand fall.

From Liberia papers received at this office.

Monrovia, Jan. 29.—Native Coffee Trees.—Professor Wright, in the Colonization debate between him and Mr. Finley, was positive that coffee trees were not indigenous to this part of the coast, but came from an African Island. If the Professor would take the trouble to pay us a visit, we would show him a dozen varieties of the coffee plant, in our immediate vicinity, growing spontaneously in our woods.

Grand Bassa Settlement.—Recent accounts from *Edina*, represent this settlement in a most flourishing condition, and so industrious had the settlers been, that 15 shingled houses had already been erected.—The recent purchase of the Devil's Bush, had given

great satisfaction to all parties, and but little time would elapse, when that spot, so long consecrated to the unhallowed rites of Moloch, would be covered with Christian inhabitants.

Monrovia, Feb. 25.—Houses for New Emigrants.—Two extensive buildings (one of which is nearly completed) are now erecting in a pleasant part of our town for the reception of new comers.

Erection of a Light House on Cape Messurado.—It is proposed to erect a Light House on Cape Messurado, for the benefit of our infant commerce. The want has long been felt, and several ship-masters have wondered that a small tax had not been levied before now, to defray the expenses of the same.

Erection of a Sawmill.—Measures are in train for the erection of a Sawmill on the creek nearly opposite Millsburgh, on the St. Paul's River. It is a pity that we have not one or two steam mills in operation for sawing lumber, as the natives have lately adopted the commendable plan of rafting down logs suitable for sawing, to our water's edge; and now they have adopted the plan themselves, there will be no difficulty in keeping them so employed, if suitable encouragement is held out.

Price of Rice and Coffee in the Settlement.—From a perusal of a late number of the *Genius of Universal Emancipation*, which has been politely furnished us by the Editor, a person would be led to believe that our Colonists really paid at the rate of 25 cents per pound for rice, and 70 cents for coffee. This is something new to us and our readers, to hear that African rice has been sold by the pound in our market.

We assert without fear of contradiction, that we have never known rice, (in times of greatest scarcity, which is during the rains, before the new rice is fit for cutting,) to sell for more than two dollars and fifty cents per bushel. To arrive at a fair rate, at which rice should be quoted, will be, to put it down at one dollar and sixty cents the bushel; as during the season when all prudent persons should lay in their rice, it can be purchased for one dollar per bushel, and often for less. Estimating a bushel at sixty-eight pounds, it would then give nearly two one-half cents per pound, instead of twenty-five. A wide difference. Coffee grows wild around us, and it a little encouragement was held out to the natives, might be purchased at a moderate rate, at least enough for home consumption.

Our Colonists have not paid much attention to the culture of this important berry, but we know one family, who have for years raised more than enough for their own consumption from trees of their own planting. We have never seen sixty cents per pound paid for coffee yet, and we are doubtful if it has ever been.

LATEST FROM EUROPE.—By the ship *New York*, Captain Hoxie, which arrived last night from Liverpool, from which port she sailed on the 26th May we have received London papers to the 25th inclusive. The *Manchester*, Capt. Swift, had already put us in possession of Paris dates of the 24th; and by the *France*, which arrived to-day, our files are completed up to that time. The French papers are devoted to the obsequies of Lafayette, with which the Parisians seem to be wholly engrossed. In London, the critical political topic of Chure Reform was net less absorbing. "It again," says a London paper, "formed the prominent subject of discussion in the House of Lords last night. The Tory Temporal Peers and some of the Right Reverend Prelates, amused themselves with vehement discourses on the mode in which the Lord Chancellor brought in the Bills for the suppression of Pluralities and Non-Residence; that is to say, for moving their first reading without a more formal notice to their Lordships. We think that the Peers would better consult their public reputation if they would interest themselves more liberally in the subject matter of Church abuses and their remedies."

It is mentioned in one of the French papers, that M. Lafitte entertained the project of proposing to the Chamber of Deputies that the body of General LAFAYETTE should be deposited in the Pantheon, but renounced it on learning that it was the decided wish of the family that the directions of the deceased as to his interment should be scrupulously followed.

All the ministerial papers contain eulogies on this

consistent and persevering friend of human liberty. The military honors paid to him were those which belong to a General in Chief. The account of the funeral will be found below.

The following is a translation of the letter addressed by the President of the Chamber to his Son, in reply to one from him announcing his father's death.

Sir, and Dear Colleague.—The Chamber has learned, with deep sorrow, the loss she has just sustained. The death of General LAFAYETTE deprives the Chamber of one of its most illustrious members—of a great citizen, whom liberty has ever found faithful to her cause, in every period when she needed a defender. The revolution of July found him again at the head of that brave National Guard of Paris, whose patriotism and devotion have never failed to comport with the device of "Liberty, public order," inscribed on their banners.

The name of General LAFAYETTE will ever remain celebrated in our annals. He will appear there amongst the principal founders of the Constitutional monarchy, which he with us, cheered onward in its course, and which had his best wishes. Accept, &c.

Signed, DUPIN.

FRANCE.—"The Parisian papers (says a London paper,) continue to be much taken up with remarks upon the character of Lafayette, to whose memory, with the exception of the Carlist party, they do the justice which we have ourselves already rendered to him, of being a most respectable private character, an ardent patriot, but not very profound politician."

The funeral took place on Wednesday, and from the public character of the deceased, both as a member of the Chamber of Deputies and a General, was invested by the Government with all the imposing pomp which the attendance of numerous bodies of military never fail to give to processions of this description, and of the National Guards, who came forward in immense numbers, to join in giving effect to this parting act of homage to their venerable colleague.

Funeral of Lafayette.

From an early hour on the morning of the 22d of May, the Rue d'Anjou St. Honore, in which the hotel of the late lamented Lafayette is situated, and every street and passage in its vicinity, was crowded with citizens of Paris, hastening to pay their last tribute of respect and attachment to the illustrious deceased.

The funeral ceremony (says Galignani's Messenger, from the public character of the deceased, both as a member of the Chamber of Deputies and a General, was invested by the Government with all the imposing pomp which the attendance of numerous bodies of military never fails to give to processions of this description; while the attendance of the National Guards, who came forward in immense numbers, to join in giving effect to this parting act of homage to their venerable colleague, and the crowded state of the streets leading to the Church of the Assumption, where the funeral ceremony was to be performed, and from thence along the Rue de la Paix, the entire length of the Boulevard, and every spot near which the procession was to pass, showed the extent of the popularity, and the affectionate esteem with which the deceased was regarded by every class.

About half past seven the members of the various deputations appointed to take part in the procession began to arrive at the hotel, which was handsomely hung with black. Among these were numbers of staff officers, of the troops, and the national guards. Detachments of infantry were placed as guards of honor in the commencement of the Rue de Faubourg St. Honore, the Rue Royale, the Rue St. Florentin, and other points by which the procession was to pass.

At a few minutes after nine the body was brought down and deposited in the hearse, which was decorated with twelve tri-colored flags, three at each corner; it was surmounted by plumes, and had the letter L on various parts of the drapery, and was drawn by four black horses. The cordons of the hearse were held by four persons of distinction, friends of the deceased. After a few minutes spent in preliminary arrangements, the funeral march struck up, and the cortege began to move. The hearse was preceded by muffled drums, deputations from various legions of the National Guards of Paris, and the Banlieu, the 61st Regiment of the Line, and a regiment of Red Lancers. The hearse followed, which was immediately succeeded by the Deputations of the Chambers of Peers and Deputies; other deputations followed, from various public bodies, among whom we perceived numbers of foreign

ers, particularly Americans and Poles. These were succeeded by *Chefs de Butillon* of the National Guards and the Line, and these again followed by other detachments of National Guards and troops of the Line, headed by muffled drums and full military band; two pieces of cannon, and detachment of the 1st regiment of Artillery, with a numerous body of cavalry of the National Guards. Four of the Royal carriages, three private ones of the General, followed by another regiment of the Lancers, several private carriages, and a body of Municipal Guards, wound up the procession.

The immense crowds, and the small space left for the military, occasioned considerable confusion previous to arriving at the church, for want of room the hearse being stopped on one occasion more than a quarter of an hour. The coffin was then taken into the church, and the funeral ceremony being performed, the procession again proceeded; and, notwithstanding the incalculable crowds assembled, has passed the Rue de la Paix, and is now (as we are going to press) far advanced on the Boulevard, with the most perfect order and regularity.

All the Ministers (says the same Gazette) on leaving the Council held by the King on the preceding day at the Tuilleries, went in a body to make a visit of condolence to the family of Gen. Lafayette. They were received by M. George Lafayette, and were conducted by him to view the body. An immense number of persons of all classes called in the course of the day, and inscribed their names as participants in the general grief.

At a meeting of the citizens of the United States in Paris, held on the 21st at the Hotel of the American Legation, to take into consideration the most appropriate manner of expressing their sorrow for the loss they and their country have sustained by the death of the great and good Lafayette.—Thomas B. Barton, Esq. Chargé d'Affaires of the United States, was called to the chair, and Dunscomb Bradford, Esq. American Consul, was appointed Secretary.

The following resolutions were offered and unanimously adopted:

Resolved, That we have heard of the death of our illustrious fellow citizen, the virtuous Lafayette, with feelings of the deepest sorrow and regret—

Resolved, That the citizens of the United States, now in Paris, will attend in a body, the funeral of Lafayette, in testimony of the high respect they entertain for his exalted character, as the undeviating friend and defender of the liberties of their country, and of those of the human race.

Resolved, That a committee be appointed to address a letter of condolence to the family of Gen. Lafayette, expressive of their deep sympathy in the afflicting dispensation with which it has pleased Divine Providence to visit them.

Resolved, That as a further testimony of their high admiration for the virtues and perfect consistency of character of Lafayette, through a long life, and under the most arduous circumstances, they will wear crape upon the left arm for three months.

On the motion of Mr. Brooks, seconded by Mr. Adams, it was then

Resolved—That a copy of the foregoing resolutions be communicated by the Secretary of this meeting to the family of the illustrious deceased, and that the proceedings of the meeting be published.

On the motion of Mr. French, seconded by Mr. Blow, it was

Resolved, That the United States, as far as they are represented at this meeting, each furnish a member to constitute the committee to address the letter of condolence to the family of General Lafayette: whereupon, the following gentlemen, representing seventeen States of the Union, were, on the motion of Mr. Hayne, seconded by Alex. Claxton, Esq. U. S. Navy, named that committee:—

Dr. Wood, of Maine.
N. Niles, Esq. of Vermont.
Charles Brooks, Esq. of Massachusetts.
J. Dennison, Esq. of Connecticut.
Mr. Burns, and Mr. Brevoort, of New York.
Philip Kearney, Esq. of New Jersey.
Dr. A. B. Tucker, of Pennsylvania.
Alexander Claxton, Esq. U. S. N. of Maryland.
Rev. F. S. Mines, of Virginia.
Arthur P. Hayne, Esq. of South Carolina.
Dr. L. A. Dugas, of Georgia.
W. P. D'Arusment, Esq. of Indiana.
Dr. A. P. Elston, of Kentucky.
J. S. Pomeroy, Esq. of Mississippi, and
D. Urquhart, Esq. of Louisiana.

On the motion of Mr. Townsend, Mr. Barton and Mr. Bradford were *ex officio* placed on the Committee. After a short adjournment, the Chairman, in the name of the Committee, reported a letter of con-

dolence to the family of General Lafayette, which was unanimously adopted. On motion of Mr. Hayne, seconded by Mr. Brooks, it was resolved, that an eulogy on the illustrious character of the revered Lafayette be delivered before the American citizens at Paris. On the motion of Mr. Brewster, seconded by Mr. Niles, it was also resolved, that five gentlemen be named by the Chair, to constitute a Committee of Arrangements, to provide for the execution of the preceding resolution; whereupon, Mr. Brewster, Mr. Niles, Mr. Atherton, Mr. Brevoort, and Mr. Brooks, were named that Committee. It was then resolved, that the proceedings of this meeting be communicated by its Secretary to the Legation of the United States at Paris, with the request that they may be recorded on the books thereof—and the meeting adjourned.

DOG CHEAP.—It is stated that during the year 1833, there were no fewer than 30,000 Crosses of the Legion of Honor conferred by the French Government, and that up to the 1st of May, in the present year, the number granted had exceeded 18,000. This approaches, in the distribution of honors, very nearly to the principle of universal suffrage.

The Chamber of Deputies had voted the budget of receipts, and has thus closed its labors. It will probably not again be convoked, except to hear the word dissolution. All France appears tranquil at present.

The Marquis de Fitzjames, who was sentenced by the Court of Assizes for the Somme, to imprisonment for three months, for chalking on the wall at a public inn, the words "Vive Henri V." has surrendered himself at the prison at Amiens, to undergo his penalty.

A splendid sword has been subscribed for, and presented to Marshal Gerard, in commemoration of the capture of Antwerp.

In 1833 the number of Volunteers who enrolled themselves in the army, amounted to 5591.

SPAIN.—[The Cortes are convoked to assemble on the 24th July. The Carlists still continue to struggle against the Government of the Queen; and one of their chiefs, General Zumalacarraguy is accused of acting with the greatest ferocity. Colonel O'Donnel, the son of the Count D'Abisbal, having fallen into his hands, the following is given as the dialogue which occurred between him and Carlist's General's Aid-de-Camp, before his execution.]

"Aid-de-camp: My general desires me to offer you not only quarter, but your continuation of your present rank, with a certain command, if you will swear fidelity to the King, Don Carlos V."

"O'Donnel: I cannot be a traitor to my honor. I have sworn fidelity to the Queen, as well as to the nation, represented by its Cortes. I have no other sovereign than those."

"Aid-de-camp: Reflect well on what you say, colonel—the death of an officer like yourself will be pitiful."

"O'Donnel: To die for my country, is to die for immortality."

"Aid-de-camp: And what shall I say to my general?"

"O'Donnel: That I will give a certain sum of money for my release, but that if my release is to be effected at the cost of a perjured oath, I would rather die a thousand times than take it."

"In consequence of this obstinacy, O'Donnel was ordered to be shot. He marched with calmness and serenity to the ground, exhorting the soldiers who were to suffer death with him to bear their fate like men, and exclaimed at the moment that the word 'fire' was given—'We die in defence of the Queen and the rights of the nation.'"

MADRID, MAY 14.—I have received the Gazette in time for the Courier. It contains, as you will see, an order from Martinez de la Rosa to the Captain-General of Castile, instructing the Sub delegate of Fomento and the Corregidor of Madrid to prepare suitable chambers for the meeting of the Courts of both one and the other Estamentos, which is to take place on the 24th July next. The order is dated Aranjuez, May 12.

The same Gazette contains a Royal order appointing Jose Martinez de San Martin to the post of Superintendent General of the Police of the Kingdom, as well as some orders for changes in the municipality of Jerez, near Cadiz, in consequence of a Carlist disturbance which took place there on the 7th inst.

The Four per cents yesterday were at 55 1/2. M. Martinez, a merchant of Cadiz, has offered to equip 100 Urbanos at his own expense.

The Royal Council of Spain and India will be installed on the 15th inst.

Intelligence has been received this morning of the capture of and declaration of Coimbra, on the 8th, in

favor of Donna Maria, and of the junction of Rodil and the Duke of Terceira. This news has raised the Funds one per cent, and the Fours are now at 57.

A conspiracy was discovered here last night, the particulars of which have not transpired. It is not a very serious matter.

PORTUGAL.—[The news from Lisbon is to the effect that Figueras and Coimbra have surrendered to the Pedroites. Both are said to have fallen without a blow being struck. Figueras was taken possession of by Admiral Napier, and Coimbra by the Spanish and Portuguese forces: the former under the command of General Rodil, and the latter under that of the Duke of Terceira. The Miguelites are still strong in the province of Beira, and their superiority in the southern part of the kingdom undisputed.]

Doubts continue to be expressed, in consequence of the non-arrival of the ratification of the Treaty from Lisbon, that Don Pedro hesitates to attach his signature to the State Document; but we are informed, upon what we consider ample authority, that the Treaty has been signed, and it will be conveyed to this country by the Government steamer, the Countess of Pembroke, which was especially appointed to carry out the Treaty and to bring back the document ratified.

GERMANY.—The Augsburg Gazette of the 18th of May, has the following, of the 11th, from Vienna:—"The Spring Festival will be celebrated tomorrow by a *dejeuner d'honneur* in the Imperial Gardens; all the Diplomats are invited. Most of the Germanic Ministers have requested audiences of leave, which indicates that the Congress is about to close. The Emperor will quit the capital for Schönbrunn on the 13th."

SWITZERLAND.—The *National Genevois*, in a postscript of the 9th of May, says—"A traveller from Rumelitz tells us a corps of troops, stated at 50,000 men, is expected in Savoy; it was even said that preparations were made to receive them." Fifty thousand Fiedmontese! a large number. The Journal adds:—"Several pieces of cannon are mounted on their carriages, in order that our ramparts may be properly armed in case of need."

ENGLAND.—*London, May 24.* In the House of Lords, yesterday, several petitions were presented for the protection of the Established Church, and against the claims of the Dissenters. Some petitions were also presented, praying for the separation of Church and State, and in favor of the Dissenters' claims.

The Earl of Harrowby, on presenting petitions for the protection of the Church, admitted that the real grievances of the Dissenters ought, as far as was practicable, to be redressed. But he called upon their Lordships to take care that they did not place that body in the 'vantage ground, by which they might be enabled to continue the attack that they had avowedly made against the Established Church. He trusted that their Lordships would agree with him, and not give their assent to any thing that would endanger the safety of that fabric.

We hear that it is finally determined that all foreign papers shall be admitted into England by payment of three-halfpence per paper, and that the same postage will be exacted for all English papers forwarded to the Continent. It is asserted, but we cannot believe it, that none but newsmen registered for the purpose, will be allowed to receive papers from the Continent.—[Morning Chronicle.]

BELGIUM.—A letter from Frankfort, dated May 2d, says—

"The difficulties in which the question of the cession of part of Luxemburg to Belgium are involved do not appear likely to be soon surmounted. The Dutch Envoy often finds it necessary to ask for new instructions from his Court, and no progress is made. As for the Austrian Envoy, Baron Von Neumann, his time seems almost entirely occupied in journeys from Biberich to Frankfort, and from Frankfort to Biberich. He too appears to be very much in want of instructions."

The Prince of Orange has returned to the Hague from the army.

The New Orleans Bulletin of the 12th has the following:—

Brig General Santa Anna, Vanstaveren, five days from Tampico, reports that a new revolution had broken out in Mexico, that the troops of Orizava and Cordova had declared for a military government, and to maintain the Catholic religion in all its apostolic forms and rules; that the troops of Puebla had declared for religion in the same tone, but to sustain the Federal government; that there had been some blood shed in Puebla; that the Northern States of

Zacatecas and San Louis Potosi, had determined to sustain the forms in religion and the present government.

SUMMARY.

APPOINTMENTS BY THE PRESIDENT.

By and with the advice and consent of the Senate.
John Forsyth, Secretary of State, in the place of Louis McLane, resigned.

Levi Woodbury, Secretary of the Treasury, in the place of Roger B. Taney, rejected.

William S. Holabird, to be Attorney for the District of Connecticut.

Thomas Turner and Fleet Smith, to be Justices of the Peace for the County of Washington, in the District of Columbia.

Charles Scott to be a Justice of the Peace for the County of Alexandria, in said District.

PENSACOLA, June 14.—*Naval.*—The U. S. sloop of War Vandalia, left here, somewhat unexpectedly, on Tuesday last, in search, we understand, of the schooner Experiment. Since the Experiment left Havana, nothing has been heard of her. Fearing that some accident may have happened to her, the commanding officer of the squadron has promptly despatched the Vandalia in quest of her. We learn that the Experiment left this port with only five weeks' provisions of board, and she has been absent upwards of seven weeks.

The suggestion contained in the following paragraph, should not be forgotten:

Some time ago, the British Government sent to that of France a complete set of its Parliamentary papers, consisting of about 600 volumes folio—the result was a similar present from the Government to ours.

A present of a somewhat similar character has been sent to the principal Libraries of the United States. This is well, as it will no doubt lead to a reciprocal exchange on future occasions. We know from experience that American constitutional documents are almost impossible to be found in London. Having had occasion a few years since, to refer to some works which are to be met with in every considerable Library in America, we searched some of the public Libraries in London, but in vain. We have often heard this complaint from others.—[Montreal Advertiser.]

Cholera at Cincinnati.—The Cincinnati Intelligencer of the 23d ult. says: "We hear of repeated cases of cholera in this city, some of which have proved fatal. Many complain of the premonitory symptoms."

Among the deaths at Louisville, of cholera, are those of John F. Anderson, of the firm of Thomas Anderson & Co.; Mrs. Margaret Grey, a native of Philadelphia, and wife of Mr. Jackson Grey, of the New Orleans theatrical company. It has been made certain, that those persons who were supposed to have been poisoned by partaking of food prepared for a wedding party, were cases of cholera.

The Louisville Journal says:—"The Cincinnati Republican has been misinformed in several particulars concerning the recent deaths in this place. The custard was not served to the company at the wedding, but sent to the houses of the guests next day. It was a day or two before any were attacked; the number was not more than twelve or fifteen, of whom about eleven have died. There is great doubt whether any poison has been employed; none has been detected with certainty, in the examinations which have taken place. The Faculty of Louisville have had a meeting on the subject, and are about equally divided in opinion whether poison was or was not used."

The Atlantic Insurance Company have declared a dividend of ten per cent, for the last six months, payable on Monday next.

[From the Journal of Commerce.]

New Banks.—We learn by a gentleman from Poughkeepsie, that the books for the capital stock of the Farmers and Manufacturers Bank in that village, were closed on Friday last—\$1,650,400 having been subscribed. Capital stock \$300,000. The stock of eight banks chartered or increased by the Legislature at the last session, has been offered, with the following results.

Names.	Where.	New Capital.	Subscribed.
Phoenix Bank	New York,	\$1,000,000	\$3,146,925
Lafayette Bank	do	500,000	1,649,000

The Rev. Wm. M. Carmichael has resigned the Rectorship of Christ Church, Rye, Westchester co., and accepted that of St. James', Hyde Park, Dutchess county.—[Churchman.]

The schr. *Sabina*, at New Orleans, reports the wreck of the schr. New Packet, Capt. Ramsdell, which took place on the 20th May, at the bar of Aransas. She is a total wreck. We learn (says the New Orleans Bulletin of the 18th) by the mate, that 82 of the Irish emigrants which went out in the N. P., died of the cholera before they reached Aransas, together with three of the crew.

We find in the Boston Liberator, Mr. Garrison's paper, the following notice, the Editor vouches for the character of the advertiser, and certifies that he is serious in his proposals, and it is actuated by disinterested and general motives:—

A Friend of Equal right, is convinced that our colored brethren and sisters are entitled to all the rights and privileges which are claimed by the whites; that prejudice against color is extremely absurd; and that as long as this prejudice exists, its victims will feel the yoke of oppression crushing them to the earth. He takes the liberty also to state, (being himself what is termed a white man,) should he meet with a suitable opportunity, he is convinced that it would be his duty, and it is his determination to bear testimony against this prejudice by marrying a Colored Woman.

Information would be thankfully received of any young respectable, and intelligent colored Woman, (entirely or chiefly of African descent,) who would be willing to endure the insults and reproaches that would be heaped upon her for being the partner of a white man; and who is either in low circumstances, or would be willing to cede all she has or may have of this world's goods, to the American Anti-Slavery Society, that the mouths of gainsayers may be stopped. Information sent by letter (post paid) to E. K., Chester, Penn. will meet with due attention.

Locusts.—The Flatbush woods are swarming with locusts, which the warm weather seems to have emancipated from their chrysalis. They are rather smaller than the ordinary green locusts, with black bodies, red eyes, and yellow legs and wings.—[L. I. Star.]

[FOR THE NEW YORK AMERICAN.]

Translated from the French.

Can Love exist without Jealousy?

I cannot persuade myself that the stoics, who had held the first rank among the ancient philosophers, could by their discipline procure their followers an exemption from every kind of passion. They knew very well that the passions were so natural to them, that it would be impossible to destroy in man what was so deeply engrained in his constitution. Seneca, who was the master of that sect, freely confessed that the wise man cannot prevent emotions from rising in his soul, but that reason can prevent their swelling into excess. We are a compound of the spiritual and the material: our spirits assimilate us to the angels, and our bodies partake of the animal nature. On the one hand, Moses informs us that the angels have been envious and presumptuous, and on the other, we see every day that animals give a loose to unrestrained passions. We know that maladies are as natural to man as his passions, and that no one has ever attained exemption from them. The body is composed of parts so different in temperament, and we are exposed to so many accidents, that it is impossible for us to escape all bodily discomfort. Some maladies are severe, and others slight; some men who have a good temperament are never troubled with any but slight disorders, which soon pass away. It is the same with the passions of the heart; and wise men, who admit they are not exempt from them, tell us they have none but slight emotions, and that while in some the passions are so powerful as to be dominant, in others, their hold is not so strong but that they may be controlled by salutary remedies.

Since, then, the passions are natural to man, jealousy, which is one of the strongest, and is compared by the Scriptures to death and hell, jealousy, the offspring of love, we are constrained to believe, will never give absolute quarter to any who love. We will expatiate a little in proof of this.

There is no need of our entering here into a description of love. The reader will find many books which unfold its nature; it is sufficient here to speak of jealousy, which is its offspring. We have said elsewhere that beauty in a person of a different sex has fascinations so great that it enchains us, even against our will, and whatever resistance we make is insufficient to defend us against its at-

tacks. Such are its attractions that it gets within our hearts and acquires the mastery of our inclinations. When love is ardent, it keeps the image of the loved object present to our thoughts, though the object be absent, and the individual takes pleasure in discoursing of the loved one. A mind that is in this state, is not capable of accurate discrimination, it receives incorrect ideas mingled with the true; delusions slip in and impose themselves upon it, and it is led to distrust, by the suspicions and conjectures it fabricates. Perhaps a man fears that he has not sufficient agreeable qualities to retain the favor of the loved individual, and thence entertains fears that she is inconstant, and that she has ceased to love him. The weakness of our nature and the delusions of love then transmute these conjectures into proofs, and these doubts into convictions, notwithstanding the assurances we may receive from the individual. Indeed, we can hardly love ardently without jealousy; for after having attained that high degree of passion in which the changeableness of our nature renders it impossible for us to continue, we are obliged to fall into coldness or hatred, at which we arrive as we pass through the gate of jealousy.—Celsus, the illustrious physician, who was a master of the knowledge of human nature, tells us that a man who is become more corpulent than is usual with him, should be in apprehensions of falling sick, because things in this world being inconstant, he cannot continue long in his usual exuberance of health. In like manner, the intelligent observer, when he sees a man the slave of excessive and extravagant love, knows that it cannot long be maintained in the same state. We might here introduce the similitude of sheet iron stoves; soon hot and soon cold again.

A person excited by a strong passion, cannot judge fairly. The mind perplexed with difficulties, and unable to separate the tangled web, is brought into wild disorder, and is subject to continual vacillation. After having combated appearances, and cut off one of the heads of the hydra, it yields again to the whimsies of love; takes chimeras for truths, and the hydra reproduces ten heads for the one it had lost. Then again seeking by all methods to disengage itself from the doubts it has conjured up, curiosity is roused, and examines every trifling circumstance. The object is watched with a scrutinizing and severe espionage. This extravagant mode of proceeding renders the matter worse, and instead of effecting a cure, aggravates the disorder. This is what the ancients intended to convey by the fable they have narrated, that Vulcan disgusted with the infidelities of his wife, resolved to revenge himself upon her by proclaiming his jealousy in the presence of all the gods, expecting them to espouse his cause. But this public disclosure brought him into disgrace among them, and they drove him from Heaven, and his fall to earth brought upon him the discomfort of a broken limb and perpetual lameness. Such is the fate of the jealous; for the sake of exposing the frailty of their wives, they draw upon themselves the derision of the world, and fix a lasting stain upon their own reputation.

They who are accustomed from youth to control their passions, may with ease prevent them from quickening into tumultuous precipitation. Julius Cesar had such force of mind, that, though he had sufficient cause for jealousy, he never succumbed to this horrible passion. That illustrious man did not clamor in public about his domestic injuries. He knew that if he did, even boys would deride him.

Women are by nature more subject to jealousy than men. Being more feeble, they stand in need of masculine protection and succor, and are apprehensive of losing the affection of one from whom they expect them; and as they are also more constant than men, the stream of their love flowing constantly towards the same object wears a deeper channel, and we have observed that jealousy is seldom the attendant of any love but that which is strong and ardent.

Great minds can generally, by the force of reason, resist jealousy, which they receive only at the gate, without admitting it into the mansion. A prudent man, says Aristotle, ought to know the honor that is due to his wife, his children, and himself, and not willfully bring any cloud over it, to obscure its brilliancy.

Having in this chapter been led a little out of my way by the consideration of a passion which is a blot upon love's escutcheon, I shall in my next chapter inquire whether the gay and frolicsome, or the timid and diffident, are most ardent in their attachments; and shall also offer some considerations on the question which is the easier, to gain the affection of a female or to retain it.

BRADDOCK'S DEFEAT.—We extract, to-day, from the appendix to Sparks's edition of the writings of Washington, a notice of the French account of this affair, which will be found interesting. It corresponds generally with that given by Gen. Lafayette, of the same affair, while last in this country, but differs in one point. It seems Captain Beaujeu, who suggested and led the expedition from Fort Du Quesne, was killed, and that the victory was completed by Capt. Dumas; and it must have been from the latter that the Monsieur Du Contrecoeur snatched the laurels.—[Pittsburg Gaz.]

"No circumstantial account of this affair has ever been published by the French, or has it hitherto been known from any authentic source what numbers were engaged on their side. Washington conjectured, as stated in his letters, that there were no more than three hundred, and Dr. Franklin, in his account of the battle, considers them at most as not exceeding four hundred. The truth is, there was no accurate information on the subject, and writers have been obliged to rely on conjecture.

In the archives of the *War Department*, at Paris, I found three separate narratives of this event, written at the time, all brief and imperfect, but one of them apparently drawn up by a person on the spot. From these, I have collected the following particulars:

M. de Contrecoeur, the commandant of Fort Duquesne, received intelligence of the arrival of Gen. Braddock and the British regiments in Virginia. After his remove from Will's Creek, French and Indian scouts were constantly abroad, who watched his motions, reported the progress of his march, and the route he was pursuing. His army was represented to consist of three thousand men. M. de Contrecoeur was hesitating what measures to take, believing his small force wholly inadequate to encounter so formidable an army, when M. de Beaujeu, a captain in the French service, proposed to head a detachment of French and Indians, and meet the enemy in their march. The consent of the Indians was first to be obtained. A large body of them was then encamped in the vicinity of the Fort, and M. de Beaujeu opened to them his plan, and requested their aid. This they at first declined, giving as a reason the superior force of the enemy, and the impossibility of success. But at the pressing solicitation of M. de Beaujeu, they agreed to hold a council on the subject, and to talk with him again the next morning. They still adhered to their first decision, and when M. de Beaujeu went out among them to inquire the result of their deliberation, they told him a second time that they could not go. This was a severe disappointment to M. de Beaujeu, who had set his heart upon the enterprise, and was resolved to prosecute it. Being a man of great good nature, affability, and ardor, and much beloved by the savages, he said to them—"I am determined to go out and meet the enemy. What! will you suffer your father to go out alone? I am sure we shall conquer." With this spirited harangue, delivered in a manner that pleased the Indians, and won upon their confidence, he subdued their unwillingness, and they agreed to accompany him.

It was now the 7th of July, and news came that the English were within six leagues of the Fort. This day and the next were spent in making preparations, and reconnoitring the ground for attack. Two other captains, Dumas and Liguery, were joined with M. de Beaujeu, and also four lieutenants, six ensigns, and two cadets. On the morning of the 9th they were all in readiness, and began their march at an early hour. It seems to have been their first intention to make a stand at the ford, and annoy the English while crossing the river, and then retreat to the ambuscade on the side of the hill where the contest actually commenced. The trees on the bank of the river afforded a good opportunity to effect this manoeuvre, in the Indian mode of warfare, since the artillery could be of little avail against an enemy, where every man was protected by a tree, and at the same time the English would be exposed to a point blank musket shot in fording the river. As it happened, however, M. de Beaujeu and his party did not arrive in time to execute this part of the plan.

The English were preparing to cross the river, when the French and Indians reached the defiles on the rising ground, where they posted themselves, and waited till Braddock's advanced columns came up. This was a signal for the attack, which was made at first in front, and repelled by so heavy a discharge from the British, that the Indians believed it proceeded from artillery, and showed symptoms of wavering and retreat. At this moment, M. de Beaujeu was killed, and the command devolving on M. Dumas, he showed great presence of mind in rallying

the Indians, and ordered his officers to lead them to the wings and attack the enemy in flank, while he with the French troops would maintain the position in front. This order was promptly obeyed, and the attack became general. The action was warm and severely contested for a short time; but the English fought in the European method, firing at random, which had little effect in the woods, while the Indians fired from concealed places, took aim, and almost every shot brought down a man. The English columns soon got into confusion; the yell of the savages, with which the woods resounded, struck terror into the hearts of the soldiers, till at length they took to flight, and resisted all the endeavors of their officers to restore any degree of order in their escape. The rout was complete, and the field of battle was left covered with the dead and wounded, and all the artillery, ammunition, provisions, and baggage of the English army. The Indians gave themselves up to pillage, which prevented them from pursuing the English in their flight.

Such is the substance of the accounts written at the time by the French officers, and sent home to their government. In regard to the numbers engaged, there are some slight variations in the three statements. The largest number reported is two hundred and fifty French and Canadians, and six hundred and forty-one Indians; and the smallest, two hundred and thirty-three French and Canadians, and six hundred red Indians. If we take a medium, it will make the whole number led out by M. de Beaujeu at least eight hundred and fifty. In an imperfect return, three officers were stated to be killed, and four wounded; about thirty soldiers and Indians killed, and as many wounded.

When these facts are taken into view, the result of the action will appear much less wonderful, than has generally been supposed. And this wonder will be still diminished, when another circumstance is recalled to, worthy of particular consideration, and that is, the shape of the ground on which the battle was fought. This part of the description, so essential to the understanding of military operations, and above all in the present instance, has never been touched upon, it is believed, by any writer. We have seen that Braddock's advanced columns, after crossing the valley extending for nearly half a mile from the margin of the river, began to move up a hill, so uniform in its ascent, that it was little else than an inclined plane of a somewhat crowning form.—Down this inclined surface extended two ravines, beginning near together at about one hundred and fifty yards from the bottom of the hill, and proceeding in different directions till they terminated in the valley below. In these ravines the French and Indians were concealed and protected. At this day they are from eight to ten feet deep, and sufficient in extent to contain at least a thousand men. At the time of the battle, the ground was covered with trees and long grass, so that the ravines were entirely hidden from view, till they were approached within a few feet. Indeed, at the present day, although the place is cleared from trees, and converted into pasture, they are perceptible only at a very short distance. By this knowledge of the peculiarities of the battle ground, the mystery, that the British conceived themselves to be contending with an invisible foe, is solved. Such was literally the fact. They were so paraded between the ravines, that their whole front and right flank were exposed to the incessant fire of the enemy, who discharged their muskets over the edge of the ravines, concealed during that operation by the grass and bushes, and protected by an invincible barrier below the surface of the earth. William Butler, a veteran soldier still living (1832), who was in this action, and afterwards at the Plains of Abraham, said to me, "We could only tell where the enemy were by the smoke of their muskets." A few scattering Indians were behind trees, and some were killed in venturing out to take scalps, but much the larger portion fought wholly in the ravines.

[From the *Detroit Courier*.]

TECUMSEH.—The following incident in the career of this remarkable savage, which we do not recollect to have seen published, may not be altogether uninteresting to our readers, though we fail to embody it in the glowing language of an eye-witness by whom we chanced to hear it narrated. We give it with the more readiness, well knowing the importance attached by the public to any occurrence, however slight, serving to illustrate the character of a distinguished individual; and such the self-styled "King of the Woods" is universally allowed to have been, though border traditions have darkened the policy and patriotism of the native warrior with the deeper penciling of ferocity and blood-thirstiness.

The train of events immediately succeeding the memorable victory of Lake Erie on the 13th of September, 1813, are still fresh in the memory of many of our inhabitants. Among them was the evacuation of Fort Malden by the British, notwithstanding the earnest counsel of Tecumseh that it should be maintained to the last; at the same time proposing to skirt the forest below with his 'braves,' and foot by foot to dispute the progress of the assailants. It was a bright autumnal day when the army of Gen. Harrison, under the escort of Commodore Perry's fleet sailed from Put-in-Bay, for the purpose of occupying that important post. The warlike array of the little squadron still scored with the marks of the recent engagement; the fluttering of pennants and waving of the battle flags; and the files of soldiery crowding the boats, with their burnished muskets throwing back the glitter of the sun were described as having formed a truly animating and imposing spectacle. Their course lay along that part of the Lake which had been the scene of conflict but ten days previous, and terrible mementoes of that bloody victory still surrounded them in the floating bodies of the dead, blackened and mangled as they were tossed from the decks, the red coat of the Briton contrasted with the grey dress of the marine, or the blue jacket of the American tar. As they drew near the Canadian shore, an object was discernible flitting along the beach, now dashing with rapid movement down the entire front of the approaching fleet, and anon pausing as if to reconnoitre. A nearer view revealed a trim and athletic horseman mounted on an Indian pony, dressed in a belted hunting frock of smoked deer skin, with the appendage of long gaiters strapped below the knee, and the richly ornamented moccasins. It was the celebrated Tecumseh, who, notwithstanding the flight of his white ally, had lingered behind to ascertain the force of the invading enemy, and who, after singly confronting their floating batteries till satisfied of their numerical strength, leisurely withdrew as if in dignified defiance from the shore, to communicate the intelligence to the remaining inmates of the Fort.

Had the dauntless spirit and quick sighted sagacity of the Indian warrior been shared by his British brother, it is probable that our troops, after a harassing march to Malden, would have met with a warmer reception than they experienced from a few bed-ridden paralytics and a group of defenceless women and children.

While upon this subject it may not be amiss to advert to a scene which formed the concluding portion of the same narrative, though not materially connected with the name of Tecumseh. A part of the Kentucky troop of horse under the command of Col. Johnson, still following upon the tracks of General Proctor, after his discomfiture at the forks of the Thames, took possession of the Moravian town on that river which had but recently been evacuated by the enemy. These wild and fearless men to whom peril was but pastime, and who seem to have resembled in some particulars the tameless horsemen of the Don, were already rendered half furious at the cold and savage butcheries which had spilt the best blood of Kentucky like water. When orders were therefore given to fire the rows of the deserted log-cabins which constituted the town, these wild riders in the mere wantonness of daring scoured furiously through the streets, walled in as they were on either side by sheets of flame; their vicious and half-tamed animals to all appearance equally elated with the strange glee of their masters. The very appearance of these mad warriors must have been semi-barbarous, bearded and browned as they were by exposure, and attired in the costume of the back-woodsmen, with their carbines slung over their shoulders, the long hunting knife thrust into the belt of the deer-skin frock, and the canteen slung from the bear-skin saddle bows. This, with the roaring of the conflagration, the crash of the falling dwellings, the shouts of these desperate troopers, and the clattering of their horses as they burst ever and anon through the smoke and flames, must have presented as singular and stirring a picture as has ever been sketched even by the pencil of romance.

French Shop Girls.—The following piquant description of a Parisian Shop Keeper is given by Mr. Fay, in one of his late letters from France, published in the *New York Mirror*:

"Next to the quay I should rank the women, that extensive class of them I mean, who keep the shops. There is nothing under heaven like a young French girl behind a counter; she is thoroughly skilled in manner. It is brilliant and irresistible. They are graceful, pretty, attentive, respectfully flattering, and always good humored; and so different from those

honest gentlemen behind the counters of Maiden lane and Broadway, who tell you "the article cost three and sixpence, but you can have it for three shillings," that one scarcely knows how to treat them. Their air resembles that of a charming belle in the meridian of a drawing room; mere pecuniary calculations—such paltry matters as *demi francs* and *sous* are the last things that enter my head; and I stand scraping and bowing and stammering interjections in vile French, and pay ten times what my purchase is worth from mere politeness.

"They are arrant sirens after all: and have several times beguiled me into bargains like that of Franklin's whistle, for most of them consider it disreputable not to cheat a foreigner. Discovering that their obliging air was but a lure, and that my polite simplicity only plunged me deeper into the snare, I resolved to resist their demands with the bluntness of one who knew rather too much to be taken in so readily. Having occasion, therefore, for a pair of gloves, I suffered the counter to be heaped with untied packages—leather, kid and silk, cotton, linen, buckskin of every size, shape and color. The young girl toiled on with the same engaging smile. It was all in vain. Nothing would do. I turned to depart, when her perfectly cheerful "Ah, monsieur cannot suit himself. I am very sorry—pardon—*bon jour Monsieur*," arrested me on the threshold. I felt like a scoundrel. I had thrown her shop into confusion. It was but just to take something. I selected a trifle, worth perhaps two shillings, and handed her a dollar. She threw the glittering coin into the drawer, and gave me the sweetest smile in the world, and I bowed out with her "*bon jour, monsieur*," ringing in my ears like the tones of a flute. There is no sound in nature like the "*bon jour, monsieur*," of a pretty French woman, after she has cheated you out of a dollar. It is actually delightful—perfect music—but it costs you more than the opera."

[FOR THE AMERICAN.]
THE HEBREW REQUIEM.

"They made a funeral oration at the grave, after which they prayed, then turning the face of the deceased towards Heaven, they said—Go in peace."—[Hebrew Antiquities.]

Go thou in peace—we may not bid thee linger
Amid the sunlight and the gloom, of earth,
Where ev'ry joy is touched by sorrow's finger,
And tears succeed the brightest hour of mirth;
Thine upward gaze is fixed upon that dwelling
Where sin and sorrow never more are known,
And seraph lips, the loud Hosanna swelling,
Have caught the music of celestial tone.

Go thou in peace—thy home on earth now leaving
In the lone chamber of the dead to dwell;
Thou hast no portion in the sorrow heaving
The hearts whose anguish tears but feebly tell—
A path of light and gladness is before thee,
The hope of Israel in fruition thine,
And thou wilt gaze upon the beams of glory
Around the throne of Israel's God that shine.

Go thou in peace, why are the loved ones weeping
Around the spot where now thy form is laid,
There is no cause for grief that thou art sleeping,
Free from each trial, and untouched by pain;
Thy path has been through many a scene of sorrow,
Thy weary form has needed this repose;
Calm be thy rest until the eternal morrow
Its light and glory on thy dwelling throw.

Go thou in peace—temptation cannot sever
The tie that now unites thee to thy God;
The voice of sin—of unbelief—can never
Enter the precincts of thy low abode:
We leave thee here with mingled joy and sadness,
Our hearts are weak, our faith is low and dim,
Yet to the Lord we turn with chastened gladness,
And yield our friend—our brother up to Him.

M. J. W.

SURVEYORS' INSTRUMENTS.

Compasses of various sizes and of superior quality warranted.
Leveling Instruments, large and small sizes, with high magnifying powers with glasses made by Troughton, together with a large assortment of Engineering Instruments, manufactured and sold by
E. & G. W. BLUNT, 154 Water street, corner of Maidenlane.

TOWNSEND & DUFFEE, of Palmyra, Manufacturers of Railroad Rope, having removed their establishment to Hudson, under the name of *Duffee, May & Co.* offer to supply Rope of any required length (without splice) for inclined planes of Railroads at the shortest notice, and deliver them in any of the principal cities in the United States. As to the quality of Rope, the public are referred to J. B. Jarvis, Eng. M. & H. R. Co., Albany; or James Archibald, Engineer Hudson and Delaware Canal and Railroad Company, Carbon dale, Luzerne county, Pennsylvania.
Hudson, Columbia county, New-York,
Jan'y 29, 1853.

LOCOMOTIVE ENGINES.

THE AMERICAN STEAM CARRIAGE COMPANY, OF PHILADELPHIA, respectfully inform the public, and especially Railroad and Transportation Companies, that they have become sole proprietors of certain improvements in the construction of Locomotive Engines, and other railway carriages, secured to Col. Stephen H. Long, of the United States Engineers, by letters patent from the United States, and that they are prepared to execute any orders for the construction of Locomotive Engines, Tenders, &c. with which they may be favored, and pledge themselves to a punctual compliance with any engagements they may make in reference to this line of business.

They have already in their possession the requisite apparatus for the construction of three classes of engines, viz. engines weighing four, five, and six tons.

The engines made by them will be warranted to travel at the following rates of speed, viz. a six ton engine at a speed of 15 miles per hour; a five ton engine at a speed of 18 miles per hour; a four ton engine at a speed of 23 1/2 miles per hour. Their performance in other respects will be warranted to equal that of the best English engines of the same class, with respect not only to their efficiency in the conveyance of burdens, but to their durability, and the cheapness and facility of their repairs.

The engines will be adapted to the use of anthracite coal, pine-wood, coke, or any other fuel hitherto used in locomotive engines.

The terms shall be quite as favorable, and even more moderate, than those on which engines of the same class can be procured from abroad.

All orders for engines, &c. and other communications in reference to the subject, will be addressed to the subscriber, in the city of Philadelphia, and shall receive prompt attention.

By order of the Company,

WILLIAM NORRIS, Secretary.

December 2d, 1853.

For further information on this subject see No. 49, page 772, Vol. 2, of Railroad Journal.

RAILWAY IRON.

Ninety-five tons of 1 inch by 1/2 inch,	Flat Bars in lengths of 14 to 16 feet counter sunk holes, ends cut at an angle of 45 degrees with splicing plates, nails to suit.
300 do. 1 1/2 do. 1/2 do.	
40 do. 1 1/2 do. 1/2 do.	
800 do. 2 do. 1/2 do.	
800 do. 2 1/2 do. 1/2 do.	
soon expected.	

250 do. of Edge Rails of 36 lbs. per yard, with the requisite chairs, keys and pins.

Wrought Iron Rims of 30, 33, and 36 inches diameter for Wheels of Railway Cars, and of 60 inches diameter for Locomotive wheels.

Axles of 2 1/2, 3, 3 1/2, 4, 5, 6, and 8 inches diameter for Railway Cars and Locomotives of patent iron.

The above will be sold free of duty, to State Governments and Incorporated Governments, and the Drawback taken in part payment.

A. & G. HALSTON,
9 South Front street, Philadelphia.

Models and samples of all the different kinds of Rails, Chairs, Pins, Wedges, Spikes, and Splicing Plates, in use, both in this country and Great Britain, will be exhibited to those disposed to examine them.

d71meowr

ENGINEERING AND SURVEYING INSTRUMENTS.

The subscriber manufactures all kinds of Instruments in his profession, warranted equal, if not superior, in principles of construction and workmanship to any imported or manufactured in the United States; several of which are entirely new: among which are an Improved Compass, with a Telescope attached, by which angles can be taken with or without the use of the needle, with perfect accuracy—also, a Railroad Goniometer, with two Telescopes—and a Levelling Instrument, with a Goniometer attached, particularly adapted to Railroad purposes.

WM. J. YOUNG,
Mathematical Instrument Maker, No. 9 Dock street, Philadelphia.

The following recommendations are respectfully submitted to Engineers, Surveyors, and others interested.

In reply to thy inquiries respecting the Instruments manufactured by thee, now in use on the Baltimore and Ohio Railroad. I cheerfully furnish thee with the following information. The whole number of Levels now in possession of the department of construction of thy make is seven. The whole number of the "Improved Compass" is eight. These are all exclusive of the number in the service of the Engineer and Graduation Department.

Both Levels and Compasses are in good repair. They have in fact needed but little repairs, except from accidents to which all Instruments of the kind are liable.

I have found that thy patterns for the levels and compasses have been preferred by my assistants generally, to any others in use, and the Improved Compass is superior to any other description of Goniometer that we have yet tried in laying the rails on this Road.

This instrument, more recently improved with a reversing telescope, in place of the vane sight, leaves the engineer scarcely any thing to desire in the formation or convenience of the Compass. It is indeed the most completely adapted to lateral angles of any simple and cheap instrument that I have yet seen, and I cannot but believe it will be preferred to all others now in use for laying of rails—and in fact, when known, I think it will be as highly appreciated for common surveying.

Respectfully thy friend,

JAMES F. STABLER, Superintendent of Construction of Baltimore and Ohio Railroad.

Philadelphia, February, 1853.
Having for the last two years made constant use of Mr. Young's "Patent Improved Compass," I can safely say I believe it to be much superior to any other instrument of the kind, now in use, and as such most cheerfully recommend it to Engineers and Surveyors.

E. H. GILL, Civil Engineer.

For a year past I have used Instruments made by Mr. W. J. Young, of Philadelphia, in which he has combined the properties of a Theodolite with the common Level.

I consider these Instruments admirably calculated for laying out Railroads, and can recommend them to the notice of Engineers as preferable to any others for that purpose.

HENRY R. CAMPBELL, Eng. Philad.,
German and Norristown Railroad

STEPHENSON,

Builder of a superior style of Passenger Cars for Railroads
No. 264 Elizabeth street, near Bleecker street,
New-York.

RAILROAD COMPANIES would do well to examine these Cars; a specimen of which may be seen on that part of the New-York and Harlem Railroad, now in operation.
J35 1f

RAILROAD CAR WHEELS, BOXES AND OTHER RAILROAD CASTINGS.

Also, AXLES furnished and fitted to wheels complete at the Jefferson Cotton and Wool Machine Factory and Foundry, Paterson, N. J. All orders addressed to the subscribers at Paterson, or 60 Wall street, New-York, will be promptly attended to. Also, CAR SPRINGS.

Also, Flange Tires turned complete.

J8 ROGERS, KETCHUM & GROSVENOR.

NOVELTY WORKS,

Near Dry Dock, New-York.

THOMAS B. STILLMAN, Manufacturer of Steam Engines, Boilers, Railroad and Mill Work, Lathes, Presses, and other Machinery. Also, Dr. Rott's Patent Tubular Boilers, which are warranted, for safety and economy, to be superior to any thing of the kind heretofore used. The fullest assurance is given that work shall be done well, and on reasonable terms. A share of public patronage is respectfully solicited.

INSTRUMENTS.

SURVEYING AND NAUTICAL INSTRUMENT MANUFACTORY.

EWING & HEARTT, at the sign of the Quadrant, No. 53 South street, one door north of the Union Hotel, Baltimore, beg leave to inform their friends and the public, especially Engineers, that they continue to manufacture to order and keep for sale every description of Instruments in the above branches, which they can furnish at the shortest notice, and on fair terms. Instruments repaired with care and promptitude.

For proof of the high estimation on which their Surveying Instruments are held, they respectfully beg leave to tender to the public perusal, the following certificates from gentlemen of distinguished scientific attainments.

To Ewing & Heartt.—Agreeably to your request made some months since, I now offer you my opinion of the Instruments made at your establishment, for the Baltimore and Ohio Railroad Company. This opinion would have been given at a much earlier period, but was intentionally delayed, in order to afford a longer time for the trial of the Instruments, so that I could speak with the greater confidence of their merits, if such they should be found to possess.

It is with much pleasure I can now state that notwithstanding the Instruments in the service procured from our northern cities are considered good, I have a decided preference for those manufactured by you. Of the whole number manufactured for the Department of Construction, to wit: five Levels, and five of the Compasses, not one has required any repairs within the last twelve months, except from the occasional imperfection of a screw, or from accidents, to which all Instruments are liable. They possess a firmness and stability, and at the same time a neatness and beauty of execution, which reflect much credit on the artists engaged in their construction.

I can with confidence recommend them as being worthy the notice of Companies engaged in Internal Improvements, who may require Instruments of superior workmanship.

JAMES F. STABLER,
Superintendent of Construction of the Baltimore and Ohio Railroad.

I have examined with care several Engineers' Instruments of your Manufacture, particularly Spirit Levels, and Surveyors' Compasses; and take pleasure in expressing my opinion of the excellence of the workmanship. The parts of the levels appeared well proportioned to secure facility in use, and accuracy and permanency in adjustments.

These Instruments seemed to me to possess all the modern improvement of construction, of which so many have been made within these few years; and I have no doubt but they will give every satisfaction when used in the field.

WILLIAM HOWARD, U. S. Civil Engineer.

Baltimore, May 1st, 1853.
To Messrs Ewing and Heartt.—As you have asked me to give my opinion of the merits of those Instruments of your manufacture which I have either used or examined, I cheerfully state that as far as my opportunities of my becoming acquainted with their qualities have gone, I have great reason to think well of the skill displayed in their construction. The neatness of their workmanship has been the subject of frequent remark by myself, and of the accuracy of their performance I have received satisfactory assurance from others, whose opinion I respect, and who have had them for a considerable time in use. The efforts you have made since your establishment in this city, to relieve us of the necessity of sending elsewhere for what we may want in our line, deserve the unqualified approbation and our warm encouragement. Wishing you all the success which your enterprise so well merits, I remain, yours, &c.

B. H. LATROBE,
Civil Engineer in the service of the Baltimore and Ohio Railroad Company.

A number of other letters are in our possession and might be introduced, but are too lengthy. We should be happy to submit them, upon application, to any person desirous of perusing the same.

23d CONGRESS....1st Session.

The following is a list of the acts of public importance passed at this session.

For the relief of John Percival, Master Commandant in the United States Navy.

Making appropriations, in part, for the support of Government for the year 1834.

Making certain allowances, and granting certain arrearsages to the Captains and Subalterns of the U. S. Corps of Marines.

To grant to the State of Ohio certain lands for the support of Schools, in the Connecticut Western Reserve.

For the relief of sundry citizens of the United States who have lost property by the depredations of certain Indian tribes.

Making appropriations for the Indian Department for the year one thousand eight hundred and thirty-four.

Making appropriations for the Naval service, for the year one thousand eight hundred and thirty-four.

Authorizing the Secretary of War to establish a Pension Agency in the town of Decatur, in the State of Alabama, and to provide for paying certain pensions in said town of Decatur.

In reference to pre-emption rights in the South-eastern district of Louisiana.

Making appropriations for Indian Annuities, and other similar objects, for the year 1834.

Making appropriations for the Revolutionary Pensioners of the United States, for the year 1834.

Concerning the gold coins of the United States, and for other purposes.

Making appropriations for the Military Academy of the United States, for the year 1834.

Making appropriations for the support of the army, for the year 1834.

Regulating the value of certain silver coins within the United States.

Making additional appropriations for certain harbors, and removing obstructions in the mouths of certain rivers, for the year 1834.

Making appropriations for the civil and diplomatic expenses of Government, for the year 1834.

To establish an additional land office in Arkansas.

Regulating the value of certain foreign gold coins within the United States.

To extend the time allowed for the discharge of the duties of the commission, for carrying into effect the Convention with France.

To change the boundary between the Southeastern and Western land districts in the Territory of Michigan, and for other purposes.

To revive and amend "An act for the relief of certain insolvent debtors of the United States," passed on the second day of March, eighteen hundred and thirty-one, and an act, in addition thereto, passed on the fourteenth of July, 1832.

Supplementary to the act entitled "An act to carry into effect the Convention between the United States and his Majesty the King of the Two Sicilies, concluded at Naples on the fourteenth day of October, 1832.

To enable the Secretary of State to purchase the papers and books of General Washington.

To authorize the removal of the Custom House from Magnolia to St. Marks in Florida.

To equalize representation in the Territory of Florida, and for other purposes.

For the re-appropriation of an unexpended balance of a former appropriation for the payment of the Georgia Militia Claims, for the year one thousand seven hundred and ninety-two, and one thousand seven hundred and ninety-three, and one thousand seven hundred and ninety-four.

Giving the consent of Congress to an agreement or compact entered into between the State of New York and the State of New Jersey, respecting the territorial limits and jurisdictions of the State.

Making additional appropriations for the Armory at Harper's Ferry, for the year 1834.

To amend an act passed on the twenty-ninth day of May, 1830, entitled "An act for the relief of the owners of sundry vessels sunk for the defence of Baltimore."

Making appropriations to carry into effect certain Indian treaties and for other purposes.

To attach the territory of the United States West of the Mississippi river and North of the State of Missouri, to the Territory of Michigan.

To provide for the organization of the Department of Indian Affairs.

Making appropriations for certain fortifications of the United States for the year 1834.

Making appropriations for the Public Buildings and grounds, and for other purposes.

For the better organization of the United States Marine corps.

To procure a bust in marble, of the late Chief Justice Ellsworth.

For the completion of the road from a point opposite to Memphis, in the State of Tennessee, to Little Rock, in the Territory of Arkansas.

Concerning the duties on lead.

Authorizing the selection of certain Wabash and Erie Canal lands in the State of Ohio.

To establish a port of entry at Natchez, in Mississippi, and creating certain ports of delivery, and for other purposes.

Concerning naval pensions and the navy pension fund.

Authorizing the President of the United States to cause certain roads to be opened in Arkansas.

To suspend the operation of certain provisos of an "act to alter and amend the several acts imposing duties on imports," approved 14th July, 1832.

To aid in the construction of certain roads in the Territory of Michigan.

To enable the President to make an arrangement with the Government of France, in relation to certain French Seamen killed or wounded at Toulon, and their families.

Limiting the time of advertising the sale of the Public Lands.

For the benefit of the City of Washington.

To create two additional Land Districts in the State of Illinois, and two new Land Districts north of said State, in the Territory now attached to Michigan, which lies between Lake Michigan and the Mississippi river.

For the continuation and repair of the Cumberland road.

An act in addition to the "act more effectually to provide for the punishment of certain crimes against the United States and for other purposes:" approved March 3d, 1825.

To amend an act entitled "An act to annex a part of the State of New Jersey to the collection district of New York; to remove the office of collector of Niagara to Lewistown; to make Cape St. Vincent, in the District of Sackett's Harbour, a port of delivery; and out of the Districts of Miami and Mississippi, to make two new Districts, to be called the Districts of Sandusky and Teche, and for other purposes.

Authorizing the Governors of the several States to transmit by mail certain books and documents.

Authorizing a sum of money to be distributed among the officers and crew of the late private armed brig General Armstrong.

Granting a township of land to certain exiled Poles from Poland.

Authorizing the payment of bounty in certain fishing vessels lost at sea.

For the relief of the Roman Catholic church at St. Louis, Missouri.

For the relief of a part of the crew of the brig Sarah George.

To regulate trade and intercourse with the Indian tribes, and to preserve peace on the frontiers.

Making appropriations for building light houses, light boats, beacons, and monuments, for the year 1834.

Making appropriation for the improvement of the navigation of the Hudson river, in the State of New York.

To authorize the Secretary of the Treasury to compromise the claims of the United States against the late firm of Minurn and Champlain and their securities.

For the relief of J. Haggerty & David Austen, of N. York.

For the relief of John Hone & Sons, of New York.

For the relief of the widow and heirs of Felix St. Vrain.

To continue further in force "An act to authorize the extension, construction and use of a lateral branch of the Baltimore and Ohio Rail-road into and within the District of Columbia."

To authorize Gazaway B. Lamar to import an iron steamboat, in detached parts, with the necessary machinery, tools, and working utensils therefor, into the United States, free from duty, and to provide for the remission of the same.

To change the time for commencing the session of the Courts of the United States in the District of Delaware.

To carry into effect the 14th article of the Treaty of the 8th of January, 1821, with the Creek nation of Indians, so far as relates to the claims of the citizens of Georgia against said Indians, prior to 1822.

Repealing certain acts of the Legislative Council of the Territory of Florida.

Authorizing a road to be cut out from the northern boundary of the Territory of Florida, by Marianna, to the town of Apalachicola, within the said Territory.

To mark and open a road from Columbia to Little Rock, in the Territory of Arkansas.

To provide for rebuilding the Frigate Congress.

Authorizing the Secretary of the Navy to make experiments for the safety of the Steam Engine.

To authorize the President of the United States to direct transfers of appropriations in the naval service, under certain circumstances.

Authorizing the purchase of live oak frames for a frigate and sloop of war, and for other purposes.

Authorizing the construction of a Bridge across the Potomac, and repealing all acts already passed in relation thereto.

Increasing the salaries of the Judges of the United States for the Territories of Michigan, Arkansas, and Florida.

To authorize an extra session of the Legislative Council of the Territory of Michigan.

To prohibit the Corporations of Washington, Georgetown and Alexandria, in the District of Columbia, from issuing promissory notes or bills of any denomination less than ten dollars, after the period therein mentioned, and for the gradual withdrawal from circulation of all such notes and bills.

Supplementary to the act to amend the several acts respecting copy-rights.

For establishing the northern boundary line of the country purchased of the Chickasaws by the treaty of 1832.

Making compensation for certain diplomatic services, and for other purposes.

To relinquish the reversionary interest of the United States in a certain Indian reservation lying between the rivers Mississippi and Desmoines.

To provide for the payment of claims for property destroyed by the enemy while in the military service of the United States, during the late war with the Indians on the frontiers of Illinois and Michigan Territory.

To complete the improvements of Pennsylvania Avenue.

Concerning tonnage duty on Spanish vessels.

Resolution directing certain Books to be procured and furnished members of the 23d Congress.

Giving the right of way through the property of the United States at Harper's Ferry, to the Winchester and Potomac Railroad Company.

For distributing the returns of the last Census.

Joint Resolution manifesting the sensibility of the two Houses of Congress and of the Nation, on the occasion of the decease of General Lafayette.

NOTICE TO MANUFACTURERS.

SIMON FAIRMAN, of the village of Lansingburgh, in the county of Rensselaer, and state of New-York, has invented and put in operation a Machine for making Wrought Nail with square points. This machine will make about sixty 6d nails, and about forty 10d nails in a minute, and in the same proportion larger sizes, even to spikes for ships. The nail is hammered and comes from the machine completely heated to redness, that its capacity for being clenched is good and sure. One horse power is sufficient to drive one machine, and may easily be applied where such power for driving machinery is in operation. Said Fairman will make, vend and warrant machines as above, to any persons who may apply for them as soon as they may be made, and on the most reasonable terms. He also desires to sell one half of his patent right for the use of said machines throughout the United States. Any person desiring further information, or to purchase, will please to call at the machine shop of Mr. John Humphrey, in the village of Lansingburgh.—August 15, 1833. A29 if K M & F

PATENT RAILROAD, SHIP AND BOAT SPIKES.

The Troy Iron and Nail Factory keep constantly for sale a very extensive assortment of Wrought Spikes and Nails, from 3 to 16 inches, manufactured by the subscriber's Patent Machinery, which after five years successful operation and now almost universal use in the United States (as well as England, where the subscriber obtained a Patent,) are found superior to any ever offered in market.

Railroad Companies may be supplied with Spikes having countersink heads suitable to the holes in iron rails, to any amount and on short notice. Almost all the Railroads now in progress in the United States are fastened with Spikes made at the above named factory,—for which purpose they are found invaluable, as their adhesion is more than double any common spikes made by the hammer.

All orders directed to the Agent, Troy, N. Y., will be punctually attended to.

HENRY BURDEN, Agent.

Troy, N. Y. July, 1831. Spikes are kept for sale, at factory prices, by L. & J. Townsend, Albany, and the principal Iron Merchants in Albany and Troy: J. I. Brower, 223 Water street, New-York; A. M. Jones, Philadelphia; T. Janviers, Baltimore; Degrad & Smith, Boston.

P. S.—Railroad Companies would do well to forward their orders as early as practical, as the subscriber is desirous of extending the manufacturing so as to keep pace with the daily increasing demand for his Spikes.

JJS iam

H. BURDEN.
